CONTINUOUS IMPROVEMENT CULTURE IN SME'S: AN INTERPRETIVE FIELD STUDIES IN INDUSTRIAL SITES

Seyfi Top
Nurdan Colakoğlu
Serkan Dilek
Beykent University

ABSTRACT

The purpose of the present study is to investigate continuous improvement cultural applications in Small and Medium Scale Enterprises (SME) in İstanbul. To this end we researched perspective of entrepreneurs and managers for innovation, improvement practices and technological applications in SME's. Continuous improvement (CI) applications are important factors that make differences in competition between SME's. We will test the organization's ability to adapt to the technological changes in firm's internal environment and improvements by conducting a survey to managers and entrepreneurs in Industrial sites in İstanbul.

The article proceeds in the following manner. First, we briefly review the literature regarding continuous improvement innovation and problem solving organizations. We develop hypotheses concerning improvement, innovation, knowledge sharing and technical values. Second we conducted the survey which embedded in our hypotheses. Next, we tested our hypotheses by using data from SME's in manufacture and service sectors in some industrial sites. Finally we used SPSS 16.00 statistical package programme to interpret our data from this survey. We provide the research findings and discuss SME's managerial and theoretical implications of continuous improvement.

We searched if the sectors have the same or different perception about innovations and improvements. Entrepreneurs differ from managers on the perception of the importance in realizing changes, making innovations, sharing knowledge, facilitating communication. We searched that if the importance of technical knowledge infrastructure is understood enough by entrepreneurs and managers. In the dimension of technical infrastructure, continuous improvement culture (CIC) is increasing as the usage of trademark, royalty, patent and Know-How increases. The ratio of the firms which use trade mark or go to national or international strategic cooperation is %60. This result means that the risks and sources are shared with other firms. In this sense we evaluated that only % 40 of the firms in this region have innovation capacity and %60 of them have elasticity capacity. The most important result is the line manager's vision perception is higher than the other managers. In other words line managers have more optimistic expectations than top managers.

Keywords: *Innovation, Organizational Learning, Continuous Improvement, Continuous Improvement Culture*

INTRODUCTION

We are living in an era which is witnessing the rapid changes in knowledge, technology, concepts, product and opportunities. Both new and old enterprises should apply new concepts which are appropriate with their organizations and management styles to survive in hard competition conditions. The enterprises, which can be changed rapidly, have chances to survive (Mendoza, 2001;14).

Continuous improvement, as the name implies, adopts an approach to improving organizational performance, with small incremental steps, over time. In this approach, it is not the size of each step which is important but the likelihood that the improvements will be ongoing. Many companies are now complementing continuous improvement with innovation, which is seen as the successful exploitation of new ideas, and there appears to be a clear synergy between these two philosophies when integrated under an appropriate corporate culture.

The architect of continues improvement culture is Japan. Japans attracted the advice of Taylor. This advice was the decreasing of wasting sources and energies. After that advice Japans developed continues improvement culture (Kaizen) and focused on decreasing failure and wasting (Imai,1994,5;Top,2009;292). Also the study of Henry Ford, which was published in 1926 and has a name of "Today and Tomorrow", attracted Japans and became an important tool for building JIT in Toyota. Addition to this, the stock systems of American Supermarkets attracted Japans and became an important concept in Continues improvement approaches (Lynch and Cross,1995;13).

Therefore improvement becomes an important activity for any single SME to own all the required resources at the required levels. Indeed, if an SME tries to own all these resources, it may find its development unsatisfactory due to dispersion and weakening of its core competitiveness. It would be more sensible to focus its own administrative and technical resources and abilities on its continuous improvement. In order to comprehend the need for improvement in the industry, firms need to look for a competitive position in today's market that is essential to provide more consistent quality and value to their owners/customers. Over the past decades, CI has been studied from many perspectives. The need to continuously improve on a larger scale within the organization became an imperative and number of CI methodologies have developed.

Literature Review

In literature, continuous improvement notion has been described in many ways. For example; improvement is defined as main goal of the quality for firms (Juran,1988,8; Top,2009,287-289). This goal is explained by Deming (1982;36-40) as endless developments in processes, products and total quality management (TQM). According to Crosby (1979;137), the goal is realized by helping organizational learning, effecting thinking processes and providing a team's mission. In these perspectives improvement concept is a useful tool and philosophy for achieving the goals of enterprises. Sinclair, Phelps and Sadler (2004;2) mentioned that improvements are related with the elasticity, velocities and qualities of problem solving approaches. In this sense CI is a life philosophy of TQM. According to Imai (1994;3) even if all the things are done best, this is not enough for future conditions. For that reason CI is a thinking the best of the best of processes, actions for all of the fields of enterprises.

One of the most important business goal is total customer satisfaction. To achieve that goal, managers need organizations which can best deliver solutions that conform to customer needs and expectations first time every time (Pantling,1993;23). Every business today and in the future must keep its own customer satisfaction with continuous improvement paths. These new needs that the market places on companies are seen as the productive and effective sphere as improvements in standards for quality, cost and service. Appropriate management philosophy can contribute greatly to such improvements (Arca and Prado,2008;247).

Continuous Improvement Concept

CI is a philosophy that Deming described simply as consisting of "Improvement initiatives that increase organization successes and reduce failures" (Bhuiyan and Baghel,2005;761). In Philosophy manner, CI is described as the development of different life fields and living styles. However, improvement is the need of life field for enterprises to continue competing (Top,2009;287-292). Deming, one of the pioneer of Total Quality Management, defines CI as "endless improvements in processes, qualities and management" (Deming, 1982, 36-40). In other words the continuous improvement is a process or level that eliminates dissatisfactions of customers, suppliers, employees, entrepreneurs and managers (Spiker and others,1992;722). In this sense, the special aim of CI is to improve the existing situation: trying to reduce costs, striving for zero defects, striving for zero inventories, and trying to offer a large product variety (Lange-Ros,1999;9).

We can also define CI more generally as a culture of sustained improvement targeting the elimination of waste in all systems and processes of any organization. It involves everyone working together to make improvements without necessarily making huge capital investments (Bhuiyan and Baghel,2005;761). CI also contains knowledge sharing and continuous learning process (Crosby,1979;137). Continuous learning is a keystone of continuous improvement and is a cement organization success (Mendoza,2001;14). In this context CI, means a commitment to constant examination of technical and administrative processes in search of better methods and techniques (Lange-Ros,1999;15).

Another definition of CI is a company-wide process of focused and continuous incremental innovation (Bhuiyan and Baghel,2005;761). CI refers to single incremental changes or development and innovation which influence all of the firms performance (Lange-Ros,1999,18-20). Briefly CI is a sustained incremental innovation, and development are taken up with learning the basic of systematic problem solving (Bessant and Caffyn,1996;3-10). According to Deming, Juran and Feigenbaum, the concept of continuous improvement is a factor that creates heterogeneous sustainability to the firms (Lynch and Cross,1995;13). Organizational change, especially improvements get much attention in literature as well as in practice. Often in literature, a distinction is made between major and minor, or incremental and changes. According to Revans, for an organization to be successful in today's rapidly changing environment, its capacity to improve must exceed the rate of change imposed on it (Buckler,1996;31). CI requires an organizational culture that constantly encourages members to innovate minimizes fear and provides them with a rich and diverse set of tools (Liao, et al. 2010;9). In this context CI require cultural change throughout the firm. (Kitazawa and Sarkis,2000;242-243).

CI philosophy is composed of a number of associated concept, such as: continuous innovation, employee empowerment of all staff to participate in innovation and problem finding and solving, experimentation as a complement to maintenance of standards, sharing of knowledge, organizational learning and measuring and monitoring incremental change (Top,2009;288-289).

Continuous Improvement Culture

Culture is the driving force behind the big team version of teamwork (Floyd, 2008, 1), that is a means of shared patterns of thought, belief, feeling and values that result from shared experiences and common learning (Sabuncuoğlu ve Tüz,2003;36). As it is seen, culture is defined as the values, beliefs, and norms of an organization that shape its behavior (Shortell et al.,1995;381). Culture may be described in several different ways by various observations based on different experiences and observed conditions. One of the most common is described by Shein (2004;17) “as a pattern of shared basic assumption that was learned by a group as it solved its problems of external adaptation and internal integration that has worked well enough to be considered valid and therefore to be taught to new members as the correct way to perceive, think and feel in relation to those problems”.

We can also describe four cultural types which explain improvement issues. The first type is a group culture based on norms and values associated with affiliation, teamwork, and participation; the second is a developmental culture based on risk-taking innovation and change; the third is a hierarchical culture reflecting the values and norms associated with bureaucracy; and a rational culture emphasizing efficiency and achievement in the business (Eren,2008,137-141; Shortell et al.,1995,381). In this context we impose team, organizational and industry culture.

Industry Culture

An industry is defined by shared or interlocking metaphors or world views and a common body of methods, behavior and knowledge appears to exist within an industry which is disseminated through media equally available to and used by executives within the industry (Basso et.al,2008;9). Together with these values, beliefs and behaviors which are used in business define industrial culture (Floyd,2008,5). On the other hand, an industry is defined as a set of firms that use similar technologies, have similar clients and suppliers, apply similar management style. As a result, the firms that belong to the same industry tend to compete in similar environments and environments characterized by similar levels of dynamism, hostility, technological sophistication, etc(Basso et.al,2008;9). These cultural values affect the industry that causing creative improvement through other people requires much more complex and engaged relationship than the current industrial practice of supervising people to perform against a fixed standard (Floyd,2008;3).

Corporate Culture

Every improvement effort has also driven an evaluation in the management style of the company and every each of development of management style can support to evolve the management culture (Pantling,1993;23). These are adaptation to the external environment and survival in and integration of its internal processes to ensure the capacity to continue to serve. Basically corporate culture functions are to solve basic problems that members facing with (Basso et.al,2008;12). Corporate culture like management philosophy, managerial structure or even strategy is needed for CI (Lumpkin and Dess,1996;139).

The principle of continuous improving is teamwork that is the collaboration between managers and non managers, between functions and between customers and suppliers. The use of teamwork between managers and non managers is based on the assumption that all employees can make important contributions to organizations when they have enough power and the necessary preparation. Teamwork among functions is based on the notion that organizations as systems cannot be effective if subunits emphasize their own outcomes over those of others. The principle of teamwork with customers and suppliers is based on the perceived benefits of partnerships. Collaboration practices include identifying the needs of all groups and organizations involved in decision making, trying to find solutions that will benefit everyone involved and sharing responsibilities and credit (Lange-Ros,1999;15).

Team Culture

There are four basic elements or preconditions necessary to ensure a culture of CI for all employees in a team based. In a much simplified way, the model requires everyone to understand why improvement is important and what exactly his/her contribution should be. Team members must have the competence and skills to do problem solving, synthesis solutions, formulate opportunities etc, (Jager,et al.,2004;316). Given the emphasis of CI efforts on empowering individuals to make decisions and on promoting communication across departments and functions, it is felt that cultures emphasizing group and developmental components will be more conducive to implementing quality and firm improvement efforts (Shortell et al.,1995;381).

It is not well understood that the sources of innovations are the common minds of teams, sharing technical knowledge and corporate learning. Teams can get ultimate success by the combination of different teammates’

experiences, abilities, visions and skills (Nsenduluka and Shee,2009;438-439). Self-directed-works- teams like quality circles are natural output from employee involvement, empowerment and leadership through quality and improvement. As management style has changed and quality and improvement principles have applied to the organizations, the need for empowerment and the development of self-directed-works-teams are becoming important for organizations (Pantling,1993;24).

Innovation Strategy

Innovations play an important role in successfully competition and surviving for business. Innovations can be defined as a motor which fires organization for adapting environment and surviving in long run (Nsenduluka and Shee, 2009, 438). One of the most important variable that effects innovations is organization climate. Organizational climate defines business environment and studying platform which includes the missions of organization members. Organizations are searched with all it's dimensions (Nsenduluka and Shee,2009;440). Group Climate for Innovation (GCI) is defined with four factors approach which comes from the group activities of innovation. The first one is vision that is the focusing of teammates on realist and clear goals. Second is the attractions which are obtained from contributions of teammates which are encouraged to innovation. Third factor is the assessment of general weaknesses to get higher degree success standards. We can call them mission adaption. Last factor is the improvement of corporation and production of new ideas which support innovations (Nsenduluka and Shee,2009;441-442).

Vision

The world where managers can discover new horizons, companies has become industry leaders by huge margins in the space of months, not years. They have found a way to open up with a viable vision. CI vision consists of two major components: core ideology and envisioned future. Core ideology, the yin in our scheme, defines what we stand for and why we exist. Yin is unchanging and complements yang, the envisioned future. The envisioned future is what we aspire to become, to achieve, to create something that will require significant change and progress to attain (Collins and Porras,1996;3). Today managers compete in such a competitive and complex environment that establishing accurate goals and understanding how they can be achieved is vital. Executives understand that their organization's measurement system strongly affects the behaviour of managers and employees (Kanji and Sá,2002;14). Core ideology defines the enduring character of an organization, a consistent identity that transcends product or market life cycles, technological breakthroughs, management fads, and individual leaders. In fact, the most lasting and significant contribution of those who build visionary companies is the core ideology (Collins and Porras,1996;3).

The concept of trust in management indicates employee faith in an organization's goal attainment and organizational leaders and the belief that organizational action will be beneficial for employees (Renzl,2008;209). To create a vision forces managers and employee to take a stand for a preferred future. To articulate their vision of the future is to come out of the closet with our doubts about the organization and the way it operates (Block,1987,102-105; Fullan,1993,3).

Company Vision

The company's vision highlights issue which will make employees feel of being as a part of their own company (Pantling,1993;25). All groups operate in an organizational culture. Every firms or organizations over time has developed its own way of doing things. An organization's culture is difficult to change in a short time (Richardson,1994-1995;10). However the importance of CI needs the cultural change stage that employee empowerment. It provides a better explanation of how an organization requires extensive training and empowerment. The cases show that there needs to be a conscious effort by management that allows more employees to participate in the decision-making process (Kitazawa and Sarkis 2000;242-243).

Companies that enjoy enduring success have core values and a core purpose that remains fixed while their business strategies and practices endlessly adapt to a changing world (Collins and Porras,1996;2). To support and motivate employees clear and direct incentive mechanisms, such as profit sharing need introduction, thus to improve employee participation. Such management commitment strongly supports the creation of job enrichment and fosters employee empowerment. These major elements are found to be supportive of each other, as well as supporting CI in operational activities that were designed for source reduction (Kitazawa and Sarkis,2000;243). The contributions of employees are important factor in Deming's approach and success is the result of collective study's nature (Dettmer,1997;10). Activities are not studied in isolation, instead the whole chain from supplier to customer is taken into account and all the activities in this chain are important (Lange-Ros,1999;10).

Organizational Human Capital

Human Capital is generally studied by capabilities. Capabilities of employees are the most important human capital. By adding new items to this concept, it is defined with technical knowledge, capacity and capability that creates different performance to organizations (Hsu,2007;1). According to Parnes, human capital includes capabilities and applied knowledge, which has price on labor markets. It is also defined as capabilities that make effective business performance. In perspective of source based firm, human capital provides competitive source that can be improved. According to this view these sources are intangible and help creating survival superiority (Hsu,2007;1-2).

The most important principle is the concept of organizations as systems of interlinked processes and the belief that by improving these human capital, organizations can continue to meet the increasingly stringent expectations of their customers (Lange-Ros,1999;15). As technologies and systems advance, their development and CI call for new kinds of resources. These could include intellectual properties, human resources, capital, management know-how, and so on. The scope of such resources keeps getting wider, and their quality and quantity requirements keep increasing (Yasuda,2005;5). Organizational learning framework provide useful ways of thinking about CI and CI a more holistic process learning suggests that efforts to improve and develop behavioral routines will be more beneficial. (Murray and Chapman,2003;281).

METHOD

This study is done in 2 industrial sites (Pirinççiler and Bakırçılar), which are located in Beylikdüzü in Istanbul, to reveal the improvement about the CIC in Enterprises. While there are 730 enterprises in total, we tried to make an appointment with the 540 enterprises. But 222 enterprises gave answer to us. Although we applied a survey by face to face method through 222 enterprises, only 178 of them gave complete answers to survey. This survey is analyzed by SPSS 16.00 statistical package programme. We made queries about the CIC in sectoral manner by this survey. 35 question was asked to measure technical infrastructures of firms which concerns about CIC, improvement philosophy of top management, Vision and Success understanding, innovation strategies, the actions of human resources in improvement.

FINDINGS

Before our analysis we made reliability tests, as a result of this test we found %84 as Cronbach Alfa coefficient. This is strictly reliable for making statistical analysis (Nakip,2006;146). We continued our analysis because we believed that 178 enterprises represent total enterprises. In Table 1 it can be seen that %74,2 of the enterprises are production and % 25,8 of the enterprises are service firms. Also we can see that %38,2 of the enterprises have less than 500.000 TL fixed investment, %24,2 have amount of 500.000-1.000.000 TL fixed investment, %18,5 have amount of 1.000.000-5.000.000 TL fixed investment, only %19,1 have more than 5.000.000 TL fixed investment. So most of the enterprises are small or medium sized.

Table 1: Sectors

Sektör	Frequency	Percent
Production	132	74,2
Service	46	25,8
Total	178	100,0

Table 2: Estimated Fixed Investment of Firms

	Frequency	Percent
Less Than 500.000 TL	68	38,2
500.000-1.000.000 TL	43	24,2
1.000.000-5.000.000 TL	33	18,5
More than 5.000.000 TL	34	19,1
Total	178	100,0

%32 of the participants are entrepreneur or employer, %30,9 of them are top manager or enterprise executive managers and %30,3 of them are medium level executive, only %6,7 of them are line executives. These results can be seen in Table 3. As a result %62,9 of participants are top managers because of this reason This view represents the improvement culture and vision of top management in CIC.

Table 3: Level of Participants

	Frequency	Percent
Entrepreneurship	57	32,0
Top Manager	55	30,9
Medium Level Executive	54	30,3
Lower Level (line Executive)	12	6,7
Total	178	100,0

Table 4 shows technical infrastructures of enterprises. Only 73 of 178 enterprises are using patents and this represents %41 of total. Also only 70 of 178 enterprises are using technical knowledge or know-how and this represents % 39,3 of total. On the other hand 112 of 178 enterprises are using trademarks or royalty (%62,9 of total), 132 of 178 enterprises are using strategic business networks (%74,2 of total), 104 of 178 enterprises have cooperation with international firms (104 of total). In other words %60 of enterprises are using trademark, strategic business networks, royalties and cooperations, %40 of enterprises are using patents, technical knowledge and know-how. We can call this balance as %60-40 balance.

When we interpret these results, we met with an interesting trend and two important solutions. Trademark, royalty, strategic business networks and cooperations are indirect items which are related with production. Patents, Technical knowledge and know-how are direct items which are related with production. It is seen that indirect items are in front of direct items. The first solution is that patent and know-how usage culture is just in improving level in industrial sites. Secondly there is a common belief that patent and know-how usage area is risky for enterprises. But, trademarks and royalties are the less risky area for businesses. The interest on trademarks and cooperation is the result of globalization which is becoming important day by day. But to test these results, we need more complicated academic searches.

Table 4: Technical Infrastructure.

	Yok		1		2-5		6+	
	f	%	f	%	f	%	f	%
Usage of Patents	105	59	32	18	30	16,9	11	6,2
Usage of Technical Knowledge and Patents	108	60,7	19	10,7	31	17,4	20	11,2
Usage of Trademarks and Royalties	66	37,1	50	28,1	43	24,2	19	10,7
Strategic Business Networks	46	25,8	32	18	60	33,7	40	22,5
Cooperation with International Firms	74	41,6	25	14	38	21,3	41	23

Enterprises define their top management philosophy in Table 5. In evaluating the philosophy of management about CIC, %89,3 of enterprises agree or strictly agree with the statement “Top Management defines core abilities and obtains other abilities from external environment”; %89,3 of enterprises agree or strictly agree with the statement “top manager knows that the increase in technical knowledge provides competitive advantage to enterprises”; %88,2 of enterprises agree or strictly agree with the statement “Top management builds sharing mechanisms of technical knowledge inside of the firm”; %87 of enterprises agree or strictly agree with the statement “top management knows that inside organizational culture have to be comfortable for sharing technical knowledge”; %87,1 of enterprises agree or strictly agree with the statement “Top management knows that with the help of sharing technical knowledge enterprise can share vision and mission”. In other words approximately %70 of enterprises have positive bias about top management philosophy. In this view, results show that CIC is taken into account by top management and the intentions of top management is positive. About %25 of participants answer “Strictly Yes” and we need further search that investigates in what amount of this applications are used.

Table 5: Top Management Philosophy

	Strictly No		No		Sometimes		Yes		Strictly Yes	
	f	%	f	%	f	%	f	%	f	%
Top management defines core abilities and obtains other abilities from external environment.	0	0	1	0,6	18	10,1	120	67,4	39	21,9
Top management knows that the increase in technical knowledge provides competitive advantage to enterprises.	0	0	1	0,6	18	10,1	119	66,9	40	22,5
Top management builds sharing mechanisms of technical knowledge inside of the firm.	0	0	1	0,6	20	11,2	127	71,3	30	16,9
Top management builds system infrastructures which are needed for sharing technical knowledge.	0	0	1	0,6	17	9,6	119	66,9	41	23
Top management knows that inside organizational culture have to be comfortable for sharing technical knowledge.	0	0	3	1,7	20	11,2	127	71,3	28	15,7
Top management knows that with the help of sharing technical knowledge enterprise share vision and mission.	0	0	2	1,1	21	11,8	121	68	34	19,1

The trends of participants about innovation strategies are shared with Table 6. %67,4 of participants agree with the statement “enterprises want to be in front of their rivals in innovation applications”; %68 of participants agree with the statement “innovation is an important competition tool for enterprises”; %68 of participants agree with the statement “enterprises should always think about designing new products and services”; %66,3 of participants agree with the statement “enterprises should allocate enough funds for R&D activities”; %68 of participants agree with the statement “enterprises should cooperate with universities and consultants about

innovations”; %75,8 of participants agree with the statement “sharing and transferring technical knowledge inside enterprise is important for organizational learning”. From these results we interpret that enterprises want to realize innovation strategies.

Table 6: Innovation Strategies

	Strictly No		No		Sometimes		Yes		Strictly Yes	
	f	%	f	%	f	%	f	%	f	%
Enterprises want to be in front of their rivals in innovation applications.	0	0	2	1,1	20	11,2	120	67,4	36	20,2
Innovation is an important competition tool for enterprises	0	0	3	1,7	21	11,8	121	68	33	18,5
Enterprises should always think about designing new products and services	0	0	2	1,1	23	12,9	121	68	32	18
Enterprises should allocate enough funds for Research and Development activities.	0	0	6	3,4	26	14,6	118	66,3	28	15,7
Enterprises should cooperate with universities and consultants about innovations.	1	0,6	9	5,1	21	11,8	121	68	26	14,6
Sharing and transferring technical knowledge inside enterprise is important for organizational learning.	1	0,6	5	2,8	19	10,7	135	75,8	18	10,1

The thoughts of participants about the human sources are shown in Table 7. %64 of participants agree with the statement “employees should see the mission, vision and values as their identities”, %69,1 of participants agree with the statement “employees are one of the basic tools for reaching the goals of enterprises.”; %70,2 of participants agree with the statement “employees build intellectual capital of enterprises with their innovation abilities and creativities”; %69,7 of participants agree with the statement “the intellectual and solving problems capacity of employees create competitive advantage for enterprises”; %68 of participants agree with the statement “employees are important sources in creating differences between rival firms”; %75,8 of participants agree with the statement “The innovation capacity and creativities of employees are important tools for response technological innovations of rivals”; %72,5 of participants agree with the statement “The innovation capacity and creativities of employees decrease the costs in medium term”. So enterprises are aware of the importance of human sources for CIC in enterprises.

Table 7: Human Resources

	Strictly No		No		Sometimes		Yes		Strictly Yes	
	f	%	f	%	f	%	f	%	f	%
Employees should see the mission, vision and values as their identities.	0	0	1	0,6	18	10,1	114	64	45	25,3
Employees are one of the basic tools for reaching the goals of enterprises.	0	0	1	0,6	12	6,7	123	69,1	42	23,6
Employees build intellectual capital of enterprises with their innovation abilities and creativities.	0	0	3	1,7	18	10,1	125	70,2	32	18
The intellectual and solving problems capacity of employees create competitive advantage for enterprises.	0	0	5	2,8	15	8,4	124	69,7	34	19,1
Employees are important sources in creating differences between rival firms	0	0	2	1,1	20	11,2	121	68	35	19,7
The innovation capacity and creatibility of employees are important tools for response technological innovations of rivals.	0	0	1	0,6	18	10,1	135	75,8	24	13,5
The innovation capacity and creatibility of employees decrease the costs in medium term.	0	0	0	0	22	12,4	129	72,5	27	15,2

The importance of team culture for CIC in enterprises are given in Table 8. %59,6 of participants agree with the statement “The innovative improvement velocity is higher in enterprises which give importance to team focused approach”; %70,2 of participants agree with the statement “The opinions of all employees should be asked before innovation inside of the enterprise”; %69,1 of the participants agree with the statement “The creativity of employees should be rewarded as a team for innovations inside of the enterprise. These results show that enterprises are aware of the importance of team culture in realizing continues improvement.

Table 8: Team Culture

	Strictly No		No		Sometimes		Yes		Strictly Yes	
	f	%	f	%	f	%	f	%	f	%
The innovative improvement velocity is higher in enterprises which give importance to team focused approach.	0	0	9	5,1	26	14,6	106	59,6	37	20,8

Management estimates that enterprise will have better quality than their rivals in following 5 years.	0	0	1	0,6	2	1,1	127	71,3	48	26,9

In this part of our study we evaluated subdimensions according to sector, estimated investment amount and the status of managers in organizations and looked for if there exists any significant differences between them. Our hypotheses will be tested as below:

H₁: There is a difference between sectors according to their Continues Improvement Culture.

We applied independent samples “t test” and results are given in Table 10. While we are looking for relationship between variables, which are defined on our hypotheses, we investigated if sig (2-tailed) rates are below 0,05. When we analyze Table 10, we see that there is no significant difference between sectors for all of the subdimensions. In other words, both sectors have same comprehension about the CIC in these industrial sites. Istanbul is one of the most important industrial region of Türkiye. As a philosophy of CIC, every firm give importance to improvement. However only %40 of these firms use patents or know-how’s. In this region, % 60 of the firms use trademarks and royalties. We evaluated that improvement in production and processes are left on main firms. So they don’t take risk of improvement.

Table 10: (H₁) Difference Between Sectors According To Their CIC

Subdimensions	t	Sig (2-tailed)
Technical Infrastructure	1,636	,106
Top Management Philosophy	-,278	,782
Innovation strategy	1,485	,141
Human Resources	1,455	,150

Team Culture	,583	,561
Vision-Success	-,088	,930

H₂: There is a difference between estimated fixed investments according to their Continues Improvement Culture.

H₂ hypothese is applied “Anova test”, because our study contains four discrete groups for estimated fixed investments. The results are given in Table 11. When we analyze this table, we see that there is no significant difference between estimated fixed investments for all of subdimensions. H₁ and H₂ hypotheses are denied after statistical analysis. According to Estimated Fixed Investments and related sectors, there is no significant difference on CIC between firms.

Table 11: (H₂) Difference Between Estimated Fixed Investments According To Their CIC

Subdimensions	t	Sig (2-tailed)
Technical Infrastructure	1,404	,243
Top Management Philosophy	,435	,728
Innovation strategy	,209	,890
Human Resources	,404	,750
Team Culture	,716	,543
Vision-Success	1,386	,249

H₃: There is a difference between the position of managers according to their CIC.

H₃ hypothesis is tested with “Anova test” and related solutions are given in Table 12. H₃ hypothese is confirmed by “Anova test”. We used “Scheffe source test” to know-how they are grouped. As a result, Entrepreneurs are in one group, and all managers (Top, middle and line) are in other group. Entrepreneurs have the lowest degree, but middle managers have the highest degree. Also Vision-Success subscale shows difference according to the positions of managers in organization. As a result of “Scheffe tests” middle managers are in one group and others are in different group. Line managers have the highest mean about Vision-Success.

Table12: (H₃) Difference Between The Position of Managers According To Their CIC.

Subdimensions	t	Sig (2-tailed)
Technical Infrastructure	6,783	,000
Top Management Philosophy	1,401	,244
Innovation strategy	,390	,760
Human Resources	,701	,552
Team Culture	,650	,584
Vision-Success	6,213	,000

H₄: There is a difference between organizations with different number of patents, according to their CIC.

H₄ hypothesis is tested with “Anova test” and related solutions are given in Table 13. There exists three groups after “Scheffe test”. First group is made of enterprises with no patent; second group is made of enterprises with one patent and last group is made of 2-5 or 6+ patents. The first group has the lowest average in technical infrastructure, third group has the highest average in this item. In this context we can say that the firms that use patents and know-how’s have higher CIC then the firms that don’t use patents or know-how’s. This shows us that patents and know-how encourage the firms to improve their technologies.

Table 13: (H₄)There is Difference Between Organizations With Different Number Of Patents, According To Their CIC.

Subdimensions	t	Sig (2-tailed)
Technical Infrastructure	60,157	,000
Top Management Philosophy	1,825	,144
Innovation strategy	2,113	,100
Human Resources	,782	,505
Team Culture	,712	,546
Vision-Success	2,170	,093

Vision-Success subdimension shows differences according to position of managers. Middle managers have the lower average of interpreting of vision-success than line, top managers and entrepreneurs. The most important result is the line manager's vision perception is higher than the other managers. In other words line managers have more optimistic expectations than top managers.

H₅: There is difference between organizations with different number of trademark or royalties, according to their CIC.

H₅ hypothesis is tested with "Anova test" and related solutions are given in Table 14. As a result of "Scheffe test", there exists three groups. First group is made of enterprises with no trademark; second group is made of enterprises with one trademark; third is made of enterprises with 2-5 or 6+ trademarks. Enterprises with no trademarks have the lowest average while enterprises with more than 2 trademarks have the highest average. Top management philosophy is analyzed and there exists two groups. First group is made of enterprises with lower than 5 trademarks; second group is made of enterprises with 6+ trademarks. Enterprises with 6+ trademarks have higher average. In this sense, we can say that the firms that use trademarks and royalties have higher CIC then the firms that don't use trademarks and royalties. This shows us trademarks and royalties encourage the firms to develop their innovation.

Table 14: (H₅) There is Difference Between Organizations With Different Number Of Trademark Or Royalty, According To Their CIC.

Subdimensions	t	Sig (2-tailed)
Technical Infrastructure	86,303	,000
Top Management Philosophy	4,374	,005
Innovation strategy	,553	,647
Human Resources	1,691	,171
Team Culture	1,176	,320
Vision-Success	,919	,433

CONCLUSION:

Istanbul is one of the most important industrial region in Türkiye. As a philosophy of CIC, every firm gives importance to improvement, however only %40 of these firms use patents or know-how's. In this region, % 60 of the firms uses trademarks and royalties. We evaluated that improvement in production and processes in some firms are left because of risky environment. So they may not be take risk of improvement.

We reached interesting results from the survey which is applied to firms in Beylikdüzü Organised Region. %75 of the participants are from production sector and the rest of them are from service sector. Main views that is revealed %93 of the participants are top managers, entrepreneurs and middle managers views. All of the managers and entrepreneurs have optimistic expectations about future. The expectations about the next five years in sectoral level are positive manner, we evaluated that visions of them are compatible to CIC.

In similar, Fixed capital investment of approximately % 40 of the firms are below 500.000 TL. Also fixed capital investment of % 62 of the firms are below 1.000.000 TL. So most of the firms in this region are SME's. %60 of the firms in this region don't use patent or Know-how. Whereas the ratio of the firms which use trade mark or go to national or international strategic cooperation is %60. This result means that the risks and sources are shared with other firms. On the other hand strategic cooperation, which clarified the innovation and elastic behavior of SME's property, are one of the main superiority. Firms need to improve patents and do new patents or make R&D activities. In this sense we evaluated that only % 40 of the firms in this region have innovation capacity and %60 of them have elasticity capacity.

We interpreted that about %70 of the firms have understood to innovation strategy is competition superiority. Also they understood the importance of human resources in making these innovations. To realize these, importance of team and organization culture is emphasized in problem solving, decreasing cost, making innovation and creation.

We have seen that there are no differences between CIC and sectors in applied relationship tests. We evaluated that in all of the sectors have the same perception about innovations and improvements. Also We have seen that

there is no differences between CIC and estimated fixed investments in applied relationship tests. In other words we evaluated that similar understandings between investments and improvement culture are significant.

An interesting result of analysis related between technical infrastructures and managers, is revealed. In this analysis, there exist two groups. The first group is consists of entrepreneurs and all types of managers revealed as an other group. When the entrepreneur's group has a lowest average on the perception of the importance in realizing changes, making innovations, sharing knowledge, facilitating communication; Middle managers have the highest average on these perceptions. We can interpret that the importance of technical knowledge infrastructure is not understood enough by entrepreneurs. In the dimension of technical infrastructure, CIC is increasing as the usage of trademark and royalty increases. At the same time CIC is increasing as the usage of patent and know-how increases.

Vision-Success subdimension shows differences according to position of managers. Middle managers have the lower average of interpreting of vision-success than line, top managers and entrepreneurs. The most important result is the line manager's vision perception is higher than the other managers. In other words line managers have more optimistic expectations than top managers.

SMALL TO MEDIUM, SIZED ENTERPRISES AND THE STRENGTH OF WEAK NETWORK TIES

Lynne Butel and Dababrata Narayan Chowdury
University of Plymouth, UK

ABSTRACT

This research explores the networks of small to medium sized enterprise in peripheral European regions, using case study based methodology and the principles established by the Upsalla School that all business activity occurs in a network setting and the development of organisations is dependent upon the direct and indirect transfer of resources such networks allow. The research identifies a rich and complex network of relationships extending quickly into the national and international arena, used extensively by small firms. The research suggests that models of regional economies that focus on clusters but ignore networks may result in overestimating the disadvantage of periphery.

Key words: strategic networks, small to medium sized enterprises (SMEs), innovation

INTRODUCTION

This research examines the contribution of one central organisation to the development of a number of small firms, over a period of four to six years. Based in network theory, it explores the relationship between the central firm and its network; the transfer of resources and capabilities, the firms' product and process innovation and the firms' strategic orientation. The research design, following Yin (1984), uses detailed case studies of the firms. The cases are treated as a series of independent experiments, and are used to test the propositions suggested by key aspects of the literature reviewed briefly below. Using replication logic, comparisons of the cases are used to confirm or refute the initial conceptual insights.

Objective 1 of the EU Structural Fund seeks to 'promote harmonious development' and 'to narrow the gap between the development levels of the various regions'. ([Http://europa.eu.int/comm/regional_policy/](http://europa.eu.int/comm/regional_policy/) 2002) More than 135 billion Euros have been allocated to areas where GDP is below 75% of the Community average. Most of these areas have declining primary industries and a geographical remoteness which is considered to have contributed to the declining economic status. Investment in these regions is considered vital to improve the local social and economic conditions and projects that are likely to employ more or contribute to the economic health of these areas are encouraged. However the research has frequently concentrated on the disadvantages of periphery to economic development, and identifying ways to overcome these disadvantages. (SWERDA 1999) The poor transport links, limited higher education facilities and decline of traditional industrial clusters are shown to contribute to limited prospects. It is generally been assumed that firms in these regions are less likely to be innovative, creative and internationally orientated. Porter (1990) links the decline of such interconnected industries with reduced competitiveness in the international arena. His recent study for the UK government continues this theme. (Porter and Ketels 2003) Even the literature focusing on supply chains and networks of firms tends to see small firms, particularly those in remote areas, as at the end of very long supply chains, often with poor quality standards and limited aspirations. It is possible however to use models developed in literature on networks, clusters and innovation and see small firms in peripheral areas from another perspective.

Using a case study based methodology, starting with four small successful organisations in different industries, the research starts at a local level and extends out. Twenty firms are studied in total, exploring existing networks of small organisations in a peripheral area. This research is the preliminary, exploratory phase of a much larger study of small to medium sized enterprises (SMEs) in peripheral regions. The purpose of this exploratory research is to identify areas for further study, seeking to identify a range of ways in which SMEs use networks, particularly in relation to their innovative activities and international orientation. The questions addressed here are: are networks used to extend small firms' resources? What resources are acquired via networks? Do networks facilitate innovativeness? Do networks contribute to international orientation? Does the peripheral area constrain networking? What sorts of networks exist?

NETWORKS AND INNOVATION

There is a diversity of conceptual frameworks, methodology and data contributing to the study of the extent of creative activity by small firms in geographically and industrially peripheral regions. The large firms perspective has dominated the literature on the management of both the internationalisation and innovation process. Both transaction cost based theory of internationalisation (Buckley and Casson 1979) and the Upsalla model (Johanson and Valne 1977) of experiential learning and gradual international commitment, emphasise the way foreign markets are selected by firms who are already competitive on a national scale, and now seeking success abroad. However the Upsalla model with its emphasis on iterative knowledge acquisition and a less competitively orientated, more co-operative strategy of internationalisation, is capable of being extended so smaller firms can establish positions in relation to foreign counterparts. Later studies of long term relationships between suppliers and customers emphasises the complexity of these international business interactions, as individuals and groups throughout organisations develop bonds where technological knowledge, social contacts, economic agreements and logistical co-ordination develop both tangible and intangible resources for firms. There is however limited exploration of the small firm perspective.

The internationalisation of isolated small to medium sized enterprises (SMEs) is however, discussed by Buckley (1992) who draws attention to the innovative nature of the first steps towards the internationalisation of firms but argues that limitations of proprietor time and management skills are a serious constraint upon SMEs' deepening international commitment. In addition, Buckley draws attention to the vulnerability of SMEs to product, market and technological change. The international arena will expose the firms to even more risk. Strategic decisions, constrained as they are by limited managerial skills are likely to be based on individual perceptions and prejudice, taking opportunities when they appear rather than evaluating a range of opportunities carefully. Buckley also suggest that SMEs are likely to internationalise for reactive rather than proactive reasons; pulled by larger firms or pushed by poor home-market conditions. At best they may find niches left by large firms, where economies of scale are not available. Essentially small firms are ignorant and vulnerable in international markets. The increased interest in the use of networks by organisations as they effect a variety of innovative strategies from new product development to internationalisation has produced a substantial body of research in the last decade. The research uses social network theory and applies it to business networks (Gadde and Mattsson 1987), and emphasises the importance of identifying network links considered to be important by the firms themselves, rather than by any objective measure of usefulness. (Johanson and Mattsson 1992) The intangible resources accumulated as a result of long term investment in these relationships contributed considerably to the range and complexity of the resources accessible to any firm. Johnson and Mattsson's research focuses on the dynamics of the process of gradual internationalisation, where firms increase their knowledge, following Upsalla Model, but not necessarily in a continual progressive way. They may develop contacts but not use them, let contacts lie dormant, extend into other areas, then revitalise links. (Johanson and Mattsson 1988).

The literature on networks, the relationships organisations have with each other in national and international markets draws our attention to a complex and developing range of activities occurring at the interface of environment and organisation. Starting with the links any firm has with their suppliers and buyers, Johansson and Mattsson's research uses the terms 'production' and 'market' web's to describe the extension of the simple market relationships to include longer term arrangements bringing firms closer together over time as they develop existing and develop new products and processes to improve the competitiveness of both partners. In addition this research identifies 'national' webs where firms with common interests are bound together to the boundaries of the country. (Johansson and Mattsson 1988) Studies examining the uses to which networks may be put by SMEs in developing innovative strategies has been explored in Butel (2001) but this research identified how little we know about the degree of internationalisation of SMEs in peripheral regions, how innovative they are and how they are able to establish and utilise appropriate networks of relationships. To some extent it may be supposed that business networks reduce both the ignorance of small firms and their vulnerability in international markets as identified by Buckley (1993). The question posed by his assertion that small firm strategy tends to be reactive rather than proactive, also remains. The importance of networking for small firms in relatively isolated economies is explored by Chetty and Blankenburg Holm (2000). This study examines how networked resources were used by small firms moving into the international arena from New Zealand. This study extends the literature on networking by comparing, the 'organically' developed networks in New Zealand, with those encouraged by the government. The latter are called by 'formal' networks by the authors. However the word 'induced' may be more appropriate since 'formal' implies and is sometimes used to mean the market-based links firms start with, before more complex relationships develop. The formal or induced networks consisted of joint action groups to promote exports in certain industries, combined action groups from different industries to encourage new activities unachievable by smaller firms and finally industry clusters by related firms in close geographical proximity.

The emphasis of most work on network strategy is the element of mutually beneficial co-operative activity, extending beyond short term market exchange. The literature on economic clusters also makes a considerable contribution. From the early studies of Emilia Romagna, Italy, (Piore & Sabel 1984) clusters have tended to be used where geographical proximity of firms in related industries has resulted in the prolonged success of small independent entrepreneurial, flexible firms serving local to global markets. With clusters, the agglomeration economies are of particular importance both to the success of the cluster and the individual firms. Clusters depend upon traded and untraded interdependencies, the former reducing transaction costs, the latter as Amin and Thrift (1994) argue facilitating the gathering of information and knowledge. These agglomerations establish coalitions conducive to entrepreneurial creativity. It is even argued that the development and testing of innovations is not possible in geographically dispersed circumstances. (Amin and Thrift 1994) The cumulative effects of developing industrial synergies, skills development and information exchange results in the dependency of location's success upon the path taken over time. However, it is clear that whilst an area may benefit from the clustering of related firms, it may also fail to adapt to changing economic conditions and the positive dynamics of association are reversed causing industrial decline. The literature on clusters is by no means all positive. The artificial creation of viable clusters has yet to be proved possible (Chetty and Blankenburg Holm 2000)

The difference that must be identified between the literature on networks and that on clusters relates to differences in the closeness of the ties, the path dependency (as opposed to duration) of the relationships and the geographical proximity of the organisations. Networks can be supply chain orientated, i.e. production and market based networks. They may develop organically, may be encouraged by government action, may form around key 'hubs' of large, creative or innovative firms and may be part of the increasing accumulation of knowledge by organisations as they grow and internationalise. However, network relationships are looser than clusters, and they may be dynamic, in a state of continual flux, depending on the needs of the individual firms. They are not constrained by geography. Indeed much of the research done on strategic alliances and joint ventures by firms operating in the international arena suggest that it is the remoteness and therefore ignorance of foreign markets that prompts firms to form informal and formal networks of relationships in the first place (Forsgren and Johanson 1992). Some research into clusters does, however, emphasise the importance of small firms in a way most network research has failed to do, except where they are used as the flexible fringe, the additional capacity of larger firms without the financial commitment of ownership. (e.g. Donaghu and Barff 1990) The use of small firms in this way however usually assumes their almost total dependence upon a much larger organisation, where the small firm is used as part of the large firm's strategic plan. Strategic networks developed by dominant firms are not the same as strategic networking by groups of these autonomous organisations. Business networks are the result of the interactions over time of largely autonomous organisations. There is clearly a gap in the literature with few studies of the international orientation and innovativeness of independent small firms, particularly those in geographically and industrially remote regions. We actually know very little about successful SMEs in peripheral regions and many of the conclusions we draw about the impact of peripherality may be inappropriately drawn from the extrapolation of models developed from the study of large firms in more central locations.

De Propriis (2002) has drawn attention to the use of inter-firm co-operation in an industrial area examining the apparent conundrum that despite low levels of investment in research and development (R&D), small firms tended to be more innovative than larger ones. De Propriis concludes that co-operation by firms may at least be a complement to investment in R&D, for firms seeking to innovate. Inter-firm co-operation may even be a substitute for R&D spending. There are significant implications for European regional policies if co-operative action by firms, usually in clusters or geographically close networks, are proved to be best at innovation and therefore successful competition. Certainly work such as that of Diez (2001) suggests that to encourage innovation, firms need first to be encouraged to behave co-operatively. Using the principles established in Upsalla and detailed by Forsgren and Johanson (1992), this research starts with the assumption that international business occurs in a network setting. The links between the organisations occur through direct and indirect relationships. Managing those relationships over time is central to the development of the organisations. It assumes that understanding the processes whereby firms develop, and utilise tangible and intangible resources acquired from knowledge via their external network, is of prime importance to our understanding of why some firms succeed in geographically remote areas. This will contribute to our understanding of where Objective 1 funds might best be spent. Having identified a gap in the literature this research explores if networking or co-operation contributes to innovativeness, in small firms in peripheral regions. In these days of almost instantaneous global communications, to what extent are these firms tied by the constraints of geography? It is possible that in seeking to create a new industrial cluster, the flexibility and creativity of organic co-operative agreements will be constrained.

Pittaway et. al. (2004) concluded that networking played a pivotal role in innovation and was crucially important in venture creation and small growing firms. The diversity of network ties was seen to have a positive impact on both innovation and performance. Granovetter's (1973) study of social networks drew attention to the advantages of weak as well as strong social and economic ties. More recently Granovetter has argued that more novel information flows through weak ties than stronger, more established ones, which is more conducive to the development of innovation. (Granovetter 2005) Buderl and Preisendorfer's (1998) study found that small firms' very survival depended on the existence of strong (social) ties, such as support from friends and family. Novice entrepreneurs make extensive use of their personal network of contacts, friends and family, in the absence of business links, to access business (economic) resources. These existing ties are then extended to access additional resources and capabilities to supplement their original asset base. In terms of resources, a large network can be critical to sustainability and growth of a firm, and in terms of innovative capacity, access to a diverse network can be critical. (McElvily and Zaheer, 1999) A hub within a business network may be seen as a bridge of 'structural holes', the link between many diverse and separate networks and therefore privy to resources from all sides. (Burt 1992) Within supply chain networks a major firm may be the hub, and manage the network to further its own and the network's innovation strategy. Government or industry bodies can act as brokers between ties and develop and manage networks. However it is the management of networks to further individual and network innovation that is least well understood. That in part is due to the lack of detailed evidence.

Hoang and Antoncic's (2003) review of network based research in entrepreneurship concludes that many of the, albeit extensive, surveys conducted were constrained by conceptual vagueness relating both to definitions of valuable productive resources and capabilities and to measurements of networks size, structures and strengths. Establishing a causal link between network size and diversity and innovative activity in business has therefore proved difficult. With this in mind, this research focuses simply upon the use made by a number of SMEs and a single hub. The small firms are classified according to their age and size, measured by numbers employed and annual turnover. The strength of the link between the hub and the SMEs is examined in relation to the length of time the link has existed, the frequency of contacts between the two organisations and the significance of the link to the small firm, measured in terms of the contribution made by the hub to an increase in the small firm's profitability, innovativeness and market growth and extension. All the small firms have elected to establish and then to extend links with the hub. These small firms are therefore proactive both in terms of the establishment of a potentially useful link and in terms of their propensity to innovate. The small firms have these factors in common. The small firms make different uses of the same link over a period of four to six years. This research explores the extent to which these differences can be explained by the age and maturity of the firms, the strength and age of the link between the organisations, the small firms competitive position, their access to complementary resources and capabilities and finally the strategic vision of their managers. The research is exploratory in nature, seeking to understand the way in which these diverse firms use this same central organisation.

METHODOLOGY AND DATA COLLECTION

The research is part of a continuing study of around 100 small companies in several different sectors. Data studied includes retrospective company accounts and competitive analysis, current observations and analysis of processes leading to innovations and summary data from end of project reports. The current data set consists of four firms, two of which are relatively new and two of which are more mature. Data was collected through interviews, observations, secondary sources and company reports as appropriate. This data was supplemented by interviews with key protagonists; company directors, employees, and outside supporters of the firm. Each case provides a detailed study of a minimum of four years in the individual firm's development. The study includes observations from data contained in the minutes of the monthly meetings, retrospective data sourced in the final programme reports, strategic and financial analyses of the companies before establishing the link and annually thereafter. Finally the interviews with key protagonists, provides supplementary qualitative data. The interviews were conducted over one to one and a half hours, notes were taken were transcribed. The interviews were undertaken with the owner/manager of each company and the external project manager. The semi-structured interviews with the firm's owner/managers consisted of questions exploring the firm's innovation strategy over the period, the strength of the firms' network ties and ways the ties have changed over the project. The interviews with external managers were less structured consisting of open-ended questions about the firms and the transfer of knowledge leading to innovation.

The research was been designed to explore how small firms in geographically peripheral regions innovate and internationalise given their limited internal resources (Buckley 1993) and peripheral location and limited local

clustering (Porter 1990, Porter and Ketels 2003). The primary data for this exploratory survey consists of four geographically close companies of varying size. The sample is of firms that need, as a result of their particular industry, to be based in the peripheral location they have chosen or one very like it. Therefore the geographically peripheral area is central to their production activity. The firms chosen are growing and are innovative and creative. The methodology is qualitative, as detailed by Yin (1989, 1991) and by Eisenhardt who focuses the use of case material in generating theory (1989, 1993) The cases were chosen both for their similarities: the importance of the location and their success and innovativeness, and for their dissimilarities: the different industries, range of sizes, age and history, as recommended by Eisenhardt (1989). Each case is examined first in isolation and then in relation to patterns of activity which can be generalised across the four cases. (Eisenhardt 1989) Yin's (1989) approach suggests pattern matching as a means of analysing data. Each firm was visited and the activities observed. In addition the CEO or a Director or Directors of the organisation were interviewed using a semi-structured questionnaire. Direct access to the main strategist or strategists in the firm resulted in an accurate exploration of the organisations' overall priorities. The questionnaire sought to examine the firms' views of the importance of their networked links. Five key network links were chosen by the firm and then followed up in a round of further interviews using a very similar semi-structured questionnaire. Secondary data on all twenty organisations, including company reports, web-site material, newspaper reports and other published works was also used. The use of multiple sources of evidence, reinforces the evidence base, provides a wealth of relevant detail and confirms the importance of the case study method. (Yin 1989) Each case study was then written up and a copy sent to the first round organisations to ensure the data accurately reflected the information provided.

The cases chosen were, with one exception, small firms operating in an area 512 sq. kms. square in South East Cornwall. The exception is the Eden Project, a firm that has grown from its inception in 1996 and opening in 2000, to be one of the largest employers in Cornwall. It is no longer an SME, but its rapid growth in less than three years is an indication of its success. The County of Cornwall is bounded on three sides by the sea, with a coastline of 697 kms indented with ancient harbours and granite moorland cut by deep wooded valleys inland. The economy has a predominance of small firms and few major employers. 97.% of the businesses employ fewer than 20 employees (www.cornwall.gov.uk) Cornwall has no university, no international airport and limited regional air links, no motorway and rail journey times are at best three hours away from Bristol, its regional hub, and four and a half hours from London. The existing clusters of mining and quarrying and fishing, which were geographically close, are in serious decline and the agricultural economy generally, which is pervasive in the county, continues to network but its innovation and creativity is limited by history and perhaps by EU regulation.

EXHIBIT 1

Round 1 Companies Interviewed

Company Name and Age	f/t equivalent Employed	SIC	Sector/ Primary Activities	Locational Advantages
TM International School of Horsemanship 21 years	4 plus 14 students/ apprentices = 10	92.62/9	Training in horse riding and care, riding holidays, lessons	Direct access to wild moorland for hacking
Lynher Valley Dairies 12 years	30	15.51/2	Cheese Making and Dairy Farming	lush pasture for dairy herds
Camel Valley Vineyards 10 years	6	01.13/1	Grape Growing and Wine Production	southerly latitude, warm, south facing steep sloping valley
Eden Project 3 years	600	92.53/0	Education and Entertainment in Botanical Gardens	warm south facing, worked out quarry pit

The Interviews

The interviews explored three main areas. First they sought to establish the primary activities of the organisation, their principal resources, and the degree of internationalisation. Secondly, the interview examined the components of the organisation's network of formal and informal contacts, how important they were to the firm, and at which stages in the firm's development they were used. Finally the interview explored the importance of innovation in the industry and to the firm, how ideas were generated, and the importance of the organisation's network both in the generation and conceptualisation phase of innovation and the planning and implementation phase. The interviews were short, of one to one and a half hours duration, followed if offered by a tour of the premises and further informal questioning. The questions asked were not related to what might be considered confidential or commercially sensitive information. No interview requests were refused. No questions were avoided. No firm requested anonymity. Second round interviews followed the same format with no specific reference to the first round firm that had recommended them. This meant that it was possible to see the importance of the network link to both parties and to understand how the **Round 1** firm might benefit from the extended network links of its **Round 2** partners.

Case Study 1: Tyrrell-Moore International (TMI)

The oldest established firm Tyrrell-Moore International (TMI) was established over 22 years ago to take advantage of the spectacular moorland riding country. The firm offers riding lessons, moorland hacks, livery services, training in the care of horses, riding holidays and training for students in equestrian careers. The owners are fluent in Scandinavian languages, having lived in Norway for many years and also speak French and German. In addition to horsemanship, EFL is offered by a qualified teacher. The horse and riding industry is a major employer in the UK, particularly in agricultural areas. It is estimated that 250,000 people are employed, either directly looking after horses and stables or indirectly in horse transport, feed merchants, equipment suppliers. 2.6 million people ride on a regular basis, more than play football or attend matches regularly. Riding is regarded as a hazardous activity and therefore the quality of the equipment, horses and tuition received are all very important. The most significant link for TMI is the registered charity the British Horse Society, maintaining and accrediting over 700 riding schools in the UK and all over the world. The BHS publishes a quarterly magazine, offers veterinary and legal advice and regular regional events where owners of riding schools can get together to exchange ideas and discuss issues of concern. Membership of the BHS is by subscription, however riding school accreditation is by regular inspection of equipment and facilities, observation of lessons and examination of students. Advice thereafter is free. The BHS Accreditation cannot therefore be considered traded since it cannot be bought, but it is essential to the competitive advantage of the organisation.

The second contributor to the Riding School's network is the Local Authority, Caradon. Legally the local government authority is required to use local veterinary surgeons inspect the tack and horses, providing a Health and Safety certificate, public liability insurance and thus the permission to trade. Again this is a non-traded but none-the-less formal resource acquired via the network. It cannot be simply purchased but must be earned by adhering to national or internationally recognised standards. The support of the local vets is an important part of the School's network. The Local Authority also provides access to the network of firms offering services to tourists. The School is listed as one of the attractions of the area. The third contact is via the School's provision of horsemanship training sessions at a number of local further education colleges. Attended by a total of fifty or so horse owners and riders each year, this networks allows the school to keep in touch with the requirements of horse owners who do not ride at the School but are often aware of changes in the riding environment. In addition some may use the School's livery service. Fourthly the proprietor cited a local agricultural supplier co-operative. In addition to supplying feed, clothing and equipment, the co-op has an equestrian club where other environmental information may be sourced. Finally there is the association of regular riders at the School who organise social activities and riding competitions and feedback their needs and ideas to the School's management.

Within the context of a small specialised riding school the environmental change can to be changes in the accounting or legal environment or factors affecting the access to the school. Thus whilst the remoteness is an advantage, inaccessibility caused by poor rail and bus links is not. Change is continual but not generally substantial. The network is tapped for advice, assistance and ideas. The BHS provides legal advice, the local authority advising on tourist related issues, the Riders' Club identifying improvements to the service provision. Innovation ideas may be initiated by the Riding Club members but generally the proprietors draw together all kinds of environmental data when they formulate a new strategy such as the most recent idea to build an indoor riding arena to provide all weather facilities. Considerable support has come from the school's extensive

network of horse owners, riders, vets, students and tourist leaders. TMI is a mature firm in a relatively stable environment. The pattern of its chosen primary network links suggests its priorities are the consolidation of its existing business through the maintenance of clear, internationally recognisable accreditation of quality and standards of the services it offers. Its links are predominantly local but its business is the most international of the four cases. However it is clear that it is its local credentials that make it competitive internationally. The BHS accreditation serves to advertise this to an international market.

Case Study 2: Camel Valley Vineyards (CVV)

Camel Valley Vineyards grow grapes, produce wine and sell the wine through a range of distributors and their own winery and shop. Their principal resources are the grapes and the south facing slope above the river Camel. They employ few people. They subcontract the chemical analysis of the wines to Corkwise, a national organisation offering consulting and microbiological services to the drinks trade. This establishes, to internationally recognisable standards, the alcohol content, and the quality of wines produced. Vigo, is a national distributor of equipment for the production, based regionally. Camel Valley is innovative, recently establishing the 'Cornwall' brand of sparkling wine to compete with other brands in international markets, they are exploring new markets and new technology in production. Wine production equipment is imported from Italy and Germany, rabbit proof fences from New Zealand. The methods of still wine production are New World, sparkling wine traditional. Camel Valley Vineyards, although established in 1989, started making wine in 1992. Their chart of key network links suggests an organisation keen on growth. Three key links, Vigo, Corkwise and Waitrose are quality national firms where Camel Valley can establish their credentials in national markets. Berry Bros, is a international major wine importer and exporter with a three hundred year history. The emphasis here is on the establishment of national and some international credentials. The company is ambitious and its links illustrate its chosen strategy. The local link is a brewery that provides quality production advice and assistance in distribution.

Case Study 3: Lynher Valley Dairies (LVD)

Lynher Valley Dairies produces a variety of farmhouse cheeses using milk from their own cows whose blood lines can be traced back many generations. The quality of the cheeses depends upon the quality of the herd and the rich pasture of the valley down to the river Lynher. The dairy operates to the highest technological and hygiene standards, with frequent inspections. They employ over thirty people, many on a part-time basis in their shop and dairy. This case is of a firm most closely linked to older agricultural networks of farmers and milk producers. Although the agricultural industry is in decline in terms of numbers employed and profits made, the networks still exist and are used by the proprietors of this firm to good effect. Lynher Valley Dairies' strategic use of business networks is less easily read than the other cases. The firm is very successful employing a large number in a very rural location, expanding their range and distribution base. Their network links are predominantly supply chain orientated, sourcing equipment locally and distributing through a specialist cheese distributor and the supermarket most associated with quality food and fair, local sourcing. The links along the axis, Taste of the West providing marketing subsidies and the local agricultural college, both providing the untraded advice, consolidate Lyhner Valley's existing strategic position. However there is little evidence in these prime links of their declared ambition to move into the international market, particularly the US. The links are more eclectic than the other cases and reveal less about the firm's strategic direction than other network maps.

Case Study 4: The Eden Project (EP)

The final case study in this paper is the Eden Project. This is a serious horticultural research institute with a clear environmental orientation and a central mission to educate but with entertainment. It was set up with UK Government Millennium funding to open in 2000, with the twin priorities of first, the economic regeneration of a declining industrial cluster of quarrying and processing china clay, and secondly to establish the broad-based horticultural research and educational institute. In this way it has become a landmark project for the Millennium. Every activity is focused on the delivery of the message; horticulture, staff development, catering, and retailing. The resources of the Eden project are considered to be its people and their commitment and creativity. These are essential to the innovativeness of the organisation. Although they are frequently asked to export the concept in locations all over the world, and would welcome the spreading of the message, they believe the specific location, history and people make the concept unique. As the concept of global awareness is central to the message, global focus is essential. Although the standards are global, the sourcing as far as possible is local. 80% of their food stuffs, plants and other retailed items are sourced locally. The Eden Project invests in the future of small businesses locally to assist them in their development to meet global standards.

Location limits the number of overseas visitors to 10%. They have developed horticultural products and concepts which have the potential for future exporting. The both the concept and its realisation are innovative. Unlike many horticultural gardens, they do not display rare plants but common ones. They tell the story of these plant roles in our lives. The 'managerial anarchy' of enthusiastic amateurs encourages the generation of innovative ideas, whilst the pragmatism of rigorous peer group scrutiny and subcontracted project management brings them to fruition. Identifying five key links was difficult. They actively encourage networking on all their many fronts. Most links develop from informal approaches. As the project developed their network grew. The following chart was their idea of current and likely future contributors to their resources.

The Eden Project is the most successful organisation studied here. Its rapid growth in very a few years has meant that a group of what they admit to be enthusiastic amateurs, have had to learn very fast. The focus of their network is first, a very clear international orientation despite limited international sales, and secondly they want to get the product right. Three of their key links are global organisations offering world class services to the Eden Project. Each global link, Cisco (IT) Systems, Davis, Langdon and Everest (Project Management) and the extensive network of university based horticulturists, indicates that the Eden Project's priority at this time, is getting the Project right to a world standard. The Government Office South West, GOSW, are the regionally based agent of many national and international funding and other decisions affecting the South West region. GOSW provides induced, untraded financial support and advice for the Eden Project. Unusually for induced, non-traded links, the success of Eden means their experience is providing some feedback to GOSW. Other untraded links of this kind tend to be unidirectional. Finally the sole local link is the organic food supermarket, Carley's. This company sources as much local, organic produce as possible. They sell via their shop and by delivery. The Eden project sees their catering services as central to explaining their core environmentally aware, educational message. They aim for global standards but local production insofar as possible. Carley's is one of many local producers to have benefited from traded and non-traded links with the Eden Project.

DISCUSSION

In all these firms, the location is essential, often very specifically, such as very southerly, south facing slopes for wine production, direct access to hacking country for riding, a deep, south facing worked-out quarry for 'greenhouse' horticultural exhibition of exotic plants. Although all contribute to tourism, only the Eden Project is a major tourist attraction. All firms are well aware of the importance of continual scanning the environmental information electronic and more traditional methods; journals, magazines, trade association meetings, are all useful sources. Environmental scanning is considered essential to the continued creativity and innovative activity of these organisations. The networks of organisational links were those *considered to be important by the managers interviewed* as Johanson and Mattsson advise (1988). The links were first differentiated by the characteristics identified by the existing literature: The acquisition of intangible resources via supply chain links, i.e. an organisation's suppliers and customers, also via non-trading links. Secondly the literature distinguishes between the scale of the network. Here we have identified locally based network links (i.e. within 32 kms of the Round 1 firm), regional links (i.e. based within the defined South West region, up to 400 kms away) plus national and international links. The principal resources of these firms are declared to be their location, people, blood lines of herds, grapes, horses and reputations. All firms extend these resources using networks. These networks extend very easily into the international arena, allowing these organisations to access international standards, international methods of production and international markets. These small companies are constrained by their limited financial resources but strategic decisions appear to be taken with considerable research. One of the main constraints of small firms in this peripheral area is the desire to remain independent rather than to become part of the supply chain of much larger firms. Small firms are well aware of their vulnerability vis-à-vis the multinational conglomerates.

The distribution of network types is broad. Firms cited a range of key links in several different locations. Each network link appears to have been chosen to serve a specific purpose rather than because of proximity. All traded links were used to exchange more than the traded items. In many cases both sides of the exchange felt that each link was close and mutually beneficial. The CEOs of larger organisations generally knew little of the specific small firms and whilst it was clear that the development of such networks was company policy, it was not pursued by the CEO. Only with the Eden Project, with its clear regional and environmental orientation, was the development of local small businesses so high on the agenda of the directors. All these small independent organisations are internationally orientated, using general informal environmental sources to scan for ideas, key network links to establish and maintain international standards, ensuring export potential, and then exporting to varying degrees. All use high quality, globally sourced equipment in production. All value their formal network links, described above and their informal networks of friends, trade associations, web links, magazines

and journals. Innovations are constrained by lack of funds, fear of risk exposure and limited opportunity. However all firms are initiating significant innovations to their products or services. In all cases it would appear that the ideas for the innovations were generated within the organisation, after general environmental scanning. However the feasibility of ideas was assessed and implementation effected with continual and highly valued inputs from network partners. This suggests that the network is critical in the generation and implementation of innovations by SMEs.

EXHIBIT 2 Forms of International Orientation

	<i>Internationalisation of output</i>	<i>Internationally networked resources</i>	<i>current/planned innovations</i>
TMI	<ul style="list-style-type: none"> - 60% students 10% holidays = 50% - regular, frequent, planned 'exports' 	<ul style="list-style-type: none"> - Accreditation by BHS, British Horse Society:- internationally recognised standard - BHS strategy to extend international brand awareness 	<ul style="list-style-type: none"> indoor riding arena for all weather, and all seasons riding
CVV	<ul style="list-style-type: none"> - limited but expanding export opportunities in US 	<ul style="list-style-type: none"> - 'New World' production methods - Italian and German equipment - UK and European producers' networking group meetings 	<ul style="list-style-type: none"> sparkling wine
LVD	<ul style="list-style-type: none"> - small number of exports via third party 	<ul style="list-style-type: none"> - EU and US standards of production hygiene, safety and quality. 	<ul style="list-style-type: none"> New cheese varieties, US market
EP	<ul style="list-style-type: none"> - 'exports' limited by location to 10% but increasing 	<ul style="list-style-type: none"> - exhibits globally sourced, - concept world standard - collaboration with international research institutes and universities 	<ul style="list-style-type: none"> New education centre New major biome for desert exhibits

CONCLUSION

This exploratory study investigates whether the different forms of co-operative arrangements between firms identified in the literature on networks can be found in SMEs in a peripheral European region. This research focuses on how firms use their supply chain orientated customers or buyers, how the traded links are extended, it also examines non-trading relationships, organic and induced links and finally looks at the local, regional, national and international links. This detailed analysis of four firms may be insufficient to develop any substantial theoretical conclusions, but it does clearly identify the need for further research. Research that models regional economies focusing exclusively on clusters but ignore networks may result in overestimating the disadvantages of periphery. Innovative strategies including internationalisation may depend on exposure to less closely related firms than those that exist in clusters. In clusters the generation of innovative ideas may be constrained by the proximity of like-minded firms. This research suggests that whilst the limitations of capital, information, knowledge and management ability may constrain the number of innovative strategies that can be taken as the literature suggests, successful small firms in peripheral area are aware of these factors and use their networks to minimise their impact. Most networks links identified as important appear to develop within supply chain (i.e. production or market) associations, over a number of years. The market based link supplemented by the development of the untraded dependencies. The financial incentives and managerial advice of agencies such as GOSW, Business Link and Local Authority business advice centres are welcomed, seen to be important and utilised if appropriate. Whether they can be considered a network resource is difficult since the process is clearly unidirectional and not necessarily long term. Networks are co-operative arrangements which are dynamic so that different elements of the network can used at different stages in a firm's development. Old network ties are sometimes recycled in new forms. It may be that geographically remote regions can have

creative, innovative and internationally competitive firms by establishing clear, internationally recognisable credentials; acquiring and utilising technology of an international standard and maintaining and exploiting the existing natural advantages of the locations.

Four network ties were studied. The ties were to firms in many different industries, of different ages and with different degrees of maturity. All the SMEs established the links with a clear intention of developing their business through one or more specific product or process innovations. The ties were known to provide access to a range of resources and capabilities and also thought to be the 'bridge' to access others. However the development, management and use of the network ties varied considerably between the firms over the period studied. One firm, for example had a clear strategic plan for the duration of the network tie and a specific output required. Another wanted access to largely financial resources and was reluctant to let the network develop. The records and interviews show that the development of the link between each small firm and the central hub, was frequently quite different from that anticipated. All the small firms developed a range of new products and processes over the period studied, as intended. The link strengthened their strategic and operational management, a recognised weakness in small firms. In addition the link was used to explore the possibilities of more radical innovations: new products, new markets, radically different processes. However, managers did not consistently view the successful innovation to be the result of the network ties. The richness of the data does provide substantial evidence of the emergence of a network and identifies areas which would benefit from continuing investigation particularly in relation to the partners' different perceptions of network strengths, contributions and success.

FEMALE DIRECTORS AND SMES: AN EMPIRICAL ANALYSIS

Antonio Mínguez-Vera, University of Murcia, Spain
Raquel López-Martínez, CARM, Spain

ABSTRACT

The topic of gender has attracted the interest of researchers in recent years. However, most empirical results are based on listed firms. The aim of this paper is to study gender diversity on boards of directors in a sample of 10,786 Spanish small and medium enterprises (SMEs) using panel data analysis. The results show that gender diversity in the boardroom has a positive effect on firm performance. Also, the presence of an individual who is a main shareholder has a positive impact on female representation on the board of directors. In contrast with this, having a non-financial firm as principal shareholder diminishes the probability that women will be appointed to the board. The results indicate that women directors prefer to be on the boards of firms with less financial risk. Finally, smaller firms and larger boards include more women as directors.

Keywords: Gender, SME's, directors

INTRODUCTION

In recent years there has been a pressure from society to include women on the boards of directors of corporate bodies. As result, in Europe, the average number of women in boardrooms has increased in recent years (Heidrick and Struggles, 2007). However, female representation is still at a low level compared to the U.S. and there is wide variation across countries. At the same time, scholars have studied the effects of the presence of women in the boardroom. They argue that women directors can have an important influence on the way that the board works, its working style and board processes, and, consequently, on firm performance (Bilimoria and Piderit, 1994; Daily et al., 1999; Farrell and Hersch, 2005).

The majority of studies that examine board diversity focus on large firms. Recently, a number of researchers have addressed the need to study the board of directors as a potential resource in Small and Medium-sized Enterprises (SMEs) that can lead to competitive advantage and improved firm performance (Gabrielsson, 2003), and women can offer many contributions to the effectiveness of the board (Bilimoria, 1995, and Segal, 1996).

The present study focuses on gender representation on boards of directors in SMEs in Spain, which is one of the countries with the lowest level of female representation on boards in the European Union. In response to the challenge of under-representation of women on boards, two legislative measures have recently been passed in Spain: the *Unified Good Governance Code* (2006) and the *Gender Equality Act* (Ley de Igualdad, 2007), similar to the one passed in Norway (2003).

The objective of this paper is to answer the following questions: How are women directors important in Spanish SMEs? Does gender diversity of Spanish boards of directors of SMEs have any impact on firm performance? What characteristics of Spanish SMEs influence the presence of women on boards? By addressing these questions, the present study contributes to the literature in several ways. First, it provides empirical evidence from Spain, where there has been an open debate about gender equality based on the legislative changes in favor of women. Second, the study focuses on SMEs, which is an area that has been ignored by the majority of empirical studies that have been undertaken. By focusing on SMEs, the study examines the firms where the majority of the employment is generated. Third, the analysis uses GMM methodology, which makes it possible to control for heterogeneity and endogeneity. This methodology has rarely been used in the study of this topic.

The paper is structured as follows. In Section 2 the theoretical arguments are developed and the Spanish context described. Section 3 reports the data selection and the sample. Section 4 describes the methodology applied and Section 5 presents the results. The main conclusions are in the final section.

BOARD DIVERSITY AND THE SPANISH CONTEXT

Board diversity

Recently, researchers have begun to investigate work group diversity (Bracatto and Patterson, 1999 and Carter et al., 2003; among others), defined as the variety of individual attributes within a group (Blau, 1977). Milliken and Martins (1996) differentiate between two types of diversity: observable and non-observable. Observable diversity is related to detectable attributes such as race, age or gender. These differences between people are visible and they can be connected with bias, prejudice and stereotypes. Non-observable diversity is associated with less visible or underlying attributes such as education, technical abilities, functional background, length of service in the organization, socioeconomic background, personality characteristics or values (Milliken and Martins, 1996).

The literature about the effects of diversity on the performance of work groups is extensive and varied. Robinson and Dechant (1997) argue that greater diversity in working groups implies a better knowledge of the market and a best identification with customers and employees, and thus it makes easier to operate in markets. Similarly, Morrison (1992) affirms that diversity in the organizational decision making group may lead to higher quality decisions, since the thinking of the group will be more realistic and complex. So, diversity can increase creativity and innovation and can improve problem-solving (Robinson and Dechant, 1997).

Milliken and Martins (1996) suggest that a diverse team has access to a larger network and, associated with this, access to a larger pool of information, skills, and support that fall within the network. Furthermore, communication between the top management group and non-members may be more frequent and of higher quality when the team representatives come from many different areas of the organization (Ancona and Caldwell, 1988) and organizational outcomes may be improved because the composition of some organizational groups has symbolic significance for both external and internal stakeholders.

There are also arguments that greater diversity may have negative effects on group outcomes. A more diverse group can be less integrated and the likelihood of dissatisfaction and turnover is higher (Milliken and Martins, 1996). Heterogeneous groups are more likely to present communication and coordination difficulties that reduce the effective use of knowledge and skills, and result in less cohesion and interpersonal attraction and fewer mutually satisfying interactions among members (Forbes and Milliken, 1999). Therefore, it is more likely that heterogeneous groups spend more time in meeting preparation, discussion of questions and taking decisions (Lau and Murnighan, 1998).

In this study the focus is on gender diversity in boardrooms. Several studies identify the importance of women directors. For example, Daily and Dalton (2003) considerer that increasing the female representation on the board is a business imperative. They provide a number of reasons: First, in a complex business environment, firms must use all available resources to compete effectively and women represent half of the workforce. It is not logical to waste the skills, expertise and background knowledge of females, which could be used to improve the effectiveness of the board of directors. Second, the presence of females on the board can send a signal to women in business and to women in general. They can play a role as models to promote the breaking of the “glass ceiling” and be considered important “tokens”. And third, women on the board of directors can have positive effects on the bottom line.

At the same time, in recent years, there has been increasing pressure from both society and investors to appoint women directors to corporate boards. These pressures have been represented in equality laws in some countries, including Spain, where there is an open debate about diversity on boards of directors and in society generally. For this reason, the study of the gender situation in the Spanish context is interesting.

After acknowledging the importance of female representation on boards of directors, it is interesting to analyze the various contributions that women can make to the board. In other words, how does gender diversity contribute to the board?

Daily and Dalton (2003) affirm that women directors provide unique perspectives, experiences and work styles as compared to their male counterparts. They can enhance the board's deliberations and their communication style is more participative and process-oriented. The presence of women may enhance decision-making processes by encouraging the board to consider more strategic options and a variety of customer needs and interests. The presence of women may improve the image of the firm and this may have a positive effect on customer behaviour (Smith et al., 2006) and can introduce more creative discussion on the boards. In contrast with this, Adams and Ferreira (2002) argue that the gender of a board member does not imply any different behaviour in the management of the firm.

Finance and accounting researchers have investigated the influence of women directors on firm performance. These studies, like the present study, have tested for a direct relationship between the presence of women on the board and firm performance. The empirical evidence is inconclusive. For example, Carter et al. (2003), Erhardt et al. (2003), and Harel et al. (2003) find a positive and significant relationship between performance and women presence on the board. Similarly, Jehn and Bezrukova (2004) report a negative and significant relationship between the percentage of female board members and several accounting measures of financial value. Watson et al. (1993) and Richard (2000) identify a non-significant relationship between gender diversity and firm performance.

The majority of previous evidence is focused on listed firms. However, the interest in the boards of SMEs has increased in recent years (Daily et al., 2002; Gabrielson, 2003). Forbes and Milliken (1999) identify several differences between boards of directors of SMEs and listed firms. They argue that SMEs tend to be undiversified, less structurally complex, and less formalized. Therefore, the range and depth of service activities available to the boards of small firms are likely to be greater. These circumstances can form a stronger link between the board's service contributions and firm performance. The directors of small firms may be entrepreneurs with relatively little general experience, and the board's knowledge and skills may be a particularly critical ingredient of its own effectiveness. Finally, share ownership is usually more concentrated in SMEs, which implies that shareholders are often represented directly on the boards and the control function is less important because shareholder rights and managerial responsibilities will reside in the same people (Forbes and Milliken, 1999). In this way, it is possible that, on the board of an SME, women assume more of a service role than a control role.

It is likely that board composition is more important in the decision-making process in SMEs because in smaller groups each director can have more power. Consequently, directors' power is increased because there is less separation between ownership and control.

In accordance with the majority of theoretical arguments and the empirical evidence, the following hypothesis is proposed: *Hypothesis 1*: gender diversity on boards of directors will have a positive effect on firm performance.

Farrell and Hersch (2005) argue that, as women directors are a rare resource, they can select boardrooms of firms with higher levels of performance. This suggests *Hypothesis 2*: a positive relationship between the performance of a firm and the presence of women on the board is expected (Adams and Ferreira, 2002).

On the other hand, Jianakoplos and Bernasek (1998) argue that women are more risk-averse than men. Taking into account these arguments, the following is suggested: *Hypothesis 3*: if women are risk adverse, they will choose to serve on the boards of firms with less risk.

Finally, the following hypothesis is derived from the research of Mateos et al. (2006): *Hypothesis 4*: firms with an individual main shareholder are more prone to adding women to the board for family reasons.

The Spanish context

Traditionally, women have suffered severe discrimination in Spanish society. During General Franco's dictatorship (1939-1975) females were considered second class citizens. In recent decades, a strong move to incorporate women in the work force took place. In 2006 48.6 per cent of workers were women (Instituto Nacional de Estadística, INE), whereas in the 1960s it was only about 21%. Women have massively increased their participation in the university and they are majority of graduates, in business studies as in other areas.

However, there is a gap between these indicators and the access of women to top positions in public administration and business. Figure 1 shows a comparison of the presence of women on boards of directors by country. Spain is in the bottom. To correct this situation, the socialist Primer Minister, José Luis Rodríguez Zapatero, took several steps: He included the same number of men and women in the Cabinet, created the Equality Ministry and promised several legislative changes to facilitate the incorporation of women in public administration and the private sector.

In March 2007 the Spanish parliament approved the Gender Equality Act. On the topic of the board of directors, the law advises that at least 40% of directors should be women by 2015 and companies that do not comply will be unable to negotiate for public contracts.

Figure 1. Presence of women on boards of directors by country

Another support for gender equality is the Spanish Unified Good Governance Code, passed in May 2006 by the Spanish Securities and Exchange Commission). Spanish listed firms have been required to publish a corporate governance report since 2007, indicating the recommendations from the code that they carry out and justifying any failure to comply. The inclusion of this principle is justified by CNMV as “an efficiency objective” and represents “economically rational conduct” and not only social justice and ethic.

Because of these policies, the debate about gender equality has been intense in Spain, but the issue has not been linked to the study of SMEs. It is interesting to know the situation of the Spanish SME’s in term of gender equality and the effect on firm performance and how it can influence it.

SAMPLE AND DATA

Data were collected from the SABI database. This database provides information on 900,000 Spanish firms. Once firms with no data and with erroneous data are excluded, as well as firms presenting extreme values, the remaining firms were used to construct an unbalanced panel comprising 10,786 companies and 43,213 observations.

Gender diversity has been measured in several ways. First, by the “Presence of women” that is a binary variable that indicates the presence, at least, of a woman on the board. Second, the “Women ratio” is included and calculated as the number of women on the board of directors divided by the total number of directors. Finally, two measures are considered that relate to the two gender categories, variety, and the uniformity of the distribution of directors across them, balance. The first one is the Blau index (Blau, 1977) calculated as

$1 - \sum_{i=1}^n P_i^2$, where P_i represents the percentage of directors in each category (women or men) and n is the number of categories. The maximum and the minimum value of this variable are 0.5 (when there is the same number of women and men on the board) and 0 (when there are only men or women directors), respectively. The second index is named after Shannon (Shannon, 1948), and is measured as $-\sum_{i=1}^n P_i \ln P_i$, where P_i and n are defined in the same way as in the Blau index. The range of values is between 0, when there is no gender diversity, and 0.69 when the parentage of each category is the same. Both indexes are analogous but the Shannon index is more sensitive to small differences in the gender composition of the board.

The return on assets (ROA) was used as a measure of firm performance. Other variables included were the logarithm of the variability of ROA over the previous 5 years as a measure of a firm's operational risk and the level of debt, DEBT (calculated as the ratio of total debt to total assets), as a measure of financial risk. Several variables were incorporated that indicate the type of major shareholder: INDIVIDUAL (binary variable that takes a value of 1 when the major shareholder is an individual and 0 otherwise), NONFINANCIAL (binary variable that takes a value of 1 when the major shareholder is a non-financial firm and 0 otherwise).

Finally, a number of control variables were used, specifically, the age of the firm, AGE, the firm size measured by the logarithm of total assets, SIZE and the logarithm of the total number of directors. See Carter et al. (2003) and Farrell and Hersch (2005).

Table 1 reports the descriptive statistics for all variables. The most important conclusion is that the mean percentage of women on Spanish boards of directors is 8.6 percent. This percentage is low but it is higher than the value calculated for large Spanish firms (about 3 percent; see Heidrick and Struggles, 2007). Moreover, only 23 percent of Spanish SMEs have one or more women on their boards.

Table 1. Descriptive statistics

	Mean	Median	Standard Deviation	Minimum	Maximum
ROA	5.881	7.090	15.373	-149,980	174.006

LNUMBER OF DIRECTORS	0.974	1.099	0.804	0.000	5.521

METHODOLOGY

To analyze the relationship between gender diversity on boards and firm performance the following equation was estimated:

$$ROA_{it} = \beta_0 + \beta_1 DIVERSITY_{it} + \sum_{j=2}^4 \beta_j CV_{jit} + \psi_t + \eta_i + \varepsilon_{it} \quad (1)$$

where ROA represents firm performance, DIVERSITY includes, in separate analyses, the Women ratio, the Presence of women variable, the Blau Index or the Shannon Indexes (BLAU and SHANNON respectively). CV represents the control variables (DEBT, AGE and SIZE). The terms ψ_t , η_i and ε_{it} symbolize the time effects, individual effect and random disturbance, respectively.

Model (1) is estimated using a panel data methodology, applying the Generalized Method of Moments (GMM) technique (Blundell and Bond, 1997). This procedure makes it possible to control, first, for individual

heterogeneity, introducing an individual effect, η_i and, second, for macroeconomic effect on the dependent variable using time dummy variables. In addition, GMM estimation resolves the trouble of endogeneity that can appear when the independent variables and the dependent variable are determined simultaneously. To remove this bias, this methodology estimates a system of two simultaneous equations, one in levels (using first differences instruments) and other in first differences with lagged levels instruments.

In the final model, the determinants of gender diversity are identified according to the following equation:

$$DWOMAN_{it} = \beta_0 + \beta_1 ROA_{it} + \beta_2 OPERATIONALRISK_{it} + \beta_3 DEBT_{it} \sum_{j=4}^5 \beta_j MAIN_{jit} + \sum_{j=6}^8 \beta_j CV_{jit} + \psi_t + \eta_i + \varepsilon_{it} \quad (2)$$

where OPERATIONALRISK and DEBT measure the firm's operational risk and the financial risk, respectively. MAIN symbolizes the dummies relative to the type of main shareholder (individual or non-financial). CV represents the control variables (SIZE, the logarithm of the number of directors and AGE). The other variables are as in Model (1).

To estimate this model, a logit panel data methodology was used which is adequate when the dependent variable is binary.

RESULTS

The results of estimating the Models (1) and (2) are shown in Tables 2 and 3. Table 2 presents the effect of gender diversity on firm performance, while Table 3 shows the determinants of women's presence on boards.

Panel A of Table 2 indicates that the presence of women on the board and the Women ratio have a positive and significant effect on firm performance, ROA. Alternatively the return on equity (ROE) has been used as a measure of firm performance and the results obtained are very similar. These results are not reported here to save space. Therefore, female representation on the boards creates an advantage for the firms and the positive effect of diversity on work groups (variety of opinions and strategies) outweigh the problems of integration and slowness in the taking of decisions. This result supports *Hypothesis 1* and it is in the line of the evidence given by Erhardt et al. (2003) and Carter et al. (2003), among others.

The effect of the Women ratio is greater than the effect of the Presence of women variable. This result indicates that increasing the number of women on boards is not only necessary for social justice but it also protects the interests of shareholders. Women bring a different style to board tasks and better environmental adaptation. This is a very important result for SMEs that have to face a competitive market environment.

For the control variables, the debt ratio has a negative and significant effect on firm performance. The negative relationship implies that SMEs may be averse to raising equity for fear of losing control of the firm and for this reason use more debt in their capital structure than would be desirable. Therefore, SMEs can have problems obtaining equity and may adopt an inappropriate capital structure. However, increasing debt may reduce agency conflicts, while employing excessive debt is likely to result in high bankruptcy costs with associated negative effects on performance.

The influence of the firm's age (AGE) on firm performance is negative, too. This result suggests that younger firms may have less inertia and fewer bureaucratic processes. They can be more agile and flexible in response to environmental changes.

Finally, in the sample, firms with more assets (SIZE) have a higher performance in terms of ROA. This last result is not what was expected, and it may be a consequence of the difficulties in obtaining suitable funding on the part of smaller SMEs.

The z_1 Wald Test indicates the combined significance of the independent variable coefficients, while z_2 reports the joint significance of the time dummies. The m_2 statistic indicates that in all the models there is no second-order serial correlation in the first-difference residuals, showing that the models are not mis-specified. Sargan's Test shows a lack of correlation between the error term and the instrument used. It follows that the estimations are adequate.

Table 2. GMM Panel Data Regression relating to the influence of the presence of women and women ratio

and diversity indexes on Return on Assets (ROA)

<i>Panel A: The Presence of women and Women ratio</i>				
<i>Variable</i>	<i>Standard Error</i>	<i>Coefficient</i>	<i>Standard Error</i>	<i>Coefficient</i>

Sargan	87.06(76)		87.77(76)	

Notes:

***, **, * denote significance at 1%, 5% and 10% levels, respectively.

In Panel B of Table 2 the Blau index measures the gender diversity of the board of directors. Some researchers (Ancona and Caldwell, 1992) affirm that this index is more suitable to measure the diversity than the Women ratio because a board composed only of women lacks gender diversity. The Blau index has a maximum value when there is the same number of women and men on the board of directors. Results are like to those shown in Panel A. This suggests that a mixture of men and women promotes more effective boards.

To test the robustness of the results an alternative diversity index is included in panel B. The Shannon index shows a positive and significant effect on firm performance, in the line with the results shown in Panel A of Table 2. It can be seen that the coefficients of the Blau and Shannon Indexes are higher than the coefficients for the Presence of women and Women ratio, while the coefficients of the other independent variables remain similar to those found earlier. This means that the impact of gender diversity increases continuously up to the point where the diversity of the board is maximised. This result indicates the importance of adding women directors to the board and the significance of a mix of women and men to create adequate gender diversity on the board. Finally, the control variables have the same signs those observed in Panel A.

The last analysis consists in testing for some determinants of women's presence on the board of directors. Table 3 shows the results and indicates that the firm's performance, ROA, does not have a significant impact on the presence of women. There is no indication that women are choosing to serve on the boards of firms with higher levels of performance. This result does not support the *Hypothesis 2* and can be explained by the notion that the boards of better performing firms will prefer to maintain board diversity when a new director is appointed.

For the effect of firm risk on female representation on the boardroom, there is no significant relationship between firm operational risk and the probability of presence of women directors. Thus, women are not affected in their decision to join a board by the risk derived from internal processes, people and systems, or from external events. This result does not support the *Hypothesis 3*. However, a negative and significant effect on the representation of women among directors was found in the case of financial risk, DEBT, which does accord with *Hypothesis 3*. This suggests that women prefer to serve on boards with low levels of debt and low probability of bankruptcy and it confirms a certain risk aversion. Possibly women take financial risk into account because it is easier to identify before joining the board than operational risk.

Firms with an individual as major shareholder (family firms) have more women on their boards of directors. However, when of a non-financial firm is the main shareholder, the probability of women's presence on the board diminishes. This confirms *Hypothesis 4* and it implies that gender discrimination persists in society in general but that it is overcome by family ties, which may help to eliminate prejudice and stereotypes. It is probably easier to achieve a positive work-life balance in family firms (Mateos et al. 2006). Consequently, promoting this type of firm can improve the number of women engaged in senior management. The results also indicate that the logarithm of total assets (SIZE) has a negative impact on gender equality. This evidence reinforces the notion that small and family firms are more likely to appoint women to their boards of directors. The logarithm of the number of directors has a positive impact on the women presence on the board. It is logical that larger boards are more likely to include women. Finally, the age of the firm (AGE) does not seem to be a determinant of women's presence.

Table 3. Logit Panel Data Regression relating to the determinants of the presence of women on the board of SMEs

<i>Variable</i>	<i>Standard Error</i>	<i>Coefficient</i>
Constant	1.898	-11.264***
ROA	0.003	0.001
OPERATIONAL RISK	0.070	0.014
DEBT	0.361	-0.936**
INDIVIDUAL	0.592	1.158*
NONFINANCIAL	0.574	-1.219**
SIZE	0.067	-0.358***
LNUMBER OF DIRECTORS	0.134	5.138***
AGE	0.188	-0.081
Wald Test	1852.66(13)	
Time χ^2	199.62(5)	
Rep χ^2	1600.56(8)	
$\chi^2=0$	23000(1)	

Notes:

***, **, * denote significance at 1%, 5% and 10% levels, respectively.

The goodness-of-fit tests indicate that the variables included in the model have high explanatory power (see Wald test and Rep χ^2). In addition, Wald tests of the joint significance of the time dummies, Time χ^2 , validate the use of such variables. These results show that the inclusion of these binary variables is important since they model for the impact of changes in the macroeconomic environment.

CONCLUSIONS

This paper examines the impact of the gender composition of boards of directors of Spanish SMEs. Spain can be characterized as a country where the incorporation of women in top management positions has been low, a situation that does not seem to have improved in recent years. The debate on this topic has been intense for two reasons: the passing of the Spain's Unified Good Governance Code (2006) which recommends an increase in the number of women directors until they are a minimum of 40% in 2015 for listed firms and the Gender Equality Act endorsed by the Spanish parliament in 2007.

The effect of women's presence on the board of directors, measured by several variables, on firm performance and the determinants of female presence on the board have been examined, using panel data methodology.

One of the contributions of this study is that it is focused on SMEs when the majority of previous evidence was taken from listed firms. SMEs are more important in terms of number, employment and sales. A second contribution arises from the fact that existing studies have not used panel data to control for potential bias in the estimation procedure.

The proportion of women on the boards of Spanish SMEs is higher than that in Spanish listed firms. This implies that SMEs are more advanced in term of gender equality.

A mix of men and women on the board has a positive effect on firm performance. This result suggests that gender diversity not only advances social equity in Spanish boardrooms but serves to improve the firms'

economic situation. The presence of an individual or a non-financial firm as main shareholder has a positive or negative impact, respectively, on female representation on the board. Consequently, it can be concluded that family firms increase gender equality on their boards.

It was also found that women do not show a preference for working on boards of better performing firms or those with lower levels of operational risk. However, they do prefer to be on the boards of firms with less financial risk. Finally, smaller firms and larger boards have more women as directors.

For future research, it would be interesting to analyse the internal processes that increase the firm performance depending on the composition of the board of directors of Spanish SMEs, identifying the different tasks and contributions that women and men can make.

**ENTREPRENEURSHIP
&
INNOVATIVENESS**

HOW DO SOCIAL ENTREPRENEURS DEVELOP INTENTIONS TO CREATE A SOCIAL VENTURE?: A CASE STUDY

Aytül Ayşe Özdemir
Anadolu University, Turkey

ABSTRACT

The exploratory study on one social entrepreneur aims to understand the intention formation process of social entrepreneurship. Building on the findings, this paper argues that social entrepreneurs have similar three variables of intentions with traditional entrepreneurs, namely perceptions of feasibility, perceptions of desirability and propensity to act. However, the antecedents of these variables differentiate from the traditional ones. At the preceding stage social sentiments form the entrepreneurial intention. Willpower as an antecedent of propensity to act, support as an antecedent of perceptions of feasibility and opportunity construction as an antecedent of perceptions of desirability are identified in this paper.

Keywords: intentions; entrepreneurial intentions formation; new venture creation; social entrepreneurship

INTRODUCTION

The intentions at the background of the individual are important determinants of the effort and willingness displayed toward behaviour. More the intention toward behaviour is strong; more the performance of that behaviour shall be high. The relation between intention and behaviour emerges in a more distinct and strong manner when the behaviour is planned and aimed at a certain target.

Intentions which form the main motivation behind the entrepreneurship behaviour that is planned and aimed at a certain target are studied in many researches (Krueger, 1993, 2000; Bird, 1988; Katz and Gartner, 1988). Most of these researches have studied the traditional entrepreneurial behaviour which has as main mission to create economic value and have contributed to the establishment of the theory in this field. The aim in this study is to research whether the models demonstrating the correlation between traditional entrepreneurial behaviour and intentions are valid for social entrepreneurship which is one of the most important concepts of the present day. With this purpose, primarily, models explaining the relationship between intention and entrepreneurship shall be elaborated, then the relationship of social entrepreneurship and intentions shall be examined and finally how it is established in a social entrepreneur shall be explained through a case study of this relationship.

INTENTIONS, ENTREPRENEURSHIP BEHAVIOUR AND THE RELATED MODELS

Entrepreneurship is related to the perception, evaluation and utilization of goods and services which wait to be produced (Venkataraman, 1997). Perception of the goods and services which wait to be produced is related to the perception of the entrepreneurial opportunities. Planned and target-driven entrepreneurial behaviour (Krueger and Carsrud, 1993; Bird, 1988; Autio et al., 1997) is influenced by the mental models and information structures, in other words from the cognitive approach which has an effect on the creation of an organization (Bird, 1988; Mitchell et al., 2004; Baron, 2004; Krueger, 1998, 2000). According to the cognitive approach, the mental models of individuals have an effect on what individuals think, say and how they behave (Baron, 2004; Hayes and Allinson, 1994). Cognitive mechanisms have an effect on how we receive, preserve and use information. In this context, intentions too are influenced by mental models. Intention, with a simple definition, is the degree of commitment displayed towards the targeted behaviour (Krueger, 1993:6) and it is not likely that the behaviour

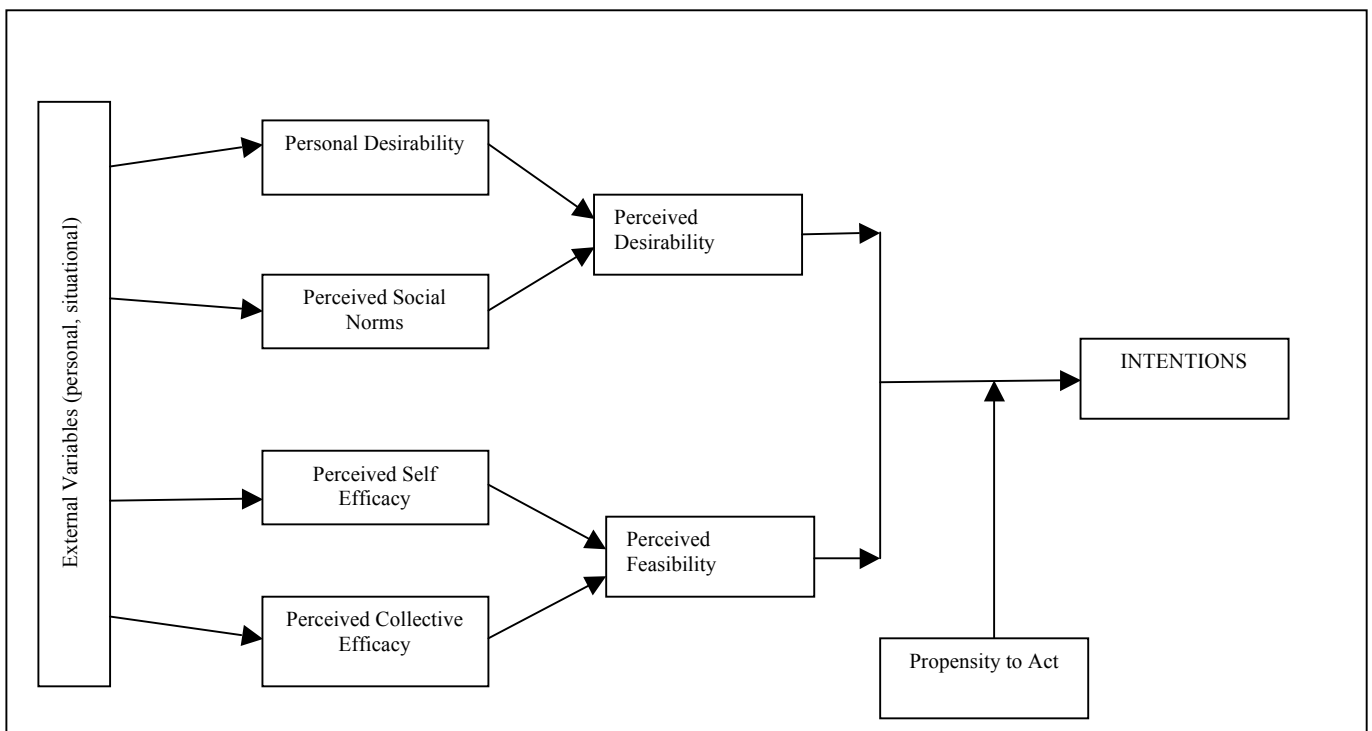

shall appear without an intention. Intentions are needed in perceiving opportunities and in pursuing them; intentions are the cognitive situation which is immediately prior to acting (Krueger, 2003:115).

There are two studies examining intentions and entrepreneurial behaviour that are most cited in the literature pertaining to the field. These are *Planned Behaviour Theory* and *Entrepreneurial Event Model*. According to Ajzen's Planned Behaviour Model the social behaviours of individuals are underneath certain factors, are caused by certain reasons and appear in a planned manner (Erten 2002: 220). Intention related to the behaviour must precede for the occurrence of behaviour. According to this model the intention has three determinants: Attitude related to the behaviour, Special norms and Perception of controlling the behaviour. Attitude related to behaviour is respective to whether the individual perceives the behaviours as an opportunity or threat. People perceive as opportunity when they find that the consequences related to the behaviour are favourable and as threat when they find them to be unfavourable. Special norms are related to the opinions on the behaviour of individuals which are important in the individual's life such as family, close friends, workmates. Perceived behavioural control has an important place in this model, because this perception has a direct effect on both intention as well as behaviour. This perception of ease or difficulty of performing the behaviour is closely related to Bandura's (1982) self-efficacy concept. Self-efficacy which has the meaning of perceived ability to execute the targeted action (Bandura, 1982: 122) has a vital place in the literature concerning entrepreneurial intention (Boyd and Vozikiz, 1994; Chen, Greene and Crick, 1998; Zhao, Seibert and Hills, 2005).

From the intentions-based models, the one related to the entrepreneurial field is the Entrepreneurial Event Model of Shapero which has appeared many years earlier than Ajzen's model. This model argues that people remain in their daily routine lives until an important event disturbing their routines occurs. For instance, especially, negative events such as being laid-off from a job, divorce, job dissatisfaction cause certain changes to occur in people's lives (Summers, 2000:28). While the selection of the events related to the changes depends on the action's perceived desirability, perceived feasibility and the tendency of the individual to perform the action. The entrepreneurial intention, as a type of behaviour and type of action, is formed again by the same determinants: perceived desirability, perceived feasibility and the tendency to perform the action. The perceived desirability is the individual's degree of finding attractive the act of launching a venture. Perceived feasibility is the degree of perception of how much predisposed the person is towards starting a business. Before forming an entrepreneurial intention the individual must both want to found a business and to find it feasible (Summers, 2000:29). In this model, differently from the Ajzen's model, social pressure (social norms) influences intentions through perceived desirability. Furthermore it is also related to the extent of prior entrepreneurial experiences and their being favourable. The extent as well as the favourable results of experiences affect both desirability as well feasibility. Another difference is the propensity to act. Desirability and feasibility are not sufficient to act on a decision (Krueger et al., 2000:418).

Krueger and his associates (2000) have tested the validity of the two models on 97 university students. According to the results of the research, intentions foresee entrepreneurial behaviour which is a planned behaviour. The impact of attitudes on behaviours is through intentions. Attitudes affect intentions, intentions affect entrepreneurial behaviours. Intentions are stronger determinants of entrepreneurship compared to personal variables (such as personality) or situational variables (such as employment situation). While in the results related to models, the subjective norms in Ajzen's model do not foresee the intentions; it has been found that Shapero's model consisting of perceived desirability, perceived feasibility and propensity to act has fully foreseen the intentions. In fact, propensity to act foresees entrepreneurship even while the other variables are kept constant (Krueger et al., 2000:422-423). Based on these two models, Krueger and his associates (2000) have created the intentions model presented in Figure 1. The intentions model which consists essentially of the two models' variables, perceived desirability is formed by personal desirability and perceived social norms. Whereas perceived feasibility consists of self efficacy and the efficacy beliefs of the persons in the environment, for instance in the organization where the individual is working (Krueger, 2000: 10-12).

Figure 1: Intentions Model

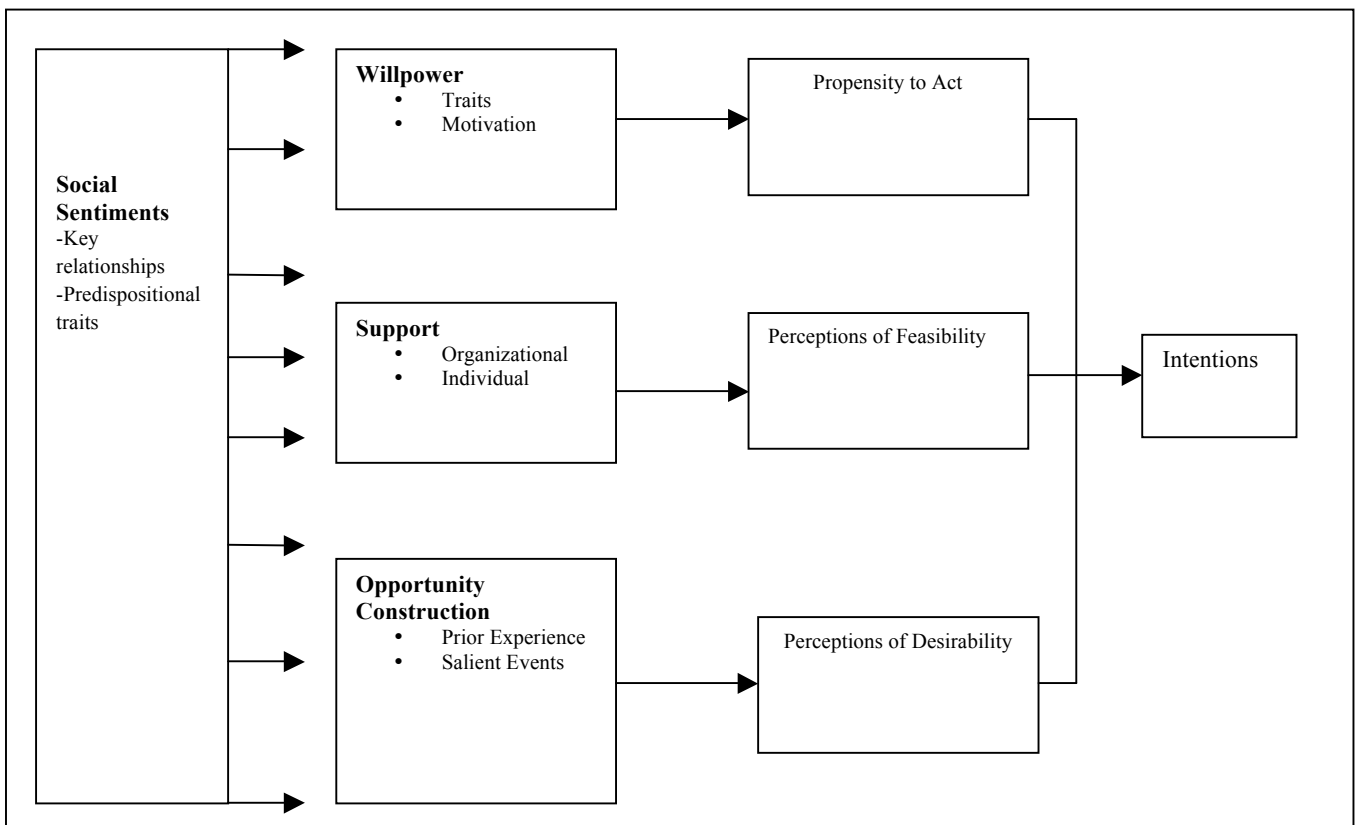

Source: Krueger, N.F. (2000), *The Cognitive Infrastructure of Opportunity Emergence*, *Entrepreneurship Theory and Practice*, Spring, pp. 9.

INTENTIONS AND SOCIAL ENTREPRENEURSHIP BEHAVIOUR

Prabhu (1999) has defined social entrepreneurs as: “People who create and manage innovative entrepreneurial organizations and whose main mission is to create social change and who aim at the development of the groups in their interest area (1999: 140). As it can be seen from this definition in social entrepreneurship *creating social change* is the main purpose. The area where social change shall be created and for which groups it shall be created is related to the perception of opportunities. Just as traditional entrepreneurship is related to perceiving opportunities and mobilizing them, the same characteristic is also valid for social entrepreneurship. The difference here is in relation with the type of opportunities. Social opportunities rather than economic opportunities draw the entrepreneur’s attention. The main criterion in the perception of opportunities is whether it shall meet a social need or not.

When social entrepreneurship behaviour is studied in the framework of the models of Ajzen and Shapero which explains the correlation of entrepreneurial behaviour and intention, the research conducted by Mair and Noboa in 2005 comes across. In the study aimed at educating children in the subject of protecting the environment by using the television and other communication channels that they have conducted with the social entrepreneur Maria Elena Ordonez. Regarding on these studies, it has been found that perceived desirability, perceived feasibility and propensity to act determine also the entrepreneurial intentions in social entrepreneurship just like in the traditional entrepreneurship. However the emergences of these three mechanisms or their development become different in social entrepreneurship (See Figure 2).

Figure 2: Social Entrepreneurship Intentions Model

Source: Mair, J. and Noboa, E. (2005), How Intentions to Create a Social Venture are Formed: A Case Study, IESE Business School, Working Paper Series, WP No:593, University of Narvana, p.7.

When Figure 1 and Figure 2 are analyzed, the differences between traditional and social entrepreneurship models appear in a more distinct manner. Krueger and Brazel (1994) have mentioned the importance of previous experience in the formation of entrepreneurial intention. The quantity and quality of these experiences have an effect on intentions. In the research where they studied Ordonez, Mair and Noboa (2005) have found that social beliefs instead of experiences have an effect on the decision to create a social venture. The feelings which include perceptions, motivation and thoughts are a complex combination of thoughts and feelings. They arise from the relations of the individuals with the events or other individuals and affect the commitment to long term acts. It is indicated that most of the social entrepreneurs have been interested in social matters at young ages. Relations with the individual or events such as having a politically active family or doing volunteer work at nongovernmental organizations; or even traumas experienced at young ages form social feelings and therefore social entrepreneurs (Light, 2005). In the context of social entrepreneurship, it can be said that social feelings transform individuals into citizens who are not pleased with the current situation, who are committed to their values and thoughts and who are motivated to act in the sense of social responsibility. Mair and Noboa (2005) have found that the relationship of Ordonez with nature and her traits such as empathy, ethical judgment form her social feelings.

As it can also be seen from Figure 2, propensity to act is influenced by willpower. Propensity to act is a tendency that motivates an individual who desires to create a venture and feels of capable of succeeding to act. In the example of Ordonez, motivation sources such as creating a social effect, reaching more people, desire for social change and traits related to coming into action form the willpower (Mair and Noboa, 2005:8, 9). As McClelland (1967) has stated that while sources such as “being one’s own boss”, “being independent”, “acquiring financial security” are important, it would not be wrong to expect that these sources shall change in social entrepreneurship. Sources such as discomfort felt from the current situation, altruism may orient social entrepreneurs (Prabhu, 1999: 142). In the research of Shaw and Carter (2007), the existence of distinct differences between traditional entrepreneurship and social entrepreneurship regarding motivation sources come forth. In the U.K. during in-depth interviews conducted with 80 social entrepreneurs, sources such as “creating a

change or difference”, “dispelling local needs”, “being interested in a social matter” and “personal satisfaction” have been encountered as main motivation sources. Different from traditional entrepreneurship it has appeared that sources such as personal demands and needs or joblessness, job dissatisfaction have a much weaker effect (Shaw and Carter, 2007:425). Shortly, motivation and action oriented traits are formed over a long time and are not expected to change within a short period. Motivation as well as traits is necessary for generating willpower. The sole existence of motivation or having solely the necessary traits will not be sufficient to create the willpower to become a social entrepreneur (Mair and Noboa, 2005:10).

Social entrepreneurs evaluate social opportunities according to their conditions of reaching sources necessary to seize the opportunities. In their research, Mair and Noboa (2005) have found that perceived feasibility is affected by the support at individual and organizational level. Social entrepreneurs perceive feasibility only after understanding that they shall be able to reach other resources and manpower (Mair and Noboa, 2005). While in traditional entrepreneurship, self-efficacy and collective efficacy constituted this perception. In social entrepreneurship individual and organizational supports constitute the feasibility perception. The sources of social entrepreneurs are more limited compared to traditional entrepreneurs; their success depends to a great extent on the support they receive (Austin et al, 2006:11). The individuals may utilize social capital in order to reach resources. Social capital is formed by networks established with stakeholders and in the success of entrepreneurship, social capital, is quit important in ensuring confidence and support. In perceiving new opportunities even beyond that information arriving from social networks is much useful. The strong relationship between innovation and social capital is originated from advantages brought by the social capital in accessing information and using information (Özdemir, 2007). Krueger (2000), in his model explaining the relationship between intentions and entrepreneurial behaviour has also defined collective efficiency as social capital (Krueger, 2000). For instance, the support and trust that the individual takes from the other people in the organization have an effect on the entrepreneurship intention. In social entrepreneurship, like in the traditional entrepreneurship, networking behaviours and social network management are important. For instance Shaw and Carter (2007) indicate that social entrepreneurs attach importance to social networks in order to ensure local support to their activities or for their credibility (trustworthiness) in the local environment.

The last variable is perception of opportunities or perceptions of desirability. Opportunities may be looked for or may be discovered. Both require knowledge or experience. An individual may not look for an opportunity about which the individual has no idea or may not discover an opportunity which is not perceived by the mind. In social entrepreneurship, differently from traditional entrepreneurship, the perception of desirability is formed as soon as the opportunity is perceived by the individual. The perception of desirability is not formed after individual preferences or social norms like in the traditional entrepreneurship (Mair and Noboa, 2005:10-11). In social entrepreneurship, unlike traditional entrepreneurship, a possible reason for the social norms losing their effect on entrepreneurial intentions is the fact that the targeted social need in social entrepreneurship is already known by a large segment of the society (Murphy and Coombes, 2009: 333). Poverty, lack of education and famine are social needs that are known and accepted by a large segment of the community and the social entrepreneur is acting in accordance with the social norms on its own.

According to the results of the research of Mair and Noboa (2005), even though we are unable to generalize the results to all social entrepreneurs, perceived desirability, perceived feasibility and propensity to act also foresees the relation between social entrepreneurial behaviour and intention, but the main difference here is the path followed by this network of relationships while it is developing. In other words variables or resources constituting the beliefs may differentiate in social entrepreneurship.

AIM OF THE RESEARCH

The main objective of this research is to analyze the process of entrepreneurial intention formation process of a social entrepreneur. The question of “How social entrepreneurs decide to create a social venture?” is investigated through the related three sub-questions:

- What are the antecedents of propensity to act?
- What are the antecedents of perceptions of feasibility?
- What are the antecedents of perceptions of desirability?

RESEARCH METHOD

The aim of this research is getting a deeper understanding of a complex relationship between intentions formation process and social entrepreneurship behaviour. In order to acquire richer knowledge of a complex situation qualitative approach is chosen. A case study has been conducted in order to display the relation between intentions and social entrepreneurship, to put forth the variables revealing the intention. The reason for choosing this method is related both to the concept of social entrepreneurship which is currently debated as content and to the intention-entrepreneurship relationship being a relatively new subject.

Type of case study research design is instrumental case study. In an instrumental case study, the researcher's primary interest is in understanding something other than the particular case. The researcher chooses the case to develop and/or test a theory or to better understand some important issue (Johnson and Christensen, 2004:377-378). The social entrepreneur who constitutes the analysis unit of this study is Ercan Tural. A very careful selection has been made in deciding who shall be the social entrepreneur analyzed in this study. As the concept of social entrepreneurship is not clear, the social entrepreneurship criteria of Ashoka Foundation (U.S. based non-profit organization that helps social entrepreneurs to develop, share and scale their ideals) which are in line with the definition of social entrepreneurship adopted in this study have been used in selecting the social entrepreneur.

Ercan Tural is the member of Ashoka since 2003. In Germany, he observed for the first time the full and equal participation of disabled persons to social life and started to contemplate on it. Establishing one-to-one relationship with disabled persons, Tural analyzed the related institutions, projects in various countries in Europe and carried his testimonial to Turkey. Carrying out studies for disabled persons to ensure their attachment to life and their social integration, Tural struggles to provide a world without obstacles to disabled persons. Enabling all types of disabled persons to dive, Tural teaches painting to those who are unable to see and to become DJ to those who are unable to hear. Every year, he gives theatre, DJ training, photography, life coaching and music lessons to hundreds of disabled young persons. He has founded Alternative Camp which is a leading and pioneering institution in convenience and accessibility standards which makes possible for disabled persons to participate fully and equally to social life. The participants and volunteers of Alternative Camp which is providing services on a fully voluntary basis to socially disadvantaged groups and individuals since its establishment in 2002, arrive from different countries throughout the world as well as from Turkey. Tural has later founded the Alternative Life Association (AYDER) which produces and implements alternative and innovative projects in order to provide a "social life without obstacles" to those who are kept outside life.

Since 1997 he is giving voluntary diving lessons to disabled persons on a voluntary basis as the "representative and course director for Turkey" of the California based Handicapped Scuba Association which is the first and only diving organization for disabled in the world. He was invited to Dublin in 2003 as Honorary Guest of Special Olympics. He participated to diving workshops in Poland, Germany and Italy. He was one of the Olympic Torch carriers in 2004. Having received the award of "UNDP Good Example in the Field of Youth", Tural has been elected as "social entrepreneur" by the US based ASHOKA Foundation

Data Collection Method and Analysis

In the study, more than one method is used to collect data. Using multiple sources of data is advantageous as it increases the external validity of research. Firstly, in-depth interview has been used as data collection method. In the month of April 2010 an interview lasting 1-1.5 hours has been conducted in Istanbul. Semi-structured interview form was used to receive a detailed explanation. Subsequent to the interview, another interview held with the disabled persons receiving training at the Dreams Academy, the music group with which these disabled persons shall give a concert was participated to as listener by the author. Also the results of document analysis (previous interviews published on internet) were combined with the data. Descriptive analysis was used. To maintain the reliability and validity of the research, the findings of the study was sent to the participant (Ercan Tural) and received his thoughts. Main and sub-questions of the research provide a framework to analyze data.

Findings

As it has been indicated in the result of Mair and Noboa's research (2005) social sentiments, in other words the strong tie with an object or person affects the perception of variables forming the intention of social

entrepreneurship. While in traditional entrepreneurship, the entrepreneurship experiences affect the feasibility and desirability perceptions of entrepreneurial behaviour, in social entrepreneurship; social sentiments take the place of these experiences. Relations with the individual or event such as having a politically active family or working at a nongovernmental organization; even traumas experienced at earlier ages constitute social sentiments and therefore social entrepreneurs (Light 2005). In this research too, it has emerged that the social sentiments of Tural are closely affecting perceptions related to his social entrepreneurship behaviours. But here, differently from the research of Mair and Noboa (2005), it was found that the social sentiments arising from a relation to certain event or person have been formed by the upbringing, culture and values conveyed by culture.

These social sentiments render social entrepreneurs uncomfortable with the current situation and make them feel responsible about it. In addition to social sentiments there are certain traits that guide the individual to take care of the needs of other people. Ultimately even in the case of two persons growing up in the same family, same culture, their approaches to social issues are different. Since traits step in at that point. As a result, social sentiments are primarily effective in the emergence of social entrepreneurship behaviour. These social sentiments consist of both external factors (upbringing style, culture) as well as internal factors (individual traits):

“My becoming a social entrepreneur is related to my conception of the world; you need a philosophical ground to transform your intellectual accumulation into an activity. You have to have a different standpoint than the normal citizen on the street you have to know how to transform knowledge into action. Sensitivity-Awareness-Consciousness motivates you. Your biggest advantage is your awareness of all the circumstances in the world. Famine, civil war, children, disabled, those with AIDS are not mere children for you. You are aware of the systems managing the world, there are obvious issues. Our youth has passed by pursuing the issues of South America, Alaska worker issues, Vietnam. We have not contented ourselves with intellectual chatter by wondering what shall become of the world, after remaining helpless and falling into depression”.

“We are a lucky generation, my childhood passed by arranging contests about who will carry how many bags of elderly people in the neighbourhood bazaar. We grew up with the values of neighbourhood and respect. We grew up with the values of being useful. I thought of becoming a pilot like my father, I know that it was not possible, I always had dreams of becoming a doctor and joining the Red Cross. Our upbringing was different. We were a conscious generation. We took interest in the issues of the country; we did not experience the identity issue that the youth now is experiencing. We knew what we wanted to do, instead of buying a Cadillac we always had fantasies directed to the community.”

“Literature, the books you read, a line of poetry, mythological tales, a movie have an influence on your vision of the world our approach to issues....”.

These statements indicate that upbringing style and the cultural values individual grew up have shaped the social sentiments. The statements of Ercan Tural also signal the significant role of intellectual capital. Intellectual accumulation supports the perception of world and/or social problems.

The other factor of social sentiments is traits. In this research predispositional traits emergence as empathy and feelings of responsibility:

“In our country, unfortunately, there are at present job advertisements written as “we are looking for presentable disabled people....”. “On the street people do not want to encounter with them, try to ignore them....”.

“According to the official statistics, 1 person out of 7 is disabled. There is a bleeding wound somewhere in our life process. They say that fire burns wherever it falls. An enlightened conscience, does not wait for burning, he does not turn his back to the fire outside; instead, he formulates solutions and applies these solutions...” (Source: DT Business Review, January-February 2010, p.139).

“I knew the difficulties before I returned to Turkey. Economic and cultural qualifications of Turkey constitute barriers on your projects. But when I was in Germany and in other countries, I saw that it is possible to implement my project. I had to find a true and a valid vehicle to begin...the years of inaction, the years of accrued problems cannot be solved through classical methods, but it can be diving... extreme, expensive, inaccessible, a real fictional...I felt that I would break down the existing taboos with the approach ‘Sports for Social Change’. Hence, I started offering diving courses free of charge to the disabled, based on the slogan ‘Diving is Freedom’.

“The world underwater is truly a world beyond borders. It offers an environment where you are not dependent on a person, an instrument, or an object. It is a world of liberty and equality. A world where dependence on the wheel chair to which one is tied from birth or later in life, the crutches or a white stick, is no longer in question...” (Source: DT Business Review, January-February 2010, p.140).

As it can be seen from the statements, his own capacity to experience empathy and responsibility feeling helped him to combine diving and the disabled people in an innovative manner.

Antecedents of Propensity to Act

In the research of Mair and Noboa (2005) the propensity to act is influenced by the willpower. In the example of Ordonez, motivation sources such as creating a social effect, reaching more people, desire of social change and traits related getting into action constitute the willpower (Mair and Noboa, 2005: 8). In this research too, the strong relationship between willpower and propensity to act has drawn attention. The motivation sources affecting willpower are the following:

Reaching More People: “This perception must reach everyone throughout Turkey...”. “Instead of joining an institution and working for the disabled people, I have things to say in Mardin, in Istanbul”.

Desire for Social Transformation: “Social transformation cannot be made otherwise, you are making a revolution...”. “There are people who have their lives changed thanks to me”. “..... for a small figure you are may be creating a welfare of 60 billion on the other side of the scale.....”.

Creating Social Effect: “Something must be done not only for yourself, but for other people’s happiness, several people are unaware of this.” “It is very easy for you to satisfy your personal needs, routine holidays may give personal pleasure but your next-door neighbour, someone in the neighbourhood may need you. There are lots of persons who are war victims, who die of famine, personal dreams seem too weak to me”.

Whereas traditional entrepreneurs have economical or self-oriented motivation sources, social entrepreneurs have a desire to create a social effect or to create a social value. They are social-oriented motivation sources instead of economical ones.

The traits facilitating to get into action and forming the willpower are as follows:

“I don’t begin something that I don’t believe at all, I have confidence in myself, while thinking about this project, I never thought that I would be unsuccessful”.

“When I started this project they sent me away from the physical rehabilitation centre, it is a very devious path, you have to fight to solve clashes”. “I had tried diving only two or three times when I was a student as an amateur, when I started this work I learned diving only to eliminate negative reactions, I became diving instructor, currently I am one of the 16 instructors in the world who teach diving to disabled persons”.

“I like taking risks; I am very tough and patient. Developing and pursuing projects uninterruptedly for 11 years requires personal toughness. If I have planned something, I carry it out without fail, nothing is unsolvable. I solve problems, I never give up, I act flexibly according to the needs of the period”. “.. enthusiasm, passion, courage are necessary for this work...”.

According to the Big-Five Factor theory of personality, it can be concluded that emotional stability, openness to experience and conscientiousness facilitate to get into action and help the individual transform his vision into real.

Antecedents of Perceptions of Feasibility

The second determinant forming the intention of social entrepreneurship behaviour is the perception of feasibility. In the traditional entrepreneurship, self-efficacy and collective efficacy formed this perception. Whereas in social entrepreneurship, individual and organizational supports constitute the feasibility perception

(Mair and Noboa, 2005: 9). In this research, among the individual supports especially family and close friends form the support network:

“My family has been very supportive, you work 365 days, day and night week-ends included. When one takes a decision, it brings also the accumulation of a lifetime. You create value; you have to think about them while you take decisions. My family members are my secret heroes. I live with my family, I don’t pay rent, my friends pay my cellular phone or my credit card; they believed in my ideals, encouraged and supported me, thanks to them I had the chance to act freely, my family is my refuge...”

But when the issue is to perceive the organizational support, the participant faced with the low level of social capital of Turkish society. According to the interview made by Ayşenur Afyon (May 2008) he pointed out that:

“All the doors I knocked were closed to my face. There was no information, data, source or respondent on the official channels. There are no associations or organizations want to break his comfort. Rehabilitation centers or academics were not accustomed to anyone except them create solutions. I always have to come back from these doors. Again and again.” (Source: http://www.dezavantaj.org/index.php?option=com_content&view=article&id=41:alternatif-yaam-dernei-kurucu-bakan-ercan-tatal-roeportaj-&catid=15:roeportaj).

“In spite of the barriers of economic difficulties, resistances and oppositions, in 2002, with the support of a few business men, the first Alternative Camp was opened in Bodrum.”

The participant believes that social entrepreneurs are the leaders who are a few steps ahead from ordinary citizens. They are alone and must create their innovative solutions:

“I had to draw my own roadmap...And so far at the beginning I realized that I had to take steps which I believe in myself and able to keep on taking steps when I will stay alone. I am still doing like that. I visited associations, municipal corporations, and rehabilitation centers and when no one attempted to make collaboration and working together, I had to form my own association.”

“Very pragmatist... includes no creativity, no vision, no strategic aim and etc. It is an assumption builds on taking guarantee. A civil servant or a manager may give importance to the support he assumes to take when make a decision... When you understand that you can take the support you need, you take the road and 2 weeks later the supporter decides to give up... What will happen? In fact this also happened...keep going to happen. I can give several examples. The idea social entrepreneur asserts, the steps he/she want to take are also exceeding the capacity of individuals and organizations. If your personal advancement is not ready to be alone for some time, the car you get in always runs idle and cannot go a step further.”

The most important thing in this case, the participant knows the vital role of being sustainable in social entrepreneurship. To gain an institutional structure, he analyzed the stakeholders and built his network according to his projects or activities.

“It is very important to foresee that your project is feasible, it exists in developed countries, I thought that it would be too complicated in our country. It cannot be solved with classical methods; Turkey has socio-economic conditions of its own...” “Your project must be turned into a corporate structure, it is very important for sustainability to have a strategic plan and a corporate roof...” “Continuously renewed needs require that you are dynamic...” “Instead of purchasing service we have developed a finance model where you produce service, the largest obstacle in the budget consists of personnel expenses. It forms 60% of the budget, as our staff works on a voluntary basis we have thus settled the 60%, while in the remaining 40%, local power and resources have been used. We analyzed local dynamics. Instead of using the private sector as a temporary sponsor, we have made it an active part of the project. They have initially seen it as a social responsibility activity, but later, as they believed in the project, they became participant to the project. We included the local actors of the area to which the project activities are related. The Neighbourhood chiefs, District health Institutions, Municipality, District Governor, Provincial Governorship, Police Forces, in Dreams Academy UNDP and State Planning Organization have helped to make the project feasible”.

In this study, different from the study of Mair and Noboa (2005), but similar to the study of Krueger (2000) , it was observed that self- efficacy affects the perception of feasibility:

“Even if I had received no support, if everyone were against me, I would still be doing the same work...”. “you first ask whether he or she can do sports, then whether he or she can dive in Turkey, do paragliding, join the federation, the Olympic games and thus create projects aimed at your target. You ask tens of questions to yourself, here accumulation of knowledge –experience is very important...”. “It can be done, because I can find clever methods, because I exist”.

Antecedents of Perceptions of Desirability

In social entrepreneurship, differently from the traditional entrepreneurship, the desirability perception is created as soon as the opportunity is perceived by the individual. The perception of desirability does not occur after personal preferences or social norms as in the traditional entrepreneurship (Mair and Noboa, 2005: 10-11). In social entrepreneurship, differently from traditional entrepreneurship, a possible reason for the social norms to lose the effect they have on the entrepreneurship is that the social need targeted in the social entrepreneurship is already known and shared by a large segment of the society (Murphy and Coombes, 2009: 333).

In this study too, it has been determined that social norms do not have any effect on desirability. Like in the study of Mair and Noboa (2005) the individuals choosing a career as soon as the entrepreneurship opportunity is perceived and having an experience enabling to perceive the opportunity constitute the entrepreneurial intention. As soon as the opportunity is perceived, a selection is made regarding the individual’s life or career:

“I was not thinking about returning to Turkey, I had other plans, but suddenly a target or mission to change my whole life was the case. I said I shall go and fight with my own methods until the issues related to disabled persons shall be solved in Turkey and I chose my way. The meaning of life changes in the lives of people at certain periods, you set new goals”.

In setting this goal or Tatal’s undertaking such a mission, some events or experiences have been effective. Tatal’s going to Germany for a second University education and seeing how active disabled people were there in every area of life have formed the basis of his social entrepreneurship intention. Being in Germany and receiving a University education where he could learn various languages enabled him to travel to different countries, to follow developments related to disabled persons throughout the world and to create the perception of desirability related to entrepreneurial behaviour. He stated that:

“A sterile environment existed in Germany, the social service system is very strong, the infrastructure is very sound, all citizens are active, as an individual you have quality living time left, the rights are very clear...”. “I have made researches, I have seen that it is feasible in Europe, I thought that it would not be too complicate to implement my idea after all...”

One of the most interesting finding of this study which is also parallel to Mair and Noboa’s (2005) finding is individual consequences of entrepreneurial behaviour is not a valid antecedent in social entrepreneurship intention. Traditional entrepreneurship literature points out that perception of desirability is the result of evaluating the effects of entrepreneurship positive or negative (Krueger, 1993, 2000). Social entrepreneurs do not think or evaluate their gains or losses at the end of the entrepreneurial behaviour. They are social mission driven and personal needs or desires are not their main concern. In one of the participant’s interview with Ayşenur Afyon (May, 2008), he stated that:

“There is no place for personal expectations of the people who are the initiatory of the social change. Because the real happiness for them is to expand the numbers of people they walk together in their joint journey.” (Source: http://www.dezavantaj.org/index.php?option=com_content&view=article&id=41:alternatif-yaam-dernei-kurucu-bakan-ercan-tatal-roeportaj-&catid=15:roeportaj).

CONCLUSION

The case study of Ercan Tatal reveals that like traditional ones, social entrepreneurs’ deciding to create a venture is subject to intentions. Propensity to act, perceptions of feasibility and perceptions of desirability are three variables of intentions. However, the findings of this paper suggest that the path through which these variables develop may differ.

First, prior researches point out that quality and quantity of prior entrepreneurial experiences affect the decision of entrepreneurship creation (Kruger, 1993, 2000). On the other hand, Mair and Noboa (2005) implied that social sentiments, regardless of prior entrepreneurial experience, direct social entrepreneurs to social issues. In this study, parallel to Mair and Noboa's study (2005), social sentiments influence the decision to create a social venture. Mair and Noboa (2005) revealed social sentiments originate from a key relationship with someone or something, and predispositional traits as empathy and moral judgement. This study signals culture and values form the social sentiments of social entrepreneur. This differentiation may be explained from the perspective of Turkish collectivist culture. Turkey has a relatively collectivist culture (Trompenaars and Hampden-Tuner, 1998; Kabasakal and Bodur, 1998) where values and family relationships play a vital role on the identity and worldview of individuals. Besides close relationships, empathy and feelings of responsibility are the traits that form social sentiments.

Second, previous studies signal that traditional entrepreneurs desire to create a venture after evaluating personal expectations and social norms. This study has similar findings with Mair and Noboa's study (2005), which means that when entrepreneurs recognize an opportunity, they constitute a desire to launch the opportunity.

Third, according to the entrepreneurship literature, perceptions of feasibility originate from self-efficacy and collective efficacy. Mair and Noboa (2005) points out after securing individual and organizational support, social entrepreneurs perceive the entrepreneurial behaviour as feasible. On the contrary, in this case, the participant tried to build relationship with organizations, but unfortunately, he cannot be able to get the support. Regardless of organizational support, individual support from family and close friends helped the participant to perceive the entrepreneurial behaviour as feasible. This finding may be linked to Turkish culture again. Turkey is identified as "society with low synergy, with many in-groups and intergroup conflicts". Ingroups, consist of primary relationships, tend to keep and maintain relationships within their closed networks and tend to see the others as strangers (Sargut, 2001). These qualifications are the barriers for generalized trust and high social capital in society. According to the study of 600 academics from different universities in Turkey has revealed that generalized trust is so low (10 %) and social capital profile of academics indicates closed, small network among academics (Özdemir, 2007).

Fourth, the finding of this study suggests that action-oriented traits and motivation originate willpower which manifests itself in propensity to act. Motivation sources are totally different from traditional entrepreneurs. Instead of "being independent", or "financial gains", social entrepreneurs are social mission driven. Risk taking, being patient and strong, being contentious are the salient action oriented traits encountered in this case.

To sum up, it is possible to argue that social entrepreneurship places in a different context of entrepreneurship literature. More related case studies enable the researchers to discuss more robust theory.

LIMITATIONS OF THE STUDY

The salient limitation of this study is obviously to focus on one social entrepreneur. Generalization of the findings is not suitable. Another limitation is the events Tural (the participant) referred occurred some years ago. However, multiple sources of data collection (from prior interviews on the internet and from one actual interview about a current activity of the social entrepreneurship project) can ensure the reliability and validity of the study.

A.Zafer ACAR

Okan University

ABSTRACT

Globalization is forcing family-owned companies need to be more flexible and faster organization structures to respond effectively to the customers' growing various types needs on the certain line of producing high quality goods and services these days. With the start of a new paradigm era in strategic management field, family-owned firms began to choose different tools to maximize their sustainable performance against rivals. These tools include special strategic orientations including learning, entrepreneurship and innovation implications. Our study tries to explore the effects of strategic orientations implications into firm performance and their effects on growth and financial performance in Turkish family-owned companies.

Key Words: *Strategic orientations, family owned firms, firm performance, empirical study*

INTRODUCTION

Strategic management is the conduct of drafting, implementing and evaluating cross-functional decisions that will enable an organization to achieve its long-term objectives. It is a level of managerial activity under setting goals and over tactics including some special tools like strategic orientations. These orientations involve both strategy formation called content and also strategy implementation called process (David, 1989; Chaffee, 1985). During the last decades, strategic orientations in family owned firms have received increased attention among scholars. The heart of the strategic management process is to achieve the performance outcomes that allow firms, including family-influenced firms, to be competitive over time (Habbershon, et al., 2003; Pieper & Klein, 2007). Family businesses significantly affect to economy and the social life of a nation. The typical family business has been characterized as an organizational controlled and usually managed by multiple family members In general, management structure in the family business will determined by the top level manager. Usually at least two generations of family are found in corporate governance. In the definition of the family company; spouse, siblings, mother / father and child may enter the partnership of the management board or support the capital as a shareholder (Shanker & Astrachan 1996; Lunsber 1999). Recent researches indicates that companies achieve their aims easily which are in family firm structure. Family firms often have concentrated ownership and / or voting rights that might enhance performance (Miller et.al., 2007). Family businesses may offer particularly appealing circumstances for studying certain kinds of organizational phenomena (Chrisman et al., 2003). The aim of this article is to develop a model of family business that accounts for the unique characteristics of family business, specify the diversity of orientation forms, and addresses the dynamics among family-owned business firm performance. It is hoped that this special research will contribute to filling this gap.

LITERATURE REVIEW

Family-Owned Firms

The literature on family business is wide-ranging and it is difficult to find consensus on the exact definition of a family firm. However, the typical family business has been characterized as an organization controlled and usually managed by multiple family members (Shanker & Astrachan, 1996; Lansberg, 1999), often from multiple generations (Anderson & Reeb, 2003; Gomez-Mejia et al., in press). Family firms can be viewed as a contextual hybrid—a unique combination of two sets of rules, values, and expectations: the family's and the business's (Flemons & Cole, 1992; Gersick et al, 1997;). Family firms share certain characteristics that render

them unique in terms of patterns of ownership, governance, and succession (Chrisman *et al* 1999; Steier, 2003). A family business is a business in which one or more members of one or more families have a significant ownership interest and significant commitments toward the business' overall well-being. In some countries, many of the largest publicly listed firms are family-owned. A firm is said to be family-owned if a person is the controlling shareholder; that is, a person (rather than a state, corporation, management trust, or mutual fund) can garner enough shares to assure at least 20% of the voting rights and the highest percentage of voting rights in comparison to other shareholders (Chakrabarty, 2009).

For instance, owner-families share the desire for ownership control and the continuity of family involvement in the firm. To fully appreciate these special characteristics, it is crucial to focus on family firms where the family is likely to have considerable impact on entrepreneurial activities. We therefore define family firms as firms where one family group controls the company through a clear majority of the ordinary voting shares, the family is represented on the management team, and the leading representative of the family perceives the business to be a family firm (Naldi, *et.al.*, 2007). Most of the research projects studying goals in family firms compare the goals of these types of firms to those of non-family firms in order to detect significant differences. Results in relation to this subject are mixed. In family firms, goals related to family roles tend to be far more important than the traditional firm-value maximization goal (Sharma *et al.*, 1997). Among those important family roles are survival, financial independence, family harmony and family employment (Trostel & Nichols, 1982; Donckels & Frolich, 1991; Westhead, 1997). Moreover, family firms are described as being more risk-averse and less growth-oriented. They focus less on technology, creativity and innovation (Donckels & Frölich, 1991). However, most of the family firm managers believe that they are operating in a hostile external environment (Westhead, 1997).

In the literature and organizational context, innovation may be linked to performance and growth through improvements in efficiency, productivity, quality, competitive positioning, market share, etc. All organizations can innovate, including for example hospitals, universities, and local governments. A convenient definition of innovation from an organizational perspective is given by Luecke and Katz (2003), who wrote: "Innovation is generally understood as the successful introduction of a new thing or method; innovation is the embodiment, combination, or synthesis of knowledge in original, relevant, valued new products, processes, or services." Discussion of the innovation philosophy generally refers to issues such as new products, technology, and discontinuous improvement, while discussion of the marketing philosophy generally concerns matters such as customer service, customer satisfaction and customer focus. The tendency to see these philosophies as mutually exclusive is reinforced by the specialization of academics and consultants in one or the other area. Some scholars, however, have paid attention to the need to integrate technology and market (Berthon *et al*, 2004).

An innovation-oriented knowledge structure is a set of organization-wide shared beliefs and understandings that guide and direct "all organizational strategies and actions, including those embedded in the formal and informal systems, behaviors, competencies, and processes of the firm" (Simpson *et al.*, 2006). Most prior innovation research has focused on factors that affect innovations, primarily rate, speed and benefits. More recent research has examined innovation as a system-based, firm-wide orientation toward innovation. Along with this broader perspective comes a need for understanding outcomes of the orientation, both positive and negative. The innovation literature to date has largely relied on a handful of specific, readily calculated outcomes of innovation, with few studies examining the link between a more comprehensive innovation orientation and its organizational effects (Totterdell *et al.*, 2002). Though no known studies have empirically examined innovation orientation effects on consumers, Schlegelmilch *et al.* (2003) make a compelling argument that a strategic innovation will yield 'proactive value creation' and Totterdell *et al.* (2002) find a relationship between novelty and greater perceived benefits to customers.

With another orientation entrepreneurial activities in family firms do involve taking risks, but to a lesser extent than in non-family firms. If family firms generally are characterized by less internal and external formal monitoring, risk taking in family firms is likely to mean that these family firms make decision that are less bias on closely calculated risks; less grounded in a systematic, unbiased way; and with less incorporation of outsiders' perspectives and opinions (Schulze *et al*, 2001; Naldi *et al*, 2007). In many global markets, speed of technological change is rapid. Especially family firm-based companies have to adopt this turbulent environment as an organic organization. Innovation-oriented firm focuses on developing key organizational competencies in resource allocation, technology, employees, operations and markets. Most prior innovation research has focused on factors that affect innovations, primarily rate, speed and benefits (Simpson, *et al.*, 2006).

Organizations that are competent learners are called "learning organizations". Garvin (1993) defined a learning organization as "an organization skilled at creating, acquiring, and transferring knowledge, and at modifying its

behavior to reflect new knowledge and insights". Most scholars' view organizational learning as a process, a cognitive enterprise, that unfolds over time, but they differ on other important matters. Some believe that behavioral change is required for learning others insist that new ways of thinking are enough Learning organization, an organization's implicit or explicit understanding of how things are done is often referred to as its theory in use. Organizational learning occurs when members of the organization act as learning agents for the organization, responding to changes in the internal and external environments of the organization by detecting and correcting errors in organizational theory in use, and embedding the results of their inquiry in private images and shared maps of organization. There has been a new perspective for significantly increasing organizational learning by providing a greater understanding of related and required concepts of change, learning, collaborative work systems, teams, synergy and authentic teams, co-mentoring relationships and learning teams, and their implementation in organizations. Learning orientation has four sub-dimensions in own structure. Team orientation is about the group members and their success as working together. All members should complement each other and must serve the same purpose. System orientation means all departments and employees create an effective system with the high level of rationalizing. Learning sub-dimension shows the degree of adapting to new circumstances and reaching success. At last, shared memory is the key element of organizational culture. All employees have a common history and their values are similar. These all sub-dimensions are about the increasing of firm efficiency when to be quickly adapted to the environment is necessary. Having the knowledge to better link resources to customer needs and increasing the pace of change within the organization (Pedler et al., 1997; Baker *et al*, 2007).

Each strategic orientation has various effects on growth and profitability performance in family based businesses. In various studies, the positive way strong relationships were found between the active return rate, growth in sales, new product success, increasing market share and profitability performance indicators (Narver & Slater, 1990). In this research, family business' financial and growth performance are tried to analyze by managers or chiefs' perspectives. Firm performance is connected to effective use of performance measures in the family firm.

METHOD

Conceptual Framework

The purpose of this empirical study is to evaluate the effects of strategic orientations levels on firm performance in family firms. In this connection, the hypothesis which we use in our study is improved by scientific literature and created a model that explains the causes of orientations over firm's qualitative and quantitative performance. If the family owned firms restructure their organizations with strategic orientations; firms have the potential to gain superior financial and growth performance. We expect a direct relationship between strategic orientations and firm's performance; with support of the modern literature, these hypotheses are expanded :

H1: There is a positive, significant and direct relationship between innovation orientation and business performance

H2: There is a positive, significant and direct relationship between entrepreneurship orientation and business performance

H3: There is a positive, significant and direct relationship between learning orientation and business performance

Sampling and Data Collecting

The aim of this study is to provide an explanation for the contradictory evidence in the literature regarding the performance of Turkish family-owned firms. For this purpose, it's evaluated the effects of strategic orientations levels on firm performance in family firms. In order to empirically investigate the hypothesis of the study, family based firms are chosen in Istanbul area. To collect the data some tools as e-mail, letter and face to face interviews are used. Minimum two members from each firm was claimed to participate the research survey. Total of 280 questionnaires have returned among over 130 firms. The descriptive statistics of the respondents are shown in Table 1. All items were measured on a seven point Likert-type scale where 1= strongly disagree and 7= strongly agree. Data is evaluated by SPSS 16.0 statistical program. The relationships between the all variables are tested using factor, reliability, correlation and regression analyses.

Table-1: Descriptive Statistics of the Sample

Gender	Frequency	Percent	Hierarchical Status	Frequency	Percent
Male	210	75	Top Level Man. / Owner	38	13,6
Female	70	25	Middle Level Man.	96	34,3
Total	280	100	Bottom Level Manager	146	52,1
			Total	280	100
Education	Frequency	Percent	Tenure	Frequency	Percent
Primary School	7	2,5	1-5 years	177	63,2
High School	39	13,9	6-10 years	70	25
Vocational School	19	6,8	11-20 years	27	9,6
Graduate	144	51,4	20+ years	6	2,1
Master / PhD	71	25,3			

Measures

All constructs were measured with existed scales from previous literature. The first of these scales is the entrepreneurship orientation. This instrument designed by Li *et al.* (2007), was used to measure the construct of entrepreneurship orientation level of the firms. Second one is innovation orientation. This instrument is modified by Hurley & Hult (2004) and Gatignon & Xuereb (1997). The other scale is learning orientation used by Hult *et al* in 2003. At last, firm's performance scales in the questionnaire are taken from recent management studies (Baker & Sinkula, 1999; Lynch *et al*, 2000; Zahra *et al.*, 2002). These items were measured on a seven point Likert-type scale where 1= strongly disagree and 7= strongly agree. All questions are tested for linguistic and meaning errors and it's controlled by Brislin's (1970) back-translate method for the translation of questionnaires.

Scale Validity and Reliability

In our study, all items and components are tested by comprehensive reliability analyses. As a beginning, it's analyzed the alpha reliability test (Croanbach); all the scale reliability coefficient has been determined a satisfactory level such that $\alpha = ,953$; this value is quite over the recommended 0.70 threshold (Nunnally 1978; Nunnally, and Bernstein 1994). The variables those exist in the scale are tested individually; some items are removed before the analyses process (e5 from entrepreneurship orientation, i7, i9 and i10 from innovation orientation, p3 and p9 from performance). Later on this process, the cumulative reliability coefficient value increased to $\alpha = ,964$. This level is higher than the critical threshold value (0.700) that generally accepted in the literature. The scale structure that was obtained with factor analysis was evaluated with the Kolmogorov-Smirnov test, and it was seen that *t* values of all of the variables were at the sufficient level for our sample that prove that the distribution of the data is statistically normal. At next step, it's examined the "corrected inter-item correlations" and "squared multiple correlations" in the item analysis stage. It was found that, except two items all of the resulting values were 0.500 and above. In pursuit of reliability and correlation analyze, it is determined the factor structures by basic component analyze. During this process, Entrepreneurship and innovation orientations constituted only one component. Learning orientation disintegrated as four components (team orientation, system orientation, learning orientation and shared memory orientation).

Table-2: Factor Analyses

Variables	Number of components	α	Total Explained Variance
Entrepreneurship Orientation	1	0,864	% 71,301
Innovation Orientation	1	0,910	% 65,696
Learning Orientation	4	0,967	% 81,779
Business Performance	2	0,930	% 73,219

Test of the Research Questions

After testing reliability and the factorial structure, correlation analysis of the research questions was begun with the purpose of examining the mutual relationship among the factors considered in our research model. It was determined that the four independent latent variables had mutually positive relationships ($\rho < 0.001$) with each other and with business performance components (see Table 3).

Table -3: Correlation Matrix

	Mean	St.D.	1	2	3	4	5	6	7	8
Entrepreneur	4,823	1,483	1,000							
Innovation	5,157	1,328	,756**	1,000						
Team	5,248	1,546	,394**	,418**	1,000

$p^* < 0,05$; $p^{**} < 0,01$

As shown on the correlation table, all sub-factors of the learning orientation have not a strength mutual relationship between firm performances. Especially the learning and shared memory sub-factors of the learning orientation have no significant effect on business performance of the firm. The Pearson correlation coefficient indicates the strength of a linear relationship between two variables, but its value generally does not completely characterize their relationship. *Because of this, after reveal of the mutual relations of examining factors in the model, the linear relationship was tested with regression analysis. According to the analyses' results (see Table 4):*

- ✓ *Entrepreneurship* (ρ : 0,182;) *and innovation* (ρ : 0,225) *orientations* directly, positively and significantly affect to the *firm's financial (a) performance*. *So, H1a and H2a hypothesis are supported.* (R^2 : ,130; F :6,768). Consistent with our hypotheses, this construct that includes these orientations is also valid and relevant in the important organizational context of family owned firms.
- ✓ *Entrepreneurship* (ρ : 0,231) *and innovation* (ρ : 0,341) *orientations* directly, positively and significantly affect to the *firm's growth (b) performance*. *H1b and H2b hypothesis are supported.* (R^2 : ,248; F :14,950).
- ✓ *Learning orientation significantly impact reversely on financial and growth performance. This situation is not valuable for our empirical study. Because of these findings, an H3a and H3b hypotheses are not supported.*

Table -4: The Effects of Strategic Orientations on Business Performance

	Model 1			Model 2		
	ρ	t	P	ρ	T	p
Entrepre.	,182	2,080	,038	,231	2,831	,005
Innovation	,225	2,488	,013	,341	4,043	,000
Team	,053	,539	,591	,023	,239	,804
System	,008	,088	,930	-,035	-,411	,682
Learning	-,048	-,527	,598	,014	,166	,868
Shared Memories	-,145	-1,485	,139	-,128	-1,411	,159
	Dependent variable: Financial performance $R^2=,130$ $F=6,768$; $p < 0,001$			Dependent variable: Growth performance $R^2=,248$ $F=14,950$; $p < 0,001$		

Depending to the results given in Table 4, we deduced that both entrepreneurship and innovation orientations have statistically significant direct positive effects on business performance with all dimensions of the firm. ***On the other hand, there is no significant prove of the affects of learning orientation with all sub dimensions on the firm performance. There is no correlation between learning orientations and firm performance. In other words, the raising the values of independent variables in the innovation and entrepreneurship make the firm***

performance increased. There is a linear relationship between the entrepreneurship and performance; innovation and performance. As a further invention, the high correlation between this two independent variables shows that this two orientations using together in the family owned firms. We also support these findings:

- ✓ Although the learning orientation does not affect firm performance, two sub factors of learning orientations have a positive and significant effect on entrepreneurship and innovation orientation. Hence this situation, learning orientation may affect the family-owned firm’s growth and financial performance indirectly. Especially the sub factors named team and system orientation positively and significantly affect the entrepreneurship and innovation orientations which exist in learning orientation’s structure model. These findings also appropriate with the correlation analysis results. recorded as an unexpected discovery in our research (see table 5).

Table -5: The Effects Learning Orientation’s sub factors on Entrepreneurship and Innovation Orientations

Sub Dimensions	Model 3			Model 4		
	β	t	p	β	t	p
Team	,162	2,011	,034	,138	2,488	,013
System	,266	3,136	,002	,392	4,784	,000
Learning	,037	,429	,668	-,095	-1,121	,263
Shared Memories	,020	,217	,828	,085	,941	,347
	Dependent variable: Entrepreneurship Orient. $R^2=,196$; $F=16,701$; $p<0,001$			Dependent variable: Innovation Orient. $R^2=,248$; $F=22,561$; $p<0,001$		

- ✓ With this findings we can assume that employers of all levels (bottom to top) including stakeholders are they key facts for implementing innovation and entrepreneurship orientations. As a sub factor of learning orientation, system orientation is about the connection between all departments inside a firm. It’s related to added value of every employers and strategic business unit; system orientation is closely influenced into the entrepreneurship and innovation orientation. Another sub factor is team orientation explains the system as a firm that enhancing individual growth as well as organizational growth. There is a strong believe to enhance coordination and communications between function departments.

Figure-1: The final model of the research

DISCUSSION

Conclusion

This study focuses on the effect of strategic orientations on the family based firms’ performance. Our research findings provide some valuable notions. The results of our empirical study show that some strategic orientations including innovation and entrepreneurship are implementing by Turkish family firms to achieve sustainable

competitive advantage in turbulent markets. Effects of strategic orientations evolve over time and that it is the implementation of the strategy which is truly important, rather than the classification of the strategic type. It may be possible for other strategic types to improve performance by altering their strategy profiles to be more aggressive, more focused or time-consuming when implementing decisions. In this research, entrepreneurship and innovation orientations are connected to firm's performance's elements as profitability, revenues before taxes, growth rate in the market, employee number, new customers, innovative products or services and financial success. For instance, the success of innovative output affects to firm's competitive advantage in a turbulent market. The organizational learning is a key determinant of manufacturing without errors and low costs. Several managers change their management comprehension for creating a customer focused, market-driven strategies. Our finding shows that the firms which use any strategic orientation are capable to be the better performers in many markets. That's what the reason of some family firms are successful. In the strategic management literature, as well as there are some researches who claim all strategic orientations effect positively on firm performance (Hult vd., 2003; Olson et al., 2004), there are some dissidents (Manu and Sriram, 1996; Noble et al., 2002). Findings show that there is a meaningful and positive relationship between the innovation, entrepreneurship and firm performance. This finding can be evaluated as Turkish family firms follow and integrate the modern management theories and global trends into their structure. These orientations have got same character; the high correlation between these two variables may be the evidence of it. They are both being used for competitive advantages for Turkish family owned firms. The managers emphasize the innovation and entrepreneurship orientations to protect firm's position and possess stronger composition than rivals. Our results suggest that innovation orientation is also shown the faith to new products and services that interests of companies; entrepreneurship orientation leads various abilities including fast fight back and leading the new services and products in the market. The results indicate that the association between strategic orientation and performance varies depending on the type of orientation used. Managers need to be able to assess the orientation of their organizations in this regard, and to consider carefully whether their assessment of the situation was that intended, and whether it is appropriate to the business environment (Berthon, et.al., 2004). our study suggests that an entrepreneurship orientation is beneficial for improvement of new product development activities in a transitional economy; top managers of firms should incline toward choosing entrepreneurship as their main strategic orientation. As a general thing, our results call into question the usefulness of learning orientations. There's no significant finding that these orientations with all dimensions affect to firm's performance. By the way, learning orientations' some sub-dimensions effect the innovation and entrepreneurship orientations and their implications for internal environment of the company and making a definitive system. This is also indirectly affects performance. Once again, our empirical study is an important step in validating the relationship between strategic orientations and firm performance. Also it provides that Turkish family firms are tend to use modern management theories in their structural organization. In the findings in replications of our research support our findings, the message to the family firm managers is clear. In the competitive market, family firms must evaluate their performance and choose a suitable strategic orientation to achieve competitive advantage strategy. It's a new way to achieve to the success for the family owned firms. The using of these orientations helps to increase family-owned business' profitability and growth rate in turbulent markets. This conclusion has implications for managers and management professors. We recommend the following:

- The examined orientations must be used together as a combination of success. Using the innovation and entrepreneurship orientations compatible with each other can be considered as a proof of this.
- It's recommended that to specify the role of learning orientations which don't directly effect on to other orientations to the academicians working on this issue. As a special finding, we found a strong relationship both system and team orientation affect the entrepreneurship and innovation orientation. A model which is designed to evaluate the sub dimensions of learning orientations' effects on other strategic orientations can be useful for future researches.
- The managers can use both the innovation and entrepreneurship orientations to improve efficiency of the family-owned firms. New product success rate, degree of product differentiation, first to market with new applications, sales growth and customer satisfaction are some criterions to reach the firm's vision by using strategic orientations (Lee and Tsai, 2005).
- Family-owned firm managers should examine the other orientations that including customer, relationship and market as a new technique to achieve sustainable performance.

Limitations and future research directions

Our empirical study has several limitations that should be kept in mind. Family firms differ on a range of dimensions and it is possible that different types of family firms show different patterns in terms of all orientations. Our data consisted of Turkish family firms and inference to other countries should be made with caution. National culture and tradition may influence especially entrepreneurship and learning orientation, which

has implications for the generalization of our findings. In contrast, responses from more individuals within the firms would have given a more complete picture of the firm's situation and behavior. Also our contributions to family business research open up possibilities for future researches.

CAN INNOVATION BE A REASON FOR A LONG TERM SURVIVAL?

Bige Aşkun and Refika Bakoğlu

Marmara University, Turkey

ABSTRACT

The purpose of the present study is to explore the innovative characteristics of firms surviving through the ages by using content analysis of their websites. The article proceeds in the following manner: First, we briefly review the literature. Second, we explore innovative characteristics of firms surviving through the ages by using content analysis method. We will be analyzing all firms that are listed in the www.henokiens.com. Henokiens is an association that accepts firms which are at least 200 years of age. The 41 firms from different nationalities were analyzed by content. The validity and the reliability reports and procedures are given. Finally, we provide the research findings and discuss their managerial and theoretical implications.

Keywords : Innovation, Survival, Firms Surviving through the ages, Innovative characteristics

INTRODUCTION

There are different approaches for explaining survival of firms like industrial economics, organizational ecology and resource based view. In industrial economics perspective; structural factors play vital role such as size and age of a firm, and survival also depends on the outcome of a market selection (Cefis and Marsili, 2005: 1168). Cefis and Marsili (2006) analyzed the effects of innovation on the survival probability of manufacturing firms, conditional on firm attributes such as age and size and sector, and found that innovation matters for increasing the survival probability of firms. The role of market selection is seen vital because of imperfect information presence by Javanovic (1982) and of uncertainty due to research and development efforts by Ericson and Pakes (1995). These two studies also indicate survival probability increases with age and size. Similarly, there are other studies that exhibit positive linkage between firm survival and its size and age (Geroski, 1995; Sutton, 1997; Caves, 1998).

This paper aims to achieve by reviewing the literature then make a research about the concept and types of innovation for analyzing to find that whether innovation be a reason for a long term survival or not.

LITERATURE REVIEW

When overviewing all the studies, survival probability related to age and size means experiences increases the chance of survival over the lifecycle of a firm. In the perspective of industrial economics, firm survival depends also the level of intangible assets and the quality of capital stock. For instance, technological capacity measured by research and development and patent statistics (Hall, 1987), and advanced manufacturing technologies (Doms et al., 1995; Colombo and Delmastro, 2001) have higher chance of survival. The other important determinants of survival at industry level according to the industrial economics are the characteristics of demand, such as market size and growth rates (Mata and Portugal, 1994). These studies clearly observe linkage between innovation and survival in industrial economics perspective.

The studies bringing forward connection between survival and age and size conditionally on age, are also in line with the organizational ecology. Organizational ecology highlights the vital role of organizational strategies, and environmental conditions like the rate of organizational change has effect on organizational strategies (Hannan and Freeman 1997). Separate organizations as specialist and generalist occupying a narrow, the first, and a

broad, the second, niche in their market for being able to survive. According to the organizational ecology perspective survival is more related to the density of the population at the time of founding and throughout the life period of an organization meaning that a firm entering crowded field would have less chance than a firm entering to less competitive area (Carrol and Hannan, 1989; Hannan and Freeman, 1988). Mitchell (1991) stresses the importance of entry timing for firm survival.

Another recent perspective on the firm survival is the resource-based view that emphasizes how firm's stock of tangible and intangible assets including employee's individual skills, and competencies representing firm's collective capacity for undertaking a specific type of activity can develop organizational capabilities and enhance organizational performance. Those working within the "resource based view of the firm" area have been inspired by the work of Selznick (1957) and Penrose (1959), and have suggested that inimitable firm heterogeneity, or the possession of unique "competencies" or "capabilities" may be an important source of strategic advantage (Lippman and Rumelt, 1982; Wernerfelt, 1984; Barney, 1986; Rumelt, 1991; Peteraf, 1993; Amit and Schoemaker, 1993). While resources are the essential building blocks, whether an organization gains a competitive advantage and thereby achieves above-normal returns will be a function of the strategy used to leverage those resources to pursue environmental opportunities (Hofer and Schendel, 1978). For an organizational "competence" to be a source of competitive advantage it must meet three conditions: it must be heterogeneously distributed within an industry, it must be impossible to buy or sell in the available factor markets at less than its true marginal value, and it must be difficult or costly to replicate (Barney, 1986; Wernerfelt, 1986; Peteraf, 1993). Liao, Kickul and Ma (2009) indicate that both the firm's resource stock and integrative capabilities, ability to recognize opportunities as well as to configure and deploy resources, affect its innovation. Additionally, they also found that the relationship between resource stock and innovation is mediated by integrative capabilities. Lieberman and Montgomery (1998) suggested that first mover advantage and resource based view are related conceptual frameworks that can benefit from closer linkage.

According to the resource based view strategies should not be build around external opportunities, but around a company's strengths, on the contrary to the industrial economics approach. Development of difficult to imitate competencies and/or on the acquisition of exclusive assets are the main strategic focus in order to gain sustainable competitive advantage. This unique resource base should be used as the starting point of strategy formation with respect to resource based view, which is the opposite of industrial economics and organizational ecology approaches. In order to the resource based view, markets should subsequently be chosen, adapted or created to exploit these specific strengths, and once a company developed a distinctive ability, it is usually difficult for competitors to imitate, and while rivals try to catch up, a company with an initial lead can try to upgrade its competencies in the race to stay ahead (Collis and Montgomery, 1995; Barney, 1991). As even Porter (1980), being accepted the guru of the industrial economics theory, advocates that a competitive advantage could be sustainable, if it cannot be copied or eroded by the actions of rivals, and is not made redundant by environment developments. As industrial economics and organizational ecology approaches heavily relies on the market dominance and market/industry position, survival of the firm may not step on the solid ground by using these approaches. Just as Hitt, Ireland and Hoskisson asserts that conventional sources of competitive advantage such as economies of scale and huge advertising budgets, are not as effective as they once were (Hitt, Ireland and Hoskisson, 2005). Since after 1990's, resource based view have changed our mindset of competitive advantage, and resource based view takes innovation as a never ending process. We can summarize the differences between industrial economics and organizational ecology approaches, as conventional competitive advantage, and resource based competitive advantage in the table below.

The role of innovation in influencing business performance and survival is widely accepted, but there is only limited evidence identifying any direct relationships between them (Bakoğlu and Aşkun, 2008) as it is indicated above. Although we have tried to make connections among innovation and different perspectives in management studies like industrial economics, organizational ecology and resource based view, we were not able to find as many study as it is expected. Cefis and Marsili (2005, 2006) also asserted that despite the role attributed to innovation in firm survival, there is little empirical evidence on the relationship between probability of survival and the innovative activities carried out within the firm. Similarly, we have found neither theoretical nor empirical study investigating directly the effect of innovation on firm's long lasting survival, and proving that survival of more than one century old firms may depends on their innovation capacity. On the contrary, some studies indicating family businesses are less likely than none family firms to pursue wealth maximization as their dominant objective (Sharma, Chrisman and Chua, 1997; Chrisman, Chua and Zahra, 2003; Sirmon and Hitt, 2003).

Table 1: Novelties on the concept of competitive advantage introduced by the resource based view

	Conventional Competitive Advantage	Resource Based Competitive Advantage
Primary Orientation and Emphasis in Competition	Product, Market, Industry	Resources, Capabilities, Competence, Business Process, Knowledge
Strategic focus	Market/Industry Position Dominance	Developing Resource Base Innovation, Distinctive Resources
Priority in Competition	Gaining Competitive Advantage	Gaining Sustainable Competitive Advantage
Innovation and Creativity	Attaining advantageous position Entering to profitable businesses Building up Mobility Barriers Enhancing Bargaining Power	Attaining distinctive resources, competence development and application for Changing the Rules of the Game Rapid competence development
Perspective in Strategy Formulation	Outside-in/ Strategic Adaptation	Inside-out/ Strategic Stretching
Starting Point	Market/ Industry Structure	Firm's Resource Infrastructure
Competitive Weapons in Business Level Strategy	Bargaining Power and Mobility Barriers	Superior Resources and Imitation Barriers
Main Emphasis on the Corporate Level Strategy	Diverse/unrelated business' portfolio/ Collection of shareholdings for profitability and cash flow allocation	Synergy among highly related businesses/value and synergy creation through shared competence-based (focused)
Approaches Towards Strategic Business Units and Their Coordination	Highly autonomous Loosely Coordinated	Highly Integrated Tightly Coordinated
Assumptions about Environment	Predictible, Slowly Changing	Unknown, Dynamic
Assumptions about Firms	Firms are actors which try to gain opportunities from their environment or/and enable themselves to catch this opportunities by attaining necessary resources.	Firms, and their resources and competencies are heterogeneous. Firms compete based on these distinctive resources.

Source: Bakoğlu, R. (2003) "Kaynak Bazlı Firma Teorisi Kapsamında Değişen Rekabet Avantajı Kavram ve Anlayışı", İ.Ü. İşletme Fakültesi Dergisi, 32(1), 65-76.

Only Koironen's article (2002) discusses firms over 100 years of age may still be active entrepreneurially in business due to their values and family characteristics, when doing literature search through the online databases. There are other studies that may be indirectly linked to this paper's purpose of searching for the linkage between firms' survival more than one century and innovation, like Jovanovic's (1982) theory of 'noisy selection', and Pakes and Ericson's model (1998) whose concerns are not the same as this paper. In Jovanovic's model, firm dynamics depend on the learning process that enables firms to discover and adapt to their particular level of efficiency, given the existence of asymmetries in efficiency and imperfect information. Over time, firms discover their levels of efficiency through operating in the industry. Ericson and Pakes (1995) extended Jovanovic's model to include the investments of individual firms on research and development. This model contrasts a process of 'active learning' to the process of 'passive learning' in Jovanovic's model, where firm efficiency levels are assumed to be constant over time (Pakes and Ericson, 1998). In Ericson and Pakes's model, firms explore the space of technological opportunities by actively investing in research and by doing so they improve their efficiency and profitability; and ultimately their chances of survival.

Although in literature, some of the studies of innovation take innovation as a basis for the survival and means of sustainable competitive advantage, none of the articles we found indicated that innovation is the reason for firms' long lasting survival. Our research question starts from this point; it would be interesting to explore whether the more than one century old firm' survival depends on innovation.

METHOD

The research is an exploratory qualitative research in its nature since the research objectives are not investigated much in the literature, and content analysis is chosen as a research method considering the objectives. Content analysis is a necessary tool in the study as purpose of the research is to explore whether the firms surviving through the ages sustain due to their innovative capacity. Our main question is that can one clearly observe that the firms surviving through the ages stress innovation on a verbal level by content analyzing their web sites. Content analysis is the only appropriate research method as the main purpose of the research is to what extent these ages firms differ from the rest on a "verbal level" not on the operational level assuming if they are the best they should give a sign of high level awareness on their websites even though all written material may represent ideals besides it would be almost impossible to enter to the 41 leading companies with the limited budget and time. The population of this study is composed of firms surviving through the ages of the global market. The 41 firms which survive through the ages will be content analyzed from the www.henokiens.com website. Each firm's "Home page" was accessed using this web address and www.google.com. After examining each firm's "Home page" to determine the presence or absence of innovation then clicked on the firm's web page and likewise examined it.

Content analysis was done by examining the Henokiens' web sites and each firm's own web pages. Each firm's own web page is read and taken notes in details by clicking on all the the headlines such as Company today, About Us, Group, expertise, press, profile of our firm, Distribution partners, News, Sustainability, investment service, products, communication, Funds Awards, Activities, General presentation, Historic, fabric procedure, the family, identity, resellers, images, Fleet, Galleries, Links, Contacts, Milestones, Contracts, Write house, Privacy, Help.

LIMITATIONS OF THE STUDY

Two limitations are present and need to be considered when interpreting the results of the research. First of all, the information and messages released online by organizations are one-sided declarations, and it is not guaranteed that they are applied and realized in the real life. This may limits the generalizability of the study. Taking into consideration this point, we limit our research with only the innovation concept.

Second limitation in this study is about the measurement of the information gathered. The "contents" of the online innovation concept provided and the "frequency" of the items are the most important information this study bases on. This type of evaluation may disregard the weight and importance of the information provided. Innovation concept was explored either Henokiens or Firm's web pages.

VALIDITY OF THE RESEARCH

To ensure validity of the research, semantic validity has been taken into account. In order to be done semantically valid study, each researcher independently and individually categorized the items of innovation concept, and the independent sorter examined the themes, made discussions and the themes have been placed under same categories with an agreement on a final categorization in the content analysis process.

POPULATION AND SAMPLING

The population of this study is composed of Henokiens which is an association of family and bicentenary companies, the Henokiens intend to enlarge their family circle. Today, there are 41 members: 15 Italian, 12 French, 3 German, 2 Dutch, 1 from Northern Ireland, 5 Japanese, 1 Belgian and 2 Swiss. According to

Henokiens Page; *In 1981, recognizing and co-opting each other, they formed a group, creating a restricted and rigorous international organization. Henokiens Association membership criteria are: company longevity – a minimum age of 200 years – and permanence – the family must be owner of the company or the majority share holder - one member of the founder must still manage the company or be a member of the board – and the company must be in good financial health. In addition, being modern is a final requirement. Created in 1981, the objective of the Association is the development of its membership throughout the world around a common philosophy: the value of the concept of the family company, real alternative to the multinationals. It is not a brotherhood, the sectors in which the members carry on their activities are in fact highly diversified: craft industries, trades, services, publishing, heavy industry. Nor is it a businesses club (certain firms may even be competitors). The Henokiens do not exchange services, they exchange only ideas”.*

Henokiens is chosen as population of this study since the aim of this study is to observe whether there is a linkage between long time survival and innovation. As members of Henokiens are at least more than two hundred years old, it will be interesting to discover whether innovation is one of the reasons why they survive many years. Surely the findings can not be generalized, and results can only be taken as first insights on the observed phenomena.

Researchers can only understand English, so the Henokiens whose have English web sites will be content analyzed. All the firms will be analyzed from general web sites of Henokiens if possible as the aim of the study is to discover Henokien’s survival and their stress to innovation as long time survival. Table 2, that composed of the Henokien’s Web site of <http://www.henokiens.com> and each firm’s individual web sites, shows general characteristics of the population. According to the Table 2, only 32 firms have English web sites, 2 firms’s web sites are in their original language, the rest of the firms’ have neither web sites nor web pages that can be read due to limited information or difficulties in open their pages. So we extracted 9 firms from the analysis.

As Table 2 indicates majority of the Henokiens are from Italy (36,59%), others from France (29,27%), from Japan (12,20%), and Germany (7,32). The rest of the 14.62 percentage is shared among Belgium, Ireland, Netherlands and Switzerland. Considering Japanese firms are only 12,20% of the whole population, it can be said that the Henokiens are mostly European, and Italian and French firms will dominate the findings of the study.

Japan	5	4	12,5
Netherlands	2	1	3,12
Switzerland	2	2	6,25
TOTAL	41	32	100

FINDINGS

Table 4 summarizes all the henokiens' characteristics in line with their sectors, foundation dates, ages and generations in order to understand general specification of the Henokiens. The youngest firm is 201 years old from France and the oldest one is 1293 years old from Japan. The generation of the firm varies from 6th to 46th. The sectors of the firms are all mature industries that some of them in the earlier stage of the globalization.

Table 4: General Characteristics of the Population: Sectors, Foundation Dates and Generation

Country	Name of the firm	Sector	Foundation Date/ Age	Age	Generation
	Fiedr. Schwarze	Alcohol drinks and liquor	1664	346	11th

When we analyze the Henokiens and the firms' Web page there are innovation categorization for each firms in these pages. They introduce some firm by stressing "the innovation concept and innovation type. We categorized innovation approaches of the Henokiens in the sample, and linkage each firms make with their survival by content analyzed in each firm's own web sites and Henokiens web page as in table 5. As it can be seen from Table 5, in 27 firms out of 41 in total, innovation concept was not stressed at the Henokiens web page. All the firms in the henokien's web sites were analyzed as it is in English in order to observe general attitude of all the firms towards innovation as this may give us an extra opportunity to observe whether innovation is vital for the Henokines. The findings are interesting as it is expected to see many firms, emphasizing innovation and its role for their very long term survival.

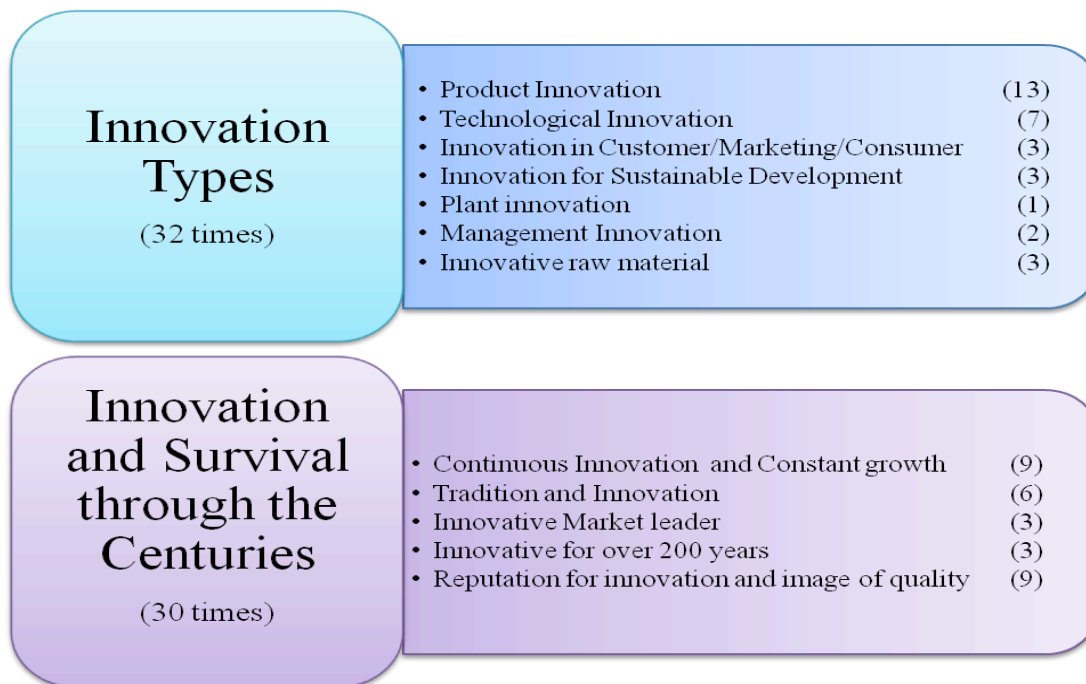

In Firm's own pages, innovation concept and its role for firm's survival are observed and categorized in table 5 below. 19 firms out of 32 firms in the sample stressed innovation concept, and importance of it. The most stressed type of innovation is product and technological innovation, as 20 times representing 62.5% of the whole sample. When considering the linkage between long term survival and innovation, only about 28% of the whole sample clearly stresses continuous innovation, and that is the most highlighted item.

Table 5: Innovation Categorization of the Firms in Web Pages

Innovation Types	Henokiens Web Page	Firm's Own Web page
	Frequency	Frequency
Continuous Innovation and Constant growth	3	9
Tradition and Innovation	4	6
Product Innovation	4	13
Technological Innovation	2	7
Innovation in Customer/Marketing/Consumer	-	3
Innovation for Sustainable Development	-	3
Plant innovation	-	1
Management Innovation	-	2
Reputation on innovation and image of quality	3	9
Innovative raw material	-	3
Innovative Market leader	-	3
Innovative for over 200 years	-	3
TOTAL	16	62

When we recategorized all the findings shown in the table 5 according to the main aim of the study, we created the table 6 below. The table indicates what stress these 19 firms make on the observed issue, such as

Table 6: Reconstruction of the Findings in line with the Aim of the Study

which innovation competence and what type of innovation they are specialized for, and how vital they see for their survival. Although only about 59% of the Henokiens in the sample emphasized innovation, this might be taken as a signal for the importance of the innovation, and might be an indicator of the role of innovation for survival through the centuries in the sample. When focusing on the linkage between innovation and survival

through the centuries, it can be clearly seen that continuous innovation and reputation for innovation are the most stressed items. Considering the linkage side of the findings in Table 6, Interesting Findings is that six of the Henokiens out of 32 stress clearly the fact that they combine tradition and innovation through their survival. Although this finding is parallel with the general web page of the Henokiens, where it is clearly mentioned that “The Henokiens are deeply rooted in the economic realities of the present and they manage their companies with talent, navigating between modernism and tradition, between know-how transmitted from the past and innovation or diversification”, generalizability of the statement is not clear as much as it is advocated in the page. Similarly in the interview at Henokiens web page with Monzino Group, the group’s leader highlighted innovation exactly with following words: “...longevity is also a result of the ability to have a feeling for and to interpret in time what's coming and to be able to innovate so as to offer the market increasingly attractive products, services, policies and image”. All these statements and the findings indicate the importance of the innovation for the survival of the Henokiens in the sample on one side, not enough emphasis has been put on innovation on the other side. Furthermore only few firms clearly highlight that their perspective of competition stems from the resource based view. This is another suspect we have as it does not really overlap with the established literature.

CONCLUSION and DISCUSSION

In literature, although innovation is accepted a core concept of survival and sustainable competitive advantage, none of the articles or studies focusing on the linkage between innovation and survival through the centuries found in the literature review searching through the online databases available at libraries and internet. Only Koiranen’s (2002) article has been found that seems related to our study. When looking at carefully to the research, an explorative study examining mainly how Finnish family firms rank their business values, only some of the values seem related to innovation indirectly such as intuitive, open, idealistic and self-esteemed. It is interesting to observe no direct and strong emphasis within the business value of these firms, that are over hundred years of age family firms which is very much similar to our sample. Adding up all the findings of our study and this study, it can be said that survival for a firm over the centuries may not necessarily depends on innovation competence of the firms. Bakoğlu’s (2004) explorative research on growth mechanisms of old goldsmith in Kapalıçarşı, Istanbul, Turkey gives no clear insight for the linkage of long term survival and innovation.

As a result it can be said that it will be too early to inference whether survival through the centuries depends on innovation or not. This study can only be described as one of the pioneer studies that shed some light on the observed phenomena. More researches with different sample and population should be done with larger sample size with this purpose. Family firms may have been lasting for over a century some other attributes. A research focusing on the reasons for firm survival for over centuries should be done and literature gap within this area should be covered.

THE ROLE OF INNOVATION FOR REDUCING THE EFFECTS OF THE CRISES

Sefer Şener
Mesut Savrul
Can Köse

Çanakkale Onsekiz Mart University, Turkey

ABSTRACT

The intensity of the global financial crisis that has affected many countries in the world has decreased but the world is still in a recession. Beginning from the first days of the crisis when the stock markets explained the high losses, the countries have resorted to several ways, implemented stimulus packages and lavished their expenditures to find a way out the crisis. One of the proposals to alleviate the effects of the crises is emphasizing innovation and R&D activities. In this way, high value-added outputs can be obtained and that will allow increased competitiveness too. Innovation represents renewal or a significant change in product, process, marketing method or organizational structure. R&D studies are the most important prerequisite to be innovative both on the basis of the country and sector-specifically. The statistics of R&D budgets of countries and sectors and the count of R&D staff is in a close interaction with developments in technology and therefore with innovation. In addition, patent applications and number of staff with higher education are used as indicators innovation.

In this study, the relation between innovation performance of European countries and crisis in terms of use of innovation in reducing the effects of crisis has been assessed. For this purpose the efficiency of Summary Innovation Index (SII) developed by European Commission in pre-crisis and post-crisis periods have been examined on the basis of performance of countries. The indicators have been compared with the changes in RGDP of the countries and it has been inferred that innovative sectors and countries have been affected from the effects of the crisis less. As a result, the positive impact of innovation for reduction of the effects of the crises and acceleration of the phase of getting out of the crisis has been laid in front of the eyes.

Keywords: Global Crisis, Crisis Management, Innovation

INTRODUCTION

The 2008 global financial crisis broke out in the USA has been tagged as the worst financial crisis since the Great Depression. The crisis has not only influenced the financial markets and the economy of the U.S. but it has spread over the other financial markets worldwide. 2008 has been a turning point for the world economy and economic growth in the world has slowed heavily since the last quarter of 2008. Governments presented various stimulus packages to relive the impacts of the crisis. However incorporate forward-looking structural measures and innovation should be injected into the mix of policies to assure sustainable growth to make the recovery process to be perennial.

Emphasizing innovation lets the countries have high value-added outputs and that will allow increased competitiveness too. Innovation helps the countries to boost their productivity and sustainable growth. So that importance of strong innovation performance is much more crucial for an economy to survive in the global arena and the innovation procedures may be useful in perception of possible changes in the future and their effects on social and economic development. In this regard innovation performance of the countries can be a pathfinder in their strategy developing stages by putting strengths and weaknesses of them forward and as a result may guide them get out of the crisis.

In the study, whether innovation can help the countries in easing the impacts of crisis has been assessed. As an indicator of innovation The European Innovation Scoreboard which covers the 27 EU Member States, Croatia and Turkey, the associate countries Iceland, Norway and Switzerland, summarising the main elements of innovation performance such as knowledge creation measures, innovation potential, the investments in R&D activities, innovation & entrepreneurship measures under application and intellectual property measures has been

used. SII statistics covering 2004-2009 have been evaluated and have been compared with the change of RGDP in the mentioned years. Temporality effect on the relation between RGDP and SII prevents the RGDP and SII figures of the same year to explain each other synchronously. So grouping countries under four groups based on "OECD Strategic Response to the Financial and Economic Crisis" presenting long term innovation performance of the countries thought to be fit. The results of the study revealed that the countries with high innovation performance had less damage in the crisis period.

2008 GLOBAL FINANCIAL CRISIS

The financial system has been changing rapidly for a couple of decades. Non-bank intermediaries carried intermediation to greater levels via private equities and hedge funds that have higher leverage in risk-adjusted terms than traditional ones. Deepening in capital resale markets, financial products and contracts which became more complex in this period led credit derivatives and asset-backed securities to mushroom (Gai, 2008: 7).

As a result financial systems of the world began to meltdown in 2008. Sub-prime mortgages in the USA have gone bad, the big banks have been supported by governments, and consumer demand has fallen down. Currently the debates are focused on what went wrong, who was wrong and what will go wrong in the future, but the damage has been done (Strategic Direction, 2009: 18).

Bankruptcy of Lehman Brothers on September 2008 led to panic in international fund market. Many banks and stock markets all over the world suffered great losses and market value of many firms decreased. Besides, financial institutions couldn't get their equity assets due to locked credit market (Floyd, 2009). Federal Reserve, European Central Bank and some other central banks tried to solve the problem by purchasing the troubled funds from the banks. This was the largest liquidity injection into the credit market, and the largest monetary policy action, in world history (Altman, 2009).

The global financial crisis began in the USA has been labelled as the worst financial crisis since the Great Depression by many including George Soros, Joseph Stiglitz, and the International Monetary Fund. The crisis has caused a great financial shock, heavy damage on markets and institutions. The crisis has not only affected the financial markets and the economy of the USA, but it has also been spreading over the other financial markets worldwide (Majid and Kassim, 2009: 341).

U.S. consumption accounted for more than a third of the growth in global consumption between 2000 and 2007. In this respect, economy of many countries, being trade partner with USA, have been easily affected by the deterioration in the economy of USA due to the shrinkage of demand in USA. For the first quarter of 2009, the annualized rate of decline in GDP was 14.4% in Germany, 15.2% in Japan, 7.4% in the UK, 9.8% in the Euro area and 21.5% for Mexico (Baily and Douglas, 2009).

2008 has been a turning point for the world trade and economy. Growth in the world economy slowed severely by the last quarter of 2008 and increase rate of the world GDP which was 3.7% in 2007 and 3.5% between 1994-2008 on the average slowed down to 2% in 2008. In spite of the recovery, GDP of United States grew by 1.1% and by less than 1% in the European Union. Advanced economies are expected to shrink by 4.1% in 2009 (UN, 2009: 1). The global crisis has deeply affected the industrialized world including EU. Sudden effects of the global crisis such as stagnation in credit markets, the reversal of capital flows, declines in exchange lingers. However shrinkage in credits declines in residence and stock markets caused loss of confidence among business and consumers. Although stock markets of high-income and emerging economies have regained almost half of their values they lost in the crisis period and Economic Sentiment Indicator has improved for 9 since March 2009, it is still below the average. Global GDPs started to rise again in the second half of 2009 by the help of financial stimulus packages after great decline in 2008. But emerging economies that have trade relations with EU and OECD had their share from the effects of the crisis. Economic projections display that fragility in financial markets will persist in 2010 and 2011 and the recovery for EU is still far away because financial systems of European countries severely affected by the crisis, their recovery is expected to take a long time. (EC, 2009: 1, Worldbank, 2010: 1-3).

Governments presented various stimulus packages to prevent collapse of financial and banking systems and to ease the impacts of shrinkage of credits. a rapid recovery and stabilising the economy was intended through these policies however they should be planned based on sustainable growth to assure the recovery process to be perennial. In these regard governments can incorporate forward-looking structural measures and innovation should be injected into the mix of policies to handle with the crisis (OECD, 2009a: 5,10).

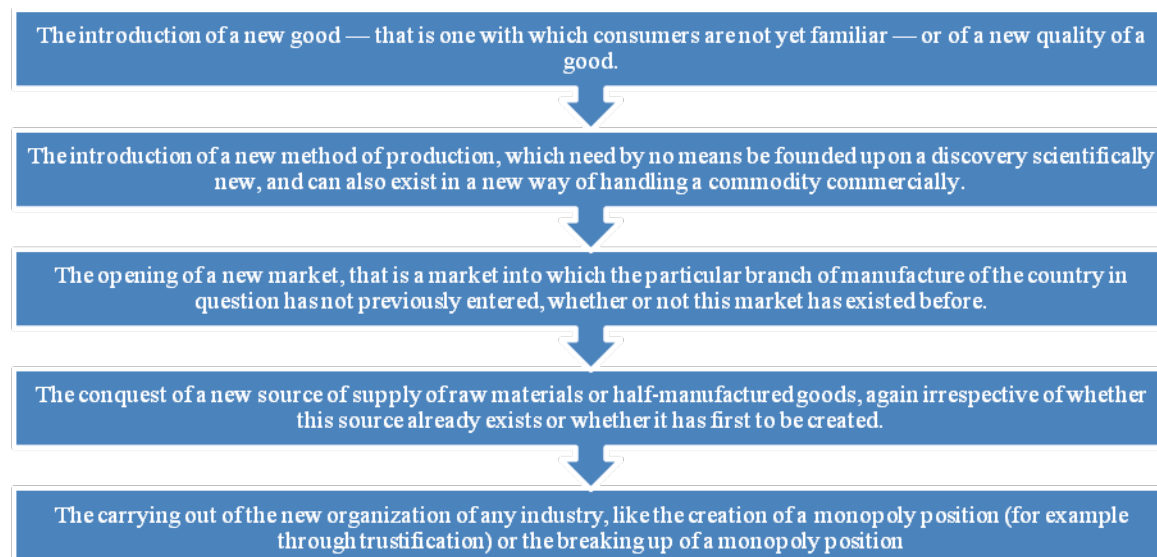

INNOVATION

Great increases in access to information have been seen and new markets have emerged due to the globalization which brought greater international competition and in new organizational forms out. Technological advances and greater flows of information have led the knowledge to be seen as a central driver of economic growth and innovation (EC, 2005a: 10).

Knowledge economy is on the basis of innovation. One of the basic concepts that fuel the new economy is the innovation that envisions constant renewal of products, systems, processes, marketing and labour. Innovation is a concept that both express the process and the result. In EU and OECD literature innovation is defined as transformation of an idea into a marketable product or service, new or improved manufacturing or distribution method or a new social service method (Kavak, 2009: 617-618).

Innovation aims not to invent what is undiscovered but to explore ways to create value. Innovation ensures sales and market share growth through enhanced and improved delivery performance and rise in the number of new products/services. It also helps reduction of costs through reduction of manufacturing or servicing times, productivity increases and efficient usage of resources and time (Elçi, 2009: 62, 64) which means that this process provides the same products and services to be presented in different forms of means. In this respect, the process of innovation is not just a concept pairing high-technology, but it is a process which can be practiced in the whole high or low-technology manufacturing and services sectors (Tilina, 2009: 225). In this respect innovation can be implemented for many explanations and can be under different forms. Schumpeter (1934) whose study has been the pathfinder for the following studies on innovation, has categorized innovation under five forms.

Figure 1: Forms of innovation

Source: Schumpeter, J. (1934), *The Theory of Economic Development*, Harvard University Press, Cambridge, Massachusetts.p.66.

Innovation can show up in any sector of the economy from manufacturing and services sector to government services. Innovation activities cover all scientific, technological, organisational, financial and commercial steps which lead to the implementation of innovations. Besides product and process innovations many other phases of development are counted in innovation such as development for preproduction, production and distribution, new marketing and new organisational methods (EC, 2005: 18).

In development process, technological change, reach to information, organizational structures and institutional factors innovation processes differ thoroughly from sector to sector (Malerba, 2005: 380). In this sense in micro and macro levels the objectives motivating innovation, displayed in Table 1, varies due to sector and country specific values and priorities.

Table 1: Objectives motivating innovation

Source: Pilar, Maria del Pilar and Pérez, Pastor, (2009), “Innovation in a Mexican Local Context”, Economics and Organization of Enterprise 1/2009, Vol 3(1); 58-72, p.67.

Engagement in innovation activities may have many different explanations. Objectives may relate to products, markets, efficiency, quality or the ability to learn and to implement changes. Pérez (2009) categorized these explanations under maintaining market share, improving quality of goods, increasing market share or entering new markets, reducing cost, reducing consumption of energy, production and delivery, developing environment-friendly products, reducing environmental impact, improving flexibility of production, competition, demand and markets and increasing range of goods from the greater importance to the less by the driver lead both the enterprises and countries.

Innovation as a key to regional development and no country in the world can compete in the global economy just hold to exploitation of natural resources or cost advantages without innovation capacity. Accepting an effective policy in this new policy design and determining the right content isn't a simple issue and requires tools such as foresight and evaluation studies (Reid, 2009: 1-2). As a matter of the fact, policy makers have begun to emphasize innovation strategies not only at national level but also regional level too since 1990s. In this respect EU structural funds have recently directed towards the activities that create knowledge environment to stimulate innovation (Commission of the European Communities, 2007: 6). Many regions EU formed development policies through operational programs. Innovation strategies such as strategies for the information society, innovation strategies for tourism and personal services have taken their places within the framework of this policy (Commission of the European Communities, 2006: 6).

As Alexandros (2006) has quoted from Fink (1986) “crisis management is the art of removing much of the risk and uncertainty to allow you to achieve more control over your own destiny”. Consequences are the immediate and long-term impacts; caution includes the measures taken to prevent or minimize the impact of a potential crisis, and coping comprises measures taken to respond to a crisis that has already occurred (Paraskevas, 2006: 893). In this regard the innovation performance of the countries can be a pathfinder in their strategy developing stages by putting strengths and weaknesses of them forward. However, in policy making not only the possible changes in the policy owner country but also priori changes in the world should be taken into account and the innovation procedures may be useful in perception of possible changes in the future and their effects on social and economic development (OECD, 2005, 9).

Innovation is a consistent process. Producers frequently alter the way they produce and collect new knowledge. This process affects the factors that influence innovation activities and the outcomes of innovation (EC, 2006). Innovation helps the countries to boost their productivity and sustainable growth. So that importance of strong innovation performance is much more crucial for an economy to survive in the global arena (OECD, 2008: 12). Innovation and exploitation of scientific discoveries and new technology are seen fundamental for long term economic growth and social welfare in advanced industrial countries. Moreover innovation

performance of a country will become even more important for economic and social development in the coming period (OECD, 2005: 7-8). In this regard, innovation which is a significant factor in long-term growth of countries can help the countries foresee the coming crises as a crisis management tool, survive by reducing their costs, boosting their productivity, obtaining they have high value-added outputs and increasing their competitiveness in the crisis times and can play an active role in reducing the effects of the crises.

ROLE OF INNOVATION FOR REDUCING THE EFFECTS OF THE CRISES

Innovation and crisis are contrary terms in many cases. Expenditures on innovation seem costliness in economic distresses and when the budgets are trimmed they usually are at the top of list. On the other hand recovery and long-term growth call for an innovative society. Research and innovation not only help to create more jobs, but also increase prosperity and the quality of life in general. By investing on innovation, governments can mitigate the effects of the crisis, boost recovery and thus enable strong and sustainable growth. After all, innovation is a key concept in achieving growth and economic development.

The available cases display that the crisis had negative impacts on innovation. Historically, business R&D expenditure and patent filings have moved in parallel with GDP, decelerating during the economic distresses of the early 1990s and 2000s. Growth in R&D spending is either in a decline or slowdown in many countries according to corporate reports for the fourth quarter of 2008 (OECD, 2009a: 5-6). However this decline is much softer compared with the other budget cuts of the enterprises and governments. In this regard relation between innovation performance of the countries and crises is a current issue. The examples of those in literature are as follows:

Linsu (2001) dealt various aspects of innovation-crisis relation. He analyzed effects of Asian crisis on South Korean economy and stressed that the Asian financial crisis has resulted in tremendous economic and social consequences in South Korea in terms of rising bankruptcies and unemployment and dwindling living standard. He stressed that not only innovation can help easing the crises but it can also introduce an opportunity for the countries to make fundamental changes in their innovation policies.

Keller and Samuels (2003) have argued relations of technological innovations in transportation, communication and elements of infrastructure with the Asian Crisis in their study they conducted from 1999 through 2001. According to them Asian innovation systems to the crisis did affect macroeconomic and industrial policies. It has also affected the ways in which business is transacted throughout the region. They also asserted that United States and European companies have gained greater access to some formerly resistant Asian economies, through direct investment, possibly even through technology acquisitions which may be gains of the crisis by means of role of use of innovation.

Gai et.al. (2008) examined the implications of developments for the likelihood and potential scale of system-wide financial crises. They stressed the financial system has been changing rapidly in recent years, macroeconomic volatility has fallen in developed countries and argued that innovation is essential for the financial system just as the other sectors. Finally they suggested a model that financial innovation and greater macroeconomic stability may have made financial crises in developed countries less likely than in the past.

In their study Tilina and Ispas (2009) emphasized that after the crisis The European Union has publicized 2009 the year of creativity and innovation. They argued that whether the economy is in recession or not innovation is the key to sustain growth. They also argued that innovation plays a critically important role in Europe's ability to respond effectively to the challenges and opportunities of the global economy. All forms of innovation, including non-technological innovation must be taken into account and as Jong and Schoemaker (2009) suggests that, for some companies, the economic crisis can actually provide an innovation platform.

In practice the U.S. and Japan are traditionally the good examples of the advanced countries in terms of industry and technology. Research, technological development and innovation support in these countries has been continuing for many years (EC, 2008: 53). Innovation in U.S. has a stable structure shaped by the size, number and diversity of government, academia, private sector and non-profit organizations involved. The Office of Management and Budget (OMB), which evaluate Annual budget and performance review of agency programs, compared to the ones of EU or other member countries is a much stronger organization. Besides, the federal government support for innovation for the framework measures such as infrastructure development and intellectual capital, financial market regulation and interstate commerce directed towards structural criteria. Innovation initiatives from many organizations at various levels provide support to the development and this system is applied in the U.S. by far have yielded successful results (EC, 2008:53).

Japan is in the forefront of world science in many indicators and has a leading place in intensity of business R&D within OECD countries. Nevertheless, R&D output does not always seem to be proportional to the R&D investment. Especially in the last ten years, the increase in employee productivity levels in Japan corresponded to OECD countries and this is the major factor of the difference between the per capita GDP of Japan and the leading OECD countries. Basic science and technology policies of Japan focus on issues such as aging of the population and climate change. Thus, in 2008 the priority is to invest in human resources and the overall policy is to support innovative activities through ongoing reforms (OECD, 2008: 132).

Besides U.S. and Japan, many European countries have a leading position in the world on technology and science. So analysing innovation performance of these countries in crisis period is significant. The innovation performance of these countries can be grounded to The European Innovation Scoreboard (EIS). EIS covers the 27 EU Member States, Croatia and Turkey, the associate countries Iceland, Norway and Switzerland. The indicators of the EIS summarise the main elements of innovation performance.

“Innovation inputs cover three innovation dimensions: Innovation drivers measure the structural conditions required for innovation potential; Knowledge creation measures the investments in R&D activities, considered as key elements for a successful knowledge-based economy; and Innovation & entrepreneurship measures the efforts towards innovation at firm level. Innovation outputs cover two innovation dimensions: Applications measures the performance, expressed in terms of labour and business activities, and their value added in innovative sectors; and Intellectual property measures the achieved results in terms of successful know-how.” EC, (2008: 34),

In practical terms, countries were grouped using the classification of the European Innovation Scoreboard based on the Summary Innovation Index (SII). Comparing SII index of EU27 with its RGDP change may reveal innovation performance of the region in crisis period.

Figure 2: RGDP and SII Change in EU27 (2004-2009)

Source: Eurostat, (2010), Real GDP growth rate, <<http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&plugin=1&language=en&pcode=tsieb020>>, (22.02.2010). EC, (2010), European Innovation Scoreboard (EIS) Belgium, p.72. EC, (2008), European Innovation Scoreboard 2007, Comparative Analysis of Innovation Performance, Italy, p.51.

Hypothetically, the response to the impact of the crisis on innovation in different countries should correlate with their innovation performance, general investment capacities, and maturity in political and strategic planning (EC, 2009: 3). However many political and economic factors are directly related to the crises. Thus, innovation investment performance of a country alone cannot be thought as a crisis preventing device. As seen in Figure 2, SII performance of the EU27 countries is in an increasing trend since the past. The second plot in the figure presents the changes in the RGDP of EU27. The plot reveals destructive effects of the crisis in EU-wide. The fact that innovation is a persistent progress gained acceptance in EU countries. Innovation is seen as a key in EU and the governments which cut governmental expenditures in many fields try to maintain their innovation investments as much as possible.

Yields of innovation come in view in long-term, and there is a temporality effect on the relation between RGDP and SII which prevents the RGDP and SII figures of the same year to explain each other synchronously. In this regard, using the country innovation classification of European Commission (EC, 2009) will be to the

point to be able to evaluate the effect of innovation on their RGDPs. This classification associated the European countries into four groups:

- Denmark, Finland, Germany, Sweden, Switzerland and the UK, the innovation leaders;
- Austria, Belgium, Cyprus, Estonia, France, Iceland, Ireland, Luxembourg and the Netherlands, and Slovenia, the innovation followers;
- The Czech Republic, Greece, Hungary, Italy, Lithuania, Malta, Norway, Poland, Portugal, Slovakia and Spain, the moderate innovators;
- Bulgaria, Latvia, Romania, Croatia and Turkey, the catching-up countries.

This classification based on the long term innovation performance of the countries. Namely, Innovation Leader countries have been giving weight to innovation investments for a long time while Catching-up Countries are relying upon Innovation Leaders in innovation. In this context, Table 2 presents changes of RGDP and SII figures of the groups mentioned before in the global financial crisis period.

Table 2: RGDP and SII Figures in European Countries in Crisis Period

	2007			2008			2009		
	Sort	Index	RGDP	Sort	Index	RGDP	Sort	Index	RGDP
Innovation Leaders									
Denmark	3	0,602	1,7	6	0,576	-0,9	6	0,574	-4,9
Finland	4	0,585	4,9	3	0,603	1,2	3	0,622	-7,8
Germany	5	0,569	2,5	5	0,581	1,3	4	0,596	-5
Sweden	2	0,63	2,5	2	0,649	-0,2	2	0,636	-4,9
Switzerland	1	0,661	3,6	1	0,683	1,8	1	0,694	-1,5
United Kingdom	6	0,556	2,6	4	0,588	0,5	5	0,575	-4,9
Innovation Followers									
Austria	8	0,523	3,5	7	0,532	2	7	0,536	-3,6
Belgium	9	0,498	2,9	10	0,513	1	9	0,516	-3
Cyprus	15	0,433	5,1	14	0,466	3,6	15	0,479	-1,7
Estonia	14	0,443	7,2	15	0,451	-3,6	13	0,481	-14,1
France	11	0,495	2,3	11	0,5	0,4	11	0,501	-2,2

Luxembourg	10	0,497	6,5	8	0,525	0	8	0,525	-3,4
Netherlands	12	0,474	3,6	12	0,484	2	12	0,491	-4
Slovenia	16	0,429	6,8	16	0,448	3,5	16	0,466	-7,8
Moderate Innovators									
Czech Republic	17	0,392	6,1	17	0,41	2,5	17	0,415	-4,8
Greece	22	0,332	4,5	22	0,349	2	21	0,37	-2
Hungary	24	0,305	1	25	0,313	0,6	25	0,328	-6,3
Italy	19	0,361	1,5	19	0,377	-1,3	22	0,363	-5
Lithuania	26	0,294	9,8	27	0,305	2,8	27	0,313	-14,8
Malta	23	0,315	3,8	23	0,34	2,1	23	0,343	-1,9
Norway	18	0,375	2,7	18	0,382	1,8	19	0,382	-1,5
Poland	27	0,293	6,8	26	0,311	5	26	0,317	1,7
Portugal	21	0,34	1,9	21	0,366	0	18	0,401	-2,7
Slovakia	25	0,299	10,6	24	0,316	6,2	24	0,331	-4,7
Spain	20	0,359	3,6	20	0,373	0,9	20	0,377	-3,6
Catching-up Countries									
Bulgaria	31	0,206	6,2	31	0,227	6	31	0,231	-5
Latvia	30	0,239	10	30	0,252	-4,6	30	0,261	-18
Romania	29	0,249	6,3	28	0,278	7,3	28	0,294	-7,1
Croatia	28	0,289	5,5	29	0,278	2,4	29	0,286	-5,8
Turkey	32	0,206	4,7	32	0,218	0,9	32	0,227	-5,8

Source: Eurostat, (2010), Real GDP growth rate, 2010, <<http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&plugin=1&language=en&pcode=tsieb020>>, (22.02.2010). EC, (2010), European Innovation Scoreboard (EIS) 2009, Belgium, p.72. EC, (2008), European Innovation Scoreboard 2007, Comparative

Analysis Of Innovation Performance, Italy, p.51. EC, (2009), European Innovation Progress Report 2009, p.3, <http://www.proinno-europe.eu/page/admin/uploaded_documents/EIPR2009.pdf>(22.02.2010).

Evaluating the table, it can be seen that Catching-up Countries have managed to provide more output from their innovation investments pre-crisis period due to their low GDP level. However these countries had more damage and their RGDP decreased further in the crisis period as regards of the ones in Innovation Leaders, Innovation Followers and Moderate Innovators groups. Over and above it can be anticipated that the effects of crisis will last longer in Catching-up Countries. On the other hand the amount of output provided from innovation and the impacts of the crisis are affected by many other macroeconomic variables and country specific determinants. So it is apparent that the innovation index is not the determinant of GDP by itself.

CONCLUSION

Innovation helps the countries to boost their productivity and sustainable growth. So that importance of strong innovation performance is much more crucial for an economy to survive in the global arena. Therefore, stimulus packages come forward due to the crisis should include the instruments that support innovation to make them long lived.

Generally speaking innovation is a key to get out of the crisis and typically crisis can magnify the competitive advantage of research-intense firms who seize the opportunity to reinforce market leadership through increased spending on innovation and R&D in which innovation leader countries are prominent. In the study directed towards determining the effects of the activities intended for innovation on economic performances of the countries for crisis period, the first inference is that the countries traditionalize innovation strategies and use them effectively for long had less losses in crisis period as regards the others particularly the ones in catching up group. Of course it shouldn't be ignored that effects of innovation on RGDP can be seen in long-term and many other factors affect the RGDP change of the countries.

The next inference carried out depending on SII index and RGDP change of EU27 displays that innovation investments are in an incremental trend despite the negative impacts of the crisis. The trend reveals that innovation may accelerate the process of getting out of the crisis by increasing productivity, sustainable growth and competitiveness of the countries. Based on these inferences causality analyses can be conducted to figure out yields of innovation to GDP and to determine size of it. The study can shed light to the future studies on this aspect.

MEASURING THE INNOVATION PERFORMANCE OF TURKISH SCIENCE&TECHNOLOGY PARKS: AN APPLICATION OF DATA ENVELOPMENT ANALYSIS

Ilker Murat Ar, Birdogan Baki
Karadeniz Technical University, Turkey

ABSTRACT

Innovation changed the fundamentals of competitive structure plays an important role in firms' strategic management attitude in today's business atmosphere. So, it can be evaluated as an important issue of strategic management concept. This study aims to compare the innovation performance of thirteen Science&Technology Parks (STPs) in Turkey using Data Envelopment Analysis (DEA). The results of the analyses implicated that more than half of them (54%) have reached the optimal level of economy of scale with constant returns to scale. However, three STPs (ESKİŞEHİR, ÇUKUROVA, and MERSİN) have not reached the optimal scale yet because they basically were in the increase returns to scale. The other three STPs (HACETTEPE, KONYA, and ANTALYA) were operating under decrease returns to scale. According to peer results, the STP of TÜBİTAK formed peer to a maximum number of inefficient STPs.

INTRODUCTION

As the millennium draws to a close, the pace of economic, social, and technological change has increased dramatically (Gopalakrishnan, 2000). Globalization of markets and increasing expectations of customers have created a turbulent environment for companies. So, companies have new strategic challenges such as reduced profit margins and higher customer expectations. These radical changes have forced companies to introduce new things constantly and to seek new ways. In this point, innovation plays an increasingly strategic role for companies to successfully overcome to these difficulties. Thus, innovation changed the fundamentals of competitive structure has been one of the key term of strategic management literature. As a result, innovation can be evaluated as an important issue of strategic management concept and also plays an important role in firms' strategic management attitude.

Innovation which is a process of discovery, learning, and application of new technologies and techniques from many sources is an important driver of economic and productivity growth, and ultimately of the improvement in living standards. Many policy makers and researchers believe that competition promotes innovation (Tang, 2006). It has been recognized by policy makers that technology and capability of conducting research are the core factors in regional economic growth and regional development (Kang, 2004). Furthermore, one of the most effective ways of promoting regional economies is often considered to be the transformation of industrial structures into economic activities with higher technological involvement. This is consistent with the national science and technology policies of many countries that attempt to concentrate Research and Development (R&D) activities into a limited geographical space. These types of policies typically involve the establishment of Science&Technology Parks (STPs) (Grayson, 1998). STPs provide spaces for high-technology research and educational activities, industrial production, and other supporting activities such as housing, commercial and administrative services (Shin, 2001). They also provide an effective way of linking between universities and industrial firms.

The advantage of STPs in promoting economic growth in converging countries is an evident topic. In emerging economies, like Turkey, the expectation is that science parks might act as 'development catalysts' driving the startup of newly established high-tech firms and tracing the path for existing firms to process and product innovation (Bigliardi et al., 2006). Therefore, it has been developed cooperative relationships between national and local governments, universities and industries for last decades in Turkey. In this context, most STPs in Turkey have been built by initiatives of the private sectors, universities and local governments. However, it should not be remembered that propositions stated above will only be true if STPs are successful in their operation (Ratinho and Henriques, 2010). Despite the important of this issue, very little research has yet been published on the performance of STPs. This article addresses this research gap. Therefore, the main purpose of this paper is to compare innovation performance of Turkish STPs by Data Envelopment Analysis (DEA). The remainder of this study is organized as follows. Section 2 provides the background information of innovation and STPs. Section 3 reviews the limited empirical evidence on evaluation performance of STPs.

Section 4 outlines the research methodology. Section 5 presents data and empirical findings. The final section consists of preliminary conclusions and suggestions for additional research.

INNOVATION and STPs

In a business environment characterized by rapid and disruptive changes, variety of customer requirements, and international competition, organizations have to acquire new technological capabilities and explore new business processes in order to stay profitable in the long run (Vanhaverbeke and Peeters, 2005). In other words, innovation that is able to meet the customer requirements and introduce products or processes has become one of the most important issues for firms. It is often linked with creating a sustainable market around the introduction of new and superior product or process (Carayannis and Gonzalez, 2003). In short, it can be concluded that firms are more competitive with innovation (De Jong and Vermuelen, 2006) or succeed in a competitive structure by creating innovation. Innovation also plays an important role in developing the economy, in expanding and sustaining the high performance of firms, in composing industrial competitiveness, in improving the standard of living, and in creating a better quality of life (Gopalakrishnan and Damanpour, 1997).

The concept of science parks originated back in the late 1950s. The idea is to provide an infrastructure of technical, logistics, administrative help that a young firm needs as it struggles to gain a foothold for its product in an increasingly competitive market (Guy, 1996). According to definition of The International Association of Science Parks (IASP) a science park is an organisation managed by specialised professionals, whose main aim is to increase the wealth of its community by promoting the culture of innovation and the competitiveness of its associated businesses and knowledge-managed institutions. To enable these goals to be met, a Science Park stimulates and manages the flow of knowledge and technology amongst universities, R&D institutions, companies and markets; it facilitates the creation and growth of innovation-based companies through incubation and spin-off processes; and provides other value-added services together with high quality space and facilities (<http://www.iasp.ws/publico/index.jsp?enl=2>). This definition shares three main elements in terms of (i) knowledge and technology transfer through interaction between universities, R&D institutions and enterprises; (ii) growth of knowledge-based and innovative companies; and (iii) creation of supportive environment (Malairaja and Zawdie, 2008). STPs are increasingly being promoted to facilitate technology transfer and regional development because they often lead to fast-growing, geographically clustered firms within industries (Tan, 2006). Consequently, STPs are major tools around the world in regional development for those areas which have excellent universities, research institutes, or a desirable living environment (Kang, 2004).

As a result of the meaning of the concepts of STP and innovation, it is generally hypothesized that STPs are important institutions for innovation and technology transfer. There are a lot of causes of this claim. First of all, linking between firms and their technology sources such as universities, laboratories, and related institutions is a necessity for the implementation of innovation. This is mostly ensured in STPs. Secondly, scientific knowledge can be transferred unproblematically from a research university to an adjacent park for development (Phillimore, 1999). Thirdly, co-location of firms in a science park, it is argued, encourages networking and collaboration, which can foster innovation. STPs thus provide an environment that assist firms to develop their technological and innovative capabilities (Malairaja and Zawdie, 2008). Finally, considerable resources are being devoted to STPs as policy instruments aimed at promoting research based industrial and innovative activity (Dettwiler et al., 2006). Consequently, it is argued that STPs contribute to fostering technological innovation and transfer and stimulating the growth of high-level economic activities (Hommen et al., 2006).

LITERATURE REVIEW

The empirical literature on science parks sits within two main groups. Studies in first focus on STPs as generally. Some of them (Shin, 2001; Appold, 2004; Phan et al., 2005; Sofouli and Vonortas, 2007) focus on different models of successful science park development and the effect of STPs on regional or national economic growth. A few studies are conducted on historical development and/or future status of a specific STP. Sutherland (2005) and Pálmai (2004) can be example for them. Surveys in second cover firms located in STPs. These surveys can purpose both examining the performance firms on STPs such as Westhead and Batstone (1999), Löfsten and Lindelöf (2005) and comparing the firms located within and outside of STPs such as Westhead (1997), Lindelöf and Löfsten (2002), Siegel et al. (2003), Löfsten and Lindelöf (2003), and Dettwiler et al. (2006).

Although there are a lot of empirical studies about STPs, there is limited empirical evidence on some dimensions of the relative performance of STPs. In the first of them, Lai and Shyu (2005) compared innovation capacity of two different science parks across the Taiwan Strait, the China Zhangjian High-Tech Park (ZJHP) and Taiwan's Hsinchu Science Industrial Park (HSIP) by ANOVA and the Kruskal-Wallis test. The researchers examined the two in the light of various factors such as 'basic research infrastructure,' 'sophisticated and demanding local

customer base,' and 'the presence of clusters instead of isolated industries,' to establish their innovation capacity. Secondly, Chen et al. (2006) analyzed the comparative performances of the six high-tech industries currently developed at Taiwan's Hsinchu Science Park by Data Envelopment Analysis (DEA) and also the Malmquist indices. Lin and Tzeng's (2009) study compared The Neihu technology park and The Hsinchu science park using the DEMATEL (Decision Making Trial and Evaluation Laboratory) technique in terms of four aspects: human resources, technology resources, invest environments and market development.

Looking the surveys which evaluate innovative capacity of industrial clusters or STPs theoretically also can be useful. First model evaluates innovation orientation of an industrial clusters was developed by Porter (1990). With the contribution of various studies, this model was expanded and it includes four critical drivers in the end. The first, factor (input) conditions, is the availability of human resources, infrastructure, and risk capital. The second driver, demand conditions, signs local or global request for product and services. The third driver, related and supporting industries, is the availability of vertically and horizontally related industries. And the last driver, context for firm strategy and rivalry, reflects competitive context (Furman et al., 2002). According to Benko's (2000) mathematical equation about technopoles, innovation ability of STPs depend on the two elements. One of them is the variable that represents the 'raw materials' of the technopole such as the research field, manufacturing or service sector companies, higher education, finance, human resources. The other is the complex function that can be summarized under myth concept of 'cross-fertilization', and whose principal influences as organization, communication, and the technopolitan culture.

Literature review shows that the role of STPs in developed and developing countries has been increasing during the last two decades. Because researches on STPs evaluation mainly cover the developed countries, there is a lack of application on STPs in the less developed countries (Bakouros et al., 2002). This study aims to partially fill this research gap in literature by examining the STPs in Turkey. When the literature is reviewed, any study compares to STPs in terms of their innovation performance is not seen except for Lai and Shyu (2005). This study also aims to partially assist to literature by measuring the relative innovation performance of STPs.

RESEARCH METHODOLOGY

Research methodology of this survey includes three basic steps. Firstly, it was determined the issues such as variable measurement and data collecting. Secondly, it was focused on sample selection. Thirdly, a linear programming model named Data Envelopment Analysis (DEA) was used to data analysis.

Variable Measurement

To explore the different innovation performance of the Turkish STPs, basic necessity is determining the variables. In order to this, it was reviewed the related literature stated in above. Thus, it was briefed the innovation indicators and they were evaluated in terms of appropriately to STPs. They were also discussed with two academicians and one STP manager. Therefore, four input and two output measures can be used for evaluating STPs were determined. Four inputs selected for the DEA analysis are: number of located firms, number of R&D employees, the support of R&D as Turkish Liras (TL), and land area as square meter (m²). Two outputs include annual sales as TL and number of new products or production methods. Data for inputs and outputs was obtained from each STP as face to face and also formal web site of Ministry of Industry and Trade of Turkey for year of 2008. Data used in the analyses was presented in Appendix.

Sample Selection

Turkey's effort to develop science parks have increased in the beginning of this century and STPs are named as "Technology Development Zones" by Ministry of Industry and Trade of Turkey created as legally on 2001. There are thirty one STPs in Turkey in the beginning of 2009. Since innovations have profitability effects over an extended period of time (Geroski et al., 1993), all active STPs in Turkey were not examined in this study. In order to make the assessment more representatives, it was carefully selected the target STPs by the legal duration of activity (more than four years). Therefore, only twenty of them (CYBERPARK, İZMİR, GOSB, İTÜ-ARI, HACETTEPE, ESKİŞEHİR, KOCAELİ, YILDIZ TEKNİK, ODTÜ, TÜBİTAK, KONYA, İSTANBUL, TRABZON, ANTALYA, ERCİYES, ÇUKUROVA, ATA, MERSİN, GÖLLER, ULUTEK) were chosen. Data was not gathered from three of them (KOCAELİ, ODTÜ, ULUTEK) due to their business policy and four of them (YILDIZ TEKNİK, İSTANBUL, TRABZON, ATA) because they have not been activated by the end of 2008. At the end, seven of them were not added the analysis and thirteen STPs are sample for this survey. This

sample size (the number of decision making units) is acceptable for a robust DEA analysis for four inputs and two outputs according to formulation of Nooreha et al. (2000).

Data Envelopment Analysis (DEA)

This study applies Data Envelopment Analysis (DEA) to compare innovation performance of thirteen STPs. It is one of the most used techniques for performance measurement and comparison. The results of the DEA were obtained from a computer program called *DEAP* Version 2.1. developed by Coelli (1996).

DEA is a linear programming based technique that provides an objective assessment of the relative efficiency of similar organizational units called as decision-making units (DMU). It has two models: CCR model and BCR model. CCR (Charnes-Cooper-Rhodes) model was proposed by Charnes et al. (1978). It is the basic DEA model which assumes constant returns to scale (CRS). The value of the efficiency can be counted by solving the following output-oriented CCR model (1). CRS model assume that all DMUs are operating at an optimal scale. However, Banker et al. (1984) suggested BCR (Banker-Charnes-Cooper) model as an extension of the CRS model to account for variable returns to scale (VRS) situations. Linear programming form of BCR model is expressed as the following (2).

$$\begin{aligned} \text{Min } g_k &= \sum_{i=1}^m v_{ik} X_{ik} & (1) \\ \text{s.t. } \sum_{i=1}^m v_{ik} X_{ij} - \sum_{r=1}^s u_{rk} Y_{rj} &\geq 0 & j=1,2,\dots,N \\ \sum_{r=1}^s u_{rk} Y_{rk} &= 1 \\ u_{rk}, v_{ik} &\geq \varepsilon & r=1,2,\dots,s \quad i=1,2,\dots,m \end{aligned}$$

$$\begin{aligned} \text{Min } g_k &= \sum_{i=1}^m v_{ik} X_{ik} + v_0 & (2) \\ \text{s.t. } \sum_{i=1}^m v_{ik} X_{ij} - \sum_{r=1}^s u_{rk} Y_{rj} + v_0 &\geq 0 & j=1,2,\dots,N \\ \sum_{r=1}^s u_{rk} Y_{rk} &= 1 \\ u_{rk}, v_{ik} &\geq \varepsilon & r=1,2,\dots,s \quad i=1,2,\dots,m \quad v_0 = \text{constant variable} \end{aligned}$$

g_k = the efficiency of DMU_k

u_{rk} = the coefficients of the weighted outputs for DMU_k

v_{ik} = the coefficients of the weighted inputs for DMU_k

Y_{rk} = the r th output value observed at DMU_k

X_{ik} = the i th input value observed at DMU_k

Y_{rj} = the r th output value observed at DMU_j

X_{ij} = the i th input value observed at DMU_j

ε = a small "non-Archimedean" constant

CRS model was used to obtain technical efficiency (TE) scores for DMUs. TE scores obtained from it can be decomposed into scale efficiency (SE) and pure technical efficiency (PTE) (Coelli, 1996). VRS model will be executed to calculate pure technical efficiency (PTE) without scale consideration. Thus, scale efficiency (SE) can be got by dividing PTE into TE. After VRS model is established and SE scores computed, the analysis can be taken to determine whether a particular DMU is experiencing increasing, constant, or decreasing returns to scale (Chen et al., 2006).

EMPIRICAL RESULTS

Basic empirical results were listed in Table 1. Second column of this table shows the TE scores by CRS DEA model. PTE scores executed from VRS DEA model are in third column. SE scores can be calculated by dividing PTE into TE, as shown in fourth column. And the fifth column of this table indicates kind of returns to scale of each DMU.

Table I: Efficiency scores and peer situation of the thirteen STPs.

DMU	Technical Efficiency (TE)	Pure Technical Efficiency (PTE)	Scale Efficiency (SE)	Returns to Scale	Peers	Peer Count
(1) CYBERPARK	1.000	1.000	1.000	CRS	(1)	2
(2) İZMİR	1.000	1.000	1.000	CRS	(2)	1
(3) GOSB	1.000	1.000	1.000	CRS	(3)	1
(4) İTÜ-ARI	1.000	1.000	1.000	CRS	(4)	2
(5) HACETTEPE	0.777	0.802	0.969	DRS	(2)-(4)-(7)-(1)	0
(6) ESKİŞEHİR	0.636	1.000	0.636	IRS	(6)	0
(7) TÜBİTAK	1.000	1.000	1.000	CRS	(7)	3
(8) KONYA	0.052	0.074	0.701	DRS	(7)-(4)	0
(9) ANTALYA	0.531	0.537	0.989	DRS	(7)-(3)-(1)	0
(10) ERCİYES	1.000	1.000	1.000	CRS	(10)	0
(11) ÇUKUROVA	0.270	1.000	0.270	IRS	(11)	0
(12) MERSİN	0.209	1.000	0.209	IRS	(12)	0
(13) GÖLLER	1.000	1.000	1.000	CRS	(13)	0
Mean	0.729	0.878	0.829			

First, we look at value of TE obtained from CRS model. Seven STPs (CYBERPARK, İZMİR, GOSB, İTÜ-ARI, TÜBİTAK, ERCİYES, and GÖLLER) have been most efficient, with TE scores of 1.000. However, six of them were inefficient with TE scores under 1.000. KONYA was the least efficient STP. The average value of TE was 0.729. All efficient STPs in terms of TE were also efficient in terms of PTE. Furthermore, STPs of ESKİŞEHİR, ÇUKUROVA, and MERSİN added to them with PTE scores of 1.000. However, KONYA was the least efficient in terms of PTE scores. The average value of PTE was 0.878.

When it is looked the SE scores, the scores of all STPs basically follow similar patterns as their TE scores. Six of thirteen STPs have SE score is under 1.000. MERSİN and ÇUKUROVA have the two least SE scores respectively. However, the average SE score was 0.829.

According to results of returns to scale, seven STPs (CYBERPARK, İZMİR, GOSB, İTÜ-ARI, TÜBİTAK, ERCİYES, and GÖLLER) have basically CRS. It indicates that these STPs have reached the optimal level of economy of scale. However, the inefficiency of an inefficient STP may arise because it is operating under IRS or DRS. Three STPs (ESKİŞEHİR, ÇUKUROVA, and MERSİN) basically were in the IRS status. These patterns show that these STPs have been expanded continuously though they have not reached the optimal scale yet. HACETTEPE, KONYA, and ANTALYA, which are not efficient, was operating under DRS. They were operating under DRS leading to the fact that any increase in inputs to these STPs results in less than proportionate increase in their outputs (Ramanathan, 2005).

After the determination of basic efficiency scores, Table 1 also gives information about peer(s) for inefficient STPs and peer count for efficient STPs. For example, HACETTEPE was considered as inefficient and İZMİR, İTÜ-ARI, TÜBİTAK, and CYBERPARK were its peers. This mean that HACETTEPE can try to emulate İZMİR, İTÜ-ARI, TÜBİTAK, and CYBERPARK (or a combination of them) in order to register the values of inputs and outputs. While TÜBİTAK formed peer to a maximum number of inefficient STPs (peer to three inefficient STPs), ERCİYES and GÖLLER were not chosen as peer for any inefficient STP.

DISCUSSION and CONCLUSIONS

This study applies DEA to evaluate the relative innovation performance of the thirteen Turkish STPs. The results of TE indicate that seven STPs, CYBERPARK, İZMİR, GOSB, İTÜ-ARI, TÜBİTAK, ERCİYES, and GÖLLER, had the best performance while other six STPs were operated relatively inefficient. According to these results of the output-oriented DEA model, inefficient STPs should increase their outputs, annual sales and number of new products/production methods focusing on their business process.

Decomposing TE scores into PTE and SE provides guidance on what can be achieved in the short and long terms. If the majority of inefficiency is due to the small size of operations, that is IRS, then the DMU will need to plan for expansion. On the other hand, PTE can usually be addressed in the short term without changing the scale of operations. Following this reasoning, we can focus six STPs that were not efficient, based on the PTE

and SE scores. The majority of inefficiency of HACETTEPE, KONYA, and ANTALYA is due to the poor performance in PTE. These three STPs had approached closely to optimal production level. They expanded rapidly and the low utilization of the inputs appears to be the key problem for them. However, low technical efficiency of ESKİŞEHİR, ÇUKUROVA, and MERSİN is attributed to low performance in SE. It also meant that STPs of ESKİŞEHİR, ÇUKUROVA, and MERSİN were not able to register unit CRS efficiency because they were not operating at the most productive scale size. According to this result, it can be concluded that the major issue of the ESKİŞEHİR, ÇUKUROVA, and MERSİN STPs is to plan for quick expansion instead of input/output transformation problem. Another finding obtained from TE and PTE scores is the fact that PTE scores were higher than TE scores for each inefficient STP. As expected, the VRS efficiencies that measure PTE excluding effects of scale of operations are larger than the corresponding CRS efficiencies (Ramanathan, 2005).

The establishment of STPs is a vital strategy employed to develop high-tech industries in many countries, including Turkey. Therefore, it is extremely important to determine how to evaluate the effectiveness of science parks (Yang et al., 2009). This study evaluating the relative innovation performance of the thirteen Turkish STPs can provide practicable objectives or strategic and managerial implications for science park authorities and firms. Science park authorities can now identify their comparative advantages and weaknesses and apply policies that leverage the parks' comparative advantages to reinforce innovative activity. One of the policy recommendations are provided to the authorities of inefficient STPs is to improve their research infrastructure. For example, it can be conducted on various implications such as giving the more support to located firms' R&D activities, guiding them to modern process management techniques and helping them to improve their marketing activities in STPs of HACETTEPE, KONYA, and ANTALYA. Strategic recommendation for authorities of inefficient STPs is to strategic alliances with other STPs. Synergetic effects of the interactions of the combination between STPs approaches can have a positive effect on increasing company and also national competitiveness. The findings about the innovation performance of STPs suggest that the parks milieu appears to have a positive impact on their firms growth as measured in terms of sales and jobs (Löfsten and Lindelöf, 2002). Firms as well might benefit from the availability of reliable performance appraisal tools to evaluate the levels of innovative productivity of STPs to guide them in choosing the location of their own research and development laboratories (Bigliardi et al., 2006). Moreover, to hinder of possible innovation failures, especially high-tech firms should make decision about the selection of their location strategically. Moreover, if it is considered that high-tech industries are characterized by high risk, and face greater technological uncertainty (Yang et al., 2009), choosing the most innovative STP is more important issue.

This research study, like a lot of the empirical researches, has many limitations that should be noted. Furthermore, it is important to discuss potential limitations before discussing the implications of our research further. One of these limitations is about input and output variables. Only three of all variables can be directly related with innovation in this study. So, to expand the model using more variables of innovation can be considered in future researches. Furthermore, the number of decision making units should be increased as a parallel of increasing research variables. The other limitation is about DEA. The original DEA results group the DMUs into two sets, efficient and inefficient. Since it is not perform full ranking (the efficiency value of 7 STPs is 1 in our study), another approach is required. The AHP/DEA model by Sinuany-Stern et al. (2000) can be used to avoid this pitfall.

ABSTRACT

In this study, the relationship between the innovation, which is known as one of the components of competitiveness, and competitiveness level is examined in macro level by taking the published data of 108 countries into account. In this scope the aim of this study is to answer the question: “What kind of a statistical relationship is there between innovation performance and competitiveness ranking of the countries that are in the scope of this study?”. In the study, first, the concepts of competitiveness and innovation are defined; then the statistical relationship between innovation and competitiveness is considered. At this step, parametric and nonparametric regression methods are used. For selecting the most appropriate model, the models are compared by taking AIC (Akaike Information Criteria), deviance ...etc. criteria into account. As a result, it is found that both the parametric and nonparametric models are statistically significant; but the nonparametric regression model explains the relationship better than the parametric model.

Keywords: Innovation, competition, competitiveness, regression analysis.

INTRODUCTION

Nowadays, national economical values replaced with global values and this situation makes the competition power of countries more important in the international market. Especially in today's crisis conditions, the countries have to enhance their competitiveness in accordance with the route defined by globalism, to gain advantage. In the related literature, the components of competitiveness are stated as follows (Schwab, 2009: 45-47) 1) institutions, 2) infrastructure, 3) macroeconomic stability, 4) health and primary education, 5) higher education and training, 6) goods market efficiency, 7) labor market efficiency, 8) financial market sophistication, 9) technological readiness, 10) market size, 11) business sophistication, 12) innovation.

In this study, the relationship between competitiveness and innovation (one of competitiveness' components), whose importance has been increasing since they are shown as the key of sustainable development, will be shown by statistical methods. Thus, the aim of this study is to answer the question: “What kind of a statistical relationship is there between innovation performance and competitiveness ranking of the countries that are in the scope of this study?”

The conceptual scope of this study is limited with “innovation performance” and “competitiveness ranking” of some countries. The application scope is limited with the innovation scores published by The Boston Consulting Group in March 2009 in the report “The Innovation Imperative in Manufacturing” (Andrew, Derocco and Taylor, 2009) and the competitiveness rankings found in “The Global Competitiveness Report 2009-2010” published by World Economic Forum (Schwab, 2009). The 108 countries which are found in both reports are taken into account. The originality of the study comes from testing of the relationship between the two main variables by two different models.

Competition and Competitiveness Concepts

In today's world, companies compete in a cutthroat competition environment to create a new product, process or a new category to become the leader of that category. Competition is with its broad meaning; "a game or a contest that is played by more than one player to share a scarce resource or to gain a prize, within some specific rules and limitations without allowing any privilege or discrimination" (Türkkan, 2009). In business administration literature, competition is defined as "being able to sustain the customer's preferentiality for their companies' products and services against alternative companies" (Porter et.al., 1996: 24). Competition with these properties, is a nested concept of creativeness and technology (Tekin et.al., 2003: 83), which has "competition" and "struggle" in its structure (Dulupçu, 2001: 1). Thus companies should develop their current production factors and products continuously to sustain a competitive advantage, in this globalization age.

The meaning of competition due to the globalization differs from the competition that was created by the industry economy in the first half of the 20th century by two main reasons. The first one is; the economics literature gained an integrated competition approach because of the company-region integration with globalization. The second reason is; the importance of national identity decreased as the companies lost their national properties (Dulupçu, 2001:94) due to globalization. Today's changing environment, technology, global competitors, life style, needs and respective solutions make the competition environment more difficult (Doyle, 1998: 59). In a study executed by TÜSİAD, competitiveness is defined as "the ability of increasing the size, market ratio and profitability" of the company (TÜSİAD, 2003: 126-127). For this reason, competition bears technological development, and new technologies bear new opportunities so the markets have to produce new products to satisfy the changing demand (Türko, 2006:75). There is an important relationship between the competition strategy and innovation capacity of countries in such a competitive environment. These strategies are; aggressive competition strategy, defensive competition strategy, and imitative competition strategy (Aygen, 2006: 46-49). Especially in the global crisis period, it is mandatory to renew and develop the current production factors and products, to have an advantage in competition. So, it becomes a necessity for the country economies to use "aggressive competition strategies", which is directly related to innovation performance and which targets the product and process innovation.

Within the globalization process, in addition to these concepts that are used in this intensive competition environment, another concept "International Competitiveness Power" is being used frequently (Kibritçioğlu, 1996: 2). This power is multi-dimensional and is different than the competitiveness power of individual companies. It has a large scope, including many institutional structures, country's production structure and technological substructure, technology production capacity and dynamics, and capital of qualified labor (Çiftçi, 2004: 102). In this scope, the international commodity system, awareness level of customers, flexibility of labor market, economical stability, natural wealth and law system of the country and level of sophistication of financial market become important besides product quality, cost and price (Aktan, 1998: 81). The International Competitiveness Power, which includes all of these factors, is known as one of the most important indicators of competitiveness level of countries.

Competitiveness, which is a term related to the long term performance (Man et.al., 2002: 47) of a company/country, is also defined as the power of increasing the company/country's market share, profit, development rate and sustaining competitiveness in the long term (Tracey et.al., 1999: 492). Competitiveness for a country is the ability of increasing the country's income, employment, life quality and international market share level as well as gaining the ability to obtain international commodity balance (Dollar & Wolff, 1995: 3). To gain and sustain this ability, the countries should enhance their innovation performance, which is known as one of the components of competitiveness, especially in this ongoing global financial crisis period. In crisis periods, innovation and creativeness are known as the best method to increase the competitiveness level of countries and to survive.

In crisis periods, sustaining the competitiveness and welfare level of countries needs more than international trade and capital flow. Both in country level and regional level, countries should increase their competitiveness power instead of producing temporary solutions to compete with the actors, who increase their power incredibly in this period. In these periods, international competitiveness becomes a term that cannot be explained by only quantitative factors. In such times, to become the leader of the competition against the rapidly changing technological environment the main factor is to keep up with the technology by innovation motivation and creating dissimilarities (Gümüştekin, 2009). Innovation is an important competition tool for countries since it increases efficiency and profitability, and helps to enter new markets and/or enlarge the current market. The economies that have efficient, profitable and competitive companies, also gain competitive advantage in global

scale. Thus, innovation performance is evaluated as an important factor that guarantees the increase in employment, sustainable development, social welfare and life quality (Elçi, 2009: 62-68).

Innovation Concept

Oslo Manuel was prepared by OECD to define basic innovation concepts systematically like innovation activities, innovative company, ...etc. and create a common language about these concepts to execute an integrated science and technology policy and make international comparisons. According to this Manuel, innovation is (Oslo, 2006: 50); the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations." In other words, innovation is the process of transforming a creative idea to a marketable product (Duygulu, 2007: 15). Shortly it is creating a new business opportunity rather than invention (Burgelman, 1986: 31) or the process of transforming information into economical activity (Tang, 2006: 68-82) and social benefit (Elçi, 2009: 62-69). Finland's old Prime Minister Esko Aho, describes innovation by comparing it to R&D with the words "R&D is transforming money to information, and innovation is transforming information to money" (Yetiş, 2009: 28-35).

Innovation can be collected under four main topics, as product, process, organizational and marketing innovation (OECD, 2006:50-57). All of these types of innovation are very important for companies and countries. World Economic Forum (WEF), defines the most developed countries as the ones whose economies are driven by innovation (Arslan, 2009:128-133). The speech of Barack Obama, defining innovation as "the capital of 21th century" can be an example of this statement since he is the last president of the U.S., which is one of the most developed countries according to this classification. Similarly, Industrial Research Institute, which is the common organization of 265 successful industry company of the U.S., declared that they owe at least half of the development of the U.S. in the last 50 years, to technological innovation (Gümüş, 2009:162-167).

As it is in the U.S. example, innovation performance of the countries also shows the economical performance of them. At this point, it is important for the countries whether they are in the demanding or supplying side. The supplier countries, contribute their long term development by innovation and distribution of technology. On the other hand, demander countries' negative payment balance forces the development model of those countries (Aygen, 2006: 86-87). The high competition environment in the standard product sector, decrease the profits and in long term it causes an unsustainable structure. Thus, in today's world, the cost-focused competition strategies left their place to design and innovation focused differentiation strategies (Kaplan, 2009: 20-26). Innovation sustains advantage to countries in the international competition since it increases the profitability (Terzioğlu, 2008:17-18) by decreasing the production expenses, avoiding irrational usage of sources (Tümer, 1995: 25-50), increasing performance and quality of the product and creating product differentiation (Roy and Riedel, 1997: 538). For this reason, while competition is shown as one of the outer reasons of innovation (Özgün, 2009:152-160), it is also accepted as one of the most important factors that affects the economical development and the improvement in life standards (Tang, 2006: 68-82). Due to these properties, innovation becomes more important during the financial crisis periods. If crisis is defined as giving a break to the race, the actions taken in this period will determine the ranking when the race starts again, and success is not possible with ordinary solutions but possible only with innovative approaches in such times. So it is obvious that the lack of innovation can be fatal in crisis periods (Elçi, <http://www.inovasyondunyasi.com/icerikg.asp?id=870>).

METHODS

In this study the innovation scores given in "The Innovation Imperative in Manufacturing", which was published by The Boston Consulting Group in March 2009 and the competitiveness rankings given in "The Global Competitiveness Report 2009-2010", which was published by World Economic Forum were used. 108 countries which were found in both documents are taken into account to be able to make a comparison. Parametric and non-parametric regression analyses are used in statistical part of the study. In selecting model stage, the models are compared by taking criteria like AIC (Akaike Information Criteria), deviance ...etc. into account. In the analysis R program is used since it is a free program that can be used online and is more successful at non-parametric analysis than most of the other programs.

EMPIRICAL STUDY

In this study, the relation between innovation and competition is examined statistically by using the data set including 108 countries' innovation scores and competitiveness rankings are evaluated by using both the

parametric and nonparametric regression models and model performances are compared by taking criteria like AIC (Akaike Information Criteria), deviance ...etc. into account. In these models, innovation score is the independent variable (innov) and competitiveness ranking is the dependent variable (comp) and the effect of innovation on competitiveness is examined.

The first model that is used in the study is parametric regression model:

$$y_i = \mathbf{x}_i^T \boldsymbol{\beta} + \varepsilon_i \sim N(0, \sigma^2), i = 1, 2, \dots, n \quad (1)$$

In this model, y_i is the i^{th} dependent variable, \mathbf{x}_i^T is the design matrix \mathbf{X} 's i^{th} row, $\boldsymbol{\beta}$ is the parameter vector and ε_i is the i^{th} error term.

When the effect of variables to the dependent variable variable is more complex than a functional relationship including finite parameter, the problem can be transformed to a nonparametric problem. For the same reason, the second model used in the study is nonparametric regression model as shown below:

$$y_i = f(t_i) + \varepsilon_i, \varepsilon_i \sim N(0, \sigma^2), i = 1, 2, \dots, n \quad (2)$$

Here, $(y_i, t_i), i = 1, 2, \dots, n$, are observation data; $f(t)$, represents itself, first and second order derivation in $[a, b]$ continuous smooth unknown function; ε_i , is the i^{th} error term.

Parametric Regression Model

Parametric model shown in equation (3) is created to examine the existence of the linear effect of innovation on competitiveness:

$$comp_i = \beta_0 + \beta_1 innov_i + \varepsilon_i \quad (3)$$

The control graphs for the model (3) are given in Figure 1.

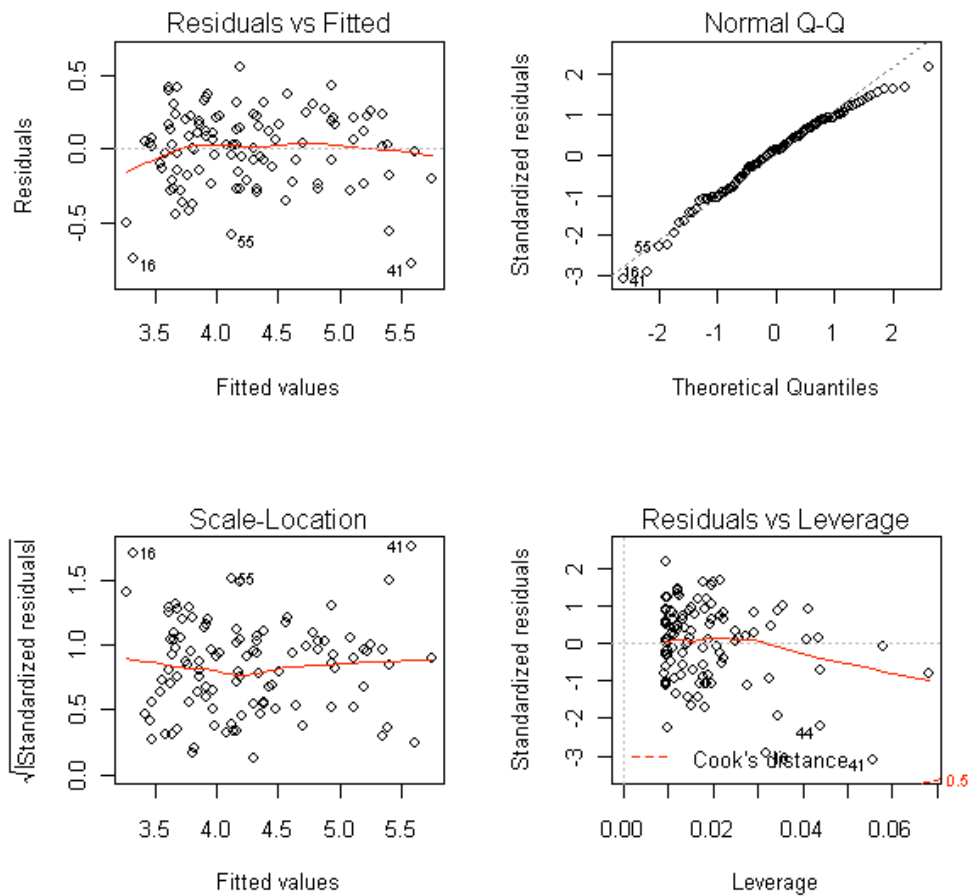

Figure 1. Control Graphs of model (3)

The graph in the upper left part shows the residuals versus fitted values. These residuals should distribute approximately equally below and above the zero line for constant variance situation. The graph in the lower left part also checks the constant variance assumption and this graph also has no problem. The upper right graph is a normal Q-Q graph. This graph shows the standardized residuals versus standard normal distribution percentage. If the residuals are normally distributed, the graph will be a straight line. Figure 1 does not fit to this description perfectly, because there is a deviation in the upper part of the graph. The lower right part of Figure 1 shows standardized residuals versus leverage. It is seen that all of the points are in acceptable limits as seen in Figure 1. The parameter forecasts and related summary of the statistics of model (3) are given in Table 1.

Table 1. Forecasts and related statistics of parametric model (3)

	Forecast	Standard Error	t-value	$\Pr(> t)$
Constant	4.2591	0.02497	170.58	<2e-16 ***
Innov	0.6082	0.02555	23.81	<2e-16 ***
Significance codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1				
F-value = 566.8, p-value = 2.2e-16				
$R^2_{adj} = 0.841$, Deviance = 7.135, AIC = 19.046				

When Table 1 is examined, it can be seen that the probability value of F statistics for parametric model (3) is smaller than $\alpha = 0.05$ significance level. This result shows that the model is statistically significant for $\alpha = 0.05$ level. When the significance of the parameter is examined, since the probability in the t statistics for the parameter forecast of innov variable is smaller than the significance level of $\alpha = 0.05$, it is statistically significant. The adjusted R^2 is also high ($R^2_{adj} = 0.841$).

On the other hand, in Figure 1, 16. and 41. observations attract attention. 16. observation belongs to Burundi, which has the lowest competitiveness score, and 41. observation belongs to Iceland, which has the third highest score for innovation. In the study, instead of forming the parametric model again by omitting these values, it is preferred to change the form of the model. For this aim, the first and last three countries in terms of innovation performance and competitiveness levels and their scores are given in Table 2:

Table 2. First and Last Three Countries in Terms of Innovation Performance and Competitiveness Levels

Country	Competitiveness Score	Competitiveness Rank	Innovation Score	Innovation Rank
Switzerland	5.60	1	2.23	2
United States	5.59	2	1.80	7
Singapore	5.55	3	2.45	1
Burkina Faso	3.23	106	-0.97	90
Zimbabwe	2.77	107	-1.63	108
Burundi	2.58	108	-1.54	107
Singapore	5.55	3	2.45	1
Switzerland	5.60	1	2.23	2
Iceland	4.80	23	2.17	3
Venezuela	3.48	96	-1.37	106
Burundi	2.58	108	-1.54	107
Zimbabwe	2.77	107	-1.63	108

In Table 2, it is seen that the countries having high competitiveness scores also have high innovation scores. But there is not a one to one correspondence. For example, the U.S. is in the second place for competitiveness but it is in the seventh place for innovation. Similarly, Venezuela, which is in the 96. place in competitiveness ranking, is in the 106. place for innovation. So it is obvious that the countries that have high competitiveness scores also have high innovation scores, but this does not mean necessarily that there is a parametric relationship between these two variables. Thus, in the following section nonparametric model is formed.

Nonparametric Model

The smoothness in the normal distribution assumption directed us to change the model form from parametric regression model to nonparametric. The equation (4) shows the nonparametric model:

$$comp_i = \beta_0 + f(innov_i) + \varepsilon_i \quad (4)$$

The model control graphs for model (4) are given in Figure 2.

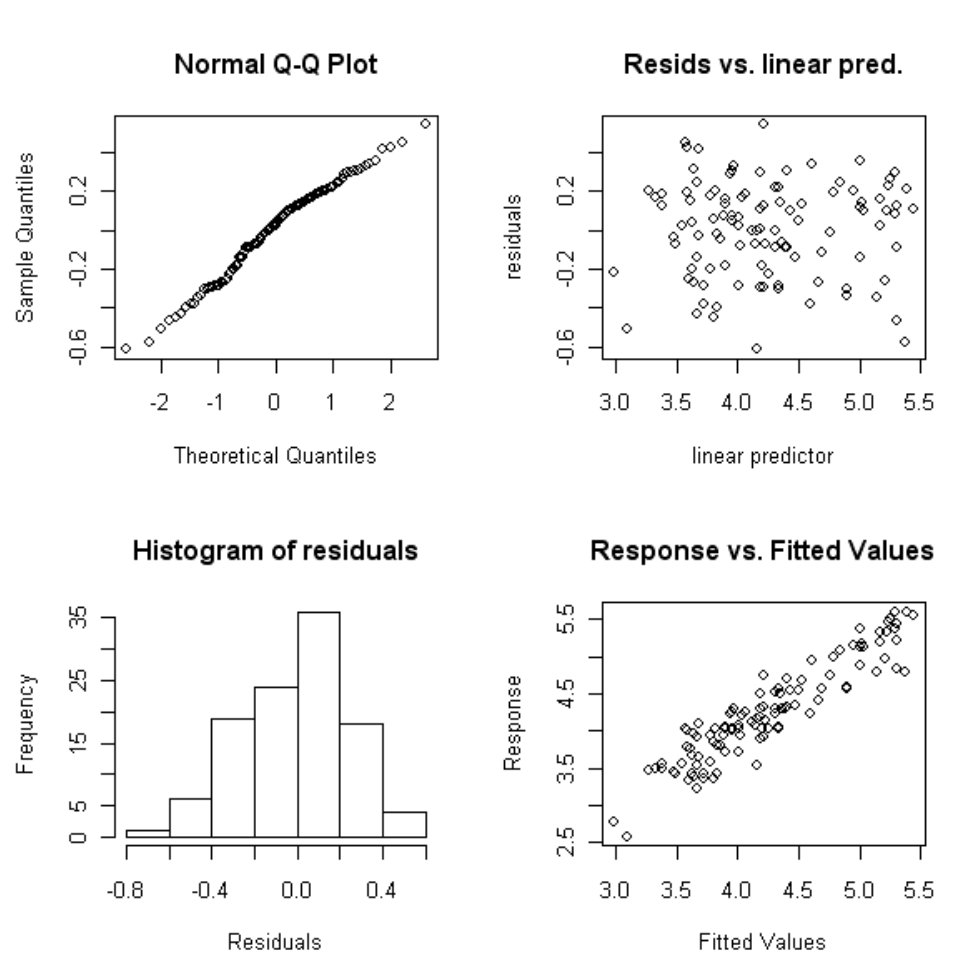

Figure 2. Control Graphs for Model (4)

When Figure 2 is examined, it can be seen that all of the graphs are meaningful. The parameter forecasts and some statistics are given in Table 3 for model (4):

Table 3. Parameter Forecasts and Some Statistics for Model (4)

Parametric Part				
	Forecast	Standard Error	t-value	$\Pr(> t)$
Constant	4.25074	0.02385	178.3	$<2e-16$ ***
Nonparametric Part				
	s.d.	Ref. s.d.	F-value	P-value
s(innov)	4.34	4.34	145.5	$<2e-16$ ***
Significance Codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1				
F-value = 566.8, p-value = 2.2e-16				
$R^2_{adj} = 0.855$, Deviance = 6.304515, AIC = 12.35716				

It is seen in Table 3, innov variable which is in the nonparametric part of the model has a nonparametric effect on comp variable at $\alpha = 0.05$ significance level. The forecast of s(innov) smooth function is given in Figure 3, graphically. The nonparametric effect of the variable innov can be clearly seen in this graph.

Figure 3. Smooth Function Forecast for Nonparametric Regression Model Given in Equation (4)

CONCLUSION

To compare the performances of Equation (3), parametric regression model and Equation (4), nonparametric regression model, Table 4 is formed:

Table 4. Statistics for Equation (3) and (4)

Models	AIC	Deviance	R_{adj}^2
Parametric Regression Model (Equation 3)	19.04569	7.135252	0.841
Nonparametric Regression Model (Equation 4)	12.35716	6.304515	0.855

It is seen in Table 4 that nonparametric regression model's AIC and deviance values are smaller than parametric regression model, and its adjusted R^2 value is larger. These three criteria show that nonparametric regression model (equation 4) is better than parametric regression model (equation 3).

The relevant literature and the data given in Table 2 show the existence of the relationship between the innovation and competitiveness. But this study focuses on the type of the relationship as well as the existence of it. As a result, Table 4 proves that the effect of innovation on competitiveness is not totally parametric. The classical parametric regression approaches in modeling do not take the existent nonparametric effect into consideration. In other words, for modeling the effect of innovation on competitiveness, the nonparametric regression model is found as more realistic when criteria like AIC, deviance and R_{adj}^2 are taken into account.

So, it is found out that, the innovation performances of countries have a positive effect on competitiveness level of these countries. This result supports the literature saying companies and countries, which do not give the necessary importance to R&D and innovation in the transition of "scale economy" to "variety economy", will be the victim of economical crisis (Arslan, 2009: 128-133).

PREDICTING MICRO-LEVEL INNOVATION POTENTIAL WITH NEUROFUZZY HYBRID MODELING – A MODEL FRAMEWORK

Richard Kasa

University of Miskolc, Hungary

ABSTRACT

In this recent article I am intent on showing the findings of my model building process. The aims of my model is as follows: forecast/estimate the innovation performance of a corporation; solve statistical and methodological problems such as stability – plasticity, interpretability - precision - significance using linguistic variables; offer solution for information granulation; avoid significant loss of information observed at hard statistic methods; able to adapt to varying environment. Nevertheless, it may exploit and algorithmize the benefits of the everyday human thinking (soft calculation – fuzzy logic) and the learning and adaptation abilities of the neural systems – the synergy between the mathematized everyday human thinking and classical mathematics. Innovation management sets the economical base of my research, which is indisputably a current issue nowadays. Fuzzy technologies have become a magic word in engineering, logistics or even in medical sciences, however, it is scarcely used in the fields of social sciences. In contrast to hard calculations – where accuracy, assurance and rigidity are the primary points of view – this soft calculation method returns to the stochastic reality, which is characterized by the tolerance to inaccuracy and some doubtfulness, thus creating effective synergy between casual linguistic and classical analytical modeling.

INTRODUCTION

In my research the positivist paradigm plays the main role of the specific coherent practices of the standards of academic pragmatics (laws, theories, adaptations, tools of researches, models). This is accounted for by the peculiarity of the subject, on the other part the predominance of available positivist literature against the interpretative.

The positivist approximation can be decolonized from any ethical considerations, normative verdicts (Friedman 1953): according to Keynes it deals with what exists and not what must exist. This approach contains a system of generalizations which makes possible to describe correctly the effects of the environmental changes with such performance which depends exclusively on accuracy, scope and correspondence with the facts of the prognosis - creating an objective system like they occur in natural science (Friedman 1953). According to the positivists a theory which is unable to describe reality with numbers is inappropriate and not well reasoned (McCloskey 1986). The goal of science for the positivist research workers is to reveal the scientific regularities whereby the phenomena under investigation will be explicable and at the same time predictable (Alvesson 2000). The goal of research is to reveal the objective verity with the collation of the effects of the research worker's personality, the chosen research method and the influential factors (McCloskey 1986). Hence the analytic confines of the research is predefined and universal, the analytic model is class-based (problem granulation), the process of the research is convergent, logically traceable an objective. According to Friedman's theory (1953) the positivist science is just as objective (or transposable) as any other natural sciences. Nevertheless the fact that social sciences deal with connections between people and organizations, the researcher oneself is a part of the research - in a more direct way than in natural sciences - makes significantly difficult to reach objectivity.

Accordingly there are two potential ways offering themselves. One of them is loosening the objectivity postulations set up by positivism. This way it can be reasonable to consider how much is the greatest permissible subjectivity which is still able to grant the objectivity of the natural scientific positivist approach.

The other available way is to prepare the applied methodology to cope with handling “fuzzy”, subjective, often inaccurate and noisy dataset by objective, solid mathematical laws.

And the research worker must choose from the two possible ways, hence according to Friedman's to this very day still standing thesis (1953) every economical deduction necessarily - even genuinely or impliedly - is based

on a positivist prediction telling us the consequences of doing rather this instead of that: providing information about the consequences of a given series of actions and not determining normative verdicts.

In the course of my research I will choose the second way: try to set up such modeling methodology into economics which based on the positivism's logical basics is able to take into the object of research also subjective and inert factors beside the expected objectivity (without yielding it). These factors are either forced to be precise (along with a high bias) by the classic methodologies or easing the positivist objectivism.

METHODOLOGICAL DIFFICULTIES OF MODELING MANAGEMENT ISSUES

Natural sciences as positivist sciences contain conditionally approved, generalizations related to social/economical phenomena. With these generalizations the effects of variations which occur in the case maps can be predicted. The extension of generalization, the accuracy of approximations, the confidence level of them and the enhancement of the predictions' accuracy are discouraged not only by the boundaries of the researcher's all-time capabilities, but such circumstances as well which occur vigorously in social sciences, especially in economics - however this is not their obligate idiosyncrasy (Friedman 1953). In economics inevitably we better rely on non-controlled experiences than on controlled experiments, hence it is exceptionally hard to provide clear and unambiguous evidence to verify hypothesizes correctly.

A hypothesis can only be tested with its conclusions, predictions and realism whether it can be verified or not. This is what disturbs our methodological principles, making difficulties in testing hypothesizes and verifying them. Ergo the social scientist has to be fully aware of his methodological principles, more than others and must strictly stick to their restrictive case maps, not allowing rejecting each or more of them. In this manner a social scientist has to adapt to those few of the deductible conclusions.

Considering the above being fully aware of restrictive assumptions is elementary during the phase when we are building our model. It is also indispensable to have the wide knowledge about techniques of testing the restrictive assumptions, being familiar with the standard system of requirements of social science's models.

Modeling requirements

The essential requirements of modeling in social sciences - just like in mathematics - are **accuracy**, **significance** and **strictness**. The consistency originates in that tract of the science philosophy of mathematics in the XIX century which is called the "Revolution of strictness". The naming originates itself from Imre Lakatos, Hungarian mathematics and science philosopher (positive heuristics, the critique of naive falsificationism). Since that time we know the very precise and exact standardization which was taken over into the classic (hard) modeling of social science. Herewith arithmetization and standardization of modeling has been started. During arithmetization it was tried to reconduct the elusive terms of analysis and the theory of real numbers to the certain conception of natural numbers. Standardization meant the method of strict verification analysis.

The second group of requirements was conceived by Lotfi Zadeh - professor of mathematics at Berkeley University - in his "Fuzzy systems" theory. The first paradox states that increasing the complexity of a model (system) causes the decrease of the ability to make precise and significant conclusions. Moreover at a margin we realize that **exactitude** (arithmetical formalism) and **significance** became two criteria of the system which are respectively baring out each other.

The stability/plasticity dilemma means also a similar problem: how could we build such a model which is **plastic** enough to bear with its fast changing environment but at the same time it is also **stable** enough to reserve the previously acquired knowledge (coherence).

Similar contradiction turns up in case of interpretability - exactitude and interpretability - significance concept pairs.

Restrictive requirements

Beside the requirements above the research worker must face several restrictive requirements during the procedure of model building. The classic modeling techniques viz. often are not prepared for such problems like for instance issued by the extreme complexity of target function: what should be done when we cannot formulate

the function which is analyzed for optimum (or any other known point). Perhaps if the high statistical error couples with low significance level or we can draw only approximate inference.

Subjective system information: Applying quantitative criteria is a common assumption of classic system modeling techniques. However in social science these so objective quantitative criteria are often not given for the researcher. In these cases the established custom is to transform the qualitative criteria to quantitatives but does this ensure objectivity? Are these transformations effective? The fact social science's - especially economics' - system information are subjective is widely admitted since all of our experiences are inevitably subjective. There are no exceptions to this rule (Babbie 2001). Accordingly it can be questioned whether a scientist could be such objective as the positivist ideal assumes. Now if our system information are subjective and the applied techniques require objectivity - just like the felt desire for positivism which seems invincible - then we must force the subjective information to precise or we must chose such methodology which is able to handle system information based on subjective value judgment.

Linearity: The cogency of congruity to the requirements of linearity is very strong since in most of the cases social scientists use linear regression in modeling. Most of the economic correspondences are nonlinear either by their variables or by their parameters. The research worker must transform the nonlinear model to linear - often with high bias - since during the estimation of parameters the case maps is near insatiable. In these cases the variables must be redefined.

Homoscedasticity: Must apply to every each probability variable of the regression model, so every variable must have the same finite σ^2 variance. Ergo each probability distribution has the same standard deviation with the target variable irrespectively of explanatory variables. Therefore the covariance matrix of the deviation variables is such a scalar matrix, which has the same σ^2 values in the main diagonal. For testing homoscedasticity the Goldfeld-Quandt, the Breusch-Pagan and the White tests are appropriate.

Independency: The explanatory variables of the model must be independent of each other: none of them can be reproduced by the linear combination of others. It is reasonable how difficult it is to find an example of such a system in reality organized in pursuance of stochastic principles where belonging to each of the criteria does not necessarily exclude the chance of belonging to another. It has an effect on that but besides there are other criteria which have effect on affiliation. In addition certainly there are lots of restrictive criteria the researcher must count on and which are well detailed in the most of statistics related books.

INTELLIGENT SYSTEMS

By the end of the 20th century the conventional system modeling techniques are more and more crowded out from scientific modeling by methods based on symbolic systems and artificial intelligence. These methods were used in same context with such expressions like interpretation and arguing by the end of the 90's. It was realized that systems based on these principles proved themselves to be efficient in solving such problems which could not be solved at all or only with defining lots of notations by traditional techniques like: analysis, statistics, precise and deterministic techniques of decision support and regulation, linear programming which can be perfect when dealing with simple problems. In more complicated cases certainly I mean the non-linear or dynamic programming techniques. The case maps of these techniques are increasingly insatiable. Let us take the simple regression model where the basic notation is the linearity of the variables and the disallowance of multicollinearity. However thinking through how hard it is to measure up to these expectations in such world where everything is coherent, connected: it is hard to identify every single effect and cause, making a big distinction between them.

Thus in very few cases the traditional techniques are not reliable and also not sure to be used. A problem can happen to be so complicated that we simply cannot formulate the function which is to be analyzed to find its optimum. It can also happen that the analysis could not provide a satisfying result, we get high statistical error with low significance level or we can only draw heuristic, approximate conclusions.

“Artificial intelligence based systems” is an umbrella term of such techniques and tools which handle problem solution by the human brain's functional analogies. The word “intelligence” alludes to the ability of efficient studying, adaptive response, making right decisions and the sophisticated way of lingual communication and comprehension. Hereby such models can be created which simulate the functioning of living organisms even the human brain's. These systems will be exceedingly appropriate for problem solution, pattern recognition, lingual processing, designing and forecasting more effectively and with less restrictions than the traditional models.

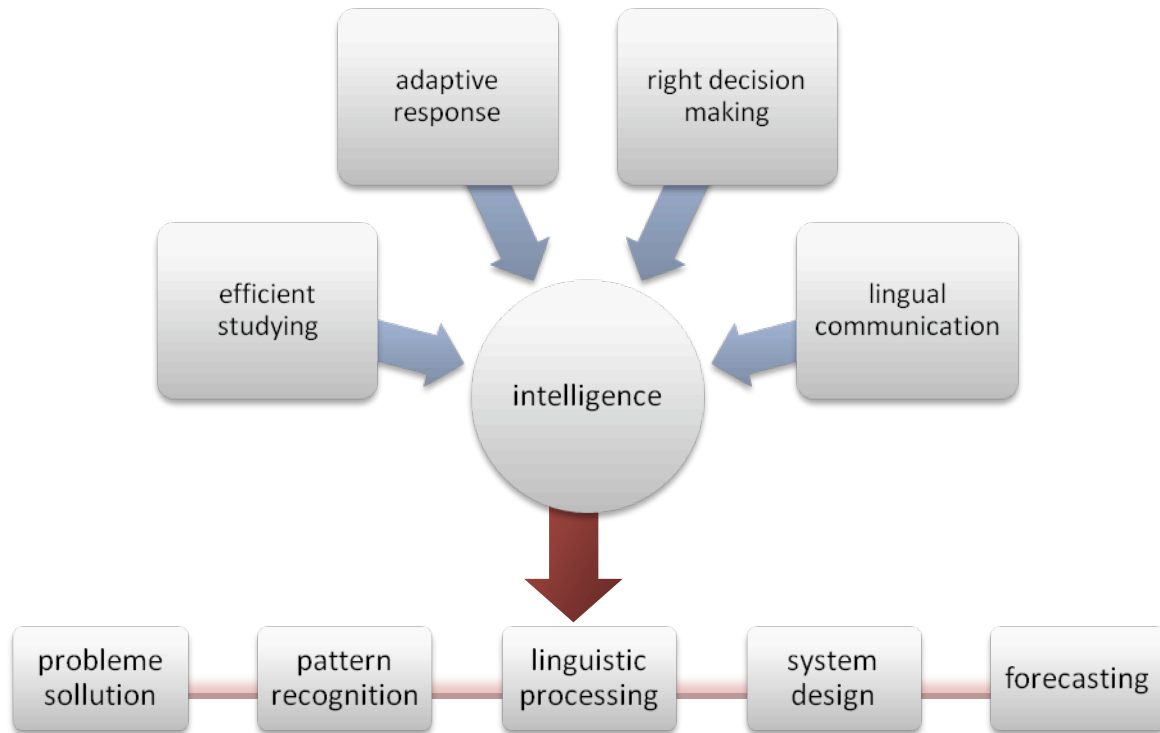

Figure 1: Intelligent systems (authors own edition)

ESTIMATION INNOVATION POTENTIAL

Modeling issues and performance objectives

Researchers tend to say that a model is not needed to develop a fuzzy controller, and this is the main advantage of the approach. However, will a proper understanding of the plant dynamics be obtained without trying to use first principles of physics to develop a mathematical model? And will a proper understanding of how to control the plant be obtained without simulation-based evaluations that also need a model? We always know roughly what process we are controlling (e.g., we know whether it is a vehicle or a nuclear reactor or a social model), and it is often possible to produce at least an approximate model. (Passino-Yurkovich, 1998) For a safety-critical application, if not a formal model is used, it is not possible to perform mathematical analysis or simulation-based evaluations. Is it wise to ignore these analytical approaches for such applications? Clearly, there will be some applications where you can simply "hack" together a controller, even fuzzy or conventional and go directly to implementation. In such a situation there is no need for a formal model of the process; however, is this type of control problem really so challenging that fuzzy control is even needed. Basically, the role of modeling in fuzzy control design is quite similar to its role in conventional control system design. In fuzzy control there is a more significant emphasis on the use of heuristics, but in many control approaches (e.g., PID control for process control) there is a similar emphasis. (Passino-Yurkovich, 1998) Basically, in fuzzy control there is a focus on the use of rules to represent how to control the plant rather than ordinary differential equations (ODE). This approach can offer some advantages in that the representation of knowledge in rules seems more lucid and natural to some people. For others, though, the use of differential equations is more clear and natural. Basically, there is simply a "language difference" between fuzzy and conventional control: ODEs are the language of conventional control, and rules are the language of fuzzy control. (Passino-Yurkovich, 1998)

Design of Controller module

According to Passino-Yurkovich fuzzy control system design essentially amounts to

- choosing the fuzzy controller inputs and outputs

- choosing the preprocessing that is needed for the controller inputs and possibly post-processing that is needed for the outputs
- designing each of the four components of the fuzzy controller

The fuzzy rule base is a central component of the fuzzy controller and it represents the “intelligence” in the fuzzy control algorithm. The rule-base is constructed so that it represents a human expert “in-the-loop.” The information that we load into the rules in the rule-base may come from some human expert (this is the place where the designer’s knowledge and experience must be correctly interpreted and organized into an appropriate set of rules). In some situations when there is no such human expert with many experiment, the control engineer will simply study the problem (perhaps using modeling and simulation) and write down a set of control rules that makes sense.

As an example, in the cruise control problem discussed above it is clear that anyone who has experience driving a car can practice regulating the speed about a desired set-point and load this information into a rule-base. For instance, one rule that a human driver may use is “If the speed is lower than the set-point, then press down further on the accelerator pedal.” (Passino-Yurkovich, 1998) Every fuzzy rule can be divided into an antecedent part (IF...) and a consequent part (THEN...), with antecedent parts describing causes and consequent parts describing consequences relevant for control action. (Bousslama-Ichikawa, 1992). A rule that would represent even more detailed information about how to regulate the speed would be “If the speed is lower than the set-point AND the speed is approaching the set-point very fast, then release the accelerator pedal by a small amount”. This second rule characterizes our knowledge about how to make sure that we do not overshoot our desired goal (the set-point speed). Generally speaking, if we load very detailed expertise into the rule-base, we enhance our chances of obtaining better performance. (Passino-Yurkovich, 1998)

Performance Evaluation

The basic reason for this is that a fuzzy controller is a nonlinear controller – so many conventional modeling, analysis (via mathematics, simulation, or experimentation), and design ideas apply directly. (Passino-Yurkovich, 1998) Since fuzzy control is a relatively new technology, it is often quite important to determine what value it has relative to conventional methods. Unfortunately, few have performed detailed comparative analyses between conventional and intelligent control that have taken into account a wide array of available conventional methods (linear, nonlinear, adaptive, etc.); fuzzy control methods (direct, adaptive, supervisory); theoretical, simulation, and experimental analyses; computational issues; and so on. Moreover, most work in fuzzy control to date has focused only on its advantages and has not taken a critical look at what possible disadvantages there could be to using it (hence the reader should be cautioned about this when reading the literature). For example, the following questions are cause for concern when you employ a strategy of gathering heuristic control knowledge.

- Will the behaviors that are observed by a human expert and used to construct the fuzzy controller include all situations that can occur due to disturbances, noise, or plant parameter variations?
- Can the human expert realistically and reliably foresee problems that could arise from closed-loop system instabilities or limit cycles?
- Will the human expert be able to effectively incorporate stability criteria and performance objectives (e.g., rise-time, overshoot, and tracking specifications) into a rule-base to ensure that reliable operation can be obtained? (Passino-Yurkovich, 1998)

These questions may seem even more troublesome (1) if the control problem involves a safety-critical environment where the failure of the control system to meet performance objectives could lead to loss of human life or an environmental disaster, or (2) if the human expert’s knowledge implemented in the fuzzy controller is somewhat inferior to that of the very experienced specialist we would expect to design the control system (different designers have different levels of expertise). Clearly, then, for some applications there is a need for a methodology to develop, implement, and evaluate fuzzy controllers to ensure that they are reliable in meeting their performance specifications. (Passino-Yurkovich, 1998)

Architecture of fuzzy model

The architecture of my fuzzy controller or fuzzy logic controller (FLC) is shown below as a block diagram. This model is composed of four main elements:

- A fuzzy rule base (a set of IF-THEN rules) which has a fuzzy logic quantification of the expert’s linguistic description of how to achieve a good control. It contains the knowledge in the form of a set or rules.

- An inference mechanism or inference engine (fuzzy inference module) which emulates the expert's judgment making in interpreting and applying knowledge about how to make predictions in desired fields.
- A fuzzification interface, which converts controller inputs into information that the inference mechanism can easily use to activate and apply rules.
- A defuzzification interface, which converts the conclusions of the interference mechanism into actual inputs of the process.

Basically we should view the fuzzy controller as an artificial decision maker that operates in a closed-loop system in real time. It gathers output data $y(t)$, compares it to the reference input $r(t)$ and then decides what the plant input $u(t)$ should be to ensure that the performance objectives will be met. (Passino-Yurkovich, 1998) To design the fuzzy controller, information must be gathered on how the artificial decision maker should act in the closed-loop system. Sometimes this information can come from a human decision maker who performs the control task, while at other times the control engineer can come to understand the dynamics of the system and write a set of rules about the forecast without outside help. These rules basically say "IF the innovation output and reference input are behaving in a certain manner, THEN the input should be some value" as mentioned above. A whole set of such "IF-THEN" rules is loaded into the rule-base, and an inference strategy is chosen, then the system is ready to be tested to see if the closed-loop specifications are met. (Passino-Yurkovich, 1998)

Fuzzy sets are used to quantify the information in the rule base, and the inference mechanism operates on fuzzy sets to produce fuzzy sets, so it must be specified, how the fuzzy system will convert its numeric inputs into linguistic outputs.

Let x (X be a linguistic variable and $T_i(x)$) be a fuzzy set associated with a linguistic value T_i . The conversion of a physical (numerical) value of x into a corresponding linguistic value by associating a membership degree, $x \in \mu T_i(x)$ is called fuzzification. The membership degree $\mu T_i(x)$ represents the fuzzy equivalent of the value of x . (Kovacic-Bogdan, 2006)

The inference mechanism has two basic tasks:

- determining the extent to which each rule is relevant to the current situation as characterized by the inputs $u_i, i = 1, 2, \dots, n$ (this is task "matching")
- drawing conclusions using the current inputs u_i and the information in the rule-base (we call this task an "inference step"). For matching note that $A_{j_1} \times A_{k_2} \times \dots \times A_{l_n}$ is the fuzzy set representing the premise of the i th rule ($j, k, \dots, l; p, q$) i (there may be more than one such rule with this premise). (Passino-Yurkovich, 1998)

The result of fuzzy inference is a fuzzy output set. On the other hand, every control task will imply the existence of crisp value at the fuzzy controller output. The procedure which extracts crisp output value from a fuzzy output set is called defuzzification.

Architecture of neural network

The neural network model is based on the following parameters which describe a neuron as shown on figure 2:

- Input connections (or inputs): x_1, x_2, \dots, x_n . There are weights bound to the input connections: w_1, w_2, \dots, w_n ; one input to the neuron, called a bias, has a constant value of 1 and is usually represented as a separate input, say x_0 .
- Input function f , calculates the aggregated net input signal to the neuron $u = f(x, w)$, where x and w are the input and weight vectors correspondingly; f is usually the summation function:
- An activation (signal) function s calculates the activation level of the neuron $a = s(u)$.
- An output function calculates the output signal value emitted through the output (the axon) of the neuron: $o = g(a)$; the output signal is usually assumed to be equal to the activation level of the neuron, that is, $o = a$. (Kasabov, 1998)

Figure 2: Artificial neuron (authors own edition)

An artificial neural network (or simply neural network) is a computational model defined by four parameters:

- Type of neurons (also called nodes, as a neural network resembles a graph)
- Connectionist architecture—the organization of the connections between neurons
- Learning algorithm
- Recall algorithm

The functioning of the neural network, when an input vector x is supplied, can be viewed as a mapping function $F: X \rightarrow Y$, where X is the input state space (domain) and Y is the output state space (range) of the network. The network simply maps input vectors $x \in X$ into output vectors $y \in Y$ through the "filter" of the weights, that is, $y = F(x) = s(W, x)$, where W is the connection weight matrix. The functioning of a network is usually based on vector-matrix real-number calculations. The weight matrix represents the "knowledge", the long-term memory, of the system, while the activation of the neurons represents the current state, the short-term memory.

The most attractive characteristic of neural networks is their ability to learn. Learning makes possible modification of behavior in response to the environment. A neural network is trained so that application of a set X of input vectors produces the desired (or at least a consistent) set of output vectors Y , or the network learns about internal characteristics and structures of data from a set X . The set X used for training a network is called a training set. The elements x of this set X are called training examples. The training process is reflected in changing the connection weights of the network. During training, the network weights should gradually converge to values such that each input vector x from the set training data causes a desired output vector y produced by the network. Learning occurs if after supplying a training example, a change in at least one synaptic weight takes place. (Kasabov, 1998)

The training examples comprise input vectors x_i and the desired output vectors o_i . Training is performed until the neural network "learns" to associate each x_i input vector to its corresponding and desired output vector o_i . For example, a neural network can learn to approximate a function $y=f(x)$ represented by a set of training examples (x, y) . It encodes the examples in its internal structure.

Hybrid modeling

The combined fuzzy-neuro system uses the advantages of both fuzzy model and neural network model. The output from the controlled process of the fuzzy controller is the input of the supervised neural network through the system's error detection mechanism. At the same time, the outputs of the neural network are the crisp inputs of the fuzzy controller. These inputs are modified by the feedback mechanism. In this sense there are two circles of the model: one for the neuro-fuzzy forecasting process mechanism, which produces outputs for the model, and the other feedback circle, intended to reduce the statistical errors of the weights of the neural network.

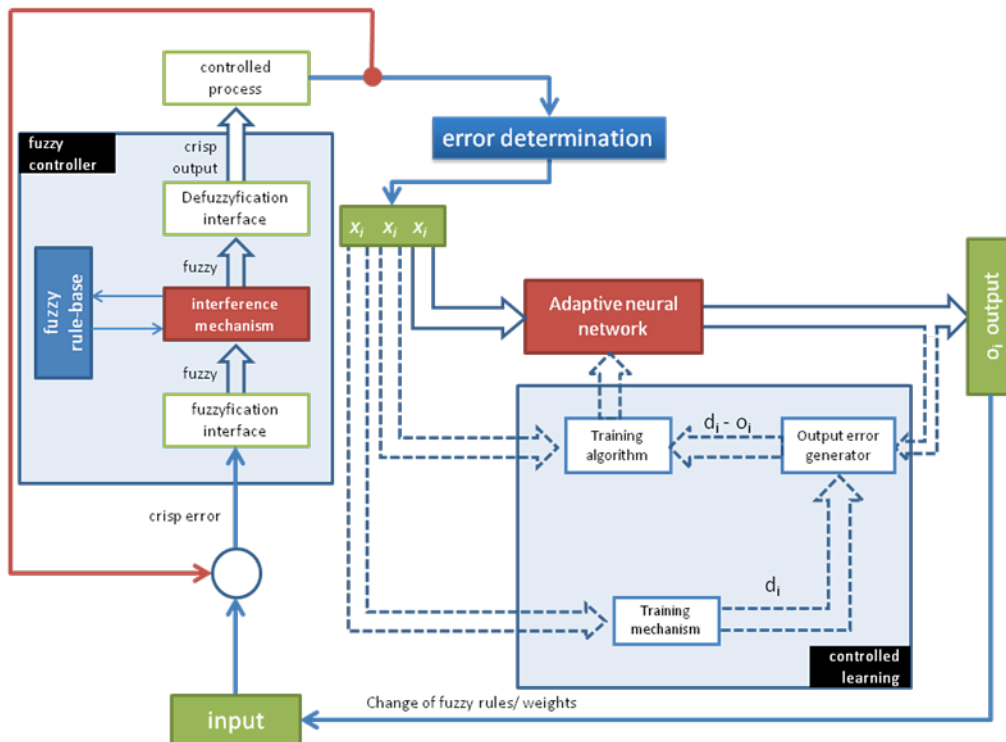

Figure 3: Block diagram of hybrid system (authors own edition)

ESTIMATION PARAMETERS

When defining the variables of the model we must separate them into two groups: on the one part the explanatory variables whereby we estimate and on the other hand the dependent (explained) variable which is estimated by the model. Each and every variable is a result of aggregation by factor analysis. The setup of each factor is done by the following variables:

F1a	Motivation	Creativity inspiration, Remuneration, Change seeking, Change adaptation
F1b	Socialization	Group work, Innovation culture, Competitiveness, Communication, Ratio of experts, Age
F1c	Action	Researches, Wide range of products, Modern products, improving quality, Adaptation of modern/efficient processes, Stepping to new markets, Increasing market share, Achieving higher elasticity in production, Improving work safety, Lowering the specific labor cost, Lowering the specific material cost, Meeting the rules, fulfilling standards
F1d	Adaptation	Problem solving, Brainstorming, Assimilation with tasks
F2	Strategy	Long term company strategy, Market improvement strategy, Product improvement strategy, Innovation strategy, Reputation of strategies, Assimilation of strategies, Fitting of strategies
F3	Diffusion	Company inside the group, Suppliers, Customers, Competitors, External experts, research centers, Universities, Outsourcing, Expositions, Conferences, Patent examination
F4	Information	Efficiency of information, Effectiveness of information, Controlling, IT, Commercial sources, Marketing, Market leverage effect
F5	Resources	Revenue, R & D expenses, Human resources, Creativity, Value added
F6	Technology	Modernity, Incidence, Efficiency, Monitoring, Pushing effect, Adaptation of technologies, Supplier companies, Production-intensive company, Research-intensive company
F7: Y	Achievements	Amount of released publications, Number of protected patents, Number of know-hows, licenses, Marketization, Number of company innovations, Commitment, Competitiveness

F1a-F1d:
Organization

SUMMARY

Hereby I schemed the reasonableness of necessity of a neuralized fuzzy system in aspect of positivist scientific theory. I presented the procedure of building the system and the particularities of its operation. I have also defined the variables which can be used to estimate effectively the innovation potential at company level.

Although the data of the primary research are just being evaluated - so I cannot provide any consequences about the functioning of the model at this stage - but it is clear by now that the model is appropriate for solving scientific theoretical and methodological problems, thus describing reality more precisely.

ISTANBUL: A CANDIDATE CITY FOR THE GLOBAL INNOVATION LEAGUE?

Dilek Çetindamar
Sabancı University, Turkey

Ayşe Günsel and Sema Türkkantos
Gebze Institute of Technology, Turkey

ABSTRACT

The main objective of this paper is to explore potential of Istanbul as a city region in the innovation league. There is a growing awareness amongst regional authorities that the economic growth and competitiveness of their cities depends largely on the capacity of indigenous firms to innovate. This paper mainly analyzes the technological and innovation infrastructure of Istanbul and compares Istanbul with some successful global cities. By situating the city in the national and global context, it shows that Istanbul has gained a substantial lead in developing an innovation environment but it still lacks global network and linkages as well as weak in terms of research institutions. Finally, some of key challenges Istanbul face in becoming a global city is pointed out.

Keywords: *Istanbul, knowledge economy, innovation, regional innovation systems, city regions.*

INTRODUCTION

The rise of the knowledge based economy highlights the crucial role technological innovation plays in economic development (Castells, 2000). The major components of knowledge-based economy include: an economic and institutional regime that provides incentives for the effective use of existing knowledge, the creation of new knowledge, and entrepreneurship; an educated and skilled workforce that can create and use knowledge; a dynamic information and networking infrastructure in order to facilitate the efficient communication, dissemination, and processing of information; and an effective innovation system to tap into global knowledge and adapt it to local needs, and ultimately create new knowledge (Wu, 2007). Thus the territorial aspect of innovation as cities and regions becomes more and more important (Crescenzi, 2005)

These regions/cities are expanding vigorously, presenting challenges to researchers and policy makers (Scott et al., 2001). Establishing knowledge-based infrastructures in regions or cities becomes as one of the main tasks for governments in transforming their economies. Accordingly academic interest in clusters, regions and big cities is increased (Faulconbridge, 2007)

The goal of this paper is to explore the potential of Istanbul in becoming an innovative city in the global knowledge economy. The paper has six sections. After this short introduction, theories on innovation systems will be briefly mentioned. Section 3 will focus on studies on cities, followed with the analysis of technological and innovation infrastructure of Istanbul. Section 5 will attempt to compare Istanbul with some successful global cities. The final section, concluding remarks, will lay some thoughts on the challenges Istanbul faces in becoming a global city.

THEORETICAL BACKGROUND

Innovation is one of the key determinants of economic growth (Jolly, 2008; Crescenzi, 2005). In other words innovation itself is a strong competitive strategy to achieve world-class manufacturing status and compete effectively in global networks and markets (Prajogo et al., 2007). The quest for mutual proximity on the part of all manner of economic agents at the present time is in significant degree a strategic response to heightened economic competition which has placed a premium on learning and innovation (Scott et al., 2001). That is

why in 2000, the conclusions of the presidency of the Lisbon European Council established the goal of making the European Union (EU) the ‘most innovative and dynamic knowledge based economy in the world’, known as the ‘Lisbon Strategy’ (Crescenzi et al., 2007).

As a collective learning and socially embedded process, innovation is crucially dependent on tacit knowledge and untraded interdependencies (Crescenzi, 2005). Successful innovation requires not only brilliant scientists; but also everyone from top management to employees in its R&D, finance, production and marketing divisions. It involves high-quality decision-making, long-range planning, motivation and management techniques and co-ordination. Accordingly, the innovation performance of a firm is determined not only by “hard” factors such as R&D manpower and R&D investment, but also by certain “soft” factors such as management practices and governance structures (Fu, 2008). Therefore as stated in the Lisbon strategy, innovations are not generated just by actors being individuals, organizations or institutions but also by complex patterns of interactions between them these actors. Actors and interactions among them form the basis of innovation systems that generate, adopt, and transform innovations into the context (Almeida et al., 2008). Innovation systems are sources of learning and innovation for nations and regions (Berger and Diez, 2006).

Networking/collaboration with local firms and organizations has always played a major role in economic theories (Faulconbridge, 2007). There has been a rapidly growing literature on this topic during the 1990s (Freeman, 2001). A basic idea of the literature on innovation systems is that it is the entire productive system rather than the firm itself that should be considered in order to understand differentiated business performance (Eraydın and Koroğlu, 2005).

Innovation systems are classified in many dimensions. For example, at the macro level, there is national innovation system (NIS). NIS is a set of institutions whose interactions determine the innovative performance of national firms. It is composed of elements and relationships which interact in the production, diffusion and use of new and economically useful knowledge (Godin, 2007). The NIS approach is theoretically rooted in institutional and evolutionary economics (Berger and Diez, 2006).

Another level where innovation systems are built upon is regions or clusters, whereby the borders of regions differ from a city to cross-border geographical units such as Kyongbuk-Taegu in South Korea and Santa Catharina in Brazil (Crescenzi, 2005). While much of innovation literature insists on the central importance of national systems; sub-national entities, such as provinces, industrial districts, cities or “Silicon Valleys” are conceived as more important than the nation-state (Freeman, 2001). Kyongbuk-Taegu in South Korea and Santa Catarina in Brazil are a few examples of successful innovative regions (Cooke, 2001).

Considering that territories with their social, cultural, and institutional realm are fundamental for successful innovation, some researchers claimed the end of the nation state and the rise of the regions (Ohmae, 1995). Even though these claims seemed exaggerated, they have stimulated strong research interest in various regions. In the field of innovation research, this led to the formulation of the concept of ‘Regional Systems of Innovation’ (RSI) (Berger and Diez, 2006; Crescenzi, 2005).

Often four criteria are mentioned to define a region: (I) a region must not have a determinate size; (II) it is homogeneous in terms of specific criteria; (III) it can be distinguished from bordering areas by a particular kind of association of related features; and (IV) it possesses some kind of internal cohesion (Cooke, 2001).

To define a region from an economic perspective, sometimes the concept of industrial cluster is used (Porter 1998). Clusters can be characterized as a dense network of economic actors, who work together very closely and who have intensive exchange relationships. On the other hand regional cluster defined as a spatial and industrial concentration of firms (Bresnahan et al., 2001). Indeed RSI is a cluster; dedicated to create inventions in which there is high geographic concentration. However regions can have more than one economic cluster. For instance, Silicon Valley is a large complex including ICT and biotechnology clusters, if we define it economically (Niosi and Bonik, 2005).

Proximity plays a major role on networks and interaction density within RIS context; this fact is in general attributed to the tacit nature of a relevant part of knowledge. Tacit knowledge “is best shared through face-to-face interactions between partners who already share some basic commonalities: the same language, common “codes” of communication and shared conventions and norms...” (Asheim and Gertler, 2005: 293). Although knowledge is a non-rival public production asset, which can generate positive externalities or

spillovers to others; knowledge spillovers are geographically or regionally localized (Fu, 2008). As a set of economic, political and institutional relationships within a given geographical area, RSI (Asheim and Coenen, 2005; Niosi and Banik, 2005):

- I. creates dispersed interactions among heterogeneous agents
- II. generates a collective and interactive learning process
- III. offers a regional production structure or knowledge exploitation subsystem which consists mainly of firms, especially where these display clustering tendencies
- IV. provides a supportive infrastructure or knowledge generation subsystem which consists of externalities and market channels such as public and private research laboratories, universities and colleges, technology transfer agencies, vocational training organizations and foreign direct investment (FDI)
- V. leads to the rapid diffusion of knowledge and best practice.

Eraydın and Koroğlu (2005) highlight the additional benefits of a RIS: unique labor market conditions, flexibility through specialization and inter-firm co-operation, collaboration instead of competition, and subcontracting relations among vertically disintegrated firms specialized in different stages of production.

As it attracts FDI; labor market conditions is perhaps the most important feature of RSI. Foreign direct investment contributes to regional learning and innovation in four ways. First, research and development (R&D) and other forms of innovation created by foreign firms and R&D labs of multinational enterprises (MNEs) raise the innovation outputs in the region directly. Second, spillovers emanating from foreign innovation activities may affect the innovation performance of small and medium size enterprises (SMEs) in the region in which they operate. Third, FDI may have an effect on regional innovation capacity through competition effect. Finally, in addition to greater R&D investments by MNEs and their affiliates, FDI may contribute to regional innovation capabilities by means of advanced practices and experiences in innovation management and thus greater efficiency in innovation. However, it is important to remind that host regions effectively benefit from the advanced technology embedded in FDI if and only if the region has capability to identify, assimilate and develop useful external knowledge (Fu, 2008).

CITIES

Cities have been always important since the beginning of civilization. Even though Adam Smith's book was entitled "The Wealth of Nations" and his main concern was to investigate "the different progress of opulence in different nations", he nonetheless included a long discussion part of "The rise and progress of cities and towns since the fall of the Roman Empire" (Freeman, 2001). Globalization has affected the social and spatial changes in large cities and city regions. The concept of city-regions can be traced back to the "world cities" idea of Hall (1966) and to the "global cities" idea of Sassen (1991). The major cities all over the world are now facing pressures to rethink the impacts of policies for competitiveness and integration with the global economy on their socio-spatial structures, after a period of entrepreneurial policies shaped by the notions of globalization (Eraydın, 2008).

City regions are major drivers in the global economy and they are themselves transformed by globalizing forces. Özdemir (2002) observes the technology based transformation economy, in which finance and producer services have an important share. City centers have become the key sites where the results of these transformations are apparent. Moreover as production becomes more science based, advantages such as developed research infrastructure, a highly qualified workforce or an innovative culture are becoming more important than natural resources, which means that a supportive environment for innovative companies can deliberately be created (Cooke, 2001).

Eraydın and Koroğlu (2005) also states that labor market conditions receives special attention in the context of clusters and innovation systems. Knowledgeable and qualified people are not evenly distributed in geographic area; they are placing greater demands on the city infrastructures that deliver vital services such as transportation, healthcare, education and public safety. Adding to the strain are ever-changing public demands for better education, greener programs, accessible government, affordable housing and more options for senior citizens. For example a report from the IBM Institute for Business Value titled as "A Vision of Smarter Cities" declares that cities symbolize and centralize so many aspects of what will make for a better education, better healthcare, better water and energy use, better public safety, better transportation, and better government and so on. In the report, Vancouver (Canada), Melbourne (Australia) and Vienna (Austria) is ranked as the smartest cities in World. Accordingly these cities appear as important centers for qualified labour and migration.

In a multi-region open economy with high levels of population mobility, the map of human capital is being restructured by labor migration (Storper and Scott, 2009). For instance, the proportion of migrants in the population of the three provincial-level cities of China (i.e. Beijing, Shanghai, and Guangzhou) is around 17 to 20 percent of the total population (Cartier et al., 2005). Besides, human capital is in part created by means of education, training, on-the-job learning and broad processes of socialization. Human capital may also be created via interactions between appropriately matched or complementary individuals. In turn, the resulting stock of human capital of a city affects its economic performance in many ways (Storper and Scott, 2009).

Another reason why the highly skilled labor appears in large cities is that skilled workers may be more productive when surrounded by their peers (Noise and Blank, 2005). Thus, 'cities exist in part to facilitate learning between individuals who come into contact with one another' leading in turn to an urban wage premium (Storper and Scott, 2009). This constitutes another aspect of cities as innovation centers.

There are numerous studies showing how regions and cities outperform in terms of growth to their counterparts. Eraydın (2008) asserts that territorial cities have grown faster and have been able to increase their relative shares in the world economy. Niosi and Banik's (2005) study also shows that companies located in three largest provinces (Toronto, Montreal, and Vancouver) of Canada definitely perform better. Cooke (2001) discusses the successful regions of Massachusetts and California in creating their biotechnology and ICT clusters as well as Hollywood, Los Angeles and 'Silicon Alley' in New York in developing new media. Faulconbridge (2007) categorizes New York and London as 'learning and knowledge intensive cities'.

In fact it is the globalization; technologic transformation and migration of labor that result with the rise of the city regions. Moreover information technologies allow the formation of new forms of social organization and social interaction along electronically based information networks within city regions (Castells, 2000). Accordingly different types of city regions with different characteristics appear. Also on the basis of the intensity of their technology production, as measured by the R&D intensity, of technology use, intangible investments and human capital, industry categorization under the auspices of the OECD takes part in these different city region definitions and categorizations. Based on her comprehensive literature review, Eraydın (2008) categorizes the city territories into six dimensions as shown in Table 1. There are global cities, learning regions, informational cities, traditional industrial districts, high technology industrial districts, challenging cities and platforms of cheap labor. A brief definition of each category is given below:

- I. Global cities: Global cities emphasize increasing attraction of cities due to increasing global functions, massive migration, and employment for both skilled and unskilled workers. As mentioned above the labor force is an important competitive asset as its size, characteristics and quality determine the level of competitiveness of a certain city and its integration within the global economy.
- II. Learning regions and informational cities: This kind of city regions stresses increasing knowledge and innovation capacity, specialization, increasing opportunities for skilled manpower and people with talents.
- III. Traditional industrial districts: Main features include production for external markets, increasing flexibilities and the use of social capital, networking among local actors and increasing employment opportunities.
- IV. High technology industrial districts: Technological capabilities and innovation become the basis of production and thus require highly skilled manpower. There is specialization in high-tech activities.
- V. Challenging cities: These cities integrate into the global economy by both traditional and new/high-technology economic activities. Challenging cities use mixed strategies.
- VI. Platforms of cheap labor: This kind of city regions involves integration in the global economy with cheap labor resources. There are increasing employment opportunities in low-wage and informal work.

Eraydın's classification concerning the city regions is a useful guide to determine the current position of a city and to make a roadmap for future. Similar to Shanghai that is a leading production, commercial and financial center, Istanbul is economic and technological locomotive of Turkey. The following section analyzes Istanbul on the basis of Eraydın's classification.

Table 1. City Types and their Sources of Competitiveness, Economic Growth and Restructuring

	The sources of competitiveness	Economic growth and restructuring
<i>Integration with command functions</i>		
Global cities	The intersection of different types of global networks Global command functions Centres of capital accumulation Concentration of specialized producer services	Increase in high value-added services; banking and finance, legal and accountancy services, consultancy, telecommunications, R&D and higher education
<i>Territories integrating with knowledge and innovation capacity</i>		
Learning regions	Medium of interaction for knowledge creation Learning infrastructure Institutions and networks that facilitate the circulation of ideas and creative knowledge	Specialisation in new fields and competitive activities Increasing relations between business and universities
Informational cities	Acting as a source of information and dissemination of information to the whole world by global Networks	Increasing importance of storage and dissemination of information Building new external networks
<i>Integrating with production capacities</i>		
Traditional industrial districts	Flexible production organization, local production networking, collaborative relations Social networks and social capital Quick response to changing demand conditions	Increasing specialization and clustering Innovativeness based on both tacit and codified knowledge
<i>Integration with technological capabilities</i>		
High-technology industrial districts Technopolis, technoparks	Infrastructure that facilitates innovation Proximity to R&D centres Clusters of high-technology firms Networks of knowledge dissemination and creation Availability of human capital	Development of innovation-oriented business Following successful firms Labor market recruitment and knowledge carriers
<i>Integration with both traditional and new functions</i>		
Challenging cities	Dualistic economic structure and labor market Sustained importance of mature and labor-intensive manufacturing	Increase in new (high-tech) manufacturing activities and producer services
<i>Integration with cheap labor and natural resources</i>		
Platforms of cheap labor	Cheap and abundant labor	Expansion of the economy Rise in foreign direct investment

Source: Adopted from Eraydın (2008)

ISTANBUL

Istanbul is the biggest city in Turkey in terms of economic development and urban population growth. It has always been the centre of the national economy and, at the same time, an important international node within a large hinterland extending from Eastern Europe to the Middle East and from the Black Sea region towards central Asia. Moreover, after the disintegration of the Soviet Union in 1989, Istanbul has become the centre of the large hinterland formed by the countries bordering the Balkans, Caucasia, Turkic Republics, Middle East and the Black Sea (Berkoz and Eyüboğlu, 2007). But which competitive assets make Istanbul attractive for becoming an innovative city? A brief background on Istanbul's competitive assets will consist of five dimensions: labor force, industrial and trade structure, FDI, technological infrastructure, and firm level technological competence.

Labor Force

The total population of Istanbul was seven million in 1990 and 12.7 million in 2008, the most crowded city among 81 cities in Turkey (TÜİK, 2008). This large population is highly diversified and well educated: 93

percent of its population is literate and almost 12 per cent of its graduates are university-graduates. 10 per cent of all university students in Turkey are in Istanbul. In addition, Istanbul has attracted migrants from several countries as well as from different parts of Turkey. On the average, the city intakes 400 thousand people every year (TÜİK, 2000). The migration of scientific and technical personnel from different regions of Turkey and abroad, on the other hand, made the city attractive to foreign investors due to its supply of qualified labor. Considering that the main characteristics of cities is the availability of qualified labor (Niosi and Blank, 2005), Istanbul has a strong asset.

The first study that compares the competitiveness of Turkish cities is conducted in 2007 to create a Turkish urban competitiveness index (EDAM, 2009). EDAM uses six dimensions in measuring the competitiveness of cities in Turkey as follows: I) Human capital, II) Physical infrastructure, III) Social capital, IV) Economic efficiency index, V) Labor market index, VI) Creative capital index. Among all Turkish cities, except creative capital index, Istanbul is ranked as the first city.

Following EDAM, International Competitiveness Research Association (URAK) created another Turkish urban competitiveness index in 2008 using four major criteria; human capital index, branding capability and innovation index, commercial ability and production potential index and accessibility index (URAK, 2008). Except human capital index, Istanbul is ranked as the first city among all Turkish cities.

It is interesting to see Istanbul as the second city following Ankara in human capital index (URAK) or in creative capital city (EDAM). Both indexes have similar components such as technical staff per 1000 people, the ratio of R&D expenditure over R&D output for public, the ratio of R&D expenditure over R&D output for private sector, academic publishing per head.

Istanbul outperforms other cities in Turkey, however in order to determine the potential of Istanbul on a global innovation league, it is necessary to explore where Istanbul is ranked among global cities. In Beaverstock et al.'s (1999) study in terms of world-cities with values ranging from 1 to 12; Istanbul is a world city with 4 points along with other international cities of Atlanta, Barcelona, Berlin, Buenos Aires, Budapest, Copenhagen, and Hamburg. Indeed Beaverstock et al.'s (1999) study is a remarkable research investigating cities' global capacity or world cityness using four basic criteria:

- I. Cosmopolitan characteristics and the multinational corporate economy
- II. World cities and the new international division of labor
- III. The internationalization, concentration and intensity of producer services
- IV. World cities as international financial centers.

Furthermore the world city index of Beaverstock et al.'s (1999) is updated by Globalization and World Cities Study Group and Network in 2008. Istanbul seems to go up into a higher class from gamma world city with 4 points to alpha world city + a higher degree than Los Angeles.

To find the relative position of Istanbul within the world cities, Taylor's (2001, 2003) comprehensive research would also be a useful guide. In his study concerning the global city networks, Taylor (2001) collected data from 100 global service firms across 316 cities world wide. Global service firms are defined as having offices in at least 15 different cities with at least one in each of the prime globalization arenas; northern America, Western Europe, and Pacific Asia. Firms so identified were from the following sectors: 18 in accountancy, 15 in advertising, 23 in banking/finance, 16 in law, 11 in insurance, and 17 in management consultancy. Service values were allocated to cities in the range of 0 to 5 where '0' indicates no presence of a firm in that city and '5' indicates the city to be the most important location for that firm (i.e. its headquarters). From this data, the global network connectivity of a city is computed from the products of its service value for each firm with that firm's service value for each other city. Summing these products over all firms in a city produces a gross value of its global network connectivity. Istanbul is ranked as the 35th city in global network connectivity in 2000 (Taylor, 2001) and 29th in 2008 (Derruder et al, 2009).

Industrial and Trade Structure

Istanbul generates 27,5 per cent of total Turkish value added and its gross domestic product (PPP) per capita is 10352 dollars in 2008 that is nearly 50 per cent higher than the corresponding value for the country (TÜİK,2010). Istanbul creates 3.3 million jobs, 15 per cent of total employment in Turkey. Agricultural employment is almost non-existent (0.35 % of total agricultural employment in Turkey). Industry is the main employee sector, corresponding 28 per cent of total Turkish industrial employment; while services constitute

20 per cent of employment in services sector in Turkey (KOSGEB, 2005). In terms of both services and industrial employment, Istanbul ranks first among 81 cities.

Manufacturing industry still generates almost one-third of employment opportunities in Istanbul, although there has been a slight decrease in this ratio from 1980 to 2000 (in 1980 it was 35.8 per cent), which indicates the importance of the manufacturing industry in the economic base of Istanbul, like many European cities (Kazepov, 2005). The industrial structure of Istanbul lays in mature industries such as textile, mechanical and chemical industry. According to TOBB reports for Istanbul (2005, www.tobb.org.tr), textile with 275 thousand employees ranks first; and it is followed by mechanical industry with 146 thousand employees, chemical industry with 78 thousand employees. Textile is the main sector, corresponding 34 per cent of total Turkish textile employment. The employment regarding the scope of business are given below

Table 2. Employment regarding the scope of business.

SCOPE OF BUSINESS	ISTANBUL	TURKEY	ISTANBUL (%)
Food Industry	42.220	382.180	11,05
Textile Industry	274.682	807.610	34,02
Furniture Industry	10.024	75.513	13,31
Paper and Printing Industry	23.891	65.854	36,28
Chemical Industry	78.480	270.268	29,04
Non Metal Industry	16.327	138.251	11,81
Metal Industry	19.445	106.387	18,28
Mechanical Industry	146.036	496.764	29,40
Other Manufacturing Industry	15.959	24.494	65,15
TOTAL	627.064	2.367.321	26.049

Source: Adapted from TOBB, 2005 (www.tobb.org.tr)

Among service sectors, Istanbul is the leading city in banking and accounting sectors. As Taylor (2003) declares that Istanbul ranks as 21st city at banking network connectivity in the whole world. Istanbul provides 45 per cent of total Turkish bank deposits and uses 43 per cent of total Turkish bank credits. Moreover Istanbul has the potential to be banking and finance center not only for Turkey but also for the region. There are five main topics to consider a city as a finance center: the size of the economy, qualified labor, legal regulations, the development of banking and finance sector, and physical infrastructure.

There are various support institutions in Turkey to support industrial production. Istanbul has eight active industrial zones out of 258 in Turkey and one more industrial zone is under construction (TOBB, 2009). Moreover Istanbul has nine small industrial areas out of 439, which host 2.272 SMEs with a total employment of 21 thousand.

Exports from Istanbul have risen from US\$18 billion in 2001 up to US\$35.9 billion in 2004, which represents approximately a 2 times increase in 4 years. On the other hand imports from Istanbul have risen from US\$ 22 billion in 2001 up to US\$ 60 billion in 2004, which represents approximately a 3 times increase in 4 years (TÜİK, 2008). Istanbul generates 43,2 % of Turkish exports mainly based on manufacturing industry (45,8 per cent of Istanbul's total exports) and 62.8 % of imports again mainly based on manufacturing industry (49,07 per cent of Istanbul's total imports) (Berköz and Eyüboğlu, 2007); thus without a doubt Istanbul is highly internationalized.

FDI

As mentioned before FDI is an important channel for transfer of technology to developing countries, since modern and advanced technologies introduced by multinational firms can diffuse to domestic firms through spillovers (Berköz and Eyüboğlu, 2007; Lenger and Taymaz, 2006). Istanbul ranks high for FDI in Turkey. Turkey attracts US\$ 17,5 million foreign direct investment with 9749 firms. 75.39% of Turkey's total capital

investment (almost US\$ 13,5 million), and 63.29% of the total number of firms (6170) in Turkey are in Istanbul. The distribution of FDI in Istanbul according to the origin of country groups show that more than half of FDI investments come from OECD countries (Berkoz and Eyüboğlu, 2007).

Technological Infrastructure

Istanbul is the capital of high education in Turkey. Out of 100 universities in Turkey, 27 of them are located in Istanbul and each year new universities are established (YÖK, 2009). Almost all high quality universities in terms of research and publications are among these universities.

Besides the existence of high education institutions, Istanbul also hosts a number of well-functioning technology development centers and incubators. Today technopolis, technology development centers and incubators are considered to be important areas for technological progress. For example the most famous technopark Silicon Valley is built around Stanford University in 1950. Many global firms such as Google, Intel, Adobe Systems, Yahoo and VeriSign exist in Silicon Valley (Elitaş et al., 2007). That is why technoparks around the world tries to establish their own Silicon Valley models. Today there are more than 800 technoparks, technopolis and technology development centers in the whole world (Zhang, 2008).

The establishment of the first technopark in Turkey happens to be in Istanbul, established in 1986 as a result of mutual efforts of Istanbul Technical University and Istanbul Chamber of Commerce in 1986. This technopark is still working as Istanbul Technical University Technology Development Center. In 2009, there are twenty technology development centers in Turkey and five of these centers are located in Istanbul around universities namely Bosphorus University Technology Development Center, Fatih University Technology Development Center, Istanbul Technical University Technology Development Center, Istanbul University Technology Development Center and Yıldız Technical University Technology Development Center. Moreover 3 of 18 incubators are located in Istanbul: ITU Arı Technocity, Istanbul University Technology and Innovation Center and Yıldız Technical University and Innovation Center. There is a dominance of software firms in these incubators. For instance 50 of total 59 firms in ITU Arı Technocity are operating in software industry (Elitaş et al., 2007).

Firm Level Technological Capabilities

Considering the firm level technological capabilities Istanbul appears to be the first city in Turkey. According to the URAK's Urban Competitiveness Report, Istanbul has the highest score at trademark capability and innovativeness index.

In terms patents applications and the number of patents issued, Istanbul ranks first as shown in Table 3. The nearest city to Istanbul's patent performance is Ankara but there is a huge gap.

Table 3. Patent numbers, 2008

City	Patent application	%	Issued patents	%
Istanbul	1057	47	187	55
Ankara	269	12	33	10
İzmir	122	5	25	7
Bursa	119	5	16	5
Konya	69	3	8	2
Turkey Total	2268	100	337	100

Source: Adapted from Turkish Patent Institute, 2009

In addition to patents, Istanbul companies are active in "utility model", "trademark" and "industrial design" applications as well. They represent over the half of trademarks (%52) out of 61 thousand trademark applications and again over the half of trademarks (%52) of 36 thousand issued trademarks made in Turkey in 2008. For the utility models Istanbul companies again embody almost the half of utility models (43%) out of three thousand utility model applications and almost the half of utility models (47%) out of a thousand and ninety issued utility models. Further, Istanbul companies represent half of the industrial designs (%50) out of six thousand design applications and again half of the industrial designs (50%) out of six thousand issued designs (Turkish Patent Institute, 2009).

CITIES IN THE GLOBAL MAP

The city rankings do not include innovation and technological capabilities however some cities are well known for their innovativeness. Therefore by studying innovative cities, it might be possible to generate a set of proxy measures that will help to benchmark Istanbul with innovative cities. This explorative attempt might be the base for designing some alternative strategies for Istanbul. Due to space limitations, the paper will mention three examples, one from a developed country and two from developing countries that might be illuminating examples for Turkey.

The Cambridge Region

Considering the rapid growth since the 1960s of a substantial cluster of technology based SMEs covering settlements located up to 15 miles around the city of Cambridge. Cambridge appears as a city region with science base and social networks embodied in Cambridge University (Keeble et al., 1999; Longhi, 1999). Cambridge example seems to have five key mechanisms supporting its innovativeness (Keeble et al., 1999):

- I. *High technology firms from different industries gather in Cambridge region*
- II. *University focused:* The cluster is historically focused on the University of Cambridge with its global reputation for research and scientific activity
- III. *Networking and collaboration:* The cluster exposes the frequency and importance of inter-firm collaboration, networking and interaction,
- IV. *Regional learning:* Regional learning occurs with local movement and spin-off of embodied technological and managerial expertise in the form of entrepreneurs. Moreover there is a flow of research and professional staff between local firms and university.
- V. *In Cambridge region* technology intensive SMEs can perhaps be inferred from the outcome of a high frequency of close inter-firm links.

Cambridge city region emphasizes regional learning and inter-firm networking and collaboration around Cambridge University. It seems that regional learning is an important theme for any region to be ranked as innovative (Lawsen and Loren, 1999).

New York City

In following rounds of economic development, New York slowly secured its dominance over rival metropolises (Batten, 1995). Since 1980s the most innovative city in the US is New York; Approximately 20 %, of the total number of innovations in the country is attributed to firms in the greater New York City area (Longhi, 1999). The major features of New York are given below:

- I. *Center for qualified labor* from both US and the whole world.
- II. *Flexible clusters:* The banking and financial services of New York represent the outputs of clustered flexible production networks that are strongly tied to world markets (Scott et al., 2001). In addition, there is a variety of clusters and sectors in New York such as creative arts, banking and finance and “Silicon Alley” with media companies (Cooke, 2001).
- III. *Intensity of learning and knowledge:* the regional practices of learning that influence the competitiveness of firms in New York is deeply supported (Faulconbridge, 2007).
- IV. *Network connectivity* New York is the first city of the US and second city in the the world after London according to the global network connectivity (Taylor and Walker, 2001).
- V. *The presence of external economies arising from inter-firm linkages:* It is the presence of such linkages today which continues to fuel much of New York’s growth as a financial services centre. Moreover some researcher suggests that there is a size and innovative capacity linkage in New York City (Batten, 1995).

As Porter (1998) showed that the US’s competitive lead in innovation was predicated on the existence of regional innovation systems based in ‘clusters’, New York is based on effective clusters.

Shanghai

Shanghai has gained a substantial lead in developing an innovation environment with extensive global linkages and leading research institutions (Wu, 2007).

Recent changes in China’s national innovation system have affected Shanghai’s policy options. For nearly three decades (1949–1979), following the Soviet Union’s model there was clear division of labor—public research

institutes responsible for conducting the majority of research activities. More specifically Shanghai's efforts to establish a local innovation system mainly began in the 1990s and followed the national lead. The efforts aim to cultivate Shanghai's local innovation system fall into five categories (Wu, 2007):

- I. *Building a support infrastructure to facilitate commercialization of innovation*
- II. *Developing an adequate regulatory and legal framework and attracting great amounts of FDI*
- III. *Investing in human capital.*
- IV. *Nurturing universities and R&D institutions and increasing investment in R&D*
- V. *There are a variety of different kinds of industries*

The Shanghai Science and Technology Commission formulate and implements policies related to the city's S and T development. Accompanying the creation of the support infrastructure is a stable rise of investment in S and T. For example, expenditure in R&D has increased extensively, reaching over US\$ 2,5 billion in 2004 (Wu, 2007).

Moreover a great number of national S and T programs launched since the mid-1980s have had significant marks on the city. Above all, the designation of high-tech/science parks in Shanghai followed the launching of the national "863" and "Torch" programs, to promote the development of high-tech industries. 4 Science parks are used as incubators for nurturing such industries and promoting research spin-offs like Caohejing High-Tech Park, Zhangjiang Science Park, Jinqiao Science Park, Shanghai University Science Parks, China International Textile Technology Development Zone and Jiading High-Tech Park. (Wu, 2007)

Important Points from Three Exemplar Innovative Cities

The examples of Cambridge, New York, and Shanghai have five common features that might highlight the critical success factors for cities like Istanbul searching to become innovative listed below:

- I. *Collaboration*: There is a great emphasize for collaboration and learning at regional level. "Cities exist in part to facilitate learning between individuals who come into contact with one another" (Storper and Scott, 2009). For example Cambridge region involves regional learning which is triggered by university based and entrepreneurial spin-offs. In Shanghai learning at regional level is supported by programs such as national S and T program.
- II. *Flexible clusters*: There are highly diverse clusters within these city regions; city regions offer many opportunities and facilities and qualified labor for these different kinds of high tech industries and clusters.
- III. *Infrastructure*: An appropriate infrastructure dedicated for innovation supports the region. Particularly, ICT infrastructure, transportation, energy and supporting institutions are very important for city regions. Technoparks and technopolis are also a critical part of any innovation infrastructure. Caohejing High-Tech Park, Zhangjiang Science Park, Jinqiao Science Park, Shanghai University Science Parks, China International Textile Technology Development Zone, Silicon Alley and Cambridge University are some examples. These institutions take part as a bridge and an incubator for supporting the firms operating in city regions.
- IV. *Labor*: These cities attract qualified labor. There are well established universities and employment opportunities within these cities.
- V. *Network*: A strong network is established between local firms, institutions and universities as well as international actors. For instance New York is always ranked as a second city for network connectivity. On the other hand Cambridge in Europe has this recognition and connectivity in many areas. The industrial infrastructures of Cambridge and New York take their roots from very old times (Cambridge in the times of industrial revolution and New York for last two centuries).

CONCLUDING REMARKS: CHALLENGES FOR ISTANBUL

In a global world in which the waves of globalization have forced the introduction of strategies to enhance innovativeness and competitiveness; the role of cities as a regional innovation centers becomes more and more significant. In recent years, there has been increasing concern over the formation and outcomes of cities as global innovation centers. Accordingly this paper investigates the potential of Istanbul in becoming an innovative city?

Istanbul has a chance to take part in the global innovation league. Considering the Eraydın's (2008) categorization, Istanbul now is a challenging city with a dualistic economic structure and labor market where both traditional industries and emerging new (high-tech) manufacturing activities. If strategies are developed and applied at government and municipality level, Istanbul can increase its position in the hierarchy of global cities. In addition, its central and transit location between Europe, Asia and Africa and the Bosphorus coupling Black

Sea to Mediterranean Sea might provide Istanbul many other opportunities to become a global center for innovation (Taylor and Walker, 2001).

On the basis of success factors identified by analyzing three innovative cities namely Cambridge, New York, and Shanghai, the position of Istanbul might be summarized as follows: 1) Istanbul has qualified labor force but still low even compared to Ankara in Turkey; 2) collaboration and regional learning exist at moderate level; 3) infrastructure is the best with the Turkish standards but they are not yet world-level/state-of-the-art institutions; 4) networking/connectivity is low in Istanbul, given that it is the 35th city in global network connectivity (Taylor, 2003); 5) diverse industrial and clusters exist in Istanbul.

Istanbul has a good base to become a global innovative city. If so, by following Eraydin's (2008) categorization, an appropriate and feasible strategy for Istanbul could be to follow a two-complementary/mixing strategy: becoming a learning region and becoming a high-technology industrial district. So, the short term strategy is to use the existing base and develop absorptive capacity in companies and institutions. The learning capability will not only increase efficiency and generate confidence in companies' own skills but also it will motivate firms to take the next step for becoming a "creative follower". At the same time, all actors of Istanbul innovation system should try to establish a well-functioning system where the development and use of new technologies will accelerate the transformation of production systems. Based on this short term strategy that is a mixing strategy, it becomes possible to develop the long term strategy whose goal is to build a global innovative city with high levels of connectivity with the rest of the world.

Both short and long term strategies require explicit plans where entrepreneurs, small firms and the government should take part in so that becoming a creative follower becomes possible. This seems a long journey but Istanbul deserves to be in the list of global cities where innovation will be the core.

THE RELATIONSHIP BETWEEN ORGANIZATIONAL LEARNING AND FIRM PERFORMANCE: THE MEDIATING ROLES OF INNOVATION AND TQM

İpek Koçoğlu
Salih Zeki İmamoğlu
Hüseyin İnce
Gebze Institute of Technology, Turkey

ABSTRACT

The main purpose of this study is to evince the influence of organizational learning on firm performance through the mediating roles of innovation and total quality management (TQM). The relationship is constructed based on the four dimensions of organizational learning namely; intra-organizational knowledge sharing, shared vision, commitment to learning and open mindedness and the two dimensions of firm performance explicitly; market performance and employee satisfaction. Amid in this research agenda three partial gaps have been explored: First, besides the relationship between TQM and innovation, a robust relationship of organizational learning and firm performance seem to be plausible but the gap embedded in the literature is the absence of a study examining the cumulative influence of the organizational factors which complement and enhance each other –organizational learning, innovation and TQM- on the organizational performance. In doing so this study investigates the four dimensions of organizational learning mentioned previously, the five dimensions of the TQM, particularly –participation, leadership, process management, continuous improvement and customer orientation, and innovation in the context of their impact to market performance and employee satisfaction as the components of firm performance. Second, previous works have almost exclusively focused on the co-alignment between organizational learning and innovation as compelled to deliver firm performance. While the relationship between organizational learning and firm performance has been investigated there has been minimal analysis of the phenomena taking into account the role of innovation. Hence little empirical evidence has so far been offered to support the positive relationship between these strategic weapons of the organization on the performance as well as each other. Third, the paper investigates the multidimensional and contingent gradual effect of organizational learning on firm performance through the conjunctive roles of innovation and TQM without ignoring the counteraction to potential changes from a satisfactory status-quo. Concurrently, this study develops a platform through which organizational learning will shape innovation, TQM and progressively the firm performance.

Keywords: Organizational learning, innovation, total quality management, organizational performance

INTRODUCTION

“The only real security that a man can have in this world is a reserve of knowledge, experience and ability.” Henry Ford’s words reflect the significance of knowledge coming into prominence in an era where the speed of change exceeds the limits of human imagination. The way an individual, an organization or even a nation can create wealth and prosperity is changed through knowledge which constitutes the basis of the third industrial revolution (S.-h. Liao et al., 2008). Although different approaches are used for the examination of organizational learning construct, learning has been more recently considered from a strategic perspective as a distinction of heterogeneity among organizations and an actor enabling competitive advantage (Gomez et al., 2005). The literature suggests that firms which are able to “learn” obtain a better opportunity in sensing events and trends in the marketplace (Martinez-Costa and Jimenez-Jimenez, 2009). Since Drucker (1985) asserts knowledge as the only source of an organizations’ competitive advantage; enterprises should find ways to strengthen the research and development, management and utilization of knowledge in order to cope with the challenges (S.-h. Liao et al., 2008). Contingently, the examination of knowledge management within the organizations has been emerged in 1990’s. The theory of Nonaka proposed in 1991, suggested the

“organizational knowledge creation” through the reshaping of old operational processes and the adoption of the novel ideas (S.-h. Liao et al., 2008). Rather than considering knowledge as the “hard” source of quantifiable data which could only be mechanistically processed to utilize, Nonaka presents the idea of “soft” tools to make use of such knowledge (Nonaka, 1994). The key to the holistic way of knowledge creation of Japanese firms explicitly; Honda, Sharp, NEC and Canon in Nonaka’s study is the essentiality of tapping the tacit and subjective perceptions. Hence, the resource-based theory of the firm suggests that knowledge dominates other resources through its inimitability characteristic by the continuous improvement of market information processing activities faster than competitors; it provides the long term competitive advantage to firms (Martinez-Costa and Jimenez-Jimenez, 2009). The survival of the firms in knowledge-based economies is determined by the successful knowledge management. Moreover, gaining superior firm efficiency, promoting high competitive advantage, achieving outstanding organizational performance and surviving in the competitive knowledge-based markets can be obtained by organizational learning (Ussahawanitchakit, 2008).

Organizational learning is often defined in the literature as a strategy for information management consisting of systematic efforts to relocate knowledge throughout an entire organization, following Senge’s (1990) *Fifth Discipline* (Spector and Davidsen, 2006). With the exploitation of organizational values, information processing behaviors, and organizational actions enterprises use organizational learning as a source of heterogeneity and of sustainable competitive advantage. Hereby firms need to strengthen the research and development of organizational learning, to manage it efficiently, to utilize it effectively and to acquire it continuously for the aim of distinctively meeting customer requirements and seeking market needs (Ussahawanitchakit, 2008). In this regard, organizations need to determine the factors affecting organizational learning, and the factors that are influenced by the organizational learning.

This study therefore contributes to this area by examining the relationship of organizational learning with the firm performance through the mediating roles of innovation and total quality management. This study contributes to the literature in several ways. First, this study is important when viewed in relation to today’s highly competitive environment where pressures for organizations to meet multiple demands is a challenging task where several forces need to be working in collaboration to achieve a unique goal. Therefore, this study targets to determine the intra-relations of organizational learning, innovation, TQM and firm performance, and to estimate their distinct effects on organizational performance. Secondly, this study constitutes an important bridging between the areas of knowledge management, quality management, innovation management and strategic management. Strategic management focuses on the performance concept in organizations and knowledge management aims at improving the performance of enterprises together with the competitive advantage using organizational learning as a key factor. Both in academic and in professional surroundings the researches prove that learning is of essential importance for organizations (F.J. Lloréns Montes et al., 2005). An overview of the innovation literature reflects that there’s a great consensus among researchers about the importance of the innovation in the achievement of high organizational performance (F.J. Lloréns Montes et al., 2005). In parallel to calls made for organizations to become innovation focused, they have also been urged to become more quality focused (Singh and Smith, 2004). From the innovation point of view, the examination of the TQM’s impact on innovation is important in contributing to the development of managerial practices which can be used as a resource for determining innovation performance (Prajogo and Sohal, 2006). The awareness of the dominance of these two concepts; innovation and learning, necessitates the examination of the relationship between the two as well. Although the arguments in literature consider the positive relationship between learning and innovation there are several gaps regarding the issue. The empirical standpoint of this link is missing and innovation’s mediating role in providing the organization to fit into its environment is not examined (F.J. Lloréns Montes et al., 2005). Moreover, the emergence of Total Quality Management (TQM) has been one of the major developments in management practice, which has been considered quite few in relation with organizational learning, and innovation as well as organizational performance. TQM started to be introduced in the US around 1980 with a devastating delay resulting in the domination of Japanese firms in the market. Western organization culture beginning to interrogate the reasons for the sudden drop in the market share has needed to primarily deal with deep competitive challenges encountered due to Japanese companies’ successful adoption of TQM (Prajogo and Sohal, 2001). At this standpoint this study recognizes the need to acknowledge the link between Nonaka’s suggestion of learning from Japanese companies in knowledge creation and management, with the successful application of TQM to their enterprises. TQM has been promoted as an approach to management that enables organizations to become customer (internal and external) and quality focused (Singh and Smith, 2004).

Based on an extensive review of relevant literatures on organizational learning, innovation, TQM and firm performance it is noticeable that the concepts are closely intertwined and explicitly linked. Accordingly, organizational learning is a critical strategy which organizations implement it to build high firm performance; gain outstanding competitive advantage and enhance competitiveness. Organizational learning makes these goals accessible to the enterprise by the mediating roles of innovation and TQM both on each other and on

organizational learning itself. This paper explores the possibility of using organizational learning with the mediating roles of innovation and TQM as collective contribution to the firm performance. Furthermore the paper is arranged starting with the literature review of each concept; organizational learning, innovation, TQM and firm performance. Accordingly six main hypotheses are investigated and supported through the literature, in parallel with the proposed theoretical model regarding the positive inter-relationships of all the above mentioned variables. The six sets of hypotheses inspected in this study are explained in the following literature research section of the study. The proceeding section is the research methodology, and finally the article is concluded with the conclusion part.

Organizational Learning and Innovation

Organizational Learning

Learning; is at the heart of company management and has become the essence of productive activity, being a need more than a choice in today's conditions (F.J. Lloréns Montes et al., 2005). When John Dewey's definition of individual learning as "the process whereby knowledge is created through the transformation of experience creating a change in that person's behavior" is compared with that of Argyris and Schön, (1978) "organizational learning occurs when members of the organization act as a learning agent for the organization, responding to changes in the internal and external environment of the environment by detecting and correcting errors" the bridge between the individual and organizational learning becomes clear. Organizational learning shares many of the characteristics of individual learning mainly; that learning is about changes that tend to persist and measuring those changes would establish that change has occurred (Spector and Davidsen, 2006). All humans are born with the ability to learn and through it they adapt to the changing and evolving environment (S.-h. Liao et al., 2008). The learning of organizations in the study of S.-h. Liao et al. (2008) are referred to as; when the members of an organization use learning to solve a common problem that they are facing. Though, learning to achieve the organizational level crosses two stages; individual and group learning thereafter it becomes organizational. Individual learning occurs with the acquisition or creation of knowledge, group learning happens when this knowledge is transferred and disseminated and finally organizational learning is achieved with the integration and sharing of this knowledge through the organization (Gomez et al., 2005). Yet, organizational learning has a collective nature that goes beyond the individual learning of people (Gomez et al., 2005). Supporting this idea, Argyris and Schön as referred to in Baker and Sinkula's (1999) study; organizational learning occurs by detecting a mismatch of outcome to expectation, which disconfirms theory in use. When this occurs, the firm moves to error correction, which results in a change in theory in use (Baker and Sinkula, 1999). The collective action of the firm to detect the unwanted outcome and its correction implies a continuum of internal changes which in turn will lead to constant improvement and innovation (Gomez et al., 2005).

Most of the researchers describe the organizational learning process as the acquisition, interpretation, storage and implementation of new knowledge in order to improve problem solving capacities of the organization (Huber, 1991; Thomas et al., 2001; S.-h. Liao et al., 2008). Learning by an individual forms the basis of organizational learning since organizations will learn through its members and because it results from an accumulation of individual learning (S.-h. Liao et al., 2008; Calantone et al., 2002). Another view is that of Nonaka (1995) who claims that, organizational knowledge is created through the continuous interaction between tacit and explicit knowledge. Consequently, Spector and Davidsen (2006) argue the measurement and modeling of organizational learning based on a socially-situated, information processing view of learning. Peter Senge; the writer of the seminal book *The Fifth Discipline: The Art & Practice of the Learning Organization* and the founder of the Organizational Learning Center at MIT, which later became the society for Organizational Learning (1990), argues that the a group of people's desire to enhance their capacity to produce is actually the interpretation of the attempt for organizational learning (Spector and Davidsen, 2006). In view of those, every organization will develop the most suitable learning method according to the needs and characteristics of the organization itself (S.-h. Liao et al., 2008).

Two types of organizational learning are mainly discussed in the literature. The first is; single-loop learning (Argyris and Schön, 1978) which can be referred to, as exploitative learning (S.-h. Liao et al., 2008), or incremental learning (Miner and Mezias, 1996), or Non-Duetero characterized as passive learning (Saban et al., 2000). The single-loop learning is adaptive and takes place within the structure and processes of the learning system (Hedberg and Wolff, 2001). It is the acquisition of new behavioral capacities framed within existing insights (S.-h. Liao et al., 2008: 184). The second type of organizational learning is double-loop learning (Argyris and Schön, 1978), which can also be referred to, as radical learning (Miner and Mezias, 1996), higher level or generative learning (Sadler-Smith et al., 2001), active learning (Saban et al., 2000), or explorative learning (S.-h. Liao et al., 2008). It occurs when organizations acquire behavioral capacities that fundamentally

differ from existing insights. This type of learning involves multi-stage learning based on discovery, criticism, effectiveness, variation, flexibility and innovation (S.-h. Liao et al., 2008). These views constitute the basis of organizational learning literature.

The concept of organizational learning assumes that there exists a collective desire that may be satisfied through collective action and, further, that there is a potential for collective improvement that may be attained through learning. Accordingly the four dimensions of organizational learning considered in this study are, intra-organizational knowledge sharing, shared vision, open mindedness and commitment to learning. To start with; intra-organizational knowledge sharing is the spread of knowledge and information across different departments in an organization, along with the systematic reexamination and structuring of their accumulation to serve as a source of future action (Calantone et al., 2002). Second; shared vision refers to a common direction among the organization for learning. Organizational learning requires bringing the members together around a common identity with the existence of a collective conscience that allows the firm to be seen as a system in which each element must make its own contribution (Gomez et al., 2005). Involvement of people in establishing and implementing a joint vision leads to their motivation to learn what they are held responsible of (Chermack et al., 2006). Respectively the importance of relationships based on the exchange of information is recognized through a common language favoring knowledge integration (Gomez et al., 2005). Third; for the organization to outrage among firms, it must go beyond adaptive learning and concentrate on generative learning. This requires, open mindedness in the organizational structure which is the willingness to critically evaluate the organization's operational routine and to accept new ideas (Calantone et al., 2002). In order to allow individual knowledge to be constantly renewed, widened and improved, a learning that implies open mentality towards new ideas, flexible solutions to current and future problems is required (Gomez et al., 2005). Lastly, the fourth dimension is commitment to learning which indicates the degree to which an organization values and promotes the acquisition, creation and transfer of knowledge considering learning as an important investment for survival (Calantone et al., 2002). According to Gomez et al., (2005), commitment to learning can be achieved with the support of management. Management should encourage the employees to understand and become involved in the process of learning. It should take the responsibility to create an organization capable of regenerating itself and coping with new challenges by leading the process of change (Gomez et al., 2005). Hence commitment to learning can diffuse to the whole organization.

Innovation

Innovation allows organizations to progress parallel with the changes flourishing in the environment. It's a strategic key in responding to the new challenges of an environment full of uncertainties (F.J. Lloréns Montes et al., 2005). For an organization, innovation would denote the generation or adoption of novel ideas or behavior (S.-h. Liao et al., 2008). In the literature the idea that innovation is essential for firms' long-term success and survival constituting a competitive instrument is widely recognized (Santos-Vijande and Alvarez-Gonzalez, 2007). As it is referred in the study of Hitt et al. (1997) and Tidd (2001), innovation is defined as the doors opening to both global and international competitive advantage through: providing the marketplace with new or unique products/services; creating entry barriers that provide the necessary resources to develop innovation through learning; and creating new values that reshape the rules of competitive environment (F.J. Lloréns Montes et al., 2005). Authors reflect Nonaka and Yamanouchi's (1989) suggestions as; organizations fit to the changing conditions of the technology and the market by diversifying and adapting, and even rejuvenating or "reinventing" through innovation (Santos-Vijande and Alvarez-Gonzalez, 2007). A profound research on innovation literature shows that various definitions of innovation are present from different perspectives. Damanpour (1991) defines innovation as; the adoption of an internally generated or purchased device, system, policy, program, process, product, or service that is not necessarily new to the world but specifically new for that adopting organization (Prajago and Sohal, 2001). Wu et al., (2008) suggest that an innovation is defined as an idea, a product or process, or a system that is perceived to be new to an individual. Besides, there are many typologies and classifications of innovation such as; radical versus incremental, product versus process, technology versus management innovation. The most established classification of innovation distinguishes it as incremental or radical. Incremental innovative capability is defined as the capability to generate innovations that refine and reinforce existing products and services. Radical innovative capability is the capability to generate innovations that significantly transform existing products and services (Subramaniam and Youndt, 2005).

The Relationship between Organizational Learning and Innovation

Innovation is closely related to organizational learning (Chaveerug, 2008). Argyris and Schön (1978) discuss in their work that organizational learning would strengthen the innovative capability of an enterprise. Veroma (1996) propounds the idea that the innovation process involves the acquisition, dissemination and the application of new knowledge (Chaveerug, 2008). Chaveerug (2008) accordingly stresses the wide agreement in

the literature on the correlation between learning and innovation capability. Moreover according to S.-h. Liao et al. (2008), innovation is the prerequisite of knowledge creation and the essential key of knowledge management, because organizations mainly learn from the innovations made or adopted. Through single and double-loop learning which forms the meta-learning process, learning of the whole organization is enhanced and this contributes to innovations (S.-h. Liao et al., 2008). Chaveerug (2008) concludes in his study that organizational learning is associated with the development of new knowledge, which is crucial for firm innovation capability and firm performance. Darroch (2005) as a result of her research states that “a firm capable in knowledge acquisition, knowledge dissemination and responsiveness to knowledge is more innovative.” Most studies consider that learning injects new ideas and strengthens the creativity and the ability to discover new opportunities, so it supports the presence of innovation (F.J. Lloréns Montes et al., 2005). Most successful innovations are the result of gradual changes in concepts and methodology implemented continually over time (S.-h. Liao et al., 2008). This gradual process relies on the creation, search, acquisition and sharing of knowledge which in turn will provide organizational learning and will constitute the base for the successful innovation. In fact, as a result of the successful applications of numerous organizational learning models to some aspects of innovative processes, the new meaning of the innovation concept starts to be reshaped as the process of organizational learning by the organizations (F.J. Lloréns Montes et al., 2005). The above discussion reflects the interaction between organizational learning and innovative outcomes of an enterprise, hence, as stated in the following hypotheses.

Hypothesis 1: Organizational learning has a positive influence on innovation.

Organizational learning and TQM

Total Quality Management

The most influential person in the quality revolution was Dr. Edward Deming. After a special program produced in television titled “If Japan can. Why can’t we?” The focus was on Deming’s role on the development of Japanese quality. After that program the importance given to quality in U.S. industry increased and U.S. government recognized the influence of quality on nation’s economic wealth (Samson and Terziovsky, 1999). Concurrently, TQM has moved away from being a uni-dimensional construct to being evaluated as a strategic weapon for the firms which has to be managed and implementation of which leads to a dynamic capability of the enterprises (Ortiz et al., 2006).

Among many definitions that have been suggested on TQM, the definition by the US Department of Defense suggests that; TQM utilizes both quantitative (technical) methods and human resource (behavioral) practices to improve material and service inputs, intra- and inter-organizational processes, and to sharpen the focus on meeting customers’ needs (Singh and Smith, 2004). The main problem in defining TQM is the absence of a common definition in the literature. TQM concepts and practices are shaped by a number of individuals who are honored as “quality gurus” such as; Deming (1982), Feigenbaum (1983), Juran (1988), Juran and Gyra (1993) and Crosby (1984). Commonly, TQM can be understood as a total company wide effort that includes all employees, customers and suppliers and that continually aims at improving the quality of products and processes to meet and even exceed the needs of the customers (Martinez-Costa and Jimenez-Jimenez, 2009). Kumar et al. (2009) refer to the definition of Pfau (1989) who describes TQM as a holistic approach to improving quality, productivity and competitiveness in the international marketplace. Another definition of TQM similar to that of Singh and Smith’s (2004) is that of Yang (2005) who gives more detail by stating that TQM is an integrated management philosophy and a set of practices that emphasizes, among other things, continuous improvement, meeting customers’ requirements, reducing rework, long-range thinking, increased employee involvement and team-work, process redesign, competitive benchmarking, team-based problem-solving, constant measurement of results, and closer relationships with suppliers (Kumar et al., 2009). Hence there is a systematic integration among the dimensions of the TQM leading to integral management (Ortiz et al., 2006). The dimensions of Total Quality Management are needed to be identified to facilitate accurate analysis. These dimensions are; leadership, people management, customer focus, strategic planning, information analysis, process management, performance (quality, operational and business performances) (Samson and Terziovsky, 1999; Singh and Smith, 2004; Prajogo and Sohal, 2001; Samson and Terziovsky, 1999).

Yet this study focuses on the four among the dimensions of TQM explicitly; participation which is also referred to as people management, leadership, continuous improvement, process management and customer focus. As stated in Costa et al.’s (2008) study reflecting Evand and Lindsay’s (2002) definition; “focus on customers and stakeholders, participation and teamwork by everyone in the organization and a process focus supported by continuous improvement and learning”. Participation indicates a decentralization of work decisions and empowerment. In parallel with the selection and training of the personnel as besides the incentive programs,

the sense of equity building creates employees that are actively taking role in the quality creation, continuous improvement of processes and products (Ortiz et al., 2006). Leadership reflects management's commitment and vision towards creating a strategic resource out of quality which acts to achieve competitive advantage. The formulation of strategy and objectives to reach quality should be aligned with corporate strategy as well as organizational values in which management plays a crucial role (Ortiz et al., 2006). Additionally continuous improvement which encourages change and creative thinking in the organization structure of the work provides to creatively exceed the quality standards or usual expectations. Moreover, as argued by Prajogo and Sohal, (2001), the continuous improvement requires the standardization of the processes which produces several consequences: (a) it reduces any ambiguity in the design of tasks, which makes its innovation difficult; (b) it results in some organizational conformism, as the employees do not want to suffer the opportunity cost of breaking routines or assume the effort of the alternative thought; and (c) it leads to lower flexibility and openness to change as a result of the "adhesion" that is finally generated to the repeated behavior (Vijande and Gonzalez, 2007). The emphasis of the continuous improvement is on incremental change developed by Imai (kaizen) aiming at process improvement (Prajogo and Sohal, 2001). Furthermore, process management focuses to guarantee the reliability of the planned and programmed tasks of the organization. The documentation and design of the processes, cleanness and preventive maintenance of the work areas are of crucial importance for the effective management of the processes (Ortiz et al., 2006). Finally the last dimension of TQM is customer focus which "is built on relationships of internal and external trust, with a view to adapting the product or service to the critical factors of quality" as indicated by Ortiz et al., (2006). Hence, TQM oriented firms should base its operations to meet or exceed the customer requirements to achieve competitive advantage where in this situation a continuous evaluation of customer orientation needs to be made (Vijande and Gonzalez, 2007).

The Relation between Organizational Learning and TQM

There appears to be no doubt about the importance of total quality management (TQM) and its positive relationship to competitiveness in terms of improved productivity and reduced costs (Sohal and Morrison, 1995). But discussions on the relationship between TQM and organizational learning do not appear very often in the literature. Essentially, only a small portion of the research regarding the concept is supported by empirical evidence or by theoretical concepts.

Enhancing competitiveness through TQM has become an increasingly important challenge for learning in organizations. Consequently organizational learning must be mentioned as a key issue, especially for organizations seeking to progress towards TQM (Martinez-Costa and Jimenez-Jimenez, 2009). According to Barrow (1993) the relationship between TQM and organizational learning has two evidences. The first evidence is that there is a cause and effect relationship, i.e. learning is an intended outcome of TQM. The second evidence is; the presence of correlation between two powerful systems – process improvement and organizational learning, which are operating in a concurrent and integrated manner. Martinez-Costa and Jimenez-Jimenez (2009) refer to Ford's (1991) consideration that TQM constitutes the environment necessary for creating organizational learning. Some authors including Senge (1994) claim that TQM is the first wave in building the learning organizations. Moreover Barrow (1993) argues that the natural outcome of TQM is the continuous improvement in quality being the accelerating vehicle for learning (Martinez-Costa and Jimenez-Jimenez, 2009). TQM is the environment where not only the single-loop learning takes place but if the organization adopts a system where workers can learn and share knowledge as well as making contributions (Martinez-Costa and Jimenez-Jimenez, 2009). Related to this fact, as a result of Hult et al.'s study in 2003; larger organizations with a longer history has a better performance in organizational learning (S.-h. Liao et al., 2008). Larger organizations having a longer history have deeper and safer quality systems. Accordingly, the TQM in such environments is created based on a double-loop learning which does not only involve trial and error but due to the vast experiences and cumulative knowledge the learning curve grows higher. The research findings indicate that organizational learning is the outcome of a successfully executed TQM processes (Martinez-Costa and Jimenez-Jimenez, 2009).

Hypothesis 2: Organizational learning has a positive influence on Total Quality Management.

Organizational Learning and Firm Performance

The Relation between Organizational Learning and Firm Performance

Related with the literature on organizational learning in relation with firm performance; organizational learning, as the source of knowledge creation and knowledge as the unique, inimitable and infinite resource of the resource-based theory, is emphasized as the factor in the achievement of competitive advantage. The

literature views organizational learning as the basis of gaining a sustainable competitive advantage and a key to firm performance (Martinez-Costa and Jimenez-Jimenez, 2009). Organizations that embrace strategies consistent with the learning organization are thought to achieve improved performance (Ellinger et al, 2002; Calantone et al., 2002). Ellinger et al. (2002) examined the relationship between organizational learning and firm's financial performance. Their research aims to determine the effects of continuous learning, inquiry and dialogue, collaboration and team learning, empowerment of people towards collective vision, connection of organization to its environment and the leadership support on the financial measures of performance (e.g. ROE, ROA, MVA). Their exploratory research suggests a positive association between learning organization practices and objective measures of firms' financial performance. Additionally, Baker and Sinkula (1999) not only think that the organizational learning orientation of a firm affects its performance directly but they also think there's an indirect relationship between. A firm's learning orientation influences its performance indirectly by improving the quality of its market-oriented behaviors and directly through facilitating the generative learning that leads to innovations (Baker and Sinkula, 1999). The direct influences of organizational learning can be listed as; (1) the promotion of generative learning as a core competency as a result of knowledge creation, (2) the questioning of long-held assumptions such as to always follow market-oriented strategy, instead try to lead the market with new product development strategy for instance, (3) the realization that customer satisfaction cannot always be maximized with customer feedback mechanism but innovative disruptions are needed (Baker and Sinkula, 1999). Accordingly the learning orientation influences firm performance indirectly through market information generation and market information dissemination (Sinkula et al., 1997:307). This market information processing, is a necessary condition for organizational learning, essentially the process transforming information into knowledge (Sinkula et al., 1997: 308). Another view is that of Calantone et al.'s (2002); they think that organizational learning affects organizational performance through the firm's innovative performance (Calantone et al., 2002). Some other arguments about the positive influence of organizational learning on firm performance are stated by Martinez-Costa and Jimenez-Jimenez (2009). Organizations better at learning have a better chance of sensing events and trends in marketplace which will in turn lead to better sales and increased market share (Martinez-Costa and Jimenez-Jimenez, 2009). Moreover, organizational learning provides a more flexible and responsive structure to the organizations so that they can respond to new challenges faster than the competitors (Martinez-Costa and Jimenez-Jimenez, 2009). Continuous learning will also provide the organization fast improvement of market information processing activities (Martinez-Costa and Jimenez-Jimenez, 2009). Chaveerug (2008) claims that the greater commitment to learning is, the more likely that firms will achieve higher organizational performance (Chaveerug, 2008: 94). The arguments from the literature contribute to the formulation of the below hypothesis.

Hypothesis 3: Organizational learning has a positive influence on firm performance.

Innovation and TQM

The relation between Innovation and TQM

The recognition of TQM as a competitive advantage cannot be underestimated around the world especially in Western countries. Together with this fact, also innovation has received considerable attention as having a crucial role in ensuring sustainable competitive advantage in the globally competitive environment (Prahalad and Sohal, 2001). Almost in parallel to the calls made for organizations to become quality focused, organizations have also been urged by the researchers to become more innovative (Singh and Smith, 2004). These two determinants of firm competitive advantage can then be examined in terms of their inter-relationship in the establishment of firm performance resulting in competitive advantage. The main aims in discussing the relationship between TQM and innovation are; (1) to examine the relevance of TQM for the management of innovation; (2) to determine how useful is TQM as a resource for innovation; (3) and to clearly identify the relation between innovation and TQM (Prahalad and Sohal, 2001). Another important view is that TQM is seen as one form of innovation (Prahalad and Sohal, 2001). There are many common aspects of TQM and innovation (Singh and Smith, 2004). Continuous improvement is a key feature of both TQM and innovation. Open culture is seen as an important aspect of both innovation and TQM (Singh and Smith, 2004). These similarities are important due to the fact that organizations implementing TQM well could also be more innovative than organizations that do not (Singh and Smith, 2004). In other words organizations adopting TQM will possess higher innovation levels and vice versa. So TQM can be an instrument for organizations to become more innovative (Singh and Smith, 2004).

Arguments about the positive relationship between TQM and innovation focus on the idea that organizations adopting TQM in their structure create an appropriate environment for innovation in terms of growth because TQM includes principles that are in agreement with innovation (Prahalad and Sohal, 2001). The

continually and rapid changing customer needs, require organizations to meet these demands, fast and accurately. This goal can be achieved more successfully if new customer demands and expectations are searched and determined. So that organizations are capable of developing and introducing new products or services as innovations required for the adaptation to changing market (Prajo and Sohal, 2001). Meeting customer needs and expectations is a requirement but to make the customers delightful is the ground for competitive advantage. Hence producers or suppliers need not only to satisfy customer demands but also to exceed those needs, and that's an issue of innovation (Prajo and Sohal, 2001). Only innovating organizations can survive in this globally competitive environment keeping in mind that dynamic and responsive structure is the key factor for competitiveness. Companies adopt innovation in two ways; by copying from other firms or developing their own innovation. The second strategy is a more successful one if the competitive advantage is targeted. Companies following a TQM approach assimilate innovations imported from other firms more easily due to the willingness of its employees to accept new ideas as a result of the continuous improvement methods promoted by TQM. These enterprises can also develop their own innovations by building on the work of both continuous and breakthrough improvements (Martinez Lorente et al., 1999). According to Martinez Lorente et al. (1999) one of the main elements of TQM is the need for adequate customer focus. Since customers are going to become increasingly more demanding for the aim of identifying current and future customers and their needs, TQM constitutes a stimulus to business innovation towards a more customer oriented structure (Martinez Lorente, 1999). In line with this discussion from the literature the following hypothesis has been created.

Hypothesis 4: Total Quality Management has a positive influence on innovation.

Innovation and Firm Performance

The Relation between Innovation and Firm Performance

The link between innovation and performance at various levels of aggregation has been the focus of attention in a number of studies in recent decades (Calantone, 2002). Nevertheless, the link between firm innovativeness and performance has not been tested sufficiently (Calantone, 2002). The ability of firms to satisfy customers' emerging and complex requirements, meet growing consumer expectations and satisfaction, and respond rapidly to changing environments, is largely based on their innovation orientation (Ussahawanitchakit, 2008). Innovation orientation is central to firms' survival strategy, and it becomes a potential strategy in gaining competitive advantage. An organization's openness, acceptance, and implementation of new ideas, processes, products or services and propensity to change through adopting new technologies, resources, skills and administrative systems reflect its innovation orientation, in other words its degree of being ready to innovation (Ussahawanitchakit, 2008). Innovation orientation strongly improves employees' job attitudes, job satisfaction and organizational commitment (Ussahawanitchakit, 2008). The diffusion of innovations literature also confirms this view and suggests that firms must be innovative to gain a competitive edge in order to survive (Calantone et al., 2002). The study of Calantone et al. (2002) resulted in the positive relationship between innovativeness and firm performance. Also the findings in other studies about new product development and innovation diffusion have resulted in positive relationship between the two values. The results of the study of Calantone et al. (2002) also suggest that the competitive advantage of the firms is built on a full understanding of customer needs, competitors' actions, and technological development, an understanding made possible by organizational commitment to learning. Firms without these attributes are less likely to stand out in terms of innovation capability, although they may look elsewhere to find ways to survive (Calantone et al., 2002). These are the factors that increase business performance. Klomp and Van Leeuwen (2001) examine the relationships between the different stages of the innovation process and overall economic performance. According to their study the innovating firms perform better than the non-innovating firms, as shown in the Figure 1, indicating the growth of sales in the innovating (indicated with white bars) versus non-innovating (indicated with black bars) firms.

Figure 1. The distribution of sales growth of innovating versus non-innovating firms.
 Source: Klomp and Van Leeuwen, 2001.

Recent innovation studies place much emphasis on innovation as a production process, with new or improved products as a separate output which enhances overall firm performance. This enables a firm's overall sales performance to be linked more explicitly to the innovation process (Klomp and Van Leeuwen, 2001). Klomp and Van Leeuwen conclude that the innovation contributes significantly to the overall sales performance, productivity (as measured by sales per employee) and employment growth. Darroch (2005) argues that managers wanting to enhance performance should pursue innovation since in the current environment; innovation might be required to simply remain competitive. Without innovation, firms risk losing their competitive position by falling behind (Darroch, 2005). Evidence obtained from the extensive literature research provides support for the consequent hypothesis.

Hypothesis 5: Innovations have a positive influence on firm performance.

TQM and Firm Performance

The Relation between TQM and Firm Performance

One of the most popular and most often recommended approaches to help companies improve efficiency and competitiveness through improvement of quality is the philosophy of TQM (Kumar et al., 2009: 23). The literature on quality argues that TQM is a strategy that provides organizations with competitive advantage (Martinez-Costa and Jimenez-Jimenez, 2009). The importance of quality for company's performance and success on the market is widely recognized in business literature and practice (Kumar et al., 2009). TQM implementation is believed to lead to company performance improvement. In order to study the influence of TQM on performance, an understanding of TQM is needed that enables us to identify which competencies it generates and what repercussions that has on the results (A. B. Escrig Tena et al., 2001). Numerous studies indicate positive relation between TQM implementation and performance. Examples of benefits achieved from TQM by companies around the world include: decreased inventory 23 percent in two years, order changes halved, delivery time reduced from 20 to 4.5 days, quality teams saved \$5.6 million over four years, customer claims frequency reduced by over 40 percent, customer service response time reduced by 44 percent, lost time from injuries reduced 46 percent, cost of quality reduced from 12 percent to 9 percent, operating profits increased 7.4 times, 98 percent first pass yield, on-time delivery increased from 75 percent to 99 percent, customer complaints reduced by 78 percent, \$12 million saved in one year in suggestion system, 91 percent of employees said proud to work for the company, positive responses on employee attitude survey increased from 76 percent to 83 percent (Kumar et al., 2009). Parallel with the argument of Powell (1995), A. B. Escrig Tena (2001) claims that the basic argument is that TQM can contribute to the improvement of performance by encouraging the development of assets that are specific, produce socially complex relationships, are steeped in the history and culture of the company and generate tacit knowledge. All these features correspond to the conditions, which, according to the RBV, allow a sustained competitive advantage (A. B. Escrig Tena et al., 2001). According to Powell (1995) and similarly, according to A.B. Escrig Tena (2001) TQM leads to the creation of an inimitable competitive advantage due to its production of routines and guidelines which are

difficult to reproduce by the competitors. Different authors present different core competencies adopted as a result of successful application of TQM.

Researchers have concluded that TQM has a positive effect on company results (Martinez-Costa and Jimenez-Jimenez, 2009). Kaynak (2003) examines the relationships among TQM practices and the direct and indirect effects of these practices on various performance levels, Samson and Terziovsky (1999) shows this relationship in cross-sectional sense; meaning that TQM's categories of leadership, management of people and customer focus were the strongest significant predictors of operational performance and A.B. Escrig Tena et al. (2001) refers to the effects of TQM on firm competitive advantage. Research findings indicate that firm performance is an output of effectively implemented TQM practices. According to literature discussed regarding the positive relationship between TQM and organizational performance, the hypothesis to be tested can be formulated as follows:

Hypothesis 6: Total Quality Management has a positive influence on firm performance.

Figure 2. The Conceptual Model; the relationship between organizational learning and firm performance through the mediating roles of innovation and TQM.

Research Method

Sampling

The data used to test the hypotheses are drawn from a varied spectrum of Turkey's industries. The sample frame of the study consisted of a range of industries including; telecommunications, computer and electronics, communication, software, manufacturing and machinery, chemical, service technologies, food, and material industries. The organizations taking part in the survey have both national and international, operational domains. Yet, 27% of the firms operate on a regional level, 20.2% operate on a national basis and 53.2% of the respondent firms' operational domain consists of international borders. The initial sample consisted of 185 white collar employees in 87 firms in total. The screening criterion was established on the basis that these firms which have been selected are parts of a wide range of foreign and domestic industries both in public and private sectors. The presumption that "individual views on issues will constitute a function of their organizational roles" directed the survey of the study to be done with individuals who occupy strategic positions in their organizations who would be more knowledgeable about the strategic relationships between the inter-organizational structure (Paulraj et al., 2008). Thus the use of key informants as sources of data is standard practice in strategic management research (Paulraj et al., 2008).

The survey form prepared was subject to a pilot study in the field. Regarding the warnings and suggestions analyzed through these results the survey was transmitted to more extensive masses. The general managers of the firms were contacted by telephone as a pre-notification of the survey and were announced about the imminent arrival of the survey as well as the aim of the study. Hence this involved the assurance of confidentiality and the anonymity of the responses, the data of their company or specifically products to be undisclosed and a premise that a report of the results and implications will be sent to the respondents in case they request. For the purpose of eliminating flexibility in the survey technique which would breed inconsistency and

to provide a common understanding of the questions for each respondent the questions are constructed by multiple choice answers. Of the 185 contacted, 173 agreed to answer the survey. Yet, of the 173 returns, 49 were deleted due to incomplete and inconsistent information, leaving 124 usable returns for analysis. Correspondingly, from 72 out of 87 of the firms contacted, usable data was received for a response rate of 67%.

Measures

The methodology consistently entails the adoption of a survey research method. A survey was conducted to validate the proposed relationships ascribed in the hypotheses and to develop a reliable discussion coextending with the findings attained. To test the hypotheses, well verified measures of multi-item scales adopted from previous studies were used. All the measurement constructs were estimated through respondents' perceptual evaluation on a seven-point Likert scale, which was anchored by the end points of "strongly disagree" (1) to "strongly agree" (7). By using the parallel translation method, the items were first translated into Turkish by one person and then translated into English by another person. The two translators then jointly reconciled all differences. Subsequently the suitability of the Turkish version of the questionnaire was pre-tested by the people working in the industry. After refining the questionnaire based on interviews with the pre-test subjects the questionnaires were then distributed and collected.

The learning dynamics in the organizations which indicate shared vision, intra-organizational knowledge sharing, commitment to learning and open mindedness are measured within the questionnaire using a scale consisting of 11 questions, developed and validated by Gomez et al., (2005). Simultaneously, concerning the evaluation of learning organizations' principles some dimensions from Chermack et al., (2006) have been adapted to survey questions. Mainly, answers for knowledge transfer, its adaptation to existing organizational culture, the encouragement of the employees' innovative ideas by top management, the involvement of the employees to the management and the favorable condition for a system based approach towards firm vision of all the employees were inquired.

An inspection on the previous empirical studies on TQM alludes that researchers have defined TQM measures in numerous ways albeit they complement each other (Prajogo and Sohal, 2006). In order to tap the domain of TQM in organizations, the scale developed by Scott et al., (2008) and Bessant et al., (2001) concerning the continuous improvement section was adopted. Besides, for the instruments captivating participation, leadership, process management and customer orientation, the scale was complemented with survey questions from the studies of Vijande and Gonzalez, (2007), Costa et al., (2008), Prajogo and Hong, (2008) were assigned. The five dimensions of TQM were in total measured with 19 questions which have proven to be valid and reliable instruments representing a composite indicator of TQM .

Regarding the discourse of the employees in the organization 5 questions have been identified and used reflecting the enterprise's innovation vision. In the construction process of these questions the study introduced by S. -h. Liao et al., 2008, studies of Akgün et al., (2007) and Vijande and Gonzalez et al.'s (2007) were adhered to.

Utmost, the organizational performance measurement captured the employee satisfaction and the market situation or performance of the organization. The employees were asked to answer 8 questions reflecting the essential aspects of firm performance. The measures regarding organization's market situation and performance were adopted from Law and Ngai's (2008) previously conceptualized and validated study examining the effects of intra-organizational knowledge sharing and learning behavior to the firm performance and from Lee et al., (2008). Consequently the measures assessing employee satisfaction and general organizational performance were shaped by Costa et al., (2008).

Measure Validity and Reliability

After the survey results of 124 respondents from 72 firms have been aggregated and their validity has been determined, SPSS13.00 statistical software has been utilized throughout the data analysis process.

Factors	Mean	S.D.	1	2	3	4	5	6	7	8	9	10
1. Participation	5.642	0.907	1.000									
2. Intra-organizational knowledge sharing	5.274	1.004	0.441	1.000								
3. Market Performance	5.524	0.935	0.449	0.456	1.000							
4. Innovation	5.700	0.771	0.733	0.468	0.548	1.000						
5. Employee satisfaction	5.693	0.965	0.682	0.457	0.572	0.662	1.000					
6. Shared vision	5.387	0.914	0.621	0.522	0.497	0.580	0.678	1.000				
7. Leadership	5.849	0.954	0.575	0.489	0.538	0.569	0.628	0.593	1.000			
8. Process Management	5.847	0.904	0.436	0.256	0.332	0.572	0.361	0.286	0.529	1.000		
9. Continuous Improvement	5.470	1.247	0.421	0.413	0.549	0.589	0.446	0.327	0.427	0.511	1.000	
10. Customer Orientation	6.016	0.770	0.527	0.434	0.445	0.565	0.474	0.479	0.575	0.596	0.513	1.000

Table 1. Correlation of Latent variables.

Table 1 shows the correlation among all ten variables. The relatively low to moderate correlations provided further evidence of discriminant validity. Also all reliability estimates demonstrated in Table 2, including cronbach alphas, average variance extracted for each construct (AVE), and composite reliabilities, were well beyond the threshold levels suggested by Nunnally (1978), except the AVE's of intra-organizational knowledge sharing and innovation having average variance extracted slightly lower with 0.47 and 0.41 respectively. Furthermore, the squared correlations did not exceed the average variance extracted further suggesting discriminant validity. Concurrently, it was concluded that measures were unidimensional and had adequate reliability as well as discriminant validity.

Construct	Composite Reliability	AVE	Cronbach Alpha
1. Participation	0.875414	0.584484	0.819234
2. Intra-organizational knowledge sharing	0.774331	0.471176	0.651797
3. Market Performance	0.898802	0.645008	0.861815
4. Innovation	0.845911	0.413297	0.779138
5. Employee satisfaction	0.835721	0.638260	0.674008
6. Shared vision	0.874846	0.585553	0.808036
7. Leadership	0.900106	0.750363	0.831590
8. Process Management	0.852090	0.658344	0.742760
9. Continuous Improvement	0.888435	0.726538	0.822372
10. Customer Orientation	0.876708	0.589406	0.820726

Table 2. Reliability and AVE.

Further, the measures were subject to factor analysis. When all the questions included in the survey are put through factor analysis some questions are dropped and put out of analysis because they are not in the expected factor interval. The questions that have lower than 0.5 factor values are remained out of analysis. The two dimensions of organizational learning; commitments to learning and open mindedness was not supported and were accordingly dropped after the factor analysis. The dependent and independent variables in this analysis have been considered as separate. The variables regarding organizational learning are loaded to shared vision and intra-organizational knowledge sharing; those regarding TQM are loaded to, participation, customer focus, leadership, process management and continuous improvement, finally variables regarding organizational

performance are loaded to employee satisfaction and market performance as factors. Because innovation is only one factor there was no need for an additional factor analysis.

At the outset, in the section regarding general information about the organization and the respondent, nominal and serial scaling has been used. While in the nominal scaling section descriptive analysis was prevailing, in the section with likert scale questions factor analysis has been incorporated. Furthermore the impact of two or more variables on the dependent variable and the evaluation of the research hypotheses have been assessed according to the regression analysis. Reliability of a construct can be defined as the consistency and the stability of the constructs. Yet, for the estimation of internal consistency of the basic structures of the study –organizational learning, TQM, innovation, organizational performance- Cronbach Alpha value was used as suggested in the literature to be equal to or higher than 0.7 (Kerlinger, 1986). The cronbach alpha values presented in Table 2 indicate high reliability with all the constructs above 0.7, except intra-organizational knowledge sharing (cronbach α = 0.65) and employee satisfaction (cronbach α = 0.674). Though, due to the high composite reliability of the items this doesn't create a major problem.

Furthermore, to test the hypotheses, we employed regression analysis and the results revealed in Table 3. Those hypotheses are; (H1) the influence of organizational learning on innovation specifically the supported construct is; shared vision positively influences innovation in organizations, among the hypotheses involved regarding the relationship between organizational learning and TQM, (H2); shared vision positively influences participation; shared vision positively influences leadership, shared vision positively influences process management, shared vision positively influences continuous improvement, shared vision positively influences customer focus are supported. Besides, intra-organizational knowledge sharing positively influences leadership, intra-organizational knowledge sharing positively influences continuous improvement, intra-organizational knowledge sharing positively influences customer focus and intra-organizational knowledge sharing positively influences participation are the bases of the relationships between organizational learning and TQM. These results reveal that shared vision dimension of the organizational learning construct has a positive relationship with all the TQM dimensions and the intra-organizational knowledge sharing dimension of the organizational learning positively influences the four dimensions of TQM namely; leadership, continuous improvement, customer focus and participation. Furthermore, concerning the influence of organizational learning on firm performance (H3) the following hypotheses are supported, shared vision positively influences market performance and shared vision positively influences employee satisfaction. Which means firm performance is positively influenced by shared vision. In the 4th hypotheses set (H4), the t-statistic values show that TQM's relationship with innovation is suggested to be relevant with values higher than 2. Those relationships are; participation positively influences innovation, process management positively influences innovation and continuous improvement positively influences innovation. Yet leadership and customer focus has no influence on innovation. Moving towards hypotheses set 5 (H5) which presents the relationship between innovation and firm performance, innovation positively influences market performance, innovation positively influences employee satisfaction, reflects that innovation positively influences firm performance. Finally the last set of hypotheses (H6) described by the relationship between TQM and firm performance reflect the positive influence of leadership on market performance and employee satisfaction, the positive relationship between participation and employee satisfaction, and that continuous improvement positively influences market performance.

	Entire Sample Estimate	Mean of Subsample	Standard Error	T-Statistics

Table 3. Results.

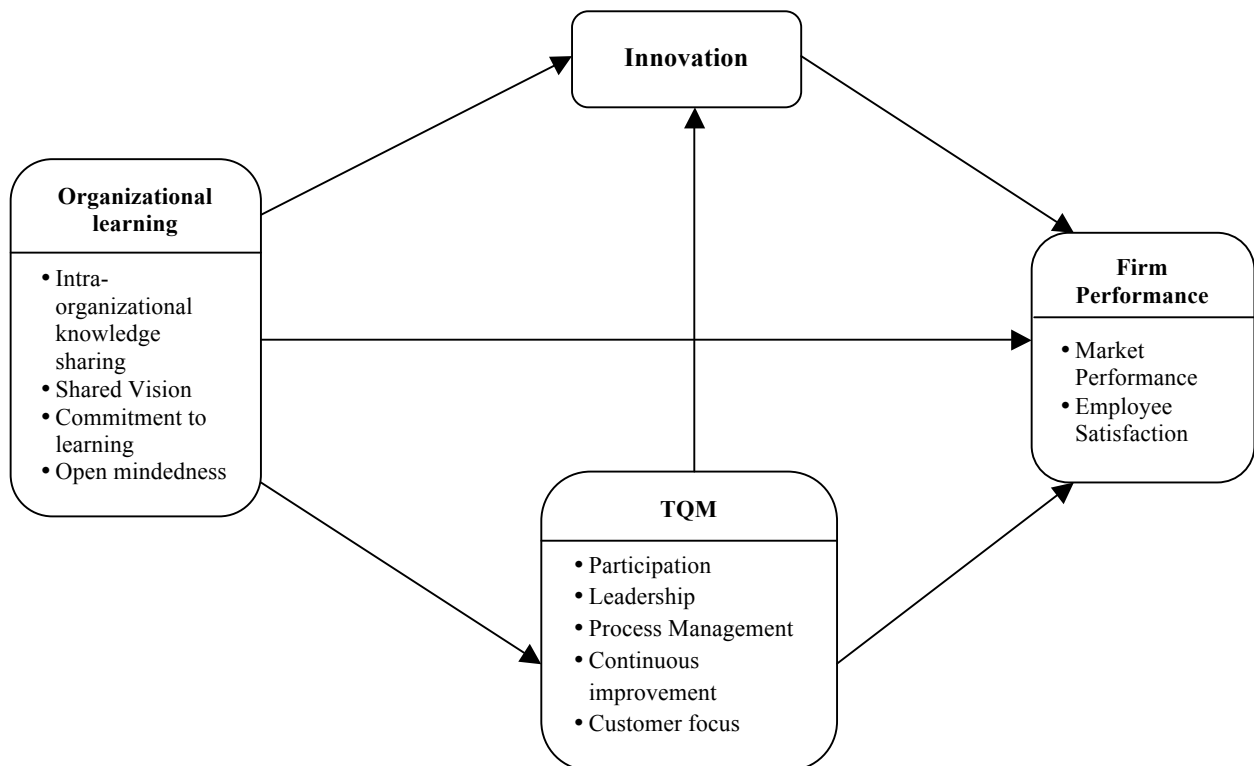

Figure 3. Research Model.

CONCLUSION

The main purpose of this study has been to explore the relationship between organizational learning, TQM, innovation and firm performance. This study develops a platform through which organizational learning shapes the strategic management of the organizations through the role of innovation and TQM for the aim of achieving

improved firm performance. Significant TQM can be obtained through the role of organizational learning. Parallel to that TQM contributes to the achievement of innovation. In addition, innovation and TQM seem to have significant influence on firm performance as well as the positive relationship extracted between organizational learning and firm performance.

The findings of the study highlight the idea that, mainly organizational learning, innovation and TQM and have began to be established as legitimate and promising pivotal factors creating firm performance. Yet in the case of the emerging market of a developing country, Turkey the crucial role of intra-organizational knowledge sharing as an element of organizational learning and customer focus as a dimension of TQM have not been fully emphasized. Though the positive effect of intra-organizational knowledge sharing on TQM cannot be underestimated, its influence on innovation and firm performance seem to be minimal. Yet country profile constitutes a predictive indicator in the analysis of the results. According to a research on social values in Turkey the trust between people is very low in Turkey which results in the direction of the personal efforts to prevent any type of sharing including knowledge (Esmer, 1999). Yet customer focus is also related with the issue of trust in two ways. If the customers are not trusted enough their contribution to firm innovativeness as well as performance would be limited. Since customer focus is driven by “customer ideas and suggestions” to achieve innovation and performance, if trust lacks it results in the absence of the influencing power of customer focus on innovation and firm performance. Second, if customers don't trust the company, their contribution to processes and products will not be practical. Accordingly, it's conceived that both intra-organizational knowledge sharing and customer focus should be effectively managed for their benefit to be extracted. Concurrently, a further area to be researched appears to be “how to manage knowledge sharing and customer focus” in developing countries?” Furthermore the results of this study reveal strong positive relationship of organizational learning with TQM and firm performance. Besides, positive relationship is obtained between TQM and innovation and TQM with firm performance. Additionally innovation positively affects the two dimensions of firm performance.

Like any empirical research effort, this study contains some methodological strengths and limitations. First, there was not an industrial separation while evaluating data; results may differ for different industries. Second, there is not a separation concerning the size or the industry of the firms involved, accordingly the results may differ for SMEs and large sized organizations as well as for different industries. Third, the results reported emerge from a local area; results may differ for firms located in different areas operating in different cultural, environmental and political conditions. Despite these limitations this study provides important implications in the context of a developing country from theoretical and practical perspectives.

KNOWLEDGE MANAGEMENT IN PROVIDING VALUE ADDED TO ORGANISATIONS

**Edward Wong Sek Khin
Abdul Razak Ibrahim**

University of Malaya

ABSTRACT

This study examined an in-depth, interpretive case study investigating the organisational impacts of a knowledge management and groupware information system named "Web-based Legacy EDI Groupware", abbreviated as "WebLegacy". In particular, the way in which WebLegacy operates as an agent in converting tacit knowledge to explicit knowledge, its organisational impact, success factors, and success indicators will be explored. This study is based on the framework and analysis used by Daniel and Graeme (1999) to examine knowledge management in the health industry. The paper will examine one organisation in Malaysia using WebLegacy. The study examined an automotive company who contracted a local external website design consultant to implement WebLegacy on their sites. In addition to interviews with the companies, interviews with the website design Consultant Company will be conducted in order to gain an alternate perspective of topics and issues raised in the research.

Keywords: Knowledge Management Systems, Web-based Legacy EDI, Organisational Impacts, and Information Systems.

INTRODUCTION

Knowledge management research has increasingly become an important concern in decision support that create value for organisational strategy and structure in meeting the challenges of the information age. Knowledge is information combined with experience, context, interpretation, and reflection. Knowledge is a high value form of information that is ready to apply to decisions and actions (Davenport, 1998). This research study will explore the practical reality of the subject of knowledge management system by focusing on a tangible, pragmatic entity, the knowledge management project. Hence, it is significance for the need of a successful knowledge management project to be in place as one of the indicators of the success of the firm is its increasing pool of knowledge.

Knowledge management may also be seen as an extension of information system management whereby the organisation benefits from the more effective use of information/knowledge. This may or may not have a strategic dimension (Remenyi, D. 1999). According to Remenyi, D. (1999) knowledge management may also been seen as tool by which the organisations core competencies may be focus and developed. This provides knowledge management with a strategic focus. As an extension of information system management, knowledge management is concerned with decision support systems, data warehousing, data mining and groupware systems. Knowledge management is also closely associated with Intranet applications.

Groupware application is also been seen as an application that can facilitate organisation-wide knowledge management. It is also able to provide human with an unprecedented global many-to-many medium to exchange information. According to Hauben & Hauben, (1997), individuals around the world are now able to broadcast their isolated opinions and gain feedback from a diversified population (Hauben & Hauben, 1997). They also suggest that knowledge management may be seen as an extension of information system management, which utilises the exchange of business information through an IT network. This entails the exchange of information electronically between separate organisations, or between an organisation and its customer, business to business or business to customer. Such a network of exchanging information is crucial to support successful business partnerships.

However, in order to achieve knowledge superiority, an organisation must first understand its knowledge asset, ie the value of its knowledge, how well that knowledge is being applied, and the true cost of its IT. This means

the organisation needs to establish a proper knowledge management project that provides strategy for managing and exploiting such knowledge.

LITERATURE REVIEW

Groupware Application and Knowledge Management

In the paper by Gunther, L (1994), the author says that WebLegacy is about 'better business practices', both in the way an organisation manages its internal operations and more directly in the way it manages its relationships with customers and suppliers. He also mentions that such WebLegacy encourages, or more often forces companies to re-examine business processes and trading relationships. As a result, WebLegacy is seen as a tool used to transmit standard structured messages electronically from the computer application in one location to another computer application in another location. Thus WebLegacy is an 'enabling technology' that allows organisation to meet its business goal

Previous Empirical Research

In this section, a framework for analysing a knowledge management project that involved the WebLegacy, based on previous empirical research is discussed.

The framework for the knowledge management project referred to above incorporates four stages: the objectives, the strategies, the success indicators and the success factors (adapted from Daniel, L and Graeme, G, 1999).

First stage, the objectives of knowledge management project.

Objectives define what a knowledge management project is trying to achieve.

According to Davenport (1998), knowledge management projects can provide four types of objectives that allow organisation to achieve knowledge superiority. They are as follows:

- "Creating knowledge repositories; WebLegacy focuses on creating structured repositories to store explicit knowledge;
- Improving knowledge access; WebLegacy focuses on providing access to tacit knowledge and facilitating its transfer between the individuals;
- Enhancing the knowledge environment; WebLegacy focuses on the establishing an environment conducive to knowledge creation, transfer and use;
- Managing knowledge as an asset; WebLegacy involves in measuring the value of the knowledge assets" (adapted from Daniel,L and Graeme, G, 1999).

Second stage, the strategies of knowledge management

Strategies define the methods for achieving the objectives.

According to Hansen et al (1999), there are two broad types of strategy for implementing knowledge management (Hansen reference in Daniel, L and Graeme, G, 1999). They are as follows:

- "Codification strategy: codification is about turning tacit knowledge into explicit knowledge.
- Personalisation strategy: personalisation focuses on tacit knowledge and involves the sharing of knowledge directly between people" (adapted from Daniel, L and Graeme, G, 1999)".

Hansen et al (1999) found that "all companies use elements drawn from each strategy, either focus on one type or focus on both together. The choice of strategy was dependent on the competitive strategy of the organisation" (Hansen reference in Daniel, L and Graeme, G, 1999).

Third stage, the success indicators for knowledge management project

Success indicators measure the effectiveness of a knowledge management project, which includes the dependent variables or the outcome measures.

According to davenport et al (1999), he identified four success indicators for knowledge management projects (Davenport reference in Daniel, L and Graeme, G, 1999). These are as follows:

- “growth in resources attached to the project. This refers to the increases in number of people or the size of the budget assigned to the project over its lifetime;
- growth in knowledge content and usage. This is measured by increase in the volume of knowledge stored in repositories;
- organisational initiative. This means that if the projects are the initiatives of one or two individuals they are less likely to succeed than projects that originate in organisation-wide initiatives;
- financial returns. This refers to the financial return either for the project itself or for the organisation as a whole” (adapted from Daniel, L and Graeme, G, 1999).

Stage four, the success factors for knowledge management projects

Success factors define the conditions that lead to success in knowledge management projects. According to Davenport et al (1998), there are eight types of success factor for implementing knowledge management project (Davenport, (1998) reference in Daniel, L and Graeme, G, 1999). They are as follows:

- “ the link to economic performance. This involves money saved or earned.
- technical and organisational infrastructure. This refers to the level of involvement through technology and organisational infrastructure for the success of knowledge management project;
- flexible knowledge structure: finding the right balance of knowledge repositories to a project;
- knowledge-friendly culture: finding the aspects of a knowledge friendly culture;
- clear purpose and language: clearly defined communication and objectives are important for success;
- change in motivational practices: incentives and rewards are important to motivate people;
- multiple channels for knowledge transfer. This means providing opportunities for face to face contact as well as electronic forms of communication;
- senior management support. This implies providing funding and other resources for the success of the organisation” (adapted from Daniel, L and Graeme, G, 1999).

In summary, the literature review above has attempted to provide an overview of the empirical studies by Daniel, L and Graeme, G (1999) pertaining to knowledge management projects. It explored the success factors, the success indicators, the strategies and the objectives. It was then synthesised into an analysis framework, and was used as the basis for analysis of the case study data.

RESEARCH OBJECTIVES

Specifically, the research objectives are to determine the followings:

- To what extent can the adoption of a knowledge management project, which involves WebLegacy, serve as a mean to support knowledge management in providing value creation to the organisation?
- If so, how and why does the adoption of WebLegacy act as a vehicle to support knowledge management in providing value creation to the organisation?

Discussion of Case Scenario

Organisation #M is a family owned automotive group. The company was established to offer Klang Valley car buyers an innovative option to serving vehicle needs, and has been in business since the mid 1980's.

To research the question raised above, the authors held preliminary discussions with organisation #M's knowledge manager and its external website design consultant's staff. Key players were identified from organisation #M and Consultant Company and these individuals (the Technical Supervisor, Operations Director and knowledge manager) were interviewed.

Analysis Framework

According to Yin (1994), it is important to ensure adequate rigour in research design when utilising case research. It is proposed that the analysis framework (adapted from Daniel, L and Graeme, G, 1999) shown in Figure 1, which incorporates the objectives, success indicators and success factors of Davenport et al (1998) and the knowledge management strategies identified by Hansen et al (1999) will be applied to this study.

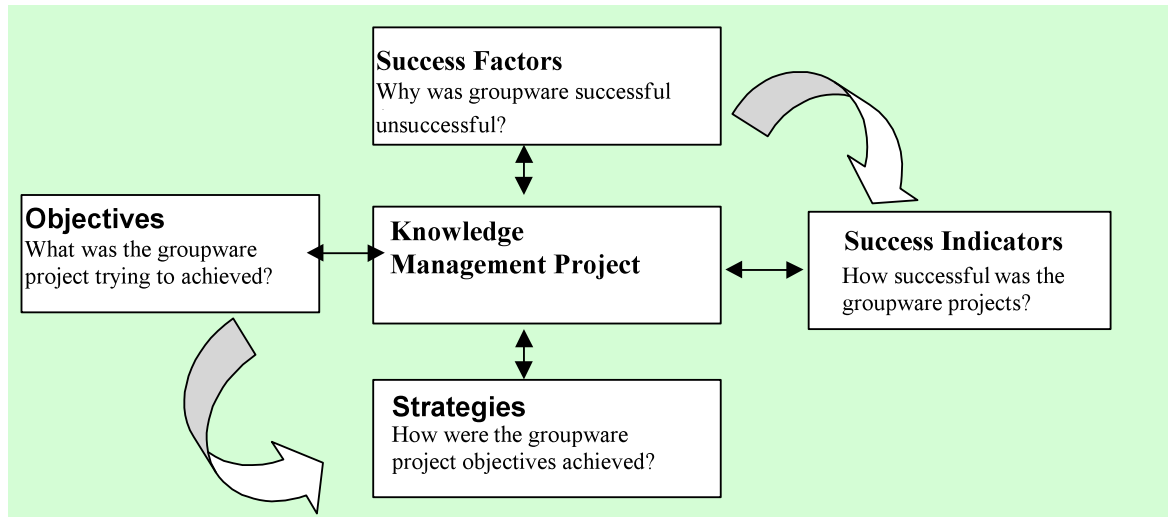

Figure 1: Proposed Analysis Framework (adopted from Daniel, L and Graeme, G, 1999)

PRELIMINARY FINDINGS AND CASE STUDY ANALYSIS.

Stage One; Objectives

What was WebLegacy project trying to achieve?

Table 2: What was WebLegacy project trying to achieve?					
	Knowledge from internal , external source				
Objectives KM project	Operations staff	Existing Customers	Marketing staff		
Create knowledge repositories	Provide 24hrs accessibility/accurate information provided	Provide quick response on request/queries	Information easily accessible to public		
Improve knowledge access	Facilitate transfer of tacit knowledge between individual	Increase in Satisfaction	Facilitate transfer of tacit knowledge between individual		
Manage knowledge as an asset	Moderate	Not sure	Moderate		
Enhance knowledge environment	Improve conducive environment for sharing knowledge	Increase in Satisfaction	Improve conducive environment for sharing knowledge		

(Table 2: Matrix showing the relationship of objectives of Knowledge Management and WebLegacy. Adapted from Daniel, L and Graeme, G, 1999).

The above indicator provides the finding for WebLegacy in trying to achieve. These are as follows:-

- In the scope of creating knowledge repositories, it created a virtual ‘information library’ accessible 24 hours a day to staff across all branches. The significant improvement observed was due to the external knowledge

(knowledge from an external source). This means that improved information exchange can lead to intangible benefits, cost reduction and quality improvement efforts.

- In the scope of improving knowledge access, it has helped to facilitate the transfer of tacit knowledge between the individuals.
- In the scope of enhancing the knowledge environment, it has helped to induce conducive environment for sharing knowledge.

In summary, WebLegacy has successfully created a knowledge repository for knowledge transformation, sharing, and knowledge creating processes for organisation #M. The WebLegacy entails staff of organisation's # M tacit knowledge, which resides in many heads can now be codified into formulated knowledge resides on electronic form. In addition, WebLegacy has also proven to be successful in allowing information sharing and collaboration across departments, and functions.

Stage two; Strategies for WebLegacy project

How were WebLegacy objectives achieved?

	Knowledge management project components.					
Strategies for the KM project	Functionality data bases, eg. operational & administration	External network, eg. supplier and customer focus	Listservers eg endusers			
Codification strategies	Not codifying because providing access to already codified knowledge	Not codifying because providing access to already codified knowledge	Not ascendable			
Personalisation strategies	Not ascendable	Not ascendable	Involves exchange of ideas and experiences between individual endusers.			

(Table 3: Matrix showing the relationship of strategies of Knowledge Management and WebLegacy groupware. Adapted from Daniel, L and Graeme, G, 1999).

To answer the question of how WebLegacy objectives were achieved. It is necessary to explore the three major of components of WebLegacy. These are as follows: functionality data bases, eg. operational and administration; external network, eg. suppliers and customers; and listservers, eg. endusers. The list server component fits into the personalisation strategy because it involves the exchange of ideas and experiences between individuals ie. endusers. However, the other two components do not fit into either of the strategies, ie. The codification strategy or the personalisation strategy. This means that both the functionality databases and external networks focus on explicit knowledge, and are not concerned with codifying knowledge. However, the functionality data bases and external network components provide only access to already codified knowledge resides in the electronic form.

Stage three; Success indicators for WebLegacy

How successful was WebLegacy project to organisation # M?

With respect to organisation #M:	Pre- adoption of groupware	Post- adoption of groupware	One years from post-adoption of groupware
Growth in resources attached to the project	Low	Improved	High
Growth in knowledge content and usage	No online discussion	Increase online discussion	Exponential increase online discussion/request /Business Improved

Organisational initiative	Not Appealing	Satisfaction	Increasingly Appealing/ satisfaction
Financial return	Stagnant	Indications of cost reduction	Business Improved/profit increased

(Table 4: Matrix showing the relationship of success indicators of Knowledge Management and WebLegacy. Adapted from Daniel, L and Graeme, G, 1999).

The above indicator provides findings on the level of success for WebLegacy in organisation # M.

- In regards to the scope of growth in resources attached to the project, the estimated total costs of ownership for implementing the project was \$98,400. However, it was estimated that the annual budget of recurring or operational costs would be \$24,000 per annum.
- In regards to the increase in the growth in knowledge content and usage, there was an exponential increase in information usage since the post adoption of WebLegacy.
- In regards to the extent of organisational initiative, there seems to be greater levels of satisfaction on the part of end user. Customers' complaints have dropped significantly since the adoption of WebLegacy in the organisation.
- In the regards to the size of the financial return, there seems to have been some reduction in cost, as WebLegacy is able to integrate web EDI with their inventory, accounting and order entry system. This means that the integration brings about an increase because it greatly decreases human involvement in information flow, thus making business processes simpler, faster, cheaper and less error prone.

In summary, the success indicators have indicated that a significant impact to organisation # M has occurred. They have improved the quality of their management decision making and thereby improved the quality of service provided to their customers.

Stage four; Success Factors for WebLegacy.

Why was WebLegacy successful or unsuccessful to organisation # M?

With respect to organisation #M:	Pre- adoption of WebLegacy	Post- adoption of WebLegacy	One years from post-adoption of WebLegacy
Link to economic performance	Normal	Indication of Improvement in financial savings	Strong Indication of Improvement in financial savings
Technical and organisational infrastructure	Normal	Increased involvement in both Intranet & Internet technology & WWW infrastructure	Exponential increased involvement in both Internet & Intranet technology and WWW infrastructure
Flexible knowledge structure	Not Appealing	Satisfaction	Increasingly Appealing/ satisfaction
Knowledge-friendly culture	Negative attitude to knowledge, organisation learning low, innovation low	Towards positive attitude to knowledge, organisation learning increase, innovation increasing	Positive attitude to knowledge, organisation learning increase, innovation increasing
Clear purpose and language	Not ascendible	Objectives being defined in company mission statement	Objectives being defined in company mission statement
Change in motivational practices	No incentives and	Staff are motivated	Staff are motivated by

	rewards system	by incentives and rewards system	incentives and rewards system
Multiple channels for knowledge transfer	Confined to face to face	Internet access for customer request	Face to face , electronic forms of communication
Senior management support	Management participation low	Indications of management support increases	Indications of management support increases

(Table 5: Matrix showing the relationship of success factors of Knowledge Management and WebLegacy. Adapted from Daniel, L and Graeme, G, 1999).

For organisation # M, the findings of the success factors are as follows:-

- In regard to the extent of linking to economic performance, this project has saved significant amounts of money for organisation # M. However, the estimated total costs to the owner for implementing the legacy EDI groupware project was \$98,400. It was anticipated to produce an increase of annual sale of RM \$ 3 million (from RM \$10 million to RM \$ 13 million) a year after implemented WebLegacy.
- In regard to the scope of technical and organisational infrastructure, this project used Internet and Intranet technical infrastructure, and the World Wide Web.
- Concerning the degree of flexible knowledge structure, the project involved different levels of structure of knowledge content. Some have sophisticated indexing structures, eg. information generated from the integration with the internal accounting and inventory system or information transformed through search engines.
- In the scope of knowledge friendly culture, there was an indication of positive attitude to knowledge sharing particularly from suppliers and among other staff. For example, supplier coordination, including smooth flows of information provides greater information linkage, and able to gain a competitive advantage over their rivals.
- In the scope of clear purpose and language, the project has provided staff and suppliers with access to on-line inventory request to support in inventory turnover. It also provided speedy information sharing with customers.
- In the scope of motivation to share knowledge, the project has successfully proven that staffs were motivated to share knowledge through an incentives or rewards system.
- In the scope of multiple channels for knowledge transfer, the project has provided two channels for knowledge transfer, both electronic: through the Internet for customers to access to the latest product information and through the listservers for staff to share knowledge and experiences amongst individuals.
- Assessing the extent of senior management support, the project has promoted and secured active participation among management.

In summary, WebLegacy has satisfied most of the eight success factors defined in the framework. WebLegacy has also successfully offered cost savings to organisation # M, which flow from improved information exchanges between its customers and its suppliers.

CONCLUSIONS

Summary of Findings

In this study it has been demonstrated that WebLegacy has successfully offered infrastructure to organisation # M, which has supported the acquisition of knowledge and enhance the environment in which knowledge artifacts are created and managed. Several reasons are associated with the significant of WebLegacy particularly to organisation # M.

- WebLegacy is identified as the most popular application used by staffs of organisation # M. It is widely noted as being helpful in its virtual office environment as its geographically dispersed branches can collaborate and exchange information.
- WebLegacy is able to provide network tools such as shared, indexed and replicated document databases and discussion threads, as well as shared white boards, joint document editing capabilities and full duplex, multimedia communication features. These tools serve to mitigate collaborative losses.

- Substantial cost savings result because of improved information exchanges between organisation # M, its suppliers, and its customers. These tools serve to add value to organisation # M products and the services to its customers. They also help organisation # M to gain a competitive advantage over its rival.
- Using WebLegacy to do business in the long run, may enable organisation # M to relinquish its control over its suppliers.

WebLegacy was chosen as a mean of supporting knowledge management in providing value creation for organisation # A, because it was believed that this project was able to provide a strategy for managing and exploiting knowledge. This project also serves to help organisation # A in understanding its knowledge asset, ie the value of its knowledge, in assessing how well that knowledge is being applied, and the true cost of its IT.

Limitations and Directions for Further Research

The approach used in this paper is geared to address factors affecting WebLegacy by using an analysis framework (proposed by Daniel, L and Graeme, G, 1999). It does not propose to build a new model that provides a new way of looking at IT investments that will help to identify its benefits. This refers to a model that is able to address a new focus of responsibility for the identification and delivery of IT investment benefits. However, the factors that have been combined into Daniel and Graeme's model that describe and explain the drivers and critical success factors for knowledge management project implementations, requires further testing for thorough empirical validation.

The work outlined in this paper may encourage other IS scholar to formulate a model that can capture the information reflecting the perception and practice of the Adoption Electronic Commerce Knowledge Management Project. In particular, it would be useful to identify the internal or external environment factors affecting the adoption of them and their degree of influence. (Length of paper is 3630 words)

LINKING DYNAMIC CAPABILITIES AND DIGITAL TECHNOLOGIES: A CASE STUDY OF SMALL FIRMS IN THE UK AUDIO VISUAL SECTOR

Keith Randle
Mariana Dodourova
University of Hertfordshire, UK

ABSTRACT

The Creative Industries are acknowledged as a significant actual and potential wealth generator (Delors, 1993). However, compared with industrial manufacturing, finance or services there has been relatively little research on them, especially from an organisational point of view (Scase and Davis, 2000). This paper presents the findings of an empirical study of the impact of digital technologies on small firms in the audiovisual sub sector of the creative media industries in the Eastern Region of the UK. The study contributes to our knowledge of the sector through examining how digital technologies are changing the way skills are acquired in an industry where individuals mainly “learn by doing” (Gregulis, 2010).

The findings demonstrate generally positive associations with digital technologies. Yet, the latter are also perceived by owner managers as a threat eradicating the market entry barriers of high cost equipment and highly developed occupational skills. Perhaps paradoxically, the study also identifies a very significant skills shortage in the SMEs operating in the Film and Digital Media industry. The study highlights the problems related to the acquisition of skills in small firms, during periods of rapid technological change and the contrasting processes of de-skilling and multi-skilling.

INTRODUCTION

At both a national and regional level, the creative industries are increasingly recognised for their existing and potential contribution to GNP and have been described as ‘at the leading edge of the movement towards the information age’ (Scase and Davis, 2000).

The East of England Region

The East of England is acknowledged internationally as a centre of excellence in the creative industries, specifically in film, television, animation, interactive media, design (graphic, packaging, product and multimedia design), and in the production of corporate video presentations and commercials. The region has one of the most highly qualified labour markets in the UK and is one of the main centres of the wider creative industries in the UK (City University/DTZ Pieda, 2002). There are three main concentrations of firms working in these areas: around West Hertfordshire (film), Norwich (TV and animation) and Cambridge (ICT and interactive media). Employing some 145,000 people in total, the creative clusters around West Hertfordshire and Cambridge are significant wealth generators for the East of England Region and account for one-tenth of the UK’s total creative and media exports, by value (Screen East 2002).

West Hertfordshire provides the location of a number of important studios, the county is home to six commercial studios, and film has been the fastest growing of the creative industries. Almost 50% of all UK commercial studio production facilities are based in the Region and filmmaking traditions go back to the early part of the twentieth century. It has been estimated that around 125 companies are involved in film, television production, animation and new media production (Screen East 2002).

Independent television production has developed around the Regional broadcaster, Anglia Television in Norwich. Animation forms an emerging sector in Norfolk ranging from the more basic animation required for children’s television through to the production of state of the art avatars (Screen East 2002, Appendix 3) Around Cambridge is a computer development and interactive software cluster, a centre of excellence producing

intellectual property and patents which already contribute to the next generation of content rich products and services for media producers and consumers.

While acknowledging film, television and the interactive software industries in the UK as growth sectors with 5.8% of the national workforce actively employed in occupations related to film, television, radio and video (ONS, 2001), it is also important to acknowledge that creative industries are not so significant in overall employment terms (except where ICT is concerned) as to figure amongst the DTI's ten recognised industrial clusters in the Eastern Region (DTI, 2001). Overall growth in employment also shields significant variations by sector. The DTI reports that there is a 'small local concentration of the film industry in Hertfordshire' which is actually an extension of the London (Soho) film industry (2001:7). However, the region is significantly underrepresented in e-commerce, television and film and video production. Nevertheless, it has been suggested that employment growth fails to reflect the very significant increases in output growth in these industries, up to 16% in 1998 (UKFC 2003).

In terms of national employment patterns, re-regulation and liberal market reforms during the 1980s, combined with new technologies, restructuring and incentives to self-employment and small business formation, led to a high degree of industrial fragmentation and growth in freelance working, self-employment, partnerships and other owner-managed enterprises (Baines 1999, Pratt 1977, Scase 1995), and away from employment in cultural and media related occupations in the UK. In 2005, of those working in independent production for television 61% were freelance or self employed (Skillset 2005a) and of those in film production 63% were on fixed term contracts (Skillset 2005b). 51% of those working in television production worked in more than one sector (Skillset 2005a) generally this means independent film, video or commercials where skills are more interchangeable.

The Eastern Region reflects this national picture, characterised by a small number of large employers and a large and growing number of small businesses and freelance workers who cluster together on an opportunistic project-by-project basis, giving rise to an 'hourglass shaped' industry (Deuze 2007). The average size of Creative Media firms in the Region is below the UK average with most being small or micro businesses - the majority of companies employing six or less persons (Screen East 2002) and consisting of an average of four. Around 60% of the workforce is estimated to be freelance or sole traders, reflecting Skillset's national figures.

The sector then can be characterised as fragile and fragmented, comprised largely of small independent production companies which operate as cottage industries. The particular characteristics of firms in the film sector create a unique set of problems for, amongst others, regional development and support agencies with the fragmented nature of the sector often making intervention strategies by providers difficult to execute. Long-term survival of these businesses is a key issue for the film and digital media industry, with business failure common.

Training and the Creative Media Industries

The most common route for new entrants onto the UK creative media labour market is by a 'Beckerian, learning-by-doing process where skills are picked up informally and without certification' (Baumann 2002:31) and where 'assistantships' rather than formally structured apprenticeships represented the route into the industry of nearly half of entrants (Dex et al, 1999).

Nevertheless the sector has an undeniably highly qualified workforce. According to Skillset a quarter of the audio visual workforce in the UK holds a media degree, with 66% of the industry being educated to graduate level. This compares with 16% of the UK workforce as a whole and is particularly evident amongst the younger members of the workforce, suggesting a continuing upward trend. However, a report examining the transition from college to work by film and audio visual media graduates in London (Holgate 2006) suggests that graduates themselves are frequently critical of the lack of practical training in the courses they have followed and this accords with the views of some employers interviewed during the present study.

The Skillset Workforce Survey (2003) found an overall lack of training in the creative industries, particularly amongst freelancers. The difference between freelancers and employees in regard to access to training was significant, with only 44% of freelancers receiving training compared to 60% of employees. 94% of freelancers who sought training experienced barriers to receiving it, such as the fear of losing work or earnings, lack of information and high course fees.

However, there have also been voices arguing the case for autodidacticism in the industry, where the technology has become less costly, lighter and easier to use and the opportunities to use, for example in the internet, to learn

filmmaking skills have increased considerably. Film Director Anthony Minghella, comments that as a result of digital technologies "...the means of production are going to be surrendered to almost anybody out there." (The Guardian, 2005: 9) suggesting a democratisation of the practice of film making with increasing numbers having access to the means of making films and presumably the skills required to do so.

The Impact of Digital Technologies

The speed of technological change in general and digitalization in particular in media industries during the last two decades has been overwhelming, with new enabling technologies being introduced not over decades but within months. Digitalisation has been defined as the process underlying the so-called multi-media revolution whereby digital technologies are gradually replacing earlier mechanical technologies (Von Tunzelman, 1995). Digital technologies are now having an impact upon every stage in the motion picture value chain from script development through to production, post-production, distribution and exhibition. Technologies in the pre-production, production and post-production stages of film-making have developed rapidly in recent years, with the use of Digital Video now common and non-linear PC based editing almost universal. The technology exists to shoot, edit, distribute and exhibit a movie entirely digitally (Culkin, et al 2003).

Digital technologies have been readily embraced for their versatility and cost efficiency. The accessibility and affordability of digital film and editing equipment has created an environment where clients and consumers can themselves now purchase high standard prosumer (professional/consumer) camera equipment, shoot & edit film using standard PCs and software and achieve reasonably professional results. The decrease in the prices for professional equipment makes the current situation, where access to significant capital is no longer a barrier to entry, evident. Costs have fallen from £103,000 per digital editing suite (hardware and software) in 1994 (Screen Digest, 2003) to around £3000 in 2004.

Moreover, the growth explosion of the creative industries sector might be explained, at least in part, the dramatic increase in work productivity under the influence of digital technologies, which in turn has led to the development of new spheres of consumption, both in knowledge-related and leisure activities.

However, studies have also suggested that the impact of digital technologies on the creative industries sector has been mixed. It has been argued that the rapid introduction of new digital technologies has transformed media markets into moving targets where firms are likely to be faced with increasingly dynamic competition. This situation poses vital questions concerning the set of skills and capabilities that can enable firms to adapt and compete successfully in the new context. Baumann (2002) comments that observers have speculated on how the labour market will supply the workforce needed for the continuing growth of the visual media – and in particular TV - industries, with Sparks (1989) and Varlaam et al (1990) forecasting a dramatic future shortage of skilled employees for these industries. Indeed, in the particular context of the creative industries in the East of England, the retention of graduates and the attraction of new graduates from elsewhere are two key challenges faced by the sector despite, or perhaps even exacerbated by, its close proximity to London.

Moreover, there is also an argument that the convergence of digital content production has blurred traditional job profiles and consequently led to the multi-skilling of individuals (Cottle and Ashton 1999). While access to training suppliers and the quality of training are key issues in the creative industries generally (City University/Pieda Consulting 2002), these become even more significant when the speed of technological change is rapid, as with the adoption of digital technology by the modern film industry. A recent study on the implications of new technology for the skill and training needs of small to medium sized printing firms (Smallbone et al 2000) showed that small firm survival ultimately depends on a systematic and structured approach to training.

Shooting a film using analogue techniques has traditionally been constrained by two factors; technical/professional know-how and the economic limits of the budget. Both of these constraints are directly related to shooting with film stock. Geuens (2002) characterizes traditional filmmaking as a time consuming and expensive process that requires a high level of professionalism and concentration from every person involved, with the crew being constantly confronted by obstacles which they learn to overcome through meticulous preparation, followed by the continuous exercise of exacting craftsmanship. He goes on to argue that digital filmmaking is eradicating these constraints which effectively maintained the quality of the product. The low cost of digital capture has led to a less professional and focussed approach characterised by greater experimentation and an attitude to problem solving on set which can perhaps be epitomised by the expression 'we'll sort it out in post'. This suggests that the ability to manipulate the final image using digital technologies is so great that the

shortcomings of what is shot on set in principal photography do not now form a major constraint on the quality of the finished product. Films can consequently be made by what this author (Geuens 2002) regards as second rate personnel and through a trial and error approach. He sees a radical discontinuity where digital represents a disruptive technology which will revolutionise the industry.

There is a counter argument to this which can be summarised as: by making learning loops faster digital video offers a higher degree of flexibility and freedom to creative talent and improvisation therefore does not lead to a lower quality product but to greater innovation and a more creative solution.

A further argument is that the 'digital revolution' is really a 'digital evolution' with technical challenges still ensuring that digital filmmaking has some way to go before it can achieve the aesthetic quality of analogue film. However, products other than feature film may benefit from technological change at an early stage while the production values expected of mainstream cinema require considerable maturity in the technologies employed. The independent production sector, then, may be less immune to the pressures associated with technological change. While this could be characterized as 'dramatic' rather than 'radical' there appears to be agreement that 'profound changes in jobs and labour relations in the content industries are coming one way or another' (Ducatel, Burgelman and Bogdanowicz 2000: 516). This is likely to impact on both small firms and the majors.

The routines that shape labour relations in filmmaking are unlikely to change or be substituted by new technologies over night. Rather, technology will be adapted in a way that is consistent with existing structures and domains of power and expertise. As the literature on routines (Nelson and Winter 1982; Andersen 2003) and temporary organisation (Grabher 2004) suggests, routines are 'selfish' and replicate themselves beyond organisations, with process knowledge in project based industries such as the audiovisual industry, being remembered in networks. A change in technology is adopted along the existing skill base in these networks, in a path dependent way.

However while a 'business as usual' position may be applicable to the case of the major film studios, producing multi-million dollar feature films the realities of the UK regional film production/post-production sector are somewhat different. In the regional context work on feature films represents only a small proportion of the work carried out by companies and the threat to livelihoods is more apparent and more immediate.

Hence the question that arises and, to the best of our knowledge, has not been addressed by previous studies, is what is the impact of rapidly changing digital technologies on fragmented industries dominated by small and micro enterprises such as the creative industries in the East of England? Answering this question will contribute to both academic debate and industry knowledge through advancing our understanding of the implications of digitalization. The findings can be deployed to develop comprehensive guidance to skill and capability development for industry practitioners and education and training providers. Moreover, they will provide regional development and support agencies with valuable insights into the problems and issues pertaining to the development of skills and capabilities by small enterprises in this highly potent sector.

LINKING DYNAMIC CAPABILITIES AND DIGITAL TECHNOLOGIES

Using the dynamic capabilities view as an underlying theoretical framework, our study examines the impact of digital technologies on small firms in the creative industries sector with particular emphasis on their ability to adapt to the new context through developing and deploying new competencies. Teece and Pisano (1994) introduced a 'dynamic capabilities' approach to strategy, which underlines the importance of dynamic change and learning. The development of this framework flows from a recognition that strategic theory is replete with analyses of firm-level strategies for sustaining and safeguarding extant competitive advantage but has performed less well with respect to assisting the understanding of how and why some firms succeed in building competitive advantage in regimes of rapid environmental change while others do not. Teece et al (1997:516) define dynamic capabilities as the firm's ability to 'integrate, build, and reconfigure internal and external competencies to address rapidly changing environments'.

The dynamic capabilities approach is especially relevant in a Schumpeterian world of innovation-based competition and 'creative destruction' of existing competences. It emphasizes two aspects: the shifting character of the environment, and the key role of strategic management in appropriately adapting, integrating and re-configuring internal and external resources and towards the changing environment (Teece and Pisano, 1994).

Thus the primary focus of this approach is on the mechanisms by which firms identify, accumulate and deploy firm-specific skills and capabilities, and on the contextual factors that influence the rate and direction of this process.

The occurrence of technological change often requires redeployment of resources to develop capabilities suitable for the new technological regime (Tushman and Anderson, 1986). Teece (1988) argues that capabilities are sets of differentiated technological skills, complementary assets, and organizational routines and capacities that provide the basis for a firm's competitive capacities in a particular business. In essence, capability is a measure of a firm's ability to solve both technical and organizational problems. Capabilities typically have both organizational/economic and technical dimensions. The organizational/ economic dimension involves (1) allocative capabilities - deciding what to produce and how to price it; (2) transactional capabilities - deciding whether to make or buy, and whether to do so alone or in a partnership; and (3) administrative capabilities - how to design organizational structures and policies to enable efficient performance. The technical dimension, on the other hand, concerns the ability to learn, to develop and design new products and processes, and to operate facilities effectively. The competitive strength of a particular company is a function of its underlying technical and organizational capabilities while idiosyncrasies in these capabilities trigger and sustain interfirm performance differences (Eisenhardt and Martin, 2000).

Prior research has reported the positive effect of dynamic capability development on small firms' survival and performance. Strategic initiatives which guide learning efforts towards development of new capability sets or rejuvenation of existing capabilities can help small firms quickly improve their performance or adapt to external trends more swiftly and nurture the emergence of internal creativity more effectively despite their lack of experience and/or resource constraints (Branzei and Vertinsky, 2006).

Hence human capital strategies can stimulate the emergence of novel capabilities through expanding external knowledge searches and facilitating the acquisition of innovative ideas from external sources, and through fostering ingenious knowledge cross-pollination within the firm. The initial development of new capabilities depends to a great extent on the quality of human capital, e.g. knowledge, interaction, task-ability, and willingness to learn. Hiring, training, improved coordination and learning-by-doing facilitate capability development (Leventhal and Myatt, 1994). Firms, which attract highly educated and/or highly skilled workers, provide skill-development and cross-training, and offer continued learning-by-doing and on-the-job training, develop 'difficult to trade and imitate, scarce, appropriable and specialized' human capital (Amit and Shoemaker, 1993:36). Attracting and training high quality technical and scientific personnel is considered critical for growth and performance, particularly for firms in dynamic environments (Deeds, et al, 1999).

However, the intensity of the learning efforts in knowledge-intensive, complex or dynamic environments depend not only on the firm's requisite human capital but also on its operational routines. Periodic inflows of qualified personnel and specialized training can improve firms' capabilities by effectively spanning different knowledge bases (Boland et al, 2001). Several studies have associated creative cross-pollination of skills across different areas of expertise with the effective recombination of technological, marketing, and organizational know-how (Helfat and Peteraf, 2003) conditional upon the quality and energy of firms' professional personnel (Deeds et al, 1999).

Hence sustained capability development requires firms to continuously nurture novel operational routines by questioning, reshuffling, realigning, and rejuvenating their core skills. Companies are increasingly organizing their activities less around functions and operations and more around time-designated projects where temporary cross-functional teams are assigned to specific projects with a clearly defined outcomes and completion dates. This type of project-based organization is increasingly viewed as a model achieving innovation, adaptability and rapid learning.

The equivalent of this model in small firms is the assembly of a group of skilled workers who can be used as 'skill containers' and easily employed in different markets (Kristensen, 1995) Firms are not strictly committed to any one business or value proposition, but instead aim strive to keep these skilled employees busy and find more valuable uses for their skills hence expanding the competency base (Cole, 2004) and generating value from extant endowments.

However, although multi-skilling seems to be a necessary condition for the adaptation and growth of smaller companies, there is also a downside. As Avilés et al (2004) have pointed out, working in several fields of competencies may increase the scope and productivity of a firm, but often leads to a lack of training and professionalism in core tasks. This issue needs to be clarified for its vital importance to small firms, particularly

in the context of rapid introduction of new digital technologies and the related questions concerning the development and rejuvenation of skills and capabilities.

Managerial decisions are acknowledged as some of the most critical antecedents of capability transformation (e.g. Adner and Helfat, 2003), influencing the depth of understanding of the external environment, the speed of reaction and the specific actions taken in response. Recent theoretical studies conceptualize managerial decisions and strategic choices as essential stepping stones in the capability-building process (Helfat and Peteraf, 2003, Zahra and George, 2002, Eisenhardt and Martin, 2000). Appropriate strategic choices may help firms overcome the constraints of their existing resource endowments by guiding the further advancement of existing skills and by facilitating development of new capabilities. Managers can shape a firm's competitive posture by specifying the content, sources of desired competencies and their intended effect (Bierly and Chakrabarti, 1996). Yet, the question of whether or how small firms deploy strategic interventions to enhance their existing capabilities and/or develop new ones has remained largely neglected by prior research.

RESEARCH METHOD

The data reported in this paper came from the results of an empirical study which involved telephone interviews with thirty production and post-production companies to investigate the impact and implications of digital technology at a UK Regional level. A qualitative methodology was employed to fully explore the level of understanding and depth of feelings that respondents had about the impact and implications of digital technology. Thirty telephone interviews, of thirty-minute duration, were conducted in the course of one month, with local business decision makers (predominantly owner managers) and individuals working in the film industry. Organisations were chosen randomly and approached for co-operation with the aim of getting access to a spread of audio visual sector companies covering both the production and post-production stages and of carrying out a total of thirty interviews. Following the taped interviews a thematic analysis was carried out.

Research was conducted amongst organisations working within the film and audio visual industry in the counties of Hertfordshire, Cambridgeshire, Essex, Suffolk & Norfolk. The principle business activity of the organisations interviewed was television, film and commercial and corporate video production. A minority of companies were solely engaged in advertising and maintaining an internet library. 25 of the interviews were with individuals in production organisations and five in post-production, although in practice the distinction was nebulous with many working across this boundary. This in itself is in part a function of digital technologies which have allowed the boundaries to become blurred.

The vast majority of organisations interviewed were relatively small, both in terms of the number of employees and their level of turnover. Most companies had fewer than five full time employees, although many of them supplemented this by contracting Freelance staff, as and when the dictates of a project demanded.

The majority of organisations operated from a single office. All relied heavily upon email and mobile phone services, but few had any permanent remote working practices or computer networks in place. Most organisations operated on a turnover of £100,000 or less. There were a few notable exceptions to this, where the research spoke to relatively small film units that were part of much bigger corporations. Consequently these types of organisations, with access to more comprehensive budgets and resources provided an interesting contrast to the remainder of the sample frame.

Approximately half of all organisations surveyed were well-established businesses that had been in operation for ten years or more. The majority had been formed by individuals who had 'learnt their trade' within the industry before setting up their own business. These individuals were typically highly experienced in their field of expertise and had been using analogue equipment prior to the advent and advancement of digital equipment.

A generic topic guide was devised to facilitate discussion around key areas of the respondent's organisational profile, perceptions of the impact of digital technology within the wider film industry, the impact within their own organisation, security, standards and training & recruitment. However, the nature of each individual's experiences, attitudes and general level of engagement with digital technology ensured that respondents themselves firmly shaped the agenda for the discussions. The research was conducted under the Market Research Society Code of Conduct, and consequently no reference will be made to any individuals within this analysis.

FINDINGS

In the section which follows we present the findings from our empirical research. While the interviews ranged over a number of issues of concern to owner managers and decision makers in the small firms we selected, we have chosen here to focus here on those related to the connected issues of training, skills and technological change.

The Managing Director of a Postproduction company in our survey described how:

‘When I was a little boy, I would go and work in a film studios or become a runner and that is how you learnt the industry, you worked your way through each grade...

But he continued:

‘...Now there aren’t the companies that can afford to do that anymore and take on a boy that doesn’t know anything and train them up. The companies need profits and they need someone who can do the job..... there is no going into a company and making cups of tea and things like that...’

Consequently, it is being argued that the traditional ‘Beckerian’ method of developing skills in the industry is not longer sustainable. Small firms were looking for individuals who already possessed the necessary skills to contribute towards the business.

Nevertheless, few of our respondents were found to be actively seeking out and attending training courses of any description in digital technology, preferring to learn about equipment and techniques ‘hands-on’ and on the job. For many of the smaller businesses time away from their work, plus the associated costs of attending courses did not make it a viable option. Consequently, training normally provided by large companies and almost always outsourced by smaller enterprises, is compromised.

There was some concern amongst respondents regarding the media studies courses offered by Further and Higher Education institutions. Whilst most felt that these courses provided a reasonably sound theoretical foundation, there was insufficient practical experience being gained by students. New entrants to the film industry required a considerable amount of hands-on practical training:

‘What happens is Universities and colleges offer what they call ‘Media Studies’ which is not a practical ‘how the industry works’.training in the industry at the moment is very bad.. ...or it is very costly.’

(Managing Director, Postproduction Company)

‘I’m very cynical about media studies I’m afraid and I’m probably not the only one.....I suppose I’m old fashioned..... I went through college at a time when one went to do a degree in a traditional subject and then went on and trained to become a producer or whatever afterwards and I don’t think there was a lot wrong with that..... when academic institutes start running technical training courses it gets out of date so soon.. that I’d question its value’

(Partner, Production Company)

Virtually everyone interviewed during the study expressed concern that the emergence and growth of digital technology, especially DV, was leading to a belief that ‘anyone can make films’.

As two independent producers reported, competition was increasing both as a result of new entrants to the business and clients taking ‘make’ rather than ‘buy’ decisions:

‘...it’s exactly what’s happening in the video industry there is a lot of competition from boys with their cameras in their bedroom sort of thing , and there is also competition in the sense that a company will say ‘I’m not going to buy that, we’re going to do it ourselves’.

(Partner, Production Company)

This respondent’s comment reflects the ambivalent attitude of many of our interviewees to

digital:

‘...it draws more people into the industry because it is more accessible and that is a good thing. Ultimately it will probably put me out of business. If you have an idea now you can go out and realize it....’

(Editor, Postproduction company)

The higher ‘knowledge intensity’ of digital cameras requires less training and seems therefore more easily accessible. However a producer maintained that:

‘...it’s not just a question of pressing buttons that gets overlooked, so it’s quite difficult to quantify that kind of expertise and people are reluctant to pay....’

This suggests that clients believe that the costs the production company has to meet, in terms of outlay on equipment and expertise are falling with the introduction of cheaper and easier to use technology. The client expects this perceived fall in costs to be passed onto him, the customer. Consequently as, for instance, the differences between cameras priced at £60,000 and those at £600 become more subtle, prices for the equipment in use no longer have such explicit quality signalling characteristics, making clients more wary when spending money on services from companies in the industry.

Findings from the interviews also suggest that while digital technology has made it easier to enter the market, it has become far more difficult to remain in it. As technology advances quickly, firms are forced into a potentially costly continuous upgrade spiral:

‘... there is this constant drive to update, constant drive to change Now you buy something and you’re not really sure how long it’s going to last and if you get three years out of it then that’s good going. So it’s difficult, the longer term financial, capital equipment and financial strategy is very different’

(Partner, corporate video production company)

Not only are some of the cost savings through digital technology offset by upgrading costs, as mentioned earlier they also have to be passed on to clients as competition grows more fierce. It is therefore unsurprising that the enthusiasm for digital in smaller companies has waned:

‘...They say that all this technology was actually supposed to make people’s lives easier but in fact it just means that you press their nose that much harder to the grindstone’

(Partner, corporate video production company)

The situation of the audiovisual industry in the Eastern Region appears therefore as a paradox. On the one hand academic commentators and government training agencies warn of skill shortages, while practitioners complain about the opposite: that digital technology requires less skill and therefore reduces market entry barriers so potentially threatening livelihoods.

There does appear to be evidence for this in the case of small firms, as is illustrated by the statement of a young independent television producer:

‘...It depends what we’ve got going on. I could be filming. I could be editing. I could be just putting together the administration for any of those two elements of the process. I could be a sales executive one day. I could be a presenter the other day because I have to, because of where we are. We’re growing. It’s all sort of multi skilled so I wear many different hats...’

(Producer, Independent television production company)

This tendency towards a blurring of the boundaries between formerly distinct sub-sectors was reflected in our firm sample. While the research was oriented towards the production sector in many cases firms worked in both production and post-production.

In summary, while the audio visual workforce is highly qualified many of its skills are acquired on the job. Graduates of media related courses do not rate them particularly highly in terms of the equipping them with the practical skills that they need in employment. Small firms tend to expect their employees to come ready

equipped with skills rather than have to provide them with training but freelancers, in particular, find it difficult to get access to training for a range of reasons. When technologies are changing quickly it becomes even more important that firms have access to appropriate skills, but these skills are not necessarily related to the changing technologies and may include, for example, business awareness related and personal skills.

DISCUSSION AND CONCLUSIONS

The research carried out among the sample of production and post-production companies in the Eastern Region showed that on the whole the adoption of digital technology was viewed as a positive step for businesses. It brought with it improvements in production times, reductions in costs for equipment purchase and hire, greater flexibility in working practices and higher productivity. However, a number of significant threats to the future shape of the local industry emerged. These concerned the linked issues of training, deskilling and product quality. Falling barriers to entry are likely to encourage competition and attract new entrants into a sector that is already made up almost entirely of micro and small business firms.

Our findings are supported by those reported in other academic literature and suggested in the reports of regional support agencies, namely that there is a need for the continuous updating of courses of media related training and education to keep pace with new technological developments. This in itself raises the question of the adequacy of educational funding required to resource high tech audio visual equipment. However, it is also the case that there is a need to ensure that at both initial graduate entry level and later CPD training should include business awareness training as well as technological updating. As the hourglass shape of the sector develops those owning, managing or working for small firms need to be multiskilled rather than simply technical specialists.

Findings from the research also have implications for the services to small firms from regional support agencies. Firstly, small firms need to extend their thinking beyond products and services to business models and strategic innovation. Consistent with previous research (e.g. Smallbone et al, 2000), this study suggests that the dominant role of the owner/manager of a small firm can lead to a narrow strategic perspective. This is particularly apparent where owner/managers lack formal training or qualifications. Strategic deficiencies are of a major disadvantage in rapidly changing environments. A related problem appears to be the narrow focus of many small firms on their customers, making their development dependent on them. Frequently this is reinforced by neglect of systematic search activities concerning new market opportunities.

Small firms are less capable of searching for and using codified knowledge which makes them more reliant on personal ways of transferring this knowledge and on learning-by-doing and interacting. Moreover, it is also more difficult for them to apply formal contracts, relying more on trust-based, informal relations instead. Hence small firms need to be made aware of the importance of networking and how it can contribute to their performance and dynamic adaptation through exchange of tacit knowledge, potential collaborative relationships and the mobility of the workforce.

More importantly, as business environments become more complex and turbulent, and less predictable, companies must build multiple capabilities and achieve excellence across multiple performance dimensions. Capabilities need to be developed not only along technical dimensions but also along organizational dimensions Teece, 1988). Indeed, the latest trends in the field of strategic management suggest that clusters (networks) of small firms working on a project-by-project basis provide the perfect flexible setting for innovating in such business environment.

However, activities directed toward deploying the existing stock of knowledge (exploitation), e.g. purchasing, producing, selling, distributing, finance, typically require high levels of specialization and coordination through rules and routines. This research demonstrates that support for small firms is needed in those organizational, more 'mechanical' areas, in the form of innovation and technology finance, training in planning, financing, and marketing, and development of downstream (distribution) relationships.

Consistent with previous research among the film and media business community (as well as amongst the creative industries more generally), secondary research underpinning our study has revealed that the key need for the creative industries is not creative or technical (apart from ICT) skills but business, management and organisational skills. The gaps identified include marketing, finance and bookkeeping, strategic planning, pricing, general ICT, and self-presentation. These skills gaps are particularly acute amongst the smallest businesses and the self-employed or freelancers. More generally new entrants need work awareness skills

(working in a team, working to commercial deadlines, handling customers, grasping market potential) and an understanding of the importance of networking. Freelancers need career building skills and small businesses need marketing support to encourage learning, development, market-building and collaboration (East of England Cultural Skills and Learning Group 2003, East of England Creative Industries: Advice and Analysis, EEDA, 2002).

There appears to be a general shift in the way skills are being acquired in the audiovisual industry. The readily accessible nature of digital equipment reduces initial learning costs, but the tendency of this equipment to become outdated quickly raises the necessity to constantly adapt the associated skills to changes in technology. Thus learning cycles have become shorter but also more frequent.

While this paper has contributed towards our knowledge of the implications of rapidly changing digital technologies on small firms in the audio visual industries, it begs a number of questions which future research might focus upon. For example:

What strategic and organisational characteristics trigger interfirm performance differences in creative industries?

How should training courses be improved/modified to deliver more value in the context of digitalization?

To what extent are our findings applicable to small firms in other industries, and particularly in sectors where digitalization has induced extensive structural changes, e.g. telecommunications and computer software?

What level of state intervention is needed to support creative clusters and small firms in such industries?

The latter question is complicated by the heterogeneity of small firms in terms of technological level, market relations and competitive strategies among others, which makes it very difficult to target support in a way that matches the specific problems and needs of very different firms.

CORPORATE GOVERNANCE AND ERM IN A HIGH RISK INDUSTRY

ABSTRACT

Amidst the culture of compliance and 'checklist' approaches to improving corporate governance, much of the accounting research has concentrated on ownership structure and Board composition with financial reporting, audit committees, earnings restatements and disclosure. Such research, although consistent with deductive research using agency theory, is seen as only partial as it fails to address how external requirements can be accommodated through organisational processes. As the governance process is also about accountability and value creation, this paper argues here that the mainstream accounting research has failed to project a balanced view for integrating governance to internal organisational processes. The paper uses an in-depth case study to evaluate the process of organisational governance in terms of different roles played by directors and managers, especially in terms of decision making and resource deployment to achieve organisational objectives.

Keywords: *Corporate governance, Management accounting, Enterprise risk management, Value creation*

INTRODUCTION

The topic 'Corporate Governance' has gained worldwide prominence due to recent corporate collapses, such as, Enron and WorldCom in the United States and HIH Insurance in Australia (Monks and Minow, 2004, Roberts's et.al, 2005, Child and Rodriguez, 2003). As confidence in financial reports diminished among investors and creditors, a sense of urgency was felt among regulators in different countries to restore public confidence and to protect shareholders and investors (Lambert and Sponem 2005, Gordon, 2002). Apart from corporate scandals, there has been a normative pressure for better governance as the business environment became more volatile, less predictable, more globalised and risky. As it was evident that the existing governance framework was inadequate, the usual response was to bring new intended to improve transparency, accountability and integrity (Parker et.al, 2002, Zandstra, 2002, Vinten, 2000, 2005, Doost and Fishman, 2004). Several commentators (Anderson and Chapman, 2002, Seal, 2006) viewed such an approach to corporate governance was limited, as it viewed governance from a narrow perspective and produced a 'checklist' of governance requirements which they felt were unlikely to solve governance problems.

Amidst the culture of compliance and 'checklist' approaches to improving corporate governance, much of the accounting research has concentrated on ownership structure and Board composition with financial reporting, audit committees, earnings restatements and disclosure (Eng and Mak, 2003; Ajinkya, Boraj and Sengupta (2005), Karamanou and Vafeas, 2005; Beekes and Brown, 2006) Such an approach, although consistent with deductive research using agency theory, is seen as only partial (Daily et.al, 2003, Pettigrew and McNulty, 1995, Finkelstein and Mooney, 2003) as it fails to address how external requirements can be accommodated through organisational processes. It will be argued here that the main stream accounting research has failed to project a balanced view for integrating governance to internal organisational processes.

Corporate governance is a process where a Board provides direction, authority, and oversight of management for the benefit of the company's stakeholders, with the ultimate goal being the protection and enhancement of the company's *value*. It is the value creation aspects of corporate governance which is neglected in the literature. In contrast to conformance requirements which is external in its focus, the value added dimension, which has a performance and risk management dimension, requires the Boards to work closely with the management and requires forward vision, strategic thinking and risk taking (Scapens et.al, 2003, Seal, 2001). As the governance

process is about accountability and value creation, it is important to evaluate the process of organisational governance in terms of different roles played by directors and managers, especially in terms of decision making and resource deployment to achieve organisational objectives.

While the Board is the owner of the governance process, day-to-day guidance and oversight by the Board clearly is not feasible. Thus, the Board must rely on other parties – executives, managers, and auditors – to help it fulfill its governance responsibilities. Often these people do not communicate with each other, staying within their silos. In this paper we argue that the management accountant can act as an ‘integrator’ in providing communication and guidance for executives, managers, and auditors who are involved in corporate governance on a day-to-day basis.

LITERATURE REVIEW

While the term corporate governance has been widely used, it has not been clearly defined (Ratnatunga, 2004, Ratnatunga and Ariff, 2005). In general, corporate governance is administered by the Board. Within this framework, each Board is accountable for outlining policies and providing overall guidance, while management is responsible for the implementation of such policies.

The principal weakness of corporate governance is usually pointed towards excessive concentration of power in the hands of top management (especially the Board of Directors) as a result of separation of ownership and management of organisations. To alleviate such problems, accounting researchers, in line with regulatory requirements, have concentrated on designing comprehensive disclosure practices to help organisational oversight activities. It is usually assumed that better reporting practices would unveil major corporate problems. However, the recent corporate scandals and collapses have led to the re-examination of the ‘traditional’ governance issues. Even though the subsequent corporate governance regulations mostly concentrated on auditing and reporting issues (Threadway Commission, 1987, Cadbury Code, 1992, Financial Reporting Council, 2003), the effectiveness of the Board’s role and control mechanisms was also emphasised (COSO, 2003, CIMA, 1999). Such an approach may help to develop a compliance culture but fails to demonstrate how governance procedures are actually achieved in day to day organisational activities. Again, when seen in terms of long term shareholder value creation, the governance processes need to be designed to provide guidance on critical issues and decision situations facing the organisation. An organisation’s governance arrangements are important in that they help determine clear objectives for management and staff to devise a system for managing risk in decision making. There is therefore a growing tendency among the commentators and researchers to expand and clarify the role of the Board in upholding formal structures and processes; and the leadership role of the Board in terms of using an organisation’s competitive advantage to produce better performance (Charan, 1998, Carpenter and Westphal, 2001).

The Theoretical Underpinnings of the Corporate Governance Process

The extant literature suggests that most Boards have failed to take a proactive leadership and define CEO accountabilities (Charan, 2005, 2005a). Even though it is desirable for the Board to be involved with the strategic direction of organisational activities, the actual impact on strategic leadership is doubtful (Westphal and Zajac, 1997). The primary role of Board has been focussed on compliance issues and several reasons are put forward for such behaviour including CEO domination of strategic issues, lack of time and capacity to judge and analyse information, and short termism (Jonk and Schaap, 2004, Finkelstein and Hambrick, 1996, Carpenter and Westphal, 2001). Different competing theories propose different roles of directors in the corporate governance process (see Table 1). It is useful to critically evaluate and adopt a perspective which can accommodate an appropriate guidance for governance of the company.

Corporate governance issues are prominently focussed in *agency* theory which highlights the tension between principal (owner) and agent (manager). Agency theory stresses the need for proper governance mechanisms because of the separation of management and ownership in the corporate structure (Davis et.al, 1997, Jensen and Meckling, 1976). The premises of agency theory are based on the assumption that both agents and owners are self motivated and that there is asymmetric information sharing between agent and principal. Such an arrangement may lead to opportunistic behaviour which can reduce overall corporate performance. In theory, the agency problems can be solved by instituting proper monitoring and incentive mechanisms. It is expected that such mechanisms will align manager’s objectives in line with principal’s interests and prevent agents to pursue opportunistic behaviour. Such a control focus of governance creates a compliance culture (Pound, 1995) and accounting reports play a major role in supporting this approach. It is evident that such an approach usually produces negative consequences where managers pursue sales and short-term profitability growth.

Table 1: Competing Corporate Governance Theories

	Agency Theory	Stewardship Theory	Resource Dependency Theory
Board's role corporate governance	Control and monitoring	Strategic decision making empowering managers	Linking role of Board of directors
Performance evaluation	Short-term measures (profits, EPS share price)	Short and long-term value creation	Short and long-term resource management
Risk attitude	Averse minimisation of risk	Prioritise and adoption of risk Encourage to manage risk	Reduce uncertainty and promote survival
Accounting information	Financial accounting, aggregate ex-post	Management accounting detailed, strategic and operation data ex ante information	Selective financial and management accounting information

In contrast to agency theory, the *resource dependency* theory lays emphasis on reducing uncertainty by securing vital resources for organisational survival (Pfeffer and Salancik, 1978). Under this perspective, the roles played by Boards are seen mainly as 'boundary spanners' to help the organisation adapt to its environment and reduce uncertainty emanating from its environment. Organisations can take advantage of resources under their control and gain key resources to achieve competitive advantage in creating better customer value.

The other major perspective dealing with corporate governance issues is from a *stewardship* perspective. The stewardship theory argues against managerial opportunism and emphasises on trust and need for achievement on the part of managers. As both managers and owners have similar objectives, the Board is expected to take an active part in the strategy formulation process (Donaldson and Davis, 1991). Senior management and Board members work as a team not merely to ensure compliance but also to enhance organisational performance through collaborative efforts. The governance process is seen to promote trust as a means of motivating employees to achieve organisational objectives. It is through such processes that the Board can provide an overall direction of the organisation and monitor managerial performance.

An Integrated Approach to Governance

Although the above theoretical perspectives, when taken individually, focus on only small part of the governance process and provide a one dimensional view (Hung, 1998, Tricker, 2000), they are nevertheless useful as they highlight different aspects of corporate governance. These theories are, however, not without limitations. While agency theory is often criticised of treating managers as opportunistic and self-interested, the stewardship theory is too optimistic about managerial behaviour. However, the key issue remains whether the Board ought to be involved in strategic direction of the company. There are those who argue that the traditional style of governance structure may not be effective for creating long term values (see Child and Rodrigues, 2003), unless the conduct of governance is seen as a two way process between the Board and management for achieving desired performance.

It can therefore be argued that a single paradigm approach may not be useful in explaining complexities faced by modern business organisations (Morgan, 1986; Child and Rodrigues, 2003). A better understanding can be gained by taking a multi-paradigm approach of organisational governance. This paper will argue for an approach to governance with a strategic focus in order to add organisational value. Such a framework is able to integrate both the conformance aspects covering accounting with performance aspects covering value creation in the overall governance process.

While conformance and performance aspects are important for creating values for long term survival of the organisation, the Board also has a responsibility for guiding the organisation to adapt environmental changes (Birkett, 1998). As change is a predominant feature of organisational life, the Board is required to act in collaboration with management to coordinate strategies, resources and processes for bringing changes. In general the corporate framework can therefore, be expressed as a framework to ensure the both conformity and performance improvements to add value to the organisation.

As discussed, most of the literature in corporate governance deals with the conformance aspects. The performance side of governance process requires Board to be involved in strategic decision making process by measuring and monitoring the organisation’s strategic position, options, and risks for creating shareholder values. Desired performance can only be achieved by managing risks and risk management can be seen as part of the governance process, because achieving results would require management of risks to ensure that ‘bad things’ do not occur. Risk management is increasingly perceived to be an essential element of good corporate governance. Accordingly, there appears to be an opportunity for Risk Management and Performance Management to be combined into a single, holistic, process.

The above discussion is summarised in Figure 1. Recent scandals highlight how accounting manipulations, especially financial accounting, were used in earning management to misrepresent company performance. Such activities were performed in collusion between managers and auditors. To alleviate these problems, stringent measures were undertaken by regulating institutions in the form of better regulations and more frequent reporting. This has resulted in an increase in the *short-term conformance* requirements. Such disclosure and audit requirements were regulated so that the investors can trust the *short-term performance measures* of an organisation such as its ROI, net profit, and share price. In addition, the regulatory bodies also required appropriate functioning of Boards in terms of composition and its behaviour. This type of corporate government can be categorized as *long-term conformance* as it is dependent on appropriate institutional responses in the longer-term. However, it will be argued here that sustainable organisational performance can only be achieved strategically in the longer-term. The economic theory that focuses short-termism cannot reveal long term implications. Even though the Board is responsible via the governance process for *long-term performance*, regulatory conformance alone cannot bring this about.

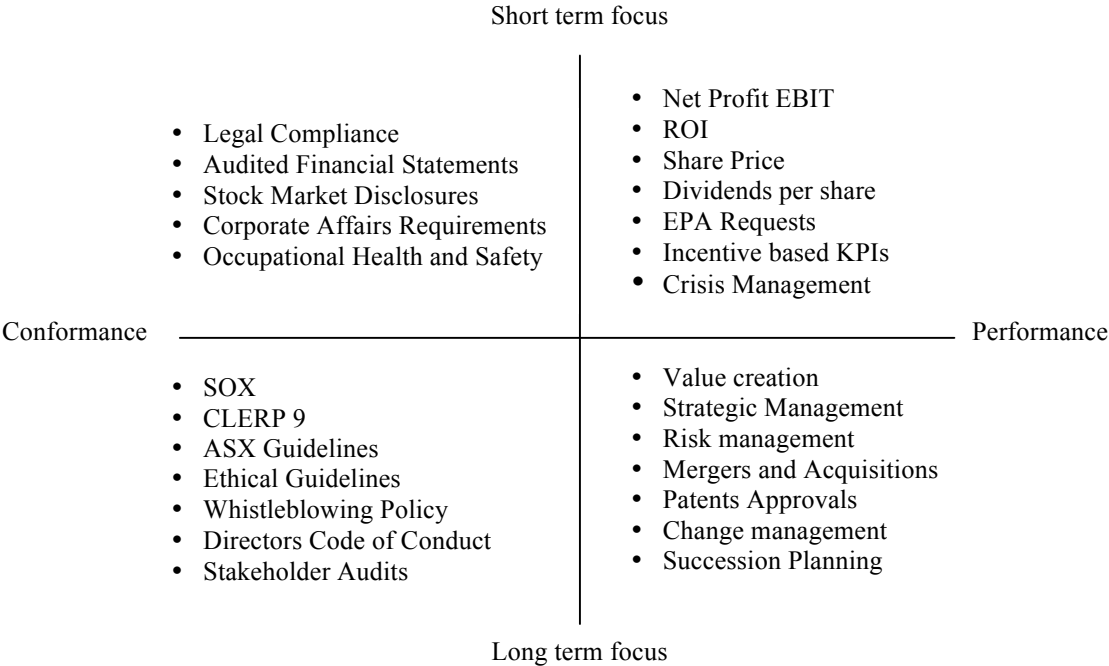

Figure 1: The Focus of Governance in the Conformance vs. Performance Interface

The Board needs to ensure that the organisation is able to respond to changing circumstances and take advantage of relevant market opportunities even as it continues to pursue its planned goals and objectives. Corporate governance needs to contribute to both business prosperity and to accountability. In the current environment it is all too easy to forget the former. Nevertheless, business leaders and shareholders alike must ensure that undue concentration on aspects of accountability does not destroy entrepreneurship and ultimately value.

In summary, the present governance framework is too limited in its approach. While the contextual environment facing the organisation has changed, the existing governance framework seems to be decoupled as it has a legacy of traditional approaches to management. As such, the governance structure may be a hindrance in guiding organisations which requires a dynamic leadership. As it is not clear whether the current governance framework can simultaneously serve strategic performance and conformance aspects, the present study investigates such issues by employing a case study.

RESEARCH METHOD

In methodological terms, the study adopted an exploratory case research approach (Scapens 1990, Van Maanen, 1979, Yin, 1989). Such an approach was justified as the study aimed to understand the role of governance process in an organisational setting. Case methodology facilitates the adoption of a holistic approach to understand different perspectives. Further, this approach was taken to investigate why the limited survey-based empirical research was showing that management accountants were not, in general, involved in governance and ERM processes.

The study was based on a leading pharmaceuticals manufacturing company in Australia (hereinafter Alpha Co.), which was originally listed on the Australian Stock Exchange (ASX) in 1999. The reasons Alpha Co. was found to be a good fit for the specific objectives of the research study was due to four criteria used for site selection:

- (a) *Industry Susceptible to High Risk and High Returns:* We chose the pharmaceuticals industry as the evolving global regulatory climate has become more complex, costly and risk-laden for this industry, with greater disclosure requirements around drug trials, increased transparency in pricing and marketing activities, and compliance with new financial and corporate governance laws. Simultaneously it is an industry where product tampering is rife and the response by the manufacturer to such tampering can either enhance or diminish its reputation.
- (b) *Strong Commitment to Corporate Governance and Enterprise Risk Management:* This commitment is clearly demonstrated on Alpha Co.'s 'Corporate Governance Statement' and 'Risk Management and Audit Committee Charter'.
- (c) *Strong Financial and Share Price Performance:* Over the last 5 years it has been one of the strongest performers on the Australia Stock Exchange with a more than 200% increase in its share price. In the 2006 financial year the company maintained this track-record with an EBIT growth of 18.1% and a PAT growth of 79.3%. Its ROCE increased from 18.5% in 2005 to 22.4% in 2006.
- (d) *A Strong Commitment to Governance Processes by the Company's Leadership:* The current CEO and managing director of Alpha Co. has a background in management accounting, and has publicly stated on numerous occasions in the business press that the company had instituted a governance process based on accounting information, especially cost control. This accounting focus was of paramount importance to test the application of theory in practice, and to investigate divergences, if any.

The CEO was approached, and the reasons why the company was chosen for an in-depth case study was explained, after which the CEO allowed the researchers access to divisional managers and to different levels of information. Given the open access granted under the CEO's authority, the researchers found that they were freely able to undertake their investigation into the firm's governance and ERM processes.

The research was conducted through a series of semi-structured interviews with key informants. Face to face interviews included the CEO/managing director, the company secretary, the chief legal officer, the CFO, the corporate management accountant, the human resources manager, and other accountants. In addition to these formal interviews, other informal discussion was carried out with selective managers and employees representing different segments of the company. Most of these interviews lasted one hour to ninety minutes.

- (a) The researchers specifically focused on the organisational requirements of resources needed to support the multi-dimensional framework of corporate governance and the processes in place to evaluate if these resources are utilised to maximise profit, growth and value. This was because it is here that the role of accounting information in governance and ERM is more likely to be apparent. Ideally, the Board needs to focus on monitoring and strategic roles and such functions need accurate and timely information.

The interviews were documented and confidentiality was given to all interviewees. In order to cross validate information generated through interviews, other information (such as annual reports, governance statements, constitution, management reports, etc.) was also obtained and analysed.

CASE STUDY: ALPHA CO.

Currently there are approximately 1200 shareholders. However, a significant amount of shares are concentrated amongst a few individuals, one representing a 17.5% holding. As such, the company was considered to have a high shareholder concentration, thus necessitating a significant transparency in governance procedures (as discussed in Ratnatunga and Ariff, 2005).

The Role of the Board in Governance and ERM at Alpha Co.

The company has a very small Board. All of the Board members are also in the risk and audit committee. From the interviews and the study of the published documents it was clear that the Board of Alpha Co. governs on behalf and for the benefit of the company's stakeholders. These include its shareholders, employees, customers, suppliers, and others. There is an induction program for all new Directors. It enables Directors to meet with relevant senior managers and inspect Alpha Co.'s operations to enable them to fully and actively participate in Board decision making at the earliest possible time. Directors are encouraged to continue their professional development. The company has issued a policy document that its Directors will be kept up to date on relevant legislative and industry issues which affect Alpha Co.. Directors also have, as a matter of policy, full access to all senior executives and information as requested. Although clearly the Board "owns" the corporate governance process at Alpha Co., the execution of policies made by the board was seen as management's responsibility. The Board, however, assumed ultimate responsibility for the corporate governance process. Senior management, on the other hand, was seen to "own" the governance execution process, and a Non-Executive Director chairs the Audit, Remuneration and Risk Management Committee. Overall, the corporate governance process was seen to be effective because:

- (a) the chief executive officer was committed to the process,
- (b) members of the Board were also members of the *Risk Management Committee*,
- (c) other officers such as the chief financial officer and the company secretary (chief legal officer) also manage the risks under their jurisdiction, and
- (d) business unit executives and managers assume everyday responsibility for managing the risks under their control.

It was evident therefore, that Alpha Co. had systems in place that went beyond the agency view of the Board's role corporate governance. Clearly, processes were in place that empowering managers in strategic decision making (stewardship).

Overview of Corporate Governance, Risk and Cost Management at Alpha Co.

The company had a 'Corporate Governance Statement' which states that Alpha Co. has established a comprehensive framework to identify, assess, monitor and manage risk across Alpha Co.'s operations. Such a governance system is supported by conducting an external and internal audit of finances and controls, with periodic meetings between the Board and the external auditor (including some meeting where the management is excused). There is also monthly reporting to the Board on group activities; a wide range of Alpha Co. policies and procedures and specific risk management activities in each business area. Further, the company has prepared a Delegation Manual; a comprehensive insurance program and a specialised TGA compliance program including standard operating procedures.

On the close examination of Alpha Co.'s policy and procedures, the researchers found it to be very heavily oriented towards compliance issues; both in the short and long-run (see Figure 1). It appeared that the primary objective of the Risk Management and Audit Committee was to ensure that the company does not damage its reputation by not complying (or inaccurately complying) with any matter related to its external regulation. As this was not what the researcher considered to be the main focus of ERM, further investigation was necessary as to long-term performance perspectives.

The section on Corporate Governance in the company's 'Risk Management and Audit Committee Charter' has a very brief 'motherhood' statement that the role of the committee is to review and make recommendations

regarding the company's corporate governance policies, practices and procedures and make recommendations regarding the Corporate Governance Statement in the company's annual report and in any other statutory report or document. The section on Risk Management itself in this document has an equally very brief 'motherhood' statement that the committee's role is to review the adequacy and effectiveness of Alpha Co.'s Risk Management policies, procedures and systems and overview the implementation and maintenance of a risk management program throughout the Alpha Co. group so that:

- (a) the wider goals, objectives and strategies of Alpha Co. are complemented;
- (b) all significant risks are identified, evaluated, treated, monitored, managed and communicated at a group, divisional and business unit level; and
- (c) the adequacy and effectiveness of Alpha Co.'s Crisis Management plans for all key businesses within the Alpha Co. Group are reviewed.

As the researchers were looking for a long term performance link in the company's ERM strategies (see Figure 1), the investigation had to find out the actual practices behind these 'motherhood' statements found in the 'Risk Management and Audit Committee Charter'. Therefore, the interview questions specifically focused on this area.

In response to the very general "Why do it?" question in relation to governance, there was an admission from the CEO that 30% of such activity undertaken by Alpha Co. is often done to be "seen" to be doing the correct thing. This is mainly what is done to fulfil mandatory or voluntary regulation (see Figure 1 issues related to conformance). The CEO stated:

We are subject to pressures such as the recommendation of CLERP 9. Also there are significant pressures in maintaining our TGA licence. If we lose that, we will have to shut down tomorrow. However, we recognise that there are governance aspects that cannot be legislated. Remember that governance is not about disclosing everything. If we disclose every crank or threatening letters we get, then it will panic shareholders unnecessarily. This is not good for the company or its customers and shareholders. Such "extortion" letters are duly handed to the police, who advise us of the appropriate action.

However, he believed that 70% of what is undertaken as 'governance' at Alpha Co. is not subject to any regulatory requirements, and done because the company believes such actions 'add-value.' He believed that most often these value-additions arise in the area of how the company manages risks. The CEO stated that, "This means we have to identify our risks, assess them, insure against downside risk when possible, but also have a 'war chest' to take advantage of upside-risks when they arise. As our profit grows, our capacity to take risks also grows." Company Secretary and General Counsel had a different take on this question:

My first responsibility is to keep Alpha Co. "legal" in terms of corporate and commercial law. There are also the TGA and EPA requirements which are mandatory. In addition, Alpha Co. is controlled by ASX requirements as a listed company. Although the ASX 10-point corporate governance guidelines are voluntary, as a listed company we follow them anyway. There is a certain amount of peer pressure to do so, but even if there wasn't, we probably will adhere as far as possible to them. These give guidelines as to the structure of our Board, disclosure requirements, etc. Unfortunately the capitalist system of profit maximisation produces "externalities". But the law there is "fuzzy". Often the TGA and EPA are seen as "regulating the same damn thing". This may not necessarily cover all stakeholder expectations.

It was clear from the discussions that the company had a number of risk drivers, the main risk drivers are the Therapeutic Goods Administration (TGA), Environmental Protection Agency (EPA), Unions, Consumer Association (e.g. animal rights), Ethical Investment Funds and Equal Opportunity (e.g. gender balance). The CEO said, however, that other pressures often exerted on the company from its numerous stakeholders, some of which they actively resisted. "For example, we don't, as a policy, contribute directly to charitable organisations. We prefer to give that money to our shareholders to give to the organisations of their choice. Charity is a personal matter, and the Board cannot second-guess the desires of its diverse shareholders as to "worthy" charities for donations."

The issues of 'cost-benefit' permeated thought the organisation, from risk management to drug testing to packaging. The CEO had built his reputation, and that of the company on the platform of sound cost management. The CEO States:

There is always a cost-benefit trade off. If we were to achieve 100% product quality and reliability in our industry then we will need to test 100% of our products. As our 'testing' must be destructive [to test if the chemical composition in the drugs are as per specifications] then we will have no product to sell after a 100% testing. Therefore, 'cost efficiency' must be a factor. But we are conscious that this should not be at the expense of our reputation. So the costs expended to safeguard our reputation must be considered in the light of the long-term benefits. The other driver is, of course, value. Not just cost value, but street value. We have a chemical that has a cost value to us of \$25,000 but a street value of \$3m. The safeguarding of this often costs us more than the product itself.

Another good example of cost-benefit that was demonstrated to the researchers was in the area of packaging. Alpha Co. has not only purchased equipment that is "energy efficient" but also the equipment is able to package in flexible sizes. As explained by a senior manager in the production area, "We found that one of our drugs was packed in a 200 capsule bottle. But upon opening the bottle, the capsules could deteriorate due to the contact with the environment. So we devised a "pack" of five small bottles, each containing 40 capsules. The additional cost of the packaging was negated by the benefit of the longevity of the product. But we need the machinery to handle such flexible manufacturing techniques. We are constantly considering such cost-benefit trade-offs." The CFO had this to say regarding the company's cost-benefit philosophy:

Cost management and cost-benefit issues are always paramount in our organisation. For example we have closed inefficient plants and relocated manufacturing to more efficient plants after undertaking a risk evaluation that TGA compliance issues may arise if production continues. Products are also discontinued regularly for TGA compliance related cost escalations. It would just not be economical to expend the CAPEX to get such products to be TGA compliant. Of course one may ask why the additional costs of TGA compliance are not passed on to customers in terms of higher prices? This is not always possible. Most of what we manufacture is on the PBS. It is a long process to get PBS approval of price increases. It is possible, but not easy."

It was evident therefore, that Alpha Co. had a risk attitude that went beyond the agency view of risk averseness and minimisation of risk (see Table 1). It was evident from the interviews that risks are prioritised and the management of risk across all levels is encouraged (stewardship) so that uncertainty is reduced and survival promoted (resource dependency). Further, whilst the 'public face' of its risk management activities was geared towards the 'conformance' issues (see Figure 1), the company's Board and senior management were mostly involved in 'performance' issues, both in terms of short and long term impacts. Many of these 'performance' criteria (and the rewarding of such) had also been incorporated into its policy documents.

Performance Evaluation at Alpha Co.

As discussed above, the company had a 'Corporate Governance Statement' on its website with 10 sections. Of particular interest here is Section 8 of the document headed 'Encourage Enhanced Performance'. Here it states publicly that the performance of the Board, individual directors (including the Chairman) and Board committees is evaluated on a regular basis by the company. On an annual basis the Managing Director's performance is evaluated by the Board against set criteria.

The performance of key executives is managed through the establishment of objectives for each executive's key accountabilities. These are reviewed on a regular basis. These objectives are designed to achieve Alpha Co.'s short and longer term business plans.

Post implementation, the Board at Alpha Co. evaluates the CEO's and senior executives' performance (including ERM performance) to ensure that their performance targets and compensation was aligned with the company's strategy and linked to shareholder value. It also evaluated senior management's succession planning process to ensure that appropriately qualified people are ready to step in and carry on corporate executive duties when members of the senior management team turn over. Some of the thinking behind the KPIs chosen for performance evaluation was elaborated by the CEO:

"All our KPIs are quantitative. But these days they are also integrated. Earlier bonuses were paid, especially on the production floor, on a single KPI indicator, e.g. "Lost Time due to Injuries." This can be

reduced by simply running under-capacity. Thus production volumes get affected. We saw these measures as “contradictory” and not helping to achieve overall company objectives. Therefore today we have an integrated KPI system, and we will provide you with an example (See Table 5). These KPIs are weighted to provide an overall ‘integrated’ score. These KPIs also cascade downwards”.

The performance evaluation process is called “SAS” (Alpha Co. Appraisal System), and is as follows. The Board sets the CEO’s KPIs such as the expected profit levels, safety record, expansion plans etc. The CEO then sets the general manager’s KPIs. For example, the KPIs for the GM-Human Resources are □ profit related and □ human effort related. The GMs then sets the next level of managers’ KPIs. The GM-Human Resources then sets the KPIs for those managers in her section, such as the National Organisational Health Manager’s (or safety guru’s) KPI. At each level the KPIs get tougher as non-achievement affects the higher level management KPIs. The KPIs do not cascade down to the ‘shop floor’ because of union activity. SAS is only for the executives and some sales employees whose commissions and bonuses are based on their KPIs.

The researchers were concerned that SAS was not going to motivate the lower-level employees, in terms of implementation of governance procedures, ERM and overall value-creation. However, the company had other motivational approaches that reached all levels of the organisation. The GM-Human Resources had this to say on the subject:

Whilst only the executive’s rewards are based on the achievement of agreed KPIs – all employees can participate in the “Employee Share Scheme.” They can obtain an interest free loan from the company to purchase up to 4,000 shares per year (equiv. at present to about \$10,000 p.a.). The loan is repaid by the dividends earned on the shares. So there is no ‘downside’ risk. Employees can sell the shares (and repay the loan and make a profit); repay the loan and keep the shares or simply forget about it when they leave the company. About 50% of our employees are subject to EBAs (Enterprise Bargaining Agreements) and the remaining 50% are on contracts of employment.

Further, it was clear that whilst the KPIs used for rewards and incentives were biased towards short term performance (see Figure 1), the company was endeavouring to provide incentive across the Board for longer term performance results. It was evident therefore, that Alpha Co. had systems in place that went beyond the agency view of Performance evaluation (see Table 1). Clearly, processes were in place that incorporated rewards for short and long-term value creation (stewardship) and short and long-term resource management (resource dependency).

Communication and Integration of the Governance and ERM Processes

The conventional wisdom of the literature suggests that there must be effective communication channels linking the ‘risk owners’. This is seen as critical to successful ERM and governance. At Alpha Co., the CFO’s area (incorporating both financial and management accounting functions) played an active role in facilitating effective two-way communication between: (1) the Board and senior management, (2) senior management and risk owners, (3) management and auditors, (4) internal and external auditors, and (5) auditors and the Board. Whilst much of the information provided was quantitative accounting information, the management accounting section also were involved in many qualitative assessments. The CFO states:

The financial issues that the Board is concerned with are, business integration issues, OHS, CAPEX - all CAPEX over \$250,000 must be Board approved- business development proposals of Brand and company acquisitions, issues of shares, exercise of options, board performance reviews and changes in management reporting. In the past they have been very sensitive about such things as injuries at work place and TGA compliance. All correspondence with TGA must be shown to Board, as well as management’s actions regarding these TGA compliance issues. Other finance related issues of great concern to the Board are EPS growth, ROI and Cash Flow Forecasts.

The company, however, does *not* have in place formal processes to gather information about the expectations of its wider group of stakeholders, hence the reason for the ‘qualified-yes’ given in terms of external reporting to Alpha Co.. When enquiring why such a process was not undertaken, the Company Secretary and General Counsel said, “With regards our wider stakeholders, our corporate governance and risk management teams are well aware of those expectations, having significant experience in the industry. Also, there are ‘risks’ associated with asking stakeholders for their expectations. They will want these delivered! And that can cost money”. On this issue, the CFO stated that, “We have a very balanced Board: - including a scientist, a pharmacist, a banker, a

financial expert, a businessman, - so it has a good understanding of stakeholder expectations. A small board but very balanced and very effective.”

In terms of internal communication, however, the answer is very much in the affirmative, as the company has recognised that many of the ERM and governance framework responsibilities, overlap, and that one process affects the other. This has resulted in common memberships in the Board and Risk Management Committee. However, true integration is only possible via effective co-ordination and communication to all employees, and here Alpha Co.’s approach is less conventional. For example the CEO simply said that, “We tell employees to behave in such a way that if their actions are reported in The Age (newspaper) tomorrow, they will not be ashamed of their actions”. Others interviewed also commented on the informality of information flows. For example, the Company Secretary and General Counsel had this to say:

Most of the communications flows are informal. As most Board members are also in the Risk and Audit Committee, there is a good communication flow between these two committees. There is little written formal reporting, however, except in the area of reporting on KPIs. The organisation is a fairly “flat structure” with the CEO and four senior managers in the executive team. There are no “layers and layers” of middle management. As the CEO has been with the company a long-time, fulfilling many roles as he progressed to his current position, he knows almost everyone by first name. Also his mobile number is available to all employees. So he is very accessible. In terms of formal communication, we have a ‘whistle-blower’ policy in place. It has never been used, however.

A similar comment was made by the GM-Human Resources:

We have also a unique informal governance approach at ALPHA CO. in that every employee is given the CEO’s personal mobile number, and therefore feels that they have access to the top. The CEO himself walks around the shop floor and knows most people, from the payroll clerk to the cleaners. This has had a very positive impact on governance and transparency at Alpha co.

It appeared from our interviews with the directors, senior management, risk owners, internal auditors, and external auditors that they all considered that ERM and governance processes to have evolved continuously. Everyone interviewed stressed the importance of their specific ERM and governance responsibilities and roles as they seek to more closely align their company’s governance with its ERM processes (Table 2).

At Alpha Co., due to the longevity of the CEO in the company, much of this appeared to revolve around his intimate knowledge of the company. Whilst this abodes well for the benefits of choosing CEOs from within the ranks of the company; we were concerned that this itself was a risk to the company in the long term. We were assured that succession planning is very much a key aspect of the company’s Corporate Governance Statement.

Other specific information that is communicated upward to the Risk Management and Audit committee and the Board includes: Written assertions regarding compliance with the company's code of conduct, Risk and control assessments, Risk management plans, and ERM performance reports. With regards to communications between management and external professionals, a clear understanding is obtained in writing, regarding specific assurance services to be provided. This not only applies to the ERM consultants but also to the external auditors. The external auditors are also required by their professional standards to specify their contractual obligations to clients in engagement letters. The same applies at Alpha Co. regarding its ERM consultants. The CFO (using both his financial and management accountants) acts as the facilitator of this two way communication process to ensure that management provides adequate information to the auditors and ERM consultants for them to complete their work.

External auditors communicate to management any deficiencies in internal control over financial reporting uncovered during the course of their work. They communicate their findings to the Board and external parties using financial accounting standards and assurance techniques. Whenever external auditors uncover evidence that fraud may exist, they are required by their professional standards to bring the matter to the attention of the Board and ultimately to the shareholders, and this has happened in one instance at Alpha Co..

Table 2: Who is Responsible for What at Alpha Co.

	PERFORMANCE MANAGEMENT RESPONSIBILITIES?	PRIMARY ROLES IN CORPORATE GOVERNANCE
<i>Board of Directors</i>	Yes (Delegated to performance Management Committee)	Provides performance management direction, authority, and oversight to senior management.
<i>Performance Management Committee</i>	Yes (Comprised of Non-Executive Directors)	Has primary responsibility for performance management. Delegates management authority, and specifies risk tolerance thresholds to managers . Reports performance plans and performance results to the Board of directors.
<i>Senior Management</i>	Yes	Assigns specific management authority and risk tolerance thresholds other personnel. Report performance results to risk management committee.
<i>Consultants, Internal and External Auditors</i>	Yes (the External Auditors)	Provide independent, objective assurance to senior management and the Board of directors about the effectiveness of management, control, and governance processes.

Whenever internal auditors uncover evidence that fraud may exist, they are required to bring the matter to the attention of an appropriate level of management, often the CFO. However, at Alpha Co., the internal auditors' assurance reports are no longer limited to ensuring adequate financial controls within the transaction recording processes. These assurance reports now include applicable conclusions and recommendations on strategic and ERM issues, and often include strategic action plans that require management agreement. Often conflict arises in this area as the conclusions, recommendations, and action plans are based on the auditors' evaluation of risk management performance, and could be very different from management's perceptions. The CFO therefore needs to be an individual who not only has the authority, but also the technical ability to resolve such conflict, especially in the area of strategic recommendations. At Alpha Co., it appears that the senior management interviewed considered that such matters also be handled by its Risk Management and Audit Committee. The CFO and the Chairman of this committee work very closely on such issues. It was evident therefore, that at Alpha Co., communication and the provision of accounting information went beyond the agency view of aggregate ex-post financial accounting (see Table 1). Ex ante management accounting information, both quantitative and qualitative was provided to all levels of the organisation in detailed to assist with strategic and operational issues (stewardship) and selective financial and management accounting information was used specifically in the ERM area (resource dependency).

DISCUSSION AND CONCLUSION

As the contextual environment changes, the governance process needs to focus on areas where changes or transitions are needed. It requires appraisal of organisational position at regular intervals and undertake strategies to prepare the organisation for change. The system of governance and ERM can be facilitated by timely and accurate information to produce better performance for the organisation.

This study has demonstrated the emergence of such a role. The key findings are:

1) Corporate Governance Reporting systems

It is clear from the discussion of the case, that the top management at Alpha Co. sees corporate governance from a value creation perspective, and have put in place processes to ensure that the organisations achieves the results as planned. The governance processes at Alpha Co. enhances values by creating an environment that has motivated employees to consider the cost-benefit of further operational efficiency and long term productivity. The generalisation we can draw from this is that corporate governance and ERM should be seen as dynamic and integrated processes which helps achieve performance by linking the organisation to its environment.

The company had a 'Corporate Governance Statement' on its website, with ten sub-sections. On studying the document, each section could be seen to cover a particular quadrant of the *Conformance vs. Performance Interface* (Figure 1) as follows:

- (a) Lay Solid Foundations for Management and Oversight (*Long term-Performance*)
- (b) Structure the Board to Add Value (*Long term-Conformance*)
- (c) Promote Ethical and Responsible Decision Making (*Long term-Conformance*)
- (d) Safeguard Integrity in Financial Reporting (*Short term-Performance*)
- (e) Make Timely and Balanced Disclosure (*Short term-Conformance*)
- (f) Respect the Rights of Shareholders (*Short term-Conformance*)
- (g) Recognise and Manage Risk (*Long term-Performance*)
- (h) Encourage Enhanced Performance (*Long term-Performance*)
- (i) Remunerate Fairly and Responsibly (*Short term-Performance*)
- (j) Recognise the Legitimate Interests Of Stakeholders (Both Long term-Conformance and Long term-Performance)

2) *Corporate Governance and Organisational Performance*

Much of the literature indicates that although the Board clearly "owns" the corporate governance process, it is not directly responsible for ERM, which is seen as management's responsibility. This was the culture prevalent at Alpha Co., which even empowered its shop-floor employees to consider it their responsibility. The generalisation we can draw from this is that, the Boards of organisations should go beyond the minimum compliance requirements of the governance legislation affecting them, and assume ultimate responsibility for corporate governance within which ERM falls. This is particularly relevant to motivate the senior management; with regards to the *performance* aspects of the company (see Figure 1). However, senior management (who "own" the ERM process) should be responsible for designing and implementing a structured and disciplined approach to managing risks. Under senior management's supervision, risk owners develop, implement, perform, and monitor risk management capabilities and activities.

Alpha Co. has a set of policies and a process for the identification and dissemination of information, so that the management team and the Board can be assured that they have the correct information and that they can communicate their trust in the information that they are providing to all stakeholders. Much of this information is a two-way flow in the organisation and all employees are empowered to act on this information with regards to governance and ERM matters. Such policies include formal processes such as the 'whistleblower policy', to informal information flows in which any employee can directly phone the CEO on such matters. The Board also evaluates senior executives' performance and ensures that their performance targets and compensation are aligned with the company's strategy and linked to shareholder value. The company also has an incentive scheme right across the organisation to its lowest employee levels. The generalisation we can draw from this is that successful strategy implementation can be achieved by the communication of knowledge and information across the organisation, empowering employees to act on this information and by linking the rewards system to such actions. This is in keeping with the theory in this area regards to open-book management (Barton, et.al, 1998) and empowerment accounting (Ratnatunga, 2004).

The Board sees its role as guiding management in major strategies and monitoring these from time to time. The Board contributes in the strategic decisions and has reduced the level of monitoring only after setting appropriate procedures, such as the formal reporting and internal control system. In addition to the above conformance issues, performance issues such as how policies are translated into financial targets and how resources are sourced and used (including capital expenditure decisions and risk strategies) are also be seen as a function of corporate governance at Alpha Co., as risk strategies need to be translated into operational practices.

DOES CEO DUALITY AND BOARD HETEROGENEITY AFFECT FIRM PERFORMANCE? EVIDENCE FROM ISTANBUL STOCK EXCHANGE (ISE) SERVICES INDEX

Serhat HARMAN
Ebru KANYILMAZ POLAT
Canakkale Onsekiz Mart University, Turkey

ABSTRACT

Boards are playing critical role in publicly listed firms. From this starting point, in this study, how CEO duality and board heterogeneity of the firms which are operated in ISE services index are related firm performance in terms of ROA and Tobin Q ratio between years 2005 and 2007. Findings indicate that in 78 percent of firms operated in ISE services index chairman works both as CEO and Chair man. Also, average board size is 6,88. According to Hierarchical regression analysis, only functional heterogeneity positively related both in terms of ROA and Tobin Q ratio. Another major finding is CEO duality has no impact on firm performance in terms of ROA.

INTRODUCTION

Board of directors plays important role in the corporate governance of publicly listed companies, and therefore understanding the determinants of board structure is an important research in the management area. Recently, theoretical and empirical works (Zimmerman 2008; Elsayad 2007; Raheja, 2005; Dalton et al., 1998; Harris and Raviv, 2006; Adams and Ferreira, 2007; Lehn et al., 2003; Boone et al., 2007; Linck et al., 2007, 2008; Coles et al., 2008; Baliga, Moyer, and Rao, 1996; Beatty and Zajac, 1994; Boyd, 1995; Buchholtz and Ribbins, 1994; Daily and Dalton, 1994, 1995; Davis and Donaldson, 1997; Finkelstein and D'Aveni, 1994;) show there is high level of attention has given to the topic. Also in the management research, basic premise is that top management plays a dominant role in formulating corporate strategy. Gioia and Chittipeddi (1991), define CEO as someone who has primary responsibility for setting strategic directions and plans for the organization, as well as responsibility for guiding actions that will realize those plans.

In general of the impact of separation of ownership and control, CEO duality has come under particular scrutiny (Lorsch and MacIver, 1989; Murray 1989; Brickley, Coles, and Jarrell, 1994). CEO duality refers, the CEO of the firm wears two hats-a CEO hat and a chairperson of the board of directors hat. Non-duality implies that different individuals serve as the CEO and the chairperson (Baliga, Moyer and Bao 1996).

With the term "Board Heterogeneity" it was addressed top management heterogeneity of the firm and it is typically measured in terms of observable characteristics such as functional background, education, age and gender, which serve as factors for psychological attributes that influence firm performance (Hambrick and Mason, 1984). Current literature offers support for the claim that the breadth of perspective, experience, knowledge, insight, etc., provided by a heterogeneous board is positively related to firm performance (Hambrick and Mason, 1984; Kilduff et al., 2000).

Most of the studies about CEO duality and board heterogeneity studies have been conducted in the US. and Western Europe settings (Adams and Ferrara 2007; Guest 2008). So there is a need for understanding of how CEO duality and board heterogeneity affect firm performance differ in countries with different legal, institutional and regulatory systems of developing countries. In the Turkish context, corporate governance has been seen as an increasingly important topic. Especially, Turkish Industrialist's and Businessmen's Association (TUSIAD) play central role in promoting of corporate governance in Turkey. TUSIAD pursues its activities in corporate governance via its Working Group established in 2000 (www.tusiad.org).

In this study, effects of CEO duality and board heterogeneity on firms performance was examining with sample of 34 firms which are traded ISE Services Index between periods of 2005-2007. Data was obtained from annual

reports and corporate governance reports of these firms. Rest of the paper follows as, theoretical background and hypothesizes of study. Sample design and measurement variables findings, and discussions and managerial implications presented.

THEORY and HYPOTHESES

Agency Theory

Separation of ownership and management in modern corporations has led to different arguments explaining the relationship between the principal and the agent. According to agency theory, the agent, in this relationship, will be a self-interest optimizer. In other words, executive managers will take decisions with the aim of optimizing their wealth and/or minimizing their risk at the expense of the shareholders' value. Therefore, it has been argued that internal and external monitoring mechanisms need to be implemented to lessen divergence in interests between shareholders and the management (Jensen and Meckling, 1976; Fama and Jensen, 1983).

Some other researchers argue against the hypothesis of agency theory and propose stewardship theory. For example, Donaldson and Davis (1991) claim that, "The executive manager, under this theory, far from being an opportunistic shirker, essentially wants to do a good job, to be a good steward of the corporate assets" (p. 51). The explicit premise of stewardship theory is that the structure of the firm is the main determinant that can assist (or otherwise) the executive manager to implement his or her plans and objectives effectively (Elsayed 2007).

Agency theory can be applied to board structure and CEO duality. As with board composition, there is strong sentiment among board reform advocates, most notably public pension funds and shareholder activist groups and capital market organizations of countries that the CEO should not serve simultaneously as chairperson of the board. And also we can say many in the scholars have pointed out this state.

Empirical evidence from management field research is inconclusive. While some studies (For example. Donaldson and Davis, 1991; Lin, 2005) support the positive impact of CEO duality on corporate performance, others For example (Kula 2005; Rechner and Dalton, 1991; Pi and Timme, 1993) find that duality leads to inferior shareholder value. Yet other studies (e.g. Berg and Smith, 1978; Chaganti *et al.*, 1985; Rechner and Dalton, 1989) find that there is no correlation between CEO duality and firm performance..

Some other authors use contingency t to explain the relationship between CEO duality and firm performance. For instance, Boyd (1995) clarifies that "We propose that both theoretical perspectives are correct – under different circumstances. Thus, duality may be negatively associated with performance in some situations, but be positively related in others" In a similar, Brickley *et al.* (1997) illustrate that the optimal leadership structure of board varies across firms. We can say independence of the CEO and the chairman of board have an impact on corporate performance, but the direction of impact varies from context to context.

In the Turkish context, TUSIAD and SPK (CAPITAL MARKETS BOARD OF TURKEY) recommends to firms which are publicly listed to separate their chairperson and CEO, but some firms separate, some not. And also, there is no empirical evidence in the Turkish context about CEO duality. So we will test the following null hypothesis:

H1: CEO duality has no impact on corporate performance

Upper Echelons Perspective

Importance of the top management noted first by Cyert and March (1963) in their work on the dominant coalition. Hambrick and Mason (1984) presented their upper echelons perspective, a behavioral approach that treats the top management as a significant influence on the direction and performance of the business. In the upper echelons perspective, the attitudes, skills, values, and cognitive structures of the top management are often cited as influencing the strategic choices of the top management (Hambrick and Mason, 1984). A myriad of studies have since examined the characteristics of the top management and their relationship to strategic decision making and firm performance For example (Zimmerman, 2008; Bantel and Jackson, 1989; Hambrick, 1994; Hambrick *et al.*, 1996; Wiersema and Bantel, 1992).

Relationship between functional background experiences and strategic decisions examined firstly by Dearborn and Simon (1958). They argued that corporate elites' experiences bias their attention and proposed solutions to complex business situations, and showed that executives in an experimental setting gravitated towards interpretations of a complex business situation that reflected their own functional backgrounds (Zimmerman 2008). Finkelstein and Hambrick (1996: 93) point out that a correspondence between functional experiences,

preferences and dispositions, and strategic choices may occur through self-selection and socialization: individuals may choose functional areas that fit their cognitive models and values, but also over time become socialized and inculcated with the area's dominant mode of thinking and acting (Jensen and Zajac, 2004).

There some measures of top management heterogeneity have been usually to explore heterogeneity (functional background, educational background, age, and tenure). These measures have been studied extensively but rarely have all four been studied together (Bantel, 1993; Murray, 1989; Pegels and Song, 2000). Published research offers support for the claim that a heterogeneous directors board makes better strategic decisions and is positively related to a variety of desirable outcomes, at least in established firms, including firm performance (Zimmerman 2008).

The functional background of the directors has been identified as an important characteristic of the top management (Zimmerman 2008; Brouthers, Brouthers, and Werner, 2000; Hitt and Tyler, 1991). Although top managers are thought to have a generalist's perspective (Hambrick and Mason, 1984), it is often the case that these individuals have a functional specialization (Gupta, 1984). Hambrick and Mason argued that top managers have an orientation that develops from functional experience; Functional background was found to influence the strategic choices of firm founders in that they emphasize the function with which they have experience (Boeker, 1988). Brouthers et al. found that managers with functional experience in management pursued more aggressive strategies compared to managers with functional experience in finance and accounting (Zimmerman 2008).

Positive relations between functional background heterogeneity h environmental scanning alternatives, effective decision making, competitive action and response, strategic clarity, innovation, and creativity have been found in established firms (Hambrick and Mason, 1984; Hambrick et al., 1996; Murray, 1989)

H2: Heterogeneity in the functional background is positively related to firm performance

Education can be defined as an individual's knowledge and skills and to be related to the team's information-processing capacity. When top managements educational level is high there can be high level of innovative outcomes. Hambrick and Mason emphasized that the type of education earned by the top managers will influence their strategic decisions. Heterogeneity in the educational background of the management board suggests variety in their perspective. Positive relationship between educational background and competitive action, competitive response, strategic change, to strategic clarity, and firm performance was found in established firms (Hambrick et al., 1996 Wiersema and Bantel, 1992 Hambrick et al., 1996 Bantel, 1993).

H3: Heterogeneity in the educational background is positively related to firm performance

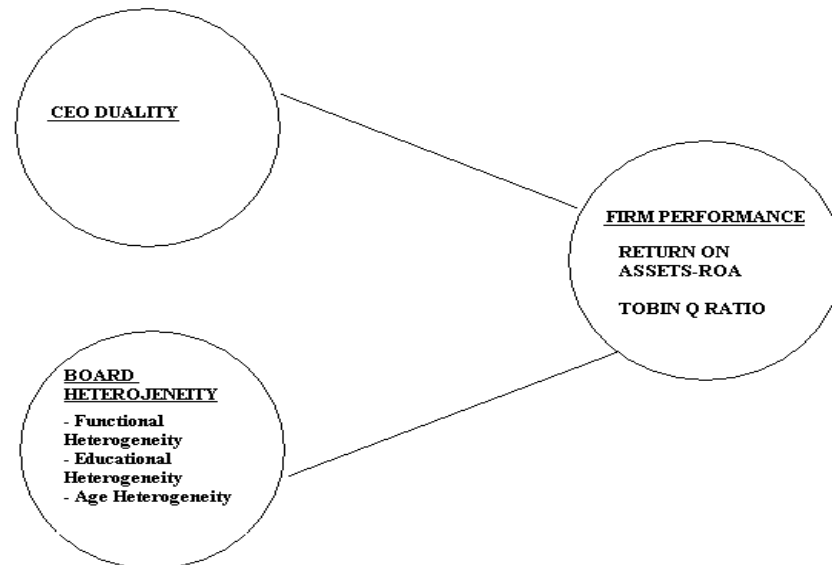

According to Richard and Shelor (2002), age is a proxy for perspectives, belief systems, networks, and affiliations. Wiersema and Bantel (1992) argued the people age their flexibility decreases and rigidity and resistance to change increases. Youthful managers are commonly associated with attempting the risky, novel, and unprecedented (Zimmerman 2008; Boeker, 1988; Hambrick and Mason, 1984; Wiersema and Bantel, 1992), linked to firm growth and more receptive to change, and willing to take more risks than older managers (Wiersema and Bantel, 1992). Firms managed by younger top managers were less likely to experience firm crisis than firms managed by older top managers (Mudambi and Zimmerman 2005). Boeker points out that younger entrepreneurs are better able to understand recent innovations (Zimmerman 2008).

H4: Heterogeneity in the age is positively related to firm performance

Sample Design and Measurement of Variables

Sample that used in this study was derived from ISE Services Index. There are 34 firms which are publicly listed in the ISE operate in different sectors these are; electricity, transportation, sports, tourism, wholesaling and retailing and telecommunications. The reason why the service industry has chosen for research is that service industry is emerging in Turkish context. The data about CEO duality and heterogeneity belongs to period of time (2005-2007) and obtained from annual reports and web site of 26 of the firms operated in service sector of ISE because of unavailability of the data. Board of directors and financial performance sections of annual reports were content analyzed. Model of the research and the variables of the research is shown in the Figure 1. The measurement of the variables was explained after the figure.

FIGURE 1: VARIABLES of THE RESEARCH

Dependent Variables

Two dependent variables were employed to measure firm performance; First variable is ROA, An indicator of how profitable a company is relative to its total assets. ROA gives an idea as to how efficient management is at using its assets to generate earnings. Calculated by dividing a company's annual earnings by its total assets, ROA is displayed as a percentage.

Second dependent variable is Tobin Q ratio. is a ratio comparing the value of the stocks of a company listed in the financial market with the value of a company's equity book value. The ratio was developed by James Tobin (Tobin 1969). It is calculated as;

Tobin Q= (Total Liabilities-Preference Capital+Market Value)/ Total Assets.

If the Q ratio is more than one, the investment is expected to be more profitable; on the other hand in less profitable investments' Tobin Q values are expected to be less than one.

Independent Variables

CEO Duality: It is measurement by checking CEO and chair person of firms are the same person for each year (2005, 2006 and 2007). CEO duality was a binary variable, If CEO also serves as chair person it was coded 1, if not Zero

Heterogeneity

Functional Background: Functional background heterogeneity was calculated using Blau's (1977) heterogeneity index $(1-\sum i^2)$, where i is the proportion of the group in the i th category. A high score indicates variability in the functional backgrounds among team members, i.e., functional heterogeneity, and a low score represents homogeneity (Smith et al., 1994). The functional categories used to calculate the index were those functional categories frequently used in the study of heterogeneity—finance, human resources, general management, marketing/public relations, operations, engineering/R&D,

Educational Heterogeneity: Educational heterogeneity was measured in terms of background using Blau's (1977) heterogeneity index described before. Educational background categories i.e., engineering, architecture, business administration, economics, law, finance and accounting

Age Heterogeneity: Age heterogeneity was calculated as the coefficient of variation of the top managers' age. A high score indicates age heterogeneity and a low score indicates age homogeneity.

Number of control variables was also employed, these control variables are, size of the board, firm's age. Size of the board was calculated as total number of board member and Firm age calculated as when the firm was established

EMPRICAL FINDINGS

Table 1 reports the descriptive statistics of the variables used in the study. It is understood that in the ISE Services Index, our CEO duality categorization shows in 73 percent of firms chairman wears both CEO and chairman hat despite Capital Market Council of Turkey suggests to the firms which are publicly listed in the ISE. And findings indicate that average ROA percentage of the firms is % 8,30 and Tobin Q ratio is 1,50. When we check firms age and board size; we can see that average firm age is 27 and boards are consist of 7 people. In terms of heterogeneity we can say that boards are seem to be heterogeneous.

Table 1: Descriptive Statistics of Variables

	Observation	Mean	Standart Deviation
Return on Assets (ROA) (%)	78	8,30	16,845
Tobin Q Ratio	78	1,50	1,391
CEO Duality	78	0,730	0,4464
Size of the Board	78	6,88	1,904
Firms Age	26	27,84	20,222
Age Heterogeneity (Variation in the Age of the Board)	78	96,24	58,36
Educational Heterogeneity ($1-\sum i^2$)	78	0,579	0,1558
Functional Heterogeneity ($1-\sum i^2$)	78	0,480	0,1367

For testing Hypothesis 1 (null hypothesis) about CEO duality's effect on ROA and Tobin Q ratio, Least Absolute Value (LAV) regression was employed. Two models were built on for ROA and one for Tobin Q ratio. LAV is regression is also known as median regression model. Median value of dependent variable is estimating by getting sum of absolute deviations around the unconditional median for finding regression coefficients to minimize function of regression (Rousseeuw and Leroy 2003). The estimates of LAV regression model as dependent variables ROA and Tobin Q ratio and CEO duality as independent variable shown in the Table 2.

Table 2: Impact of CEO Duality on Firm's ROA and Tobin Q Ratio According LAV Regression Estimates

Dependent Variables (Firm's Performance Indicators)	ROA	TOBIN Q RATIO
CEO Duality	0,824	0,0178

The LAV regression estimates shows that CEO duality has no impact on firms performance in terms of ROA and Tobin Q ratio. That result shows that Hypothesis 1 is supported. We cannot reject our null hypothesis.

To test relationship between board heterogeneity and firm performance Hierarchical regression analysis was employed. In the first step, control variables (firm's age and board size) add to model as independent variables, ROA and Tobin Q ratio as dependent variables. And in the second step, age, educational and functional background heterogeneity added to model as independent variables, ROA and Tobin Q ratio was added as dependent variables. Results of Hierarchical regression analysis for ROA are presented in the Table 3.

Table 3: Results of Hierarchical Regression

Dependent Variables (Firm's Performance Indicators)	ROA MODEL 1	ROA MODEL 2	TOBIN Q RATIO MODEL 1	TOBIN Q RATIO MODEL 2
Size of the Board	0,026		0,047	
Firms Age	-0,032		0,021	
Age Heterogeneity		0,087		-0,063
Educational Heterogeneity		0,076		0,438*
Functional Heterogeneity		0,364*		0,126**

R ²	0,21	0,61	0,34	0,54
F		19,620*		18,899**

N: 78, Dependent Variables: ROA and Tobin Q Ratio, *p<0,10, ** p<0,05

Results hierarchical regression analysis show that, in the ISE services sector, functional heterogeneity positively related to the ROA of firms p<0,10 and Tobin Q ratio of the firm p<0,05 so that Hypothesis 2 supported both in terms of ROA and Tobin Q ratio.

When impact of educational is examined it is understood that educational heterogeneity is positively related with Tobin Q ratio of the firms in the ISE services index. Thus we can say that results give partial support to the Hypothesis 3. And when there no positive relation with age heterogeneity both in terms of ROA and Tobin q ratio. So that Hypothesis 4 is not supported.

DISCUSSION and SUGGESTIONS FOR FUTURE RESEARCH

Management boards are one of the main predictor of the firm performance. According to the corporate governance principle ownership and management of firms should be separated. Also this study's theoretical roots of this study depends in agency theory and Hambricks and Mason's (1984) upper echelons perspectives. Two main questions was tried to answered in this study, These are Does CEO duality and board heterogeneity affect the firm performance?. To answer these questions, annual reports and corporate governance principles reports of the firms operated in ISE services index was analyzed. And then, LAV and Hierarchical regression was employed.

Findings indicate that in ISE service index, in 73 percent of the firms CEO is also Works as a chair person. That finding is similar with the work of Rechner and Dalton (1991) 78,7 percent, Elsayed (2007) 79 percent and Donaldson and Davis (1991). But when the web site of Capital Markets Board of Turkey is checked it is understood this council strongly recommends to publicly listed firms to separate CEO and the duality. According to the corporate governance also CEO and chair man should be separated person. But our findings show that CEO duality has no impact on performance of ISE service index firms. But also for the future all the firms in the ISE (237 firms) can be included to the sample and then the same procedure can be hold and effects of CEO duality can be explored according to the different sectors.

Board heterogeneity is also accepted predictors of firm performance according to our hypothesis about heterogeneity and performance relation. But the findings showed that only functional heterogeneity is positively related both in terms of ROA and Tobin Q ratio and the educational heterogeneity is positively related in the ROA of the firms. On the other hand Age heterogeneity is not related with firm's performance both in terms of ROA and Tobin Q ratio. Also we can suggest that for the future research, all of the 237 in ISE heterogeneity of board can examined and relation with the firm's performance can be explored.

There are some attempts to analyze board structure and firms performance in the Turkish Context. For example Kula (2005) analyzed 386 mostly small and non-listed stock ownership companies in Turkey and he found that the separation of chairman and general manager positions has significant positive impact of firm performance. And Kaymak and Bektaş (2008) investigated the association of board independence, CEO duality, board size, and board tenure with bank performance in Turkey. These relationships are examined for all 27 Turkish banks operating in the market between the years 2001-2004. Their findings suggested that the presence of insiders has a positive impact on return on assets, while duality and board tenure are negatively associated with performance. As it is understood that there is no study that covers all of the firms in the ISE. Our recommendation for the future research about board structure-firm performance relationship in Turkish context is to reach full sample of the firms in the ISE.

Also there have to be some explanations about the study. As mentioned in the introduction there 34 firms in ISE services sector. But data was gathered only from 26 of the firms. Unavailability of the information about firm's board, information about board members or annual report in their website was the reason. That is also another paradox that we have faced publicly listed firms not to having information about board member of their annual reports.

ABSTRACT

Recent financial reporting scandals have increased the attention given to corporate governance practices, resulting in an upward trend in the number of empirical studies conducted in literature relating to this topic. This paper aims to evaluate the impact of corporate governance on financial performance in Turkey, taking the issue of institutional ownership into account. The purpose of this study is also to explore how the financial performance of the companies which are listed in Corporate Governance Index is affected by institutional ownership, distinguishing between domestic and foreign ownership. This paper employs panel data analysis on a sample of 164 firm-year observations for Real Sector firms on the Istanbul Stock Exchange (ISE) covering the 4 year time span from 2005-2008. The study is unique as it contributes to literature providing empirical evidence by constructing several types of models with panel data analysis. Inclusion of the institutional owners, together with a detailed breakdown, also adds to the significance of the study's findings. The results of the analyses demonstrate the positive influence of corporate governance and institutional ownership on financial performance. Additionally, the impact of institutional investors is found to be more strongly pronounced on firms listed on the corporate governance index.

Keywords: *Corporate Governance Index, Financial Performance, Institutional Ownership, Emerging Market*

INTRODUCTION

Corporate governance has been the subject of numerous theoretical and empirical studies especially after the fraudulent financial reporting scandals such as Enron, World.com, Adelphia, and Parmalat. Given the importance of corporate governance practices, many analyses have been conducted in developed countries evaluating the relationship between corporate governance and financial performance. However, the number of studies performed in developing countries has been limited mostly due to problems with data gathering and a lack of investor awareness of these practices. Even in Turkey, the Istanbul Stock Exchange (ISE) only recently launched a special index, the Corporate Governance Index (XKURY); only companies that comply with the Corporate Governance Principles of Capital Market Board (CMB) may participate. This index was introduced in 2005, created to expand the breadth and significance of corporate governance applications and principles. At the end of 2005, only 5 companies qualified for listing on the index. However, the number of companies that currently fall within the scope of this index provides evidence that emphasis given to corporate governance practices has increased their importance. As of the end of 2009, there are 24 companies in total and they are: Anadolu Efes, Arçelik, Asya Katılım Bankası, Coca Cola İçecek, Dentaş Ambalaj, Doğan Holding, Dogan Yayın Holding, Hurriyet Gazetecilik, İş Finansal Kiralama, Logo Yazılım, Otokar, Petkim, Prysmian Kablo, Şekerbank, TAV Hava Limanları, Tofaş Oto Fabrikası, T.S.K.B., Türk Telekom, Turk Traktor, Tupras, Vestel, Vakıf Yatırım Ortaklığı, Yapı ve Kredi Bankası and Y & Y GMYO (ISE, 2009). All these arrangements carried out in our country are undoubtedly very important in terms of becoming a powerful member of the European Union and a trusted commercial partner to all countries of the world.

Empirical studies have documented a positive and significant relation between corporate governance and firm performance (Chen et al. 2008; Chalhoub 2009; Sueyoshi et al. 2003; Mehdi 2007; Brown and Caylor 2009). In

this study, we analyze not only the association between these two variables, but also take the issue of institutional ownership into account. Even though rich empirical literature exists focusing on firm performance and institutional ownership (Ferreira and Matos 2008; Ferris and Park 2005; Ko, Kim and Cho 2005), few of these studies have included corporate governance in their analyses (Chung et al. 2008).

Chung et al. (2008) identify the corporate governance factors as ownership structure, board of directors, outside directors and institutional investor ownership. The major reason why the presence of institutional investors in a firm's ownership structure is taken into account in this study is due to the significance of these investors in corporate governance practices. Based on McKinsey & Company's 2002 survey, institutional investors are found to prefer investing in companies with sound corporate governance structures. Therefore, we try to provide additional insight by analyzing the impact of institutional ownership on financial performance with a distinction between firms that are listed on the Corporate Governance Index and those that are not. Furthermore, we conduct additional analyses to more clearly evaluate performance differences based on institutional ownership categories, specifically foreign and domestic.

The remainder of the paper is organized as follows: first information regarding the empirical analyses, the data and sample selection, the variables employed and the estimation methodology is described; then the findings of the study is interpreted; and lastly concluding remarks are provided.

EMPIRICAL RESEARCH

The purpose of this study is to investigate whether firms' corporate governance practices lead to better financial performance. Most previous surveys and empirical analyses have explored the issue from the perspective of developed economies (Sueyoshi et al., 2010; Aaboen et al., 2006; Bianco and Casavola 1999). Therefore, this study tries to fill in a gap by focusing on an emerging economy, Turkey. One other distinguishing feature of this study is that it performs several different analyses to study the topic in greater detail. First, we try to determine whether companies engaging in corporate governance practices outperform others. Then, we analyze the impact of institutional ownership on financial performance, segregating firms between those listed on the corporate governance index and those that are not.

Data and Sample Selection

Multiple sources have been used in this study to generate the data set employed in the analyses. Financial information regarding the companies is compiled from the publicly available database of the Istanbul Stock Exchange (ISE). The initial sample is composed of all firms listed on the ISE 100 for the four years from 2005 to 2008. However, financial sector firms are excluded to prevent data distortion due to differences in firm operating characteristics. Therefore, the final sample consists of 41 companies making up a total of 164 firm-year observations. It is important to note that data relating to years prior to 2005 are not included to eliminate the impact of Inflationary Accounting Practices on financial statements. Information relating to corporate governance practices is obtained from the Public Disclosure Platform. 13 companies out of the final sample are listed on the corporate governance index. Lastly, yearly information as to institutional ownership percentages is provided from the Central Registry Agency.

Variables

The selection of variables is based on an examination of previous empirical studies. The Table 1 below shows the dependent variable, the explanatory variables, in terms of Corporate Governance and Institutional Ownership indicators, and the control variables employed for all estimated models of the study.

The Dependent Variable

Both stock market and accounting based measures are used in literature to determine firm financial performance. As noted by Prowse, stock market returns are affected by differences between interests of managers and shareholders (Prowse, 1992). Furthermore, Demsetz and Villalonga also note that accounting profit rates are not distorted by investor psychology and do not fail to provide insight to a certain extent into the future by including estimations on issues like goodwill and depreciation (Demsetz and Villalonga, 2001). Therefore, this analysis employs return on assets (ROA) as the dependent variable to proxy for firm financial performance in line with

many studies in literature (Klapper and Love, 2004; Omran et al., 2008; Bhagat and Bolton, 2008; Brown and Caylor, 2008).

Table 1: The Labels and Computations of the Variables

The dependent variable:	
ROA	The ratio of net income to total assets
The explanatory variables:	
A-Indicators of Corporate Governance	
CG	A dummy variable equal to unity if the company is listed on the corporate governance index, and otherwise equal to zero
CG2005	A dummy variable equal to unity if the company is listed on the corporate governance index in year 2005, and otherwise equal to zero
CG2006	A dummy variable equal to unity if the company is listed on the corporate governance index in year 2006, and otherwise equal to zero
CG2007	A dummy variable equal to unity if the company is listed on the corporate governance index in year 2007, and otherwise equal to zero
CG2008	A dummy variable equal to unity if the company is listed on the corporate governance index in year 2008, and otherwise equal to zero
NONCG2005	A dummy variable equal to unity if the company is not listed on the corporate governance index in year 2005, otherwise equal to zero
NONCG2006	A dummy variable equal to unity if the company is not listed on the corporate governance index in year 2006, otherwise equal to zero
NONCG2007	A dummy variable equal to unity if the company is not listed on the corporate governance index in year 2007, otherwise equal to zero
B-Indicators of Institutional Ownership	
INST	The ratio of the number of shares held by institutional investors to the number of shares outstanding
DMFUND	The ratio of the number of shares held by domestic investment funds to the total number of outstanding shares
DMCORP	The ratio of the number of shares held by domestic corporate to the total number of outstanding shares
DMOTHR	The ratio of the number of shares held by domestic other institutions to the total number of outstanding shares
FRFUND	The ratio of the number of shares held by foreign investment funds to the total number of outstanding shares
FRCORP	The ratio of the number of shares held by foreign corporate to the total number of outstanding shares
FROT HR	The ratio of the number of shares held by foreign other institutions to the total number of outstanding shares
The control variables:	
LNSALES	The log of net sales
AGE	The number of years that passed since the establishment of the firm to the observation date
LEVERAGE	The ratio of long and short term debt to total assets
DIVYIELD	Total dividends over market value multiplied by 100
CAPINT	The ratio of net fixed assets to total assets
CURRENTR	The ratio of current assets to current liabilities

The Explanatory Variables

To evaluate the issue from different perspectives, several models are created employing two main types of explanatory variables to quantify dimensions of corporate governance, CG and NONCG, and institutional ownership, INST. Furthermore, these explanatory variables are broken down to subcategories, which are yearly variables in terms of CG and NONCG, and ownership related variables in terms of INST.

As Table 1 shows, the main indicators of corporate governance are CG and NONCG. The explanatory variable CG is expressed as a dummy variable taking the value one if the company is included on the Corporate Governance Index and, zero otherwise. The reason why companies' corporate governance ratings are not used is because of the existence of several different rating agencies in Turkey, which prevents the existence of a single

and common rating for each company. To better evaluate yearly differences and capture the impact of the recent financial crisis on corporate performance in 2008, seven yearly dummy variables are generated. The dummy variable labeled CG2005 takes the value 1 if the company is listed on the Corporate Governance Index in year 2005 and, zero otherwise. Likewise, the dummy variable denoted by NONCG2005 takes the value 1 if the company is not listed on the Corporate Governance Index in year 2005 and, zero otherwise. Other yearly dummies, CG2006, CG2007, CG2008, NONCG2006 and NONCG2007, are generated in the same manner.

The method of Nofsinger and Sias (1999) is followed to define institutional ownership, whereby they use annual fraction of shares held by institutional investors for all NYSE firms in their study. They define fractional institutional ownership as the ratio of the number of shares held by institutional investors to the number of shares outstanding. Therefore, the variable denoted by INST is used to quantify the percentage of firms' shares held by institutional owners. Furthermore, six subcategories are generated, which are labeled as DMFUND, DMCORP, DMOTHR, FRFUND, FRCORP and FROTHR. Table 1 provides a clear explanation of the breakdown of institutional investors. Results of the analysis as to foreign and domestic institutional owners are important to gain an understanding of the overall issue. The Central Registry Agency generates three categories for the breakdown of domestic and foreign institutional investors as follows:

- Investment Funds; comprises mutual funds and private pension plans,
- Corporate; comprises banks, financial intermediaries, corporations and investment trusts,
- Other Institutions; comprises charities, associations and cooperatives.

The Control Variables

Several firm and industry specific factors have to be controlled for to more clearly analyze the impact of corporate governance and, as a second step, institutional ownership on firm financial performance. The control variables employed help neutralize firm and industry specific differences in the sample that have the tendency to affect the dependent variable, ROA.

Firm size is found to affect financial performance and employed by numerous studies as a control variable (Burhop, 2009; Chen et al. 2008, Abdelkarim and Alawneh, 2009; Mehdi, 2007). Therefore, log of net sales is utilized to control for firm size in this study.

Firm age is considered to be one of the factors that are likely to affect corporate performance due to issues such as accumulation of experience and market share. Therefore, using AGE as a control variable is important to evaluate its influence on firm performance, thus, more clearly analyze the link between corporate governance and the dependent variable, ROA. This variable is employed in previous studies as well, such as Patibandla (2006) and Firth et al. (2002).

The debt level of a company has the potential to influence financial performance due to costs of finance and risk of default. Therefore, firm's financial policy regarding degree of leverage is controlled for as in the works of Anderson and Gupta (2009) and Bhadat and Bolton (2008).

To control for companies' future growth prospects, dividend yield ratio DIVYIELD, obtained from the ISE, is used as a control variable. A high ratio of dividend distribution can be an indicator of a company's profit seeking tendency (Thomsen and Pedersen, 2000). Therefore, this variable is used to proxy for differences in performance that arise from companies' dividend policies.

The capital intensity, CAPINT, of the firms is considered as an industry-related control variable and is used to measure the differences in firms' input structures. In their work, Chhibber and Majumdar (1999) indicate a significant and negative relationship between capital intensity and firm performance.

The liquidity of a firm affects its financial performance as it is an indicator of the ability to meet short term cash requirements, preventing it from getting into financial difficulty. However, an excessive amount of current assets has the potential to create problems as those assets generate lower rates of return. This variable has also been employed in the study of Küçükçolak and Özer (2007).

The Methodology

Numerous studies in literature investigate the relationship between corporate governance and firm financial performance. Some of these studies are conducted as surveys (Brenes et al, 2009; Aaboen et al., 2006), while others are performed as empirical analyses. This study employs panel data analysis, which enhances the combination of time-series and cross-sectional observations, consistent with the works of Patibandla (2006), Omran et al. (2008), and Sueyoshi et al. (2010). The general format of the panel data model can be expressed as below:

$$Y_{it} = \alpha + \beta_k X_{k,i,t} + u_{i,t} \quad (1)$$

whereby the dimension of cross-sectional units is represented by i and that of time-series is represented by t . Y_{it} denotes the performance measure, which is the dependent variable of the model; β_k represents the parameters to be estimated with $k = 1, 2$ and so on showing the independent variables; $u_{i,t}$ represents the stochastic error term.

GLS estimation procedure is utilized based on the results of the Modified Wald Test for heteroskedasticity (Woolridge, 2003). Furthermore, the different models used are not found to suffer from serial correlation based on the results of the Wooldridge Test for Autocorrelation (Woolridge, 2003).

EMPIRICAL RESULTS

In this section, results of the econometric analyses are provided to evaluate the association between corporate governance practices and firm financial performance, together with the impact of institutional ownership on the issue. As a first step, the results of the descriptive statistics are shown followed by those of the panel data analyses.

Panel Data Regression Analysis

Table 2 provides the results of the analyses regarding the first two models. As the table highlights, different approaches are used, whereby the first model explores the impact of corporate governance practices on the dependent variable ROA, and the second model evaluates the same issue with a yearly perspective.

The results in Table 2 show that some of the control variables have significant impacts on financial performance. Firm size is reported to be positively and significantly related to ROA consistent with the findings of previous studies (Abdelkarim and Alawneh, 2009; Omran et al., 2008). We observe the significant and negative coefficient of the variable LEVERAGE, which indicates that costs of finance and default risk have a tendency to distort firm profitability. Another study that has the same findings regarding this variable is that of Aderson and Gupta (2009). Our findings also demonstrate the negative and significant relationship between capital intensity and ROA meaning that as the firms become more capital intensive, their financial performance decreases, which can be attributed to the high cost of capital in Turkey during the period analyzed. Dividends are regarded as indicators of future growth prospects, supported by the positive and significant coefficient of the variable DIVYIELD in the analysis. The current ratio is found to be a significant factor with a positive impact on financial performance meaning that firms' ability to meet short term cash requirements is an important issue in determining performance. Another finding relates to firm age, and shows that this variable does not have a significant impact in explaining the dependent variable at least for our sample during the period analyzed. Contrary to our expectations, we are not able to find a significant effect of being listed on the corporate governance index on firm financial performance. However, this may be due to a spurious insignificant relationship between the performance measure and corporate governance arising from yearly differences. Therefore, the second model is estimated to clarify the findings of the study.

In the second model, the signs and significance statuses of the control variables' coefficients are the same as those of the first one. Therefore, explanations provided for the first model are applicable to the second one as well. However, findings referring to the yearly dummies for the companies listed and not listed on the corporate governance index are noteworthy. In this model, the constant term represents NONCG2008. The table demonstrates the significant yearly corporate governance dummies to be CG2007, NONCG2005, NONCG2006 and NONCG2007. The positive coefficient of CG2007 is larger than that of NONCG2007 meaning that companies listed on the Corporate Governance Index outperform those not listed in 2007. However, for the years 2005 and 2006, NONCG firms are the outperformers. This may be due to the fact that the Index for corporate

governance was newly founded in those years; therefore, being listed or not listed was not a significant issue for the stakeholders in Turkey.

Various studies have been performed taking the issue of institutional ownership and corporate governance into account (Patibandla, 2009; Hellman, 2005; Belev, 2003; Davis, 2002). In the second part of the analyses, we develop two more models to evaluate the impact of institutional investors on performance with an emphasis on corporate governance. Therefore, the sample is analyzed as to whether the firm is listed on the index or not, followed by panel data analysis in which the variable INST is included as an explanatory variable to evaluate the impact of institutional investors on firm performance, ROA. An evaluation of the results for the third and fourth model, which are displayed on Table 3, reveals that the existence of institutional investors improves firm financial performance, whereby the impact on the ROA of the firms listed on the corporate governance index is more than those not listed on the index. The signs and significance statuses of the control variables are the same as those of the first model except for the variable LEVERAGE and DIVYIELD. The table shows that the debt level of the firms listed on the index does not have a negative impact on financial performance while it has a negative and significant influence on those firms not listed on the index.

The last set of models is developed to evaluate any differences that exist between different types of institutional investors. In models 5 and 6, firms are separated by being listed on the index or not, following the same approach in the previous analysis. The difference between the last two sets of models is the existence institutional investors' breakdown in the models 5 and 6 as shown on Table 4. The results again reveal the positive and significant impact of institutional investors on financial performance regardless of the firms' being listed on the index or not. However, differences between types of institutional investors are important to evaluate. DMFUND has the largest coefficient but is found to have a significant impact only on CG firms and this impact is larger than those of foreign institutional investors, namely FRFUND and FRCORP. These two types of institutional investors are found to improve financial performance of all firms, with the impact being larger on CG firms. Overall, it can be concluded that institutional ownership is found to have a positive influence on financial performance measured by ROA, whereby this impact is larger on firms listed on the Corporate Governance Index.

CONCLUDING REMARKS

This paper attempts to add to literature by providing evidence from an emerging market on the impact of corporate governance practices on financial performance. One of the distinguishing features of this study is the development of additional models to consider the impact of institutional ownership on performance. Furthermore, the use of panel data analysis enhances the results by empirically investigating the issue from both a cross-sectional and a time series dimension.

The main motivation of this study is the lack of empirical evidence regarding issues of corporate governance, financial performance and institutional ownership for Turkish listed companies. Therefore, the results of our study are crucial in terms of providing insight into the impact of corporate governance practices on financial performance, which is a topic receiving considerable attention after the recent financial reporting scandals.

The findings of the study support the argument that corporate governance practices enhance firm financial performance during the observation period after controlling for firm size, age, debt level, dividend policy, capital intensity and liquidity. As a second step, yearly analyses are conducted and CG firms are found to outperform others in 2007. Furthermore, the affect of institutional investors on financial performance is evaluated, with a separation between firms listed on the corporate governance index and those that are not. As a result of the analyses, institutional investors are found to improve financial performance of all firms, whereby the impact on firms listed on the index is more than those not listed on the index. In the last set of analyses, institutional ownership is broken down to subcategories and DMFUND, FRFUND and FRCORP are found to be significant in terms of financial performance improvement. However, it has to be emphasized that DMFUND impacts only CG firms, whereas FRFUND and FRCORP impact all firms in our sample with the affect being larger on CG firms. This last set of analyses shows more detailed evidence on the positive influence of institutional ownership on financial performance.

This study contributes to literature by exploring how the financial performance of the companies which are listed in the Corporate Governance Index is affected by institutional ownership in terms of being domestic and foreign.

In summary, corporate governance practices and institutional ownership are found to influence financial performance positively. Additionally, it must be noted that the impact of institutional ownership is stronger on the financial performance of CG firms.

ABSTRACT

Strategies for overcoming global recession are best developed through institutionalism and corporate governance. The purpose of this study is to refine the literature for modeling the relations among the best corporate governance codes, selected parameters for level of institutionalization involved and organizational commitment. Required codes of Corporate Governance in order to harvest public-open funds, pre-require the well completion of institutionalization for organizations. Performance shown in taking those steps may effect organizational commitment. The developed mediational model searches for the causal relations among them.

Key Words: Institutionalism, Corporate Governance, Organizational Commitment, Mediational Model

INTRODUCTION

Economic crises, fiscal scandals and financial market deficiencies happened in last decays proved that institutionalism and corporate governance are best for use of strategies for overcoming global recession. Organizations affirm Organization Commitment for their members and are expected to follow Corporate Governance practices especially when they are to be funded in national capital market. Their post-institutionalized status may lack necessary strength where they might have pretend it is complied already. The purpose of this study is to refine the literature for modeling the relations among the best corporate governance codes, selected parameters for level of institutionalization involved and organizational commitment.

LITERATURE SURVEY

Institutionalism and Corporate Governance

Institutionalism is the application of orientation, management and control systems those are required for sustainable successful performance (Hergüner, 2007: 72). Sound corporate governance assists corporations in taking into account the interests of various parties, as well as the society within which they operate, and aims to ensure that their boards are accountable to their shareholders. The rationale that follows is that corporations operate for the benefit of the society as a whole; investor confidence is maintained and foreign longer-term capital is attracted (Cuhruk and Ozkan, 2004: 2). Good governance goes far beyond common sense and the interests of shareholders in an individual company. It is a key part of the contract that underpins economic growth in a market economy and public faith in that system (Witherell, 2002: 7-8).

There are various codes of best practices that take into account differing legislation, board structures and business practices in individual countries. However, there are standards that can apply across a broad range of legal, political and economic environments. In this context, the Business Sector Advisory Group on Corporate Governance to the OECD put forward a set of core principles of corporate governance practices that are relevant across a range of jurisdictions. These are (Demise, 2006: 111; Sullivan and Shkolnikov, 2006: 2; Claessens, 2003: vi; Hergüner, 2007: 72):

- (a) *Fairness* to all shareholders, whose rights must be upheld,
- (b) Clear *accountability* by the board and management,
- (c) *Transparency*, or accurate and timely financial and nonfinancial reporting,
- (d) *Responsibility* for the interests of minority shareholders and other stakeholders and for abiding by the letter and spirit of the law.

They are the main (*sine qua non*) concepts in all international corporate governance approaches that are widely accepted (CMB, 2005: 6). Policy makers around the world increasingly argue that codes embodying these principles not only protect investors against fraud and poor stewardship but also may help reduce the corporate sector's cost of capital (Coombes and Wong, 2006: 2). These principles are equally relevant whether businesses are privately, publicly, or state-owned, or are subject to a controlling shareholder (Claessens, 2003: vii).

Selected Parameters for Level of Corporate Governance

Among many of parameters for level of corporate governance; (a) formalization, (b) professionalism, (c) organizational culture and (d) autonomy are held below. Formalization is developing detailed guidelines of appropriate operating procedures and roles of members of the organization, which enhances coordination within an organization (Hartline et al, 2000: 35-36). Professionalism is the thinking of executives about their jobs and taking the high road when the route is tougher. Professionalism means that the practitioner bears a responsibility to the client and to the public that overrides his or her own profit. A professional is not merely a craftsman or a paid employee, but a person who owes his best and most honest judgment, whether or not that is welcome (Tourtellot, 2003: 38-39). Organizational culture consists of shared beliefs, values, and assumptions. Cultural strength is how widely organizational culture is shared and how strongly it is held by the members of the organizations (Slater and Narver, 1995: 67). Professionals can be integrated to the firm by giving them autonomy and authority thus may increase their commitment to the firm. The basis of authority is likely to be professional standards that are defined by superior knowledge or expertness in professional organizations (Wallace, 1995:232).

Organizational Commitment

The stereotypical view of commitment is loyalty and willingness to work toward organizational objectives (Meyer and Allen, 1997: 4). Over a period of time certain costs accrue that make it more difficult for the person to disengage from a consistent pattern of activity, namely, maintaining membership in the organization. The threat of losing these investments, along with a perceived lack of alternatives to replace or make up for the loss of them, commits the person to the organization (Becker, 1960: 36). Organizational commitment is a strong belief in and acceptance of the organization's goals and values, a willingness to exert considerable effort on behalf of the organization, and a strong desire to remain in the organization (Porter et al, 1974: 604). These commitments constrain the behavior of participants in any given organization unavoidably and strongly influence it in some instances (Scott, 2003: 23). Goals and plans make possible employees' identification with the organization and support them by reducing ambiguity and clarifying what they should achieve. Deficiency of a clear goal can harm employee commitment (Daft, 2000: 208).

Organizational commitment is a multifaceted construct and terms like allegiance, loyalty and attachment should be considered in its context as well (Meyer and Allen, 1997: 10). Organizational commitment represents an employee's orientation toward the organization in terms of his or her loyalty to, identification with and involvement in the organization (Robbins and Decenzo, 2004: 229). Committed employees identify with and agree to pursue the company's mission (Dessler, 2004: 386). Committed employees ensure that the products or services which are involved with are of a high quality can respond to changes in customer demands, contain innovative features and will have no negative impact on the wider community as well (Newell, 1995: 6). Commitment means that workers will share the leader's viewpoint and willingly fulfil instructions Commitment is hold as resource for organizations, contributing for to foster the organizational effectiveness and efficiency. The overall success is high as much as commitment level is high (Ofenloch and Madukanya, 2007: 9). Employee commitment and involvement are vital for companies to compete in today's speedily changing world.

Based on different approaches in defining organizational commitment, it has been viewed in three components as follows (Meyer and Allen, 1997: 67): (a) reflecting an affective orientation toward the organization (the employee's emotional attachment to, identification with, and involvement in the organization. Employees with a strong affective commitment continue employment with the organization because they want to do so), (b) Continuance commitment (an awareness of the costs associated with leaving the organization. Employees whose

primary link to the organization is based on continuance commitment remain because they need to do so), and (c) Normative commitment (a moral obligation to remain with the organization).

MODEL DISCUSSION

A refining of the best corporate governance codes, selected parameters for level of corporate governance involved and organizational commitment is employed for hierarchy for a model of a proposed research. The following model mainly represents the dependent variables, the independent variables and the intervening variables.

Before the mediation effect is considered in the statistical methods they first study the association of one variable, X, with another variable, Y. Often a distinction is made between the independent variable (the predictor), X, and the dependent variable (the criterion), Y, to identify the direction of the hypothesized relationship between the variables (MacKinnon, 2008: 6). Organizations affirm Organization Commitment for their members and are expected to follow Corporate Governance practices especially when they are to be funded in national capital market. Organizations may try to compromise those both conditions, first one beliked and the second they are pushed through. However they may fail to strenghten their institutionalization where they might have pretend it is complied already. The model developed is hypotizes that Corporate Governance practices (X) may effect the Organizational Commitment (Y) where it also questions the (mediation or moderation) effect of the level of Institutionalization (M) of the organizations.

Variables

The set of core principles of Corporate Governance practices (X):

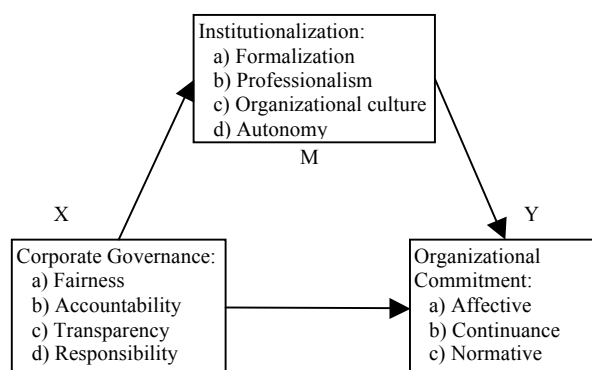

- a) Fairness
- b) Accountability
- c) Transparency
- d) Responsibility

Dimensions of Organizational Commitment (Y):

- a) Affective
- b) Continuance
- c) Normative

Selected parameters for level of Institutionalization (M):

- a) Formalization
- b) Professionalism
- c) Organizational culture
- d) Autonomy

Researchers should recognize that there are no magical methods for assuring the correctness of causal inferences other than a well-developed theoretical framework and the cautious interpretation of the results stemming from analyses based on them. In general, researchers are asked their perceptions of causal relationships whether the causal relationship between one variable and another is positive, negative, or zero, often in the form of a matrix (Aldag and Steams, 1988: 263). The extent one variable causes another variable to move on a scale of 0-1, the

sign of the value represents the direction. A negative sign (-) means an inverse relation and a positive sign (+) means a direct relation. The Causal Analytics is the analysis of data in an attempt to determine which variables cause each other, when and to what extent. Causal modeling may be used to reject causal hypotheses those cannot be defensible, but the result will not necessarily be a correct causal model that cannot be attacked (James and Singh, 1978: 1106). An asymmetric effect is the impact on the one variable happens to be larger than the impact on the other variable and asymmetry analysis can be run with multiple independent variables (Kahneman and Tversky, 1979: 288-289). Multiple regression analysis could be used to identify which set of variables truly drives the dependent variable (Sambandam, 2004: 4). An asymmetric relation is a binary relation which is not a symmetric relation. The set of core principles of Corporate Governance practices (X) and Dimensions of Organizational Commitment (Y) are asymmetrically related.

Mediation is a causal model and in a mediational model, the independent variable is presumed to cause the mediator, and in turn, the mediator causes the dependent variable (Wu and Zumbo, 2008: 369). The mediation model is one that seeks to identify and explicate the mechanism that underlies an observed relationship between Corporate Governance practices (X) and Organizational Commitment (Y) via the inclusion of a third explanatory variable the level of Institutionalization (M), known as a mediator variable. Rather than hypothesizing a direct causal relationship between the X and the Y, the mediational model hypothesizes that the X causes M, which in turn causes Y. M, then, serves to clarify the nature of the relationship between X and Y. A symmetric relation is one in which both X and Y causes each other. By restricting the discussion to two variables and assuming no other variable affects the relation between X and Y, there are four possibilities: X and Y are unrelated, X causes Y, Y causes X, or X causes Y and Y causes X at the same time, a reciprocal relation. Much research and theory are based on statistics from this two-variable system of relations. The correlation coefficient, regression coefficient, odds ratio, and the difference in the mean between two groups (where X represents assignment to the groups) are examples of quantitative measures from a two-variable system. Even in a two-variable system, it can be very difficult or impossible to identify causal relations because these relations are inferred from observed data (MacKinnon, 2008: 6).

In case the third variable is a moderator then it modifies the form or strength of the relation between X and Y. The third variable in this case is not part of a causal sequence but qualifies the relation between X and Y (Preacher, Rucker and Hayes, 2007: 188). Moderator variables are typically introduced when there is an unexpectedly weak or inconsistent relation between the independent variable and the dependent variable (Baron and Kenny, 1986: 1178).

Other than multiple regressions, there are new methods to test mediation models (like Sobel Test for large and normally distributed samples, and Bootstrapping and M-test for small and not necessarily of normal distribution samples) (Hayes, 2009: 5-6).

CONCLUSION

Theoretically the drivers of Organizational Commitment are of the results of institutional applications but they might be skipped or less emphasized in order to catch the codes of Corporate Governance those utilise public funding. In such a rush of finance, organizations do what they can with what they have at that time and go ahead without any clear plan for their institutionalization. Upon this post-institutionalization period the codes of Corporate Governance are applied piously. The developed model first search for that piousness, as discussing for its effect on Organizational Commitment. Stronger or weaker applications in the codes of Corporate Governance may indicate the well completed or missing steps in institutionalization. Thus, level of institutionalization is put into the model as an interactive variable.

ABSTRACT

The 2001 Crisis in Turkey has showed that how systemic failure of corporate governance stemming from poor banking practices, inadequate legal and regulatory systems, inefficient and unregulated capital markets, inconsistent accounting and auditing standards, incompetent boards of directors have led to fiscal crises. After the bankruptcy of some banks during that crisis process, "systemic banking crises" is put in to agenda by the Turkish government and banking sector has been restructured.

Corporate governance has been seen as remedy for those banking crises at that restructuring process of Turkish banking sector. However, some structural factors as like opaque structure and boards of directors may prevent the executing the corporate governance efficiently.

Although there are so many literature on the issue of banking crises or corporate governance, this survey differs from the others by focusing on (1) the reasons of systemic banking crises in Turkey with the case of Imarbank and Demirbank; (2) the role of corporate governance on managing those crises; and (3) the banking-structure related factors preventing the efficient practice of corporate governance as a whole.

Keywords: Banking Crises, Corporate Governance, Opaque Structure, Board of Directors

INTRODUCTION

During the last three decades Turkey has gone into so many recessions and crises arising from the political and financial failures. 2001 Crisis is one of those crises which rooted in financial failures, particularly in banking failures. Indeed, 2001 Crisis in Turkey, has showed that how systemic failure of corporate governance stemming from poor banking practices, inadequate legal and regulatory systems, inefficient and unregulated capital markets, inconsistent accounting and auditing standards, incompetent boards of directors have led to fiscal crises.

Corporate governance systems have evolved over centuries, often in response to corporate failures or systemic crises. Each crisis or major corporate failure –often a result of incompetence, fraud, and abuse- was met by new elements of improved system of corporate governance. Through this process of continuous change, developed countries have established a complex mosaic of laws, regulations, institutions, and implementation capacity in the government and private sector Iskander and Chamlou, 2000:1).

Turkey also has experienced that kind of process in financial sector to manage the systemic banking crises. According to Levine (2002; 7); corporate governance at banks means the structure that operations of those institutions are managed by their board of directors and top management. The structure of corporate governance at banks; includes developing corporate objectives, keeping the rights of depositors, organizing the operations and behaviors with the hope that the banking system can operate in accordance with current laws and regulations, and paying attention to the rights of shareholders.

However some times it may be difficult to achieve those enforcements because of some challenges -such like opaque structure and board of directors structure- arising from the characteristic of banking structure.

CORPORATE GOVERNANCE IN BANKING SYSTEMS

Banks undertake a critical mission in economy through their differential characteristic of deposit acceptance and credit allocation rights. From the point of view of those characteristics, being trustable institutions has been the main concern of the banks over decades. Moreover, the role they are assigned in an economy, as like operation of payment systems, money creation ability, encouraging savings and investments, offering a wide range of financial services to the society are all the issues underlining the economic and social importance of banks. Thus, the cost of failures caused by those institutions has severe effects on society and economy. As Beyaz (2003;10) stated, effective risk management policies and strong corporate governance at banks are very significant issues since banks are so important over the economy and society.

Banks are intermediary institutions which operate as trust institutions and allocating funds collected from saving holders to the business as loans. Because of this important role, corporate governance is crucial for keeping the rights of savings holders and achieving confidence and stability in financial markets (Barth, Caprio and Levine, 2001; 13).

Levine (2002; 7) indicate that corporate governance at banks means the structure that operations of those institutions are managed by their board of directors and top management. The structure of corporate governance at banks includes developing corporate objectives, keeping the rights of depositors, organizing the operations and behaviors with the hope that the banking system can operate in accordance with current laws and regulations, and paying attention to the rights of shareholders.

Even though the importance of corporate governance in banking sector, Beyaz (2003; 10) argues that carrying out the corporate governance at banks is more difficult and complex compared to other companies and organizations. First of all, although the problem of asymmetric information is viable in all companies, it is more significant in banking. One of the most important problems arising from asymmetrical information sharing is the difficulty of enforcing corporate governance principles at the banks that have opaque structures. As a result of this opaque structure, it is difficult for other parties to monitor and assess banks. So, high degree of asymmetrical information in banking system makes it difficult for shareholders and lenders of banks to monitor the acts of directors, The absence of efficient monitoring by minor shareholder and lenders makes it possible for directors and dominating shareholders to use banks' funds on their own interest which constitutes second challenge for efficient corporate governance enforcement.

1. Opaque Structure Challenge

In the case that any party in trading transaction has little information than the counterpart about the product or service, there asymmetrical information issue reveals. Lack of information causes two types of problems on financial markets, as adverse selection and moral hazard.

Adverse selection occurs when any party in the transaction, before it is exercised, is served with counterparts' past, interests and abilities in misleading way. Therefore, parties of trade struggles to show themselves as trustable, hard working, qualified and affect the trade in favor of them. John, Saunders and Senbet (2000; 27) underline that moral hazard arise when the demanding party cannot have full details of acts of counterpart and this is costly. Trading partner, in those circumstances, have strong sensations not to fulfill the performance standards stated in the contract. It can be exemplified in banking as that the credit demanding customer changes his or her behavior after receiving the credit payment and causing the bank to make loss. If the bank customer struggles to reduce risk he or she is exposed before using credit, but does not show the same effort after receiving the payment or starts behaving to increase risks, there occurs moral hazard.

Adverse selection is a problem that exploits the asymmetric information about the future performance before the contract, whereas moral hazard is the problem that exploits the asymmetric information about the current performance after the contract.

Besides information asymmetry between bank shareholders and governors, below mentioned information asymmetry types are also existing:

- a) Between savings account owners, bank and regulating authority
- b) Between bank owners, directors and regulating authority
- c) Between lenders of bank, directors and regulating authority.

Problems arise from those information asymmetries are the inability of monitoring bank performances, the issue that bank owners and governors prior their individual benefits, and opaque structures averting competitive management.

On the other hand Mortlock (2002;27-32) argue that inability of monitoring the performances of banks successfully is one of the main reasons arising the information asymmetry. Buyers in production and service markets make transaction in current time. For instance, as can be seen in the cases that a car or the service of a worker is not enjoyed, defects of goods in production and services may occur in near future. However money is saved on bank in current time and it is transacted with the expectation that it will be repaid at maturity. Credit quality in banks cannot be seen in a short time, even it can be hidden for a long time.

Ciancanelli and Gonzalez (2000;5) argue that this type of opaqueness, in other words, difficulty in estimating the recent performance of the company is much more complex in banking industry for the reason that loans in banking, generally, cannot be subjected to liquidate in secondary markets. But pension funds or insurance companies just can deal with that opaque issue by subjecting their assets to resell in efficient secondary markets. Furthermore, the liability arising from insurance includes the same information problem with loans. Consequently, banks, pension funds and insurance companies are much more affected from the delivery of asymmetric information.

Banks can change their risk composition of their assets faster than companies in real industry. Banks have ability to reallocate credit to firms which failed to repay their previous credits and hide their existing troubles in a short time. Increase in inventories of production companies is a negative indication of inefficiency in company performance. On the other hand, in the case of increasing cash amounts and banks become more liquid, it is too much difficult to distinguish whether it is the indication of inaction or bank follows deliberate management practices in a risky environment.

The case that bank owners and directors look after their individual benefits arise from lack of transparency and institutional structures. This type of structures provide more possibility to company owners and directors to use the rights of creditors in favor of themselves. Risk taking behavior in this case occurs altogether as using the assets of others iniquitously. Here Beyaz (2003) note that fraudulent bankruptcy will become widespread when the accounting system in a country is poor; legal regulations are inefficient and punishment is low; regulations encourage company owners to convert the situation for their own benefit and not to pay their debts.

Prowse (1997;29) state that opaque structure of banks provides ability to major shareholders, holding governance and auditing rights, using the assets of the bank in the way of risking the effective operation of the bank, directly or indirectly. Banks often are prone to engage in more risky operation in the hope that creating high interest income and profit amounts. Because of this ambitious will they may allocate credit to firms in the trouble of repayment of previously used credits. Therefore, dominating shareholders of the bank mislead the market by using the information asymmetry in favor of them and have the ability to show their financial position as strong and profitable in a given period. Similarly, if there is an oligopolistic market, banks mislead market prices by manipulation and victimize other investors. Depositors as the main source of funds and other lenders of banks can not audit the bank because of opaque structure.

According to Porta, Lopez, Shleifer (2000); in many less developed countries, the existence of a few conglomerates which have dominance in overall economy, especially in banking, and structured as family company, eases abuse of bank shareholders and governors. This abusement arises against the benefits of minority shareholders, depositors and tax payers. For instance, in Indonesia a country which is depending mostly on agriculture and has relative underdeveloped economy, a serious crisis occurred at the end of 1990s although there was not a significant income decrease in agricultural sector. The use of funds by bank owners for their own benefit caused the crisis to become much more severe. Some banks allocated credit to their shareholders ranging from 85% to 345% of their capital and those credits were not repaid.

According to Article 32 of Turkish Banking Law, all banks are obliged to establish an internal auditing system including the organization as a whole. In this framework, the consistency of operations to legislations, general agreement, internal principles, and banking principles are audited by bank inspectors. According to the same

article, auditing function is fulfilled by minimum required number of inspectors and paying great attention to job ethics. Auditing reports on three month period basis are delivered to board of directors.

1.1. The Case of Imarbank Related to Opaque Structure Challenge

Akçay and Bolgün (2003;73) indicates that Imarbank scandal was so serious in the banking literature. Bank was acquired by Uzan Group in 1984. Imarbank was taken into enclosure of 64. article of 3182 numbered law on 20th June 1994. The reasons of close monitoring of the bank are allocation of all credits to Uzan Group, diverging from banking functions, damage of income-expense balance, decrease of profitability and liquidity tightness. After the foundation of Banking Regulation and Supervision Agency (BRSA), because its riskiness continued, Imarbank remained to be monitored. BRSA wanted the bank to serve a plan to deal with the problems. However, plans developed by bank management were not accepted realistic, BRSA wanted reducing risks depending on Uzan Group and solidify its capital structure, by detailed directives. Due to fact that bank did not in accordance with instructions, BRSA assigned a board member with the power of veto on 12th July 2001 and increased number of members to two on 26th December 2001. Within the context of the Program of Divergence of Bank Capitals, by three step auditing process over 2001 financial results, 284 million USD of 910 million USD group risk collected, guarantees were acquired for loans allocated to the group (50 trillion TL alienation for collections from Çukurova Electricity), Uzan group increased the capital of the bank by 70 trillion TL.

Article 50 of Turkish Banking Law underlines that banks cannot allocate cash or non-cash credits to board members, general manager, authorities to give out credits, their spouse and children, shareholders owning more than 25% of the capital, any in cases. However, Imarbank was the main source of financing Uzan Group projects. Before confiscation of Imarbank by SDIF, there occurred extraordinary events. Privileges allowed to ÇEAŞ and Kepez, electricity companies belonging to Uzan Group, were cancelled on 12th June 2003. Same day, BRSA empowered the assigned member in the board with veto and stricted allowing no extra funds to the group at all. Due to fact that contradicting practices with those directives increased until 25th June 2003, BRSA reiterated its directives. Based on the reports from the bank to BRSA, those issues were reported in the period of 12th June and 25th June, 2003: 89.8 trillion TL and 24.7 million USD of deposits were withdrawn. Net liquidity on 12th June 2003 as much as 41.9 trillion TL decreased to 6.6 trillion TL on 25th June 2003. In contrast to directives, there was seen some actions of turning off-shore accounts into deposits. Therefore, it was decided to make close monitoring of transactions.

Imarbank gave up sending reports and other documents to BRSA on 26th June 2003 and averted distant monitoring. Similarly, all board members resigned except the member assigned by BRSA, on the same day. Those people, in such a hard time, caused the bank to face managerial problems by their resignation, not obeying their obligations given by Trade Law and Code of Obligations. On the following days of batch resignation, liquidity tightness increased and problems occurred in repayments.

It was impossible to make any decision between 13th June and 2nd July 2003, because there were only four members in BRSA and no member was assigned for vacancies. By the assignment of new member on 2nd July 2003, a new board of directors members was appointed to the bank. Deposit insurance about 50 billion TL became unlimited on 3rd July 2003 and permissions of Imarbank to banking and collecting deposits were abated. (BL 14/3). Management and supervision of the bank was acquired by the SDIF (BL 16/1). It was foreseen, thus, to pay just savings deposit accounts instead of all liabilities, and demanding the bankruptcy of the bank.

Why the 14/4 article was not applied in handing over? 14/4 article of Banking Law can be applied when the major shareholders use the funds in favor of their individual benefits and risking the efficient operation of the bank and causing it to make loss. However, such a determination could not be stated. A special way followed for Imarbank. For previously confiscated banks, their banking permissions were not abolished.

A strategy for those banks to restructure and sell was followed previously. As the method followed so far required, all liabilities of the confiscated bank was undertaken by SDIF. Data on hand indicates that almost all of on-balance-sheet liabilities of Imarbank were composed of deposits under 50 billion TL and under the guarantee of Savings Deposit Insurance, while almost all of off-balance-sheet liabilities were composed of risks from Uzan Group. Such a way was accepted with the idea that it would not bear any difference in practice for saving the rights of victims and minimizing the public cost by not undertaking the liabilities from the group. Information systems of the bank was outsourced by Merkez Investment AS., an Uzan Group company and shareholder of Imarbank. When banking records were required to use auditing of BRSA, records at Merkez Investment and back-up systems were all locked away, substitution of locked reports was not possible due to

batch resignation of key managers. In contrast, Legislation for Internal Auditing and Risk Management Systems, Article 14 underlines that banks must hire efficient systems, reliable, state-of-art, allowing in-time access to data stored at main memory. However, information systems of Imarbank had been built up for illegal transactions.

Another issue was that how the access to records was impeded? As a result of impediment of access to records, head office and some branches were visited for inspection. Because the records on computers on hand and transcribed were not enough, it was started to collect documents from victims. 4th August – 1st September 2003 period was spend with collecting documents from victims and inspection of them.

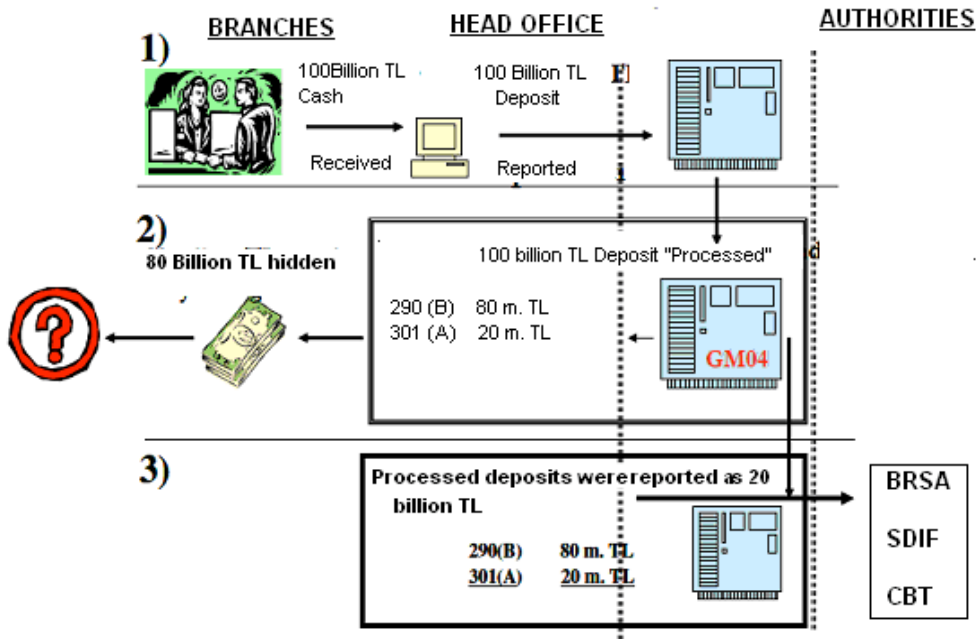

As of 25th June 2003, the last day of reporting, savings deposits were accumulated as 753 trillion TL, exceeding too much the announced levels. Due to such a difference, because it was impossible to compensate so high amounts by SDIF, Treasury and the government set in the process. Law infrastructure of this case was built by the 4969 numbered law on 12th August 2003. Draft of enactment prepared within the framework of this law, and determining procedures and principles for the payments to victims, was sent to Treasury on 12th September 2003. Payments would be made in accordance with procedures and principles stated in the enactment and within the availability of budgetary possibilities.

According to Article 14 of Turkish Banking Law; Banks established in Turkey may open branches or representative offices abroad, including off-shore banking regions, on the condition to set up undertakings or participate in existing undertakings comply with the corporate governance and protective provisions set forth herein and to comply with the principles to be established by the Board; Permission for authorization of independent audit, valuation, rating and outsourcing institutions

Numbers of transaction were observed contradicting to legislation. Data on hard disk of computer systems at Imarbank allowed just making the inspection for 2003. Those records, enabled to the identification of some points. The difference between the total of actual deposits and reported deposits, was based on converting off-shores to domestic deposits, unlicensed and short-selling of government bonds, low reporting of deductions from deposits interest income (stoppage, funds, taxes) and other illegal transactions. Due to determinations about branches, education level of branch managers were relatively low, compared to other banks. Minimum authority had been allowed to branch managers. For instance, branch managers had no authority to allocate credits. Victims had to demand even for their small amounting deposits before they withdraw. General reporting was impossible from the system in branches. Residual amounts were examined on the basis of bank slip from information system at branches, were not accessible. Data to be the basis of ledgers was prepared by head office. Ledgers prepared by using this, do not correctly reflect the account figures. Recording system was interestingly manipulated in transactions contradicting to legislation. All transactions occurred at branches transferred to hard disk located at head office, consequently at Merkez Investments AS. Financial results of each branch and, in general of the bank, were prepared by the manipulation of data transferred from branches. Bank had been hiring two types of software to manipulate data. One of software hired had been used for decreasing the results of deposits, taxes, and expenses by fictitious debt/credit records. Other software had been used for wiping off bond transactions with customers from auxiliary accounts. Manipulated data auxiliary book, trial balance, general ledger were sent to branches.

Branches transferred all real data to main memory at head office. By using a software called GM04, under the right to use of a few people, deposit accumulation was reduced on account basis, reverse transactions were made for a given date, amount, account and branch. “Account closure”, “paid” notes for records by GM04 were attached to auxiliary books sent by head office to branches and no detailed statement was supplied. For reverse transactions, 290 numbered branches current account was used. Counter transaction for accounting could not be identified. Not allowing 290 numbered account to give balance in banking techniques is only possible by the reverse transaction of the opponent branch. Article 18 of Legislation for Internal Auditing and Risk Management Systems obliges that banks must group their risk types, evaluate each group, control and manage each risk type. Imarbank, however, used all deposits as a credit source to Uzan Group paying attention to no risk management principle. Credit worthiness of Uzan Group from Imarbank was unlimited.

Figure 1: Reporting Deposits Low

Source: BRSA

Although it is allowed to operate on behalf of a bank abroad, driving customers to open an off-shore account is forbidden. According to Article 96 of Banking Law, without order, banks are not allowed to transfer deposits to offshore and reverse. If so, bank is liable to results of the transaction. In Imarbank case, off-shore deposits were converted to domestic deposits. Bank allocated credit to group companies from off-shore since 1994. After every inspection, bank management was alerted about the issue. Several protocols were made about reduction of off-shore deposite. Lastly, on June 2003, a directive was dictated to the bank "not to convert off-shore deposits to domestic and not to depo in off-shore". Bank ignored all directives since 2003 June and continuously increased off-shore deposite with the purpose of transferring to domestic deposite. As a result of inspections, after the directive on 12th June 2003, deposite converted from off-shore was 616 trillion TL, 17.5 million USD and 9.4 million Euro. Government bond transaction were also made contrary to legislations. Imarbank had given up all of its intermediary operation in Istanbul Stock Exchange since 31st October 1989, called back its representatives and closed its desk. Here upon, Capital Markets Board of Turkey decided to cancel the bank's permissions of agency and membership at ISE, on 25th October 1990. However, the bank continued to make intermediary transactions, contradicting to legislation.

Article 42 of Turkish Banking Law The original letters received and activity-related documents, or proper copies where the original ones are not available, as well as the photocopies of letters written shall be kept in order of their number and dates for a period of ten years within the body of the relevant bank. It is possible to keep such documents in the form of micro films or in electronic or magnetic environments. Same Articles urges banks keep their records for 10 years within the bank. Imarbank systematically made short selling of government bonds at significant amounts since October 2002. It was observed on 30th June 2003 that, although it had a portfolio of government bonds around 15 billion TL, it collected 728.4 trillion TL from victims by short-selling of bonds. Volume was hidden by the software applied in wiping off auxiliary transactions. Documents of all transaction were sent to head office, no document was hold at branches. Very few of documents received from branches was signed by authorized managers at head office. This activity was contrasting to Article 42. Signed documents reflected to deposited securities account, thus, registered to ISE. However, on 3rd July 2003, it was understood that really sold bonds were also not within the bank. As of 4th July 2003, Bank had made short selling of bonds amounting to 728 trillion TL, with the nominal value of 1,023 trillion TL. As Richter (1990,154) stated, the complex continuing business relationships among savers, credit users and banks can be assessed as a relational contract. Due to fact that it is an incomplete contract as argued by Hart (1994) that eventually may required further regulation. In continuing business transactions any party may relay on private contract enforcing mechanisms such as reputation, for instance. Individual monitoring in banking is impossible, on the other hand, because of a collective action problem. Dewatripont and Tirole (1994,117-118) underlines that unsophisticated and small parties on banks suffer from information asymmetries and have little chance to invest in monitoring as a result of a free rider problem. Depositors must be represented actively by organizing 'delegated' monitoring. In contrast, if no ability of private representation is or can be provided, regulation may be required there. Public

regulation of banks is a very complex issue, thus should limit itself to a complementary role by light-handed regulation.

Deductions from interest income reported at very low levels. Taxes were reported low by using GM04 software with reverse transactions. Just 3-10% of income tax stoppages deducted from customers were paid. It was observed for the first 5 months of 2003, the amount not paid to tax administration was around 125 trillion TL. Penal provisions are stated in tax legislation.

2. The Challenge of BOD (Boards of Directors) and BOE (Board of Executives) Structures

In all enterprises of market economies, the board of directors (BOD) functions as the intermediary between owners and managers. It is responsible for protecting shareholder investments by ensuring management performance and accountability (Pannier, 1996:16). Thus, boards of director are widely believed to play an important role in corporate governance, particularly in monitoring top management. BOD are supposed to supervise the actions of management, provide advice, veto poor decisions. In other words it is seen as the shareholders first line of defense against incompetent management (Weisach, 1988:431).

Macey (2001;6) contributes that corporate governance in banks means a structure that business and operations of a banks are managed by board of directors and top managers. Corporate governance indicates the management philosophy of the bank, by underlining the development of corporate objectives for banks, realizing daily operations, paying attention to the benefits of employees, customers and other bank related institutions, managing corporate governance and behaviors, and saving the rights of depositors.

Although stressful economic conditions affect bank's performance, decisions and policies of directors and top management have more significant impact on the success or failure of the bank. La Porta (2000;33-37) argues that usually within the banks having poor management, besides external negativities, wrong credit policies of bank management such as insufficient functioning of mechanisms determining problematic credits, lack of mechanisms adapting bank policies and laws, credit allocations contradicting to banking principles due to aggressive policies of top management and extensive credit allocations are among the milestones of banking problems.

The main one of governmental problems in corporate governance processes is lack of interest of directors and top management on bank's operations and lack of information about banking. It must not be expected too much from a board of directors that is lacking experience and knowledge about banking industry, or acting passively in controlling the bank operations, for good corporate governance.

In order to determine strategic objectives of the bank and to allocate the required financial and human resources efficiently in achieving those objectives, board of directors should not compose of members who lacks of banking knowledge and experience and the ability of assessing and managing risks) Macey (2001;6) also indicates that although board members do not have knowledge or experience inadequacy, in the case of passive management, executive board can be controlled by some dominant members of the BOD, who follows the a few privileged shareholders' interests. In case of such a management, executive board includes passive members who are not able to interrogate whether the practices of BOD or top management's practices are in consistent with banking principles and related laws.

On the other hand, in too much aggressive boards that target profitability and growth; asset quality of the bank, the size of risks undertaken, and banking ethics are mostly disregarded. Although it is admired that aggressive approaches combined with well developed policies and control mechanisms can give good results, it is required that bank management must prevent too much aggressive practices which have the potential to harm the solidity of the bank.

The role of board members in corporate governance determines the maintenance of the quality of corporate governance. Especially, policies to prevent the behaviors, actions and relations having the risk of reducing the quality of corporate governance, should be adopted. Those behaviors and relations can be in form of allocating advantageous credits to the relatives of managers or directors in bank. Moreover, some issues such as providing privileges of maturity and bonification advantages to some people and institutions related to the bank, exempting from commission payments, can be mentioned. Chong (2004;46) states that bank management should execute the required policies considering that those behaviors may lead to clash of interests; monitor the relevancy to

those policies; and create possibilities of reporting possible deviations from those policies at different management levels.

According to Mortlock (2002;27-32) members of BOD determine main policies of bank operations, assign top management to implement those policies and fulfills the complete management of risk that the bank is exposed to. Duties of BOD and bank top management must be separated. In this context, first of all, bank board of directors must assign skilled executives. Bank performance can be monitored by building an efficient internal control mechanism. In order to fulfill those duties, BOD must determine the borders of authority and must assure that top management fulfills these policies; must hold the control mechanism although leaving the fulfillment of daily operations to top management.

Meanwhile, general manager and other top level managers responsible for the operation in bank corporate governance, have vital role in the success of the bank. According to Ciancanelli (2000;5); general manager and other top level managers must have required skills and experience to manage the bank successfully, so that the bank can grow profitably and maintaining the asset quality. In this context, it is important that a bank must have assigned a general manager and other top managers capable of adapting corporate governance for the bank's success. As mentioned before, whether he is successful or not, leaving the decision making process to the authority of a general manager for bank's management would cause the bank to be under the control of a dominant person and cause some problems.

Banks which adopted a management style far away from corporate governance approach- do not have systems providing consistency with bank policies and laws; top managers and departments of those managers are not monitored enough, decisions of the banks are made by dominant executives such as general managers, controlling shareholder -and board members. Barth (2001;11-15) argues that it is impossible to mention corporate governance principles in a bank managed by e such a executive who can not achieve required effectiveness within bank organization structure; can not realize intra-bank relations and communication; lacking consistency with trusteeship and ethics, can not monitor the bank's performance, can not implement policies to increase the success of bank, can not perceive the risks that the bank has undertaken.

Caprio (2002;7) underlines that general manager must follow his duties with honesty in the behalf of the shareholders and perceive his role in the management of the bank, in order to contribute the strengthening the corporate structure of the bank. General manager, on the other hand, must also fulfill his role in management of daily operations, must be aware of his right to assign top management of the bank and assert for right disclosure of top management.

Board of directors and general manager must be responsible for necessary controls and creating required balances about other managers. Similarly, other managers must also undertake the responsibility of general manager's control in various operation areas of the bank. For small sized banks, too, decision making process should include more people rather than one person. In efficient corporate governance, a great attention must be paid for the selection of top managers responsible for decision making processes of bank's operations.

As a result, it is very important to establish good corporate governance practices in banking industry in order to enable solid operation of the system, to protect the interests of depositors, to increase the value of the banks' stock prices to highest possible levels within a competitive environment in line with trade ethics, vision, purpose and criteria. Banks, for this purpose, must be aware of their responsibilities against customers, shareholders, employees and business partners, operate in accordance with business laws and regulations, obey ethical values and business ethics in a competitive environment. Corporate governance principles of banks must depend on strategic vision, responsibility, achieving performance targets, accountability, transparency and lawfulness.

2.1 The Case of Demirbank Related to BOD and BOE Structures Challenge

Before Savings Deposit Insurance Fund seized it, Demirbank was a prestigious bank, belonging to Cıngıllıoğlu Group (Akçay and Bolgün, 2003;66). November 1999 and February 2000 crises must be well understood in order to comprehend the issue. When the economic conditions before crisis are examined, economy contracted by 6.1%, inflation reached to 70%, interest of government bonds exceeded 100%, double digit inflation for 30 years become unsustainable, and economy was facing hyperinflation threat. Turkey signed stand-by agreement with IMF and looking for ways to rescue from these circumstances. A new economic program including three main principles was started by the support of IMF:

- Disciplining budget and extra budgetary public finance

- Determination of exchange rates by predetermined currency peg
- Realizing reforms and accelerating privatization.

The main purpose of this frame was reducing inflation and achieving a sustainable growth. Budgetary part of the program targeted to increase budget surplus excluding interest payments. This was aimed to be achieved by increase in tax revenues and reduction in domestic borrowing costs by switching from domestic to external borrowing. In monetary policy, a target of Net Internal Assets around 1200 trillion TL for the central bank. Central bank would supply liquidity only by offset of currency inflows. When the domestic borrowing need of treasury, the amount of funds available for other actors would increase, extra liquidity would be supplied by money created by offset of exchanges, thus, any liquidity stress would be prevented. Positive effects of the new program appeared on markets immediately. Average compounded interest rates of 1999 reaching to 106% decreased to 36% in January 2000. Interbank overnight rates average decreases from 66% in December 1999 to 34%. Decrease of interest rates so quickly was indicating a risk for inflation levels. Decrease in interest rates was favoring the cost of borrowing for treasury but, damaging inflation contends of central bank. Central bank normally would not allow such a case to occur. However, because the attitude of both politicians and the society as a whole was in the situation of allocating funds to renters, the probable impacts of this rapid decline was not paid attention. Even central bank was fascinated with this issue. Although many economists argued that this situation would cause serious problems for inflation contend, they were not successful to get their theories admired by others.

Table 1: Treasury Auctions Average Interest Rate

Months	Compounded interest rate Average(%)
Average of 1999	109%
January	37%
February	41%
March	36%
April	34%
May	36%
June	40%
July	32%
August	33%
September	34%
October	38%
November	39%
December	36%
Annual Average	36%

Source: Undersecretariat of Treasury

The issue that monthly average interest rates of treasury from 109% to 106% starting from the first month caused serious problems in inflation contend. Postponed consumption spending started to be realized immediately. Savings started to be spend for consumption even by the support of low interest rated consumer credits by banks. Consequently, because domestic demand remained being eager, real decline in inflation did not occur at expected levels. Investors who understood that currency peg could not be remained too long, especially foreign banks, preferred closing their exchange positions. Banks tended to close their open positions at the end of October 2000 because of year end results end budgetary purposes. This increased the need for liquidity, consequently, interest rates. This was a well known case because banks do the same in every year end. When the overview of Turkish economy is analyzed, growth rate was moving towards 6.5%-7%. Therefore, the shrink of 1999 about 6.1% was returned into growth. Eager domestic demand as the main source of economic growth was oriented both domestic market and imports. In contrast to eager domestic demand, inflation declined from 69% to 40%. The reason why the inflation could not decline rapidly is eagerness of demand fueled by consumer credits of banks. Unexpectedly fast decrease in interest rates brought allocation to spending of the amount can be saved from income. This case created a medium for demand to increase, consequently, the decrease in the inflation lower than the expected. Budget was running ahead a record deficit. In other words, inflationary pressures from budget deficit was being eliminated gradually. Reforms postponed so far had been realizing. Banking system was being restructured. Privatization revenue equal to 15 years was realized in 2000 itself. Although current deficit was running to 8-10 billion USD, it was commonly accepted not to risk. There was no apparent cause for a crisis at the beginning of November. Banks were struggling to close their open positions and

foreign investors were demanding foreign exchange to close their accounts. Those issues were resulting into increase of interest rates. New regulations was forcing banks to close their open positions and hold more liquidity. Banks tended to buy more exchange to hold more liquidity. This increased liquidity demand forced interest rates to jump suddenly. Starting crisis and increased interest rates troubled banks holding excessive amounts of bonds and using them in repo transactions. Banks with lack of liquidity and in the obligation of funding bonds started to face big losses. Furthermore, the whispering news that several banks will be owned by SDIF, drove banks to cancel their lines against others. So serious liquidity problem caused banks to be ready to borrow at too high rates. This steep increase in interest rates resulted into decrease in liquidity of secondary markets. Foreign investors leaving the market at first for year end transactions, started to mean the market in a different way and left the market immediately. This tendency caused interest rates to increase much more. Turkish banks were purchasing Turkish securities by joint funds supplied by foreign banks and the profit was delivered among partners. The whole risk was undertaken by Turkish banks. Due to increased stress in markets, foreign banks tended to sell the securities and withdraw the funds. In order to meet withdrawal demand of foreign banks, Turkish banks started to demand more exchange by their funds on hand. This was another reason behind the liquidity tension in markets. Average of November for interest rates as much as 72.4% jumped to 223.8% in December. When we look at daily results of repo markets, development can be well understood.

Table 2: Change in Overnight rates

Days	Overnight Repo rates
01 November	44%
10 November	30%
15 November	92%
22 November	153%
28 November	200%
01 December	727%
04 December	1275%
15 December	63%

Source: Undersecretariat of Treasury

Cancellation of treasury auctions caused the crisis too much serious. At three auction in January 2000, average interest rates were about 63%. As it is common in all crises, the tension in financial sector spread over real sector. Interest fluctuations in markets damaged eagerness of demand immediately. Decrease in demand reduced sales of real sector and increase in inventories. It was inevitable the impact of tension in real sector and upcoming crisis over the financial sector. There was significant increase in non-performing credits. This event drove banks to reduce their credits allowed to real sector.

La Porta (1998;1127) argues that banks should act in accordance with risk legislations for the solidity of the bank. They should apply to risk diversification. However, Demirbank ignored all risk management principles and invested in risky assets. However, all risks undertaken were realized and it went into bankruptcy. The main reason of the crisis besides below points is also the spreading out of the approach focusing solely on profit, ignoring risk assessment, undertaking excessive risks. All issues in fact was a liquidity crisis. One obtained liquidity did not seek exchange. Instead, liquidity tightness due to a common exchange demand in every year end caused a dramatic jump in exchange demand. In fact, even in the most stressful time of the crisis, demand for exchange from real sector did not show a significant increase. Basic point of liquidity crisis was the fact that new regulations would be implemented in very short period. Crisis was mis-diagnosed by the authorities, thus, mis-treated.

Consequently, SDIF confiscated Demirbank and Sitebank. Demirbank was the most effected institution from the crisis. The case of Demirbank was too serious. Management strategy lacking from risk management caused numbers of banks to threshold of bankruptcy. When the costs of excessive risk taking were compared to possible profit, there occurs dramatic results. Demirbank had very strong public image and its bankruptcy was gobsmacked. However, it was sold for price that is too low from its original value. When the balance sheet of Demirbank is examined, there can be observed very significant managerial mistakes.

Table 3: Demirbank Gap Analysis (billion TL)

	Demad Deposit	Upto 1 month	1-3 months	3 months - 1 year	1-5 years	5+ years	Undelivered	Total
Assets	118.023	199.328	197.619	884.599	1.340.552	0	422.842	3.162.963
Liabilities	196.322	1.945.426	355.700	226.501	59.656	0	379.358	3.162.963

Source: ISE

Gap analysis of Demirbank, therefore, must be well examined. Ambiguity in banking industry and money markets deranged investors. Tendency to hold savings on short term instruments raised up. Although assets maturity was as much as 1-2 years, maturity for liabilities had an average of 30-45 days. 90% of deposits has a maturity of shorter than 30 days. When the Gap analysis of Demirbank was examined, it can be observed that bank had a cumulative 1.8 quadrillion TL in 1 month maturity period. On the other hand, when repo amounts are also taken into account, the situation becomes much more serious.

Table 4: Demirbank Gap Analysis (Including Repo) (billion TL)

	Demad Deposit	Upto 1 month	1-3 months	3 months - 1 year	1-5 years	5+ years	Undelivered	Total
Assets	118.023	199.328	197.619	884.599	1.340.552	0	422.842	3.162.963

Source: ISE

After repo transactions are added to above table, cumulative gap amount in 1 month maturity exceeds 4 quadrillion TL. In other words, Demirbank rolls over its liabilities 80% by 1 month maturity deposits. Demirbank was acting with foresight that interest rates will continue declining. Top management, thus, purchased excessive amounts of securities exceeding their capabilities and tended to fund those securities by deposits having maturity less than 1 month and repo having maturity of less than 1 week. Sudden dramatic increase in interest rates and liquidity tension in markets prepared the end of Demirbank. Financial depth in secondary bond markets was very low and it caused liquidity crisis much more dramatic. Consequently, Demirbank had to find resources to fund with enormous costs. Finally, Savings Deposit Insurance Fund confiscated Demirbank.

Pre-crisis real results of the bank was different from officially announced results. Although above mentioned figures are depending on official results, it is commonly accepted that the banking industry entered crisis with 20 billion USD open positions. Legal room for falsifications and lack of efficient monitoring and auditing allowed banks to carry open positions exceeding too much their capacity. The main problem of Demirbank was disregarding risk management policies with excessive profit expectations. Demirbank is a good example of bankruptcy due to market risks. Despite the fact that HSBC had bid 1.5 billion USD one year ago, Demirbank was sold for a price of 330 million USD again to HSBC.

As Beck, Demirgüç-Kunt and Levine (2003;13) stated that the supervisory power view is based on the idea that highlighting official oversight of banks (increasing Supervisory Power) will enable the improvement of banking management and increase the ways the bank invest in alternatives based on sound risk-return tradeoffs, so that Supervisory Power will be negatively associated with Bank Corruption. However, before 2001 crisis, there was not a fully authorized institution responsible for banking supervision and regulation. This activity was being realized by Treasury and Central Bank. Bank owners were able to find room to invest in risky instruments with the expectation of more profits. Lack of effective supervision caused Turkish banks, especially Demirbank less risk aware. Excessively undertaken risks were realized by the liquidity tightness in the market and Demirbank faced too high levels of losses.

According to Stout (1995;53) excessive risk takings of banks cause serious problems in turbulent. Banks purchased large amounts of risky securities by funding with short term deposits start to face troubles when the booming period of economies end. Demirbank purchased long term assets, however, in Turkish banking industry, deposits had a maturity of less than a month. Liquidity problem occurred at the end of 2000 caused many banks, especially Demirbank, by being ready with unrealistic rates. So, just in a few months, Demirbank went into bankruptcy.

As Baltensperger (1990) argued that governmental authorities may prevent ex post interventions, instead offer protection for the banking system as a whole, including depositors and credit users to eliminate any trouble in balance bank insolvency. Governmental authorities should prefer monitoring the amount of risks undertaken without intervening the bank management, decrease any risk of liquidation. However, before 2001 crisis, there was no efficiently operating regulative authority in the system. Government could not effectively controlled the amount of risks in the banking system. Therefore, Demirbank undertook high levels of risks with the hope to make more profit. Consequently, the root went to bankruptcy and sale of the bank.

CONCLUSION

All these cases were a result of lack of an efficient regulation authority pre-crisis era. Turkey was not too much aware of and paying attention to corporate governance principles. Since banking system is the locomotive of the overall economy, it needs to fully and efficiently monitored and regulated. Because, this industry is the softest area for corruption. Since most economic crisis in the near past, unregulated banking system is the leading cause.

Demirbank was the victim of excessive risk takings without risk management because of high profit expectations of bank owners and directors. Demirbank preferred funding long term securities by short term deposits. At the end of 2000, there occurred a liquidity problem. Funding become a hard issue with rallying interest rates.

Finally, it can be stated that Imarbank scandal was a worse example to other financial scandals of the world, subject to international literature. Although it was argued by some that Uzan group was subjected to a political lynch, the importance of the corruption is apparent. SDIF authorities claim their dazedness by each property they find belonging to Uzan group and confiscate. All these events are good examples to the lack of corporate governance enforcement. After those banking crises not only Turkish government but also banking sector noticed the importance of corporate governance and engaged in some regulations related to banking sector. Among those regulations, establishment of transparency system is the most critical one to overcome the challenges of BOD and BOE structures, and opaque structure that constitute the basis of the banking crises.

CROSS-CULTURAL STRATEGIC MARKETING, APPROACH TO ANALYZE THE HIGH-CONTEXT AND LOW-CONTEXT CULTURES (EDWARD HALL MODEL) IN WEB DEVELOPMENT

**Ehsan Fakkar
Farhad Siasar Djahantighi
Mohammad Haghghi
Seyed abolghasem Mira**

Tehran University, Iran.

ABSTRACT

Today's with increased usage of Internet in the World as a tool for displaying information with different cultures. The marketing is considered as a tool for understanding and communication between cultures to identify how to distribute goods and services to foreign markets. Therefore, High and Low cultures identification, to perform strategic decision is so important and this research has been focused on that. In this research, the findings of anthropologist Edward Hall has been chosen as a base element in web sites development because every country and culture needs to be studied in the differences in cultures of High and Low societies. Results show that for designing an ecommerce websites for multi cultures, translate texts is not enough whereas use the correct variables (for instance images and Themes) for High and Low cultures in web sites has more influence to attract the audience. As a result these variables must play a key role in strategic decision to promote an e-commerce in the internet.

KEYWORDS: Cross-Cultural Strategic Marketing; Web Development; Edward Hall Model

INTRODUCTION

Today's with increased usage of Internet in the World as a tool for displaying information with different cultures. The marketing is considered as a tool for understanding and communication between cultures to identify how to distribute goods and services to foreign markets. Therefore, High and Low cultures identification, to perform strategic decision is so important and this research has been paid to it. In this research, the findings of anthropologist Edward Hall has been chosen as a base element in web sites development because every country and culture needs to be study in the differences in cultures of High and Low societies. Results show that for designing an ecommerce websites for multi cultures, translate texts is not enough whereas use the correct variables (for instance images and Themes) for High and Low cultures in web sites has more influence to attract the audience. As a result these variables must play key role in strategic decision to promote an e-commerce in the internet.

LITERATURE REVIEW

With increased globalization of the world economies, for most enterprises, market opportunities seem to be endless these days. This in turn, of course, causes heightened competition among the players in order to achieve better performance. Consequently, departing from the traditional commercial strategies and tactics, innovative managers are looking for unique ways to compete more effectively on a local, regional and global basis. Although there is increased research interest in culturally preferred design elements, there are few studies that systematically investigate such preferences across cultures. This is an important area for research, if, as Robbins and Stylianou (2003) suggest, "Developing an effective multinational Internet presence requires designing Web sites that operate in a diverse multicultural environment. Globally accessible Web sites likewise have the

potential to inform, and include, various nations around the world in large scale information sharing in order to reduce any exclusion effects”.

There are many ways to think about culture. Dutch management professor Geert Hofstede refers to culture as the “software of the mind” and argues that it provides a guide for humans on how to think and behave; it is a problem-solving tool (Greet Hofstede 2001). Anthropologist and business consultant Edward hall provides a definition even more relevant to international marketing managers: “the people we were advising kept bumping their heads against an invisible barrier... we knew that what they were up against was a completely different way of organizing life, of thinking, and of conceiving the underlying assumptions about the family and the state the economic system, and even man himself.” (Edward T. Hall, 1959). The salient points in hall’s comment are that culture differences are often invisible and that marketers who ignore them often hurt both their companies and careers. Finally, james day hodgson, former U.S. ambassador to Japan, describes culture as a “thicket” (Jams D. Hogson, Yoshihiro Sano, and John L. Graham, 2008). This last metaphor holds hope for struggling international marketers. According to the ambassador thickets are tough to get through, but effort and patience often led to successes. On the basis of decades of anthropological fieldwork, Hall places two cultures along a high context / low context continuum (Edward T. Hall, August 1976). Communication in high context culture depends heavily on the contextual or nonverbal aspects of communication, whereas the low context culture depends more on explicit. Communications international connections may be unsuccessful for so many reasons. For instance a message might not transfer because of media insufficiency, a message might be received by the audience but in different cultural interpretations they are not understood. Even message may seems to understand but does not impact, because marketing has not identified a target market needs and demands (Jennifer Aaker, 2000)

This paper tends to discover the effective factors for strategic decision in website designs for high-context and low-context cultures. So, identification of what factors, from customer’s perspective, are important for website designers and studying some attributes of cultures for decision in web development is the main objectives of this research. The study was conducted as a cross-cultural, qualitative analysis of websites from countries categorized among either high and low cultures. The differences between the two website samples were explored and sought to be explained in terms of hall's dimensions.

High and low context cultural factors

Edward T. Hall anthropologist categorizes cultures as being either high or low context, depending on the degree to which meaning comes from the settings or from the words being exchanged (Edward T. Hall, 1976). Hall defines context as “the information that surrounds an event; it is inextricably bound up with the meaning of the event” (Edward T. Hall, 1990). A high context communication is one in which most of the information is already in the person, while very little is the coded, explicitly transmitted part of the message. A low context communication is just the opposite, and the mass of the information is vested in the explicit code (Edward T. Hall, 1976). In high context cultures people use a variety of channels to deliver meaning and these channels involve many non-verbal factors such as gestures, space and silence, even the dress and appearance can help. In low context cultures, words and explicit expressions are the only authentic message to deliver meaning. Usually the recipient will ignore any other messages. So when people interact with others, they need detailed background information. (Figure 1)

Figure 1 High and Low Context by culture

HYPOTHESES

This research includes four hypotheses:

H1: percent of using the famous people's figures in a high context cultural websites is higher than the low context cultures.

H2: high context cultures tend to post more images than low context cultures in their web sites.

H3: selected images website reflects the high context cultural features such as high context cultural value of family values

H4: web site structure in high context is deferent but low context cultures websites have unique page layout and colors.

METHODS

This research's methodology from the objective point of view is applicative research and descriptive analytic, from the methodology point of view. The present research is based on the analytical model of visual communication on websites presented by Lisbeth Thorlacius (Thorlacius, Lisbeth, 2002). This model in turn is shaped by Roman Jacobson's verbal communication model, and thus provides a systematic and comprehensive approach for identifying the various communicative functions present on websites. To prevent reduction of samples mass, in totality 70 questionnaires reproduced and then distributed. The population constitutes from individuals who are expert in websites design and has knowledge of marketing in 2010. Applied sampling method is sampling from accessible samples. Finally, after evaluating and removing inappropriate questionnaires, 45 one of questionnaires have been applied. Each one of these questionnaires has 22 indexes designated based on a five-point Likert scale spectrum. To determine continuity of questionnaires, the Cronbach alpha has been used. For all questions, the measured alpha was 0.81. Finally, to test hypotheses about the difference between high and low Web sites of cultural cross-tabulation tables for each of the cases under the categories of cultural and cultural characteristics of high and low context cultures were analyzed for differences between cultures using the Binominal Test and Wilcoxon Test.

APPLIED HYPOTHESIS IN THE RESEARCH METHODS

Community relations: Presence or absence of community policy, giving back to community, social responsibility policy. (Cheng, 1994; Lin, 2001; Singh et al., 2003; Singh and Matsuo, 2004; Zahedi et al., 2001)

Symbols and Images: Flags, pictures of historic monuments, pictures reflecting uniqueness of the country, country-specific symbols in form of icons, and indexes.

Family Theme: Pictures of family, pictures of teams of employees, mention of employee teams and emphasis on team and collective work responsibility in vision statement or elsewhere on the Web site, and emphasis on customers as a family. (Cheng and Schweitzer, 1996; Cutler et al., 1995; Singh et al., 2003; Singh and Matsuo, 2004)

Pictures of specific individuals: Displaying photos of products which are using by specific and well-known individuals. (Cheng and Schweitzer, 1996; De Mooij, 1998; Robbins and Stylianou, 2003; Singh et al., 2003; Singh and Baack, 2004; Zahedi et al., 2001)

The hypothesis applied for this variable is:

H1: percent of using the famous people's figures in a high context cultural websites is higher than the low context cultures.

Motions Images: using motions Images in the websites.

Graphic oriented: High levels of use of images, pictures, streaming video, etc. The website should be visually noticeable. (Albers-Miller and Gelb, 1996; Cho et al., 1999; Cheng and Schweitzer, 1996; Lin, 1993; Mueller, 1987, 1992; Zandpour et al., 1994)

Messages and information transfer: How to transfer messages through pictures and images and texts either. (More rational and more understandable)

Quality of Pictures: Links promote an exploratory approach to navigation on the website; process-oriented or clear and redundant cues in connection with navigation on a website; goal-oriented focus on beauty, and emphasis on pleasing images, format, design, etc. (Albers-Miller and Gelb, 1996; Cho et al., 1999; Cheng and Schweitzer, 1996; Mueller, 1987, 1992; Zandpour et al., 1994)

In terms of this, we suggested this hypothesis:

H2: high context cultures tend to post more images than low context cultures in their web site.

Tradition theme: Considering the history and native culture, emphasis on a company's relationship with a particular nation, emphasis on respect. (Albers-Miller, 1996; Cheng and Schweitzer, 1996; Mueller, 1987; Singh and Baack, 2004; Singh et al., 2003)

Realism Theme: Less fantasy and imagery on the Web site, pointed information, lack of nature and oneness with nature appeal, appeals emphasizing product attributes. (Albers-Miller and Gelb, 1996; Zahedi et al., 2001)

Use of Superlatives: Use of superlative words and sentences. such as: "We are the number one," "The leader," "World's largest."

Family values, national pride: using family pictures and show people use symbols and signs of dominant cultural values in different types Such as voice, image, text, etc.

Clear Gender Roles: Separate pages for men and women, depiction of women in nurturance roles, depiction of women in positions as telephone operators, models, wives, and mothers, depiction of men as macho, men doing manual work, the strength of men, men as powerful personalities. (Milner and Collins, 2000)

Applied hypothesis for this variable is:

H3: selected images website reflects the high context cultural features such as high context cultural value of family values

Hierarchy information: Information about the ranks of company people, information about organizational chart, information about country managers or country-based important people. (De Mooij, 1998; Robbins and Stylianou, 2003; Singh et al., 2003; Zahedi et al., 2001)

Customize web pages: Customize Web pages according to user's needs and comment. Coordination structure and content: Home Pages and other Web design have similar color, pattern and have similar structure.

Guided Navigation: such as Site maps, well-displayed links, links in form of pictures or buttons, forward, backward, up and down navigation buttons. (Singh, Zhao, and Hu, 2003)

Followed hypothesis is presented for studying this issue:

H4: web site structure in high context is deferent but low context cultures websites have unique page layout and colors.

Hypothesizes which discussed above are used to study the High-Context and Low-Context Cultures in web site development that are so important in strategic decisions about how to create an e-commerce web site for each of them. Theses Hypothesizes which is going to be examined, presented in Table 1.

Hypothesis	Parameter	Hypothesis	Parameter
H1	Community relations Pictures of specific individuals Family Theme Images and Symbols	H3	Tradition theme Realism Theme Family values, national pride Use of Superlatives Clear Gender Roles
H2	Motions Images Quality of Pictures Graphic oriented Messages and information transfer	H4	Hierarchy information Customize web pages Coordination structure and content Guided Navigation

Table 1 Hypothesis Parameters

Testing Model and Research Hypotheses

The suggested model evaluated, using Binominal Test and Wilcoxon Test.

Binominal Test has been used to indicate if hypothesis are playing a rule or not. In order to accept or reject assumptions and parameters of this study, those who wanted to fill the questionnaire were requested to accept or reject the assumptions and parameters based on their experiences and backgrounds. Following Hypothesis indices has been used for this test:

$$\begin{cases} H_0 : P < 50\% & \text{Does not play role} \\ H_1 : P > 50\% & \text{Play role} \end{cases}$$

The results have been shown in Table 2. As you can see here, all practice indices confirm the model.

Binomial Test									
	Category	Observed Prop.		Category	Observed Prop.		Category	Observed Prop.

Table 2: Binominal Test Results

In addition, for study Web sites features in High-Context and Low-Context Cultures (based on Edward Hall's model) a number of international companies website's address specified and classified into High-Context and Low-Context Cultures. This information's were given to individuals based on their observations on Web sites to insert information requested in the questionnaire related to each act. Wilcoxon Test has been used with following indices:

$$\begin{cases} H_0 : \mu_d = 0 & \text{Does not play role} \\ H_1 : \mu_d \neq 0 & \text{Play role} \end{cases}$$

Table 3: Wilcoxon Test Results

Information's in Table 3 explicit that Sig values in most of cases are more than 5 percent. As a result H0 is not confirmed and significant differences between the two communities are considered. Base on the information's Sig value in (m2-s2, m6-s6 and m14-s14) are more than 5 percent, It shows that both surface and deep societies have differences in the use of any of the above parameters and they do not use any of the parameters same as each other. In addition, this test revealed clear differences between the parameters apply in designing website for both societies. Resulted outputs from Wilcoxon Test illustrated in Table 4.

Hypothesis	No	Parameter	Wilcoxon Test Result

Table 4: Wilcoxon Test results in High-Context and Low-Context Cultures

Based on observations, test results, features and properties of low and high context cultures and also differences in the use of parameters, It was determined that in order to achieve the desired goals and objectives, using each parameter used in this research will be effective. The results indicate that all the assumptions of this research on high context cultural communities have been accepted

SUGGESTIONS

We suggest that when someone is making decision about creating any kind of web sites, especially an E-commerce site, the decision maker must pay attention to the following items:

- Use social values such as well-known figures to show images in High-Context communities to create the desired effect.
- Since high context cultures tend to post more images than low context cultures in their web site. Images of goods and services with specific persons, who are using them, make trust and persuade costumers to accept them in both High-Context and Low-Context Cultures.
- Using images reflects the high context cultural features in the High-Context community's websites can effect audience and bring their attention to it.
- Web site structure in high context is deferent but low context cultures websites have unique page layout and colors.

FINDINGS & CONCLUSION

As a result, it is clear that only the translation language web site to target the local market marketing purposes is not enough. Translation may lead to major cultural errors that cause this lack of cultural compatibility of business failures in international marketing. Providing a framework for cultural analysis website this research hopes to help marketers and web designers to create Web sites for international and help them to prevent some common mistakes in the relationship between cultural lead. The findings of this study indicated that the internet is not a neutral culture media. But significant differences in drawing the local cultural values are on the website. In addition, this research as a criterion for future studies attempt to measure cultural values in international marketing environment. The proposed framework based on cultural values can be useful website design and development and applied to marketing strategies in international field, which can cause increased use of websites and help companies in global. The results have been shown in Table 4 show that the understanding of cultural content on the web site can declare social and cultural characteristics of a particular culture. Therefore Strategic decision makers must pay attention to the differences between cultures and for implement these parameters they must be able to identify and incorporate cultural aspects and values. If they aim to create and establish a website, it should not be based on their personal tastes and views. It is strongly recommended that results from this research have been applied in websites and based on parameters of each cultural, websites must be designed and created to act more effectively for their purposes and goals in the selected community. Proposed framework in this research can lead marketers and Web designers to study detailed features and values of different cultures and make a good decision for creating or designing international webs. The results explicit and emphasis on this message that web designers should not only be able to recognize and incorporate cultural dimensions and values, but they need to study specific elements of each culture to use symbols and language of specific culture.

CHANGING CORPORATE CULTURE TO IMPROVE BUSINESS PERFORMANCE: CASE OF THE AUSTRALIAN AUTOMOBILE INDUSTRY

Clark Li Ke You, Max Coulthard, Sonja Petrovic-Lazarevic,
Monash University, Australia

ABSTRACT

Literature suggests that by developing distinctive cultural traits of involvement, mission, consistency and adaptability, firms can achieve effective business performance. Whilst this topic has been researched worldwide, little research has been done in Australia. This paper helps fill this gap in the literature using the automobile industry. The research findings suggest that a link between corporate cultural traits and business performance exists in the Australian automobile industry. Compared to other cultural traits, adaptability has the greatest influence over business performance. Of the business performance measures assessed, both non-financial and financial, customer satisfaction as a non-financial measure was considered the most important one. In comparing cultural traits and business performance, consistency and mission were found to be important predictors of profitability; and adaptability and mission important predictors of sales growth.

Keywords: *cultural traits, adaptability, consistency, customer satisfaction*

INTRODUCTION

This paper looks at the influence of corporate cultural traits on business performance in the Australian automobile industry undergoing rapid change. The aim is to identify traits that may enhance business performance and lead to a sustainable competitive advantage.

For decades, researchers have assessed the influence of corporate culture on the management style within organisations and how this affects employee performance (Lee & Yu, 2004). For example, Wirtenberg *et al.*, (2007) argue that the key to sustained business performance is using the knowledge, expertise, and commitment of employee. For Hsu *et al.*, (2009) leadership style, organisational culture, and especially organisational learning have an impact on organisational performance. Denison *et al.*, (2003) and Kasila and Poskiparta (2004) go further suggesting that corporate culture may be one of the most powerful tools to be used to improve business performance. Although few studies have tested the value of corporate cultural traits during periods of rapid change, Singh (2006) identified that organisations with a highly adaptive corporate culture can actively respond in a changing environment and capture market opportunities.

Corporate culture can be characterised through employees' values, beliefs and their behaviour within the organisation (Petrovic-Lazarevic, 2006; Singh, 2006). This study used the corporate cultural traits of *consistency, mission, involvement, and adaptability*, developed by Denison *et al.* (2003). Accordingly, cultural traits are defined as follows:

Consistency characterises the organisation's core values; methods used to achieve agreement; and the coordination and integration systems that hold the company together (Denison *et al.*, 2003). Cultural *consistency* improves business performance by creating coordination from top level management to first line employees (Mavondo & Farrell, 2003).

Mission describes the strategic direction and intent an organisation is aiming to achieve; its goals and objectives; and its vision. Hence, employees who have a clear *mission* in their mind can significantly improve their own productivity (Buckingham, 2005).

Involvement covers the level of staff empowerment in decision making; its team orientation; and the capability development undertaken by the organisations. It is used to measure the company's ability to drive commitment and develop ownership with employees (Denison *et al.*, 2003; Rotenberry & Moberg, 2007).

Adaptability measures the company's ability to read and scan the business environment and to respond to change (Denison *et al.*, 2003). Organisations that have an adaptable culture tend to both actively and openly receive and interpret opportunities and threats from the external environment, responding to these external signals appropriately (Pennington, 2003). An adaptive culture encourages and supports employees to improve their ability by learning from day-to-day tasks (Denison *et al.*, 2003).

Some authors focus on financial measures of business performance (Allen & Helms, 2002). In this respect, financial indicators usually include profit, efficiency trend, sales trend (Kloot, 1999), return on investment (Kennerley & Neely, 2003) and market share (Bloodgood & Katz, 2004).

Concept of corporate sustainability, comprising company's activities that demonstrate inclusion of social and environmental concern in business operations and in interactions with stakeholders (van Marrewijk & Werre, 2003), is recently introduced as a measure of sustainable business performance. Findings by Hubbard (2009), Johnson (2009), Robert (2000), and Scholten (2009) suggest that corporate sustainability may assist organisations in the long run as it has a positive impact on corporate performance. One key sustainable non-financial indicator considered important is customer satisfaction (Briffaut & Saccone, 2002; Vukmir, 2006).

The Australian automobile industry was chosen for this study because it is a key sector in the Australian economy. Exports now account for around 40 percent of domestic motor vehicle production. The industry's domestic value added component total is over AUD \$5.6 billion and 5.6 percent of the total Australian manufacturing sector (Department of Foreign Affairs and Trade, 2008). Since free trade agreements between Australia and other nations have been signed, the Australian automobile industry is gradually moving towards a more open trading environment with low levels of government protection. This new competitive environment has led to significant job shedding within the industry, in particular within the automotive component manufacturer and retail sector.

To minimise further job losses, maintain viability, and above all help the Australian economy to overcome the present global economic crisis, the Australian automobile industry should improve its business performance. One of the ways in which this may be achieved is through developing a performance oriented corporate culture. Dealing with this matter, this paper is organised as follows: after the methodology, we present and discuss the project results, followed by concluding remarks and future research interests.

METHODOLOGY

A multi-method study based on quantitative research was chosen for better understanding of data and an in depth and valid analysis of research findings (Creswell, 2003) relevant to the automotive industry in Australia. This paper focuses on the quantitative results of a questionnaire used to survey both manufacturers and retailers in this industry.

We have used the Australian Bureau of Statistics (2002) measure for business size, by employees: small business 1-19; medium business 20-199; and large business 200 plus employees. A quantitative approach has been applied based on the *Denison Organisational Culture Survey* (Denison & Neale, 1996). The survey measured twelve indices of organisational culture (See Table 1) using five questions for each index, a total of 60 questions. For all items a five-point Likert scale with response categories ranging from strongly disagree to strongly agree was applied. The twelve indices were used to measure four main cultural traits: *involvement*, *consistency*, *adaptability* and *mission*. Table 1 outlines these four cultural traits.

The survey also sought senior executive's perception of organisational performance on the following variables: *net profit*, *customer satisfaction*, *market share*, *return on investment*, *efficiency trend*, and *sales trend*. Chief executive officers and/or general managers were chosen as the preferred research subjects to complete the questionnaire as they were seen to be best placed to comment on the organisation's corporate culture. The interviewees were further divided into two groups: high performing organisations versus low performing organisations; the criterion used is based on the summated mean of the six performance measures used (See Table 2). Thus, high performing organisations have summated mean of the six performance measures used in this study above 22.51, while low performing organisations have summated mean below 22.51 This process

helped identify key differences in cultural traits and their potential influence on organisational performance. It also allowed differences between small to medium organisations and large organisations to be assessed.

The selection of the organisations, to create a mailing list, was based on three main sources: Membership list of the Federation of Automotive Products Manufacturers; Australian Automotive Aftermarket Association – Exporters Directory; and Registered Automotive Retailers from the telephone directory-Yellow Pages. 250

Table 1. Four Cultural Traits and Indices of Organisational Culture

Cultural Trait		Indices of Organisational Culture		
1	Involvement	Empowerment	Team Orientation	Capability Development
2	Consistency	Core Value	Agreement	Coordination and Integration
3	Adaptability	Creating Change	Customer Focus	Organisational Learning
4	Mission	Strategic direction and Intent	Goals and Objectives	Vision

organisations were selected in total for this project. Eighty useful questionnaires were returned and analysed using SPSS for Windows 15.0. All measures were aggregated at the organisational level.

Table 2. Breakdown of Surveyed Organisations Based on Employee Size and Performance

Performance	Small to Medium organisations	Large Organisations
Hi	42	0
Low	31	7
Total	73	7

LIMITATIONS

In our research, we used self-report survey data that may be affected by leniency or inflated responses. If the actual performance measures were available in the public domain as it was not the case, we could have achieved greater accuracy in our findings. Further, we did not use multiple responses within each organisation, thus we could not reduce perceptual bias. Finally, we collected data at a single point in time that does not allow for changes in perceptions and attitudes over time. A longitudinal study on organisational culture would be more appropriate.

DISCUSSION OF RESULTS

A survey response rate of 25 percent or more is considered as satisfactory (Sellitto, 2006); the survey response rate for this project was 32 percent. Based on the demographic data, three groups were identified: manufacturer (51 percent), retailer (46 percent) and others (three percent). Of these respondents, 34 percent of the organisations had been operating less than 10 years and 66 percent over 10 years. The majority of organisations were subsidiaries of overseas organisations (48.5 percent), another 44 percent were privately owned domestic organisations, and 7.5 percent publicly owned domestic organisations. About 54 percent of respondents were in general management position, while the rest of respondents were either chief executives officers (14 percent) or lower level managers and specialists (32 percent).

Reliability test results measured by Cronbach's alpha are presented in Table 3.

According to Liu and Zumbo (2007), a Cronbach's alpha of 0.70 and above is an acceptable reliability coefficient. Hence, as all the summated measures used to assess business performance and cultural traits in this study were above 0.70, they were treated as reliable.

Table 3. Cronbach's Alpha Analysis for Major Variables

	Cronbach's alpha
Business performance measures	0.83
Involvement	0.91
Consistency	0.89
Adaptability	0.88
Mission	0.93

Business Performance

Statistical analysis of the questionnaires identified that all four cultural traits influence business performance, confirming the findings of Denison *et al.* (2003) and Kasila and Poskiparta (2004).

The first step undertaken was to assess respondent's opinions on the impact of cultural traits on business performance. Although respondents overall considered all traits important, there were some differences with *consistency* (mean 3.99) scoring the highest, while *adaptability* (mean 3.92) scoring the lowest of corporate cultural traits (See Table 4).

Table 4. Respondents' Opinions as to the Importance of Corporate Cultural Traits to Business Performance

		Involvement	Consistency	Adaptability	Mission
N	Valid	80	80	80	80
	Missing	0	0	0	0
	Mean	3.98	3.99	3.92	3.97

Overall, respondents considered all performance measures important, though there were different values placed on each measure (See Table 5). For example, some respondents felt traditional financial measures

Table 5. Business Performance Measures

	Mean	SD
Financial measures		
Net Profit	3.68	.839
Customer Satisfaction	3.86	.707
Market Share	3.75	.907
Return on Investment	3.68	.938
Efficiency Trend	3.79	.758
Sales Trend	3.76	.903
Non-financial measures		
Customer Satisfaction	3.86	.707

were not as important as the non-financial measure of *customer satisfaction*. Respondents ranked *net profit* (mean= 3.68) and *return on investment* (mean =3.68) the lowest, followed by, in ascending order, *market share* (mean 3.75) *sales trend* (mean 3.76) *efficiency trend* (mean 3.79) and *customer satisfaction* the highest (mean 3.86). This suggests a belief that customer satisfaction is a precursor to achieving financial objectives.

We further studied strength of the relationship between the four cultural traits and business performance in Australian automobile organisations using correlation analysis (See Table 6). This confirmed the opinions of respondents that all four cultural traits have a strong relationship with business performance as all achieved $r > 0.5$ level. *Adaptability* had the strongest relationship with business performance ($r=0.573$); followed by *involvement* ($r=0.505$), *mission* ($r=0.510$). The regression analysis identified that those traits that really improve performance are the exact opposite to the traits respondents perceive as important.

Table 6. Correlation Analysis between Four Cultural Traits and Business Performance

Variables	1	2	3	4
1 Business Performance				
2 Involvement	.505**			
3 Consistency	.545**	.761**		
4 Adaptability	.573**	.720**	.721**	
5 Mission	.541**	.779**	.817**	.757**

** $p < .01$ (2-tailed)

A breakdown of the components of each of the cultural traits identified that the key variables with the greatest relationship with business performance were *creating change* ($r=0.652$), *team orientation* ($r=0.532$), *strategic direction and intent* ($r=0.525$), and *core value* ($r=0.503$) (See Table 7).

Table 7. Correlation Analysis between all Cultural Trait Indices and Business Performance

Cultural Traits	Variables	1	2	3	4	5	6	7	8	9	10	11	12
	1 Business Performance												
Involvement	2 Empowerment	0.497**											
	3 Team Orientation	0.532**	0.786**										
	4 Capability Development	0.276*	0.430**	0.512**									
Consistency	5 Core Value	0.503**	0.574**	0.635**	0.510**								
	6 Agreement	0.488**	0.610**	0.634**	0.328**	0.631**							
	7 Coordination and Integration	0.309**	0.569**	0.579**	0.152	0.508**	0.487**						
Adaptability	8 Creating Change	0.652**	0.673**	0.647**	0.353**	0.538**	0.555**	0.513**					
	9 Customer Focus	0.332**	0.456**	0.501**	0.162	0.484**	0.506**	0.570**	0.407**				
	10 Organisational Learning	0.312**	0.581**	0.632**	0.329**	0.491**	0.378**	0.506**	0.476**	0.468**			
Mission	11 Strategic Direction & Intent	0.525**	0.576**	0.652**	0.389**	0.658**	0.540**	0.619**	0.613**	0.486**	0.497**		
	12 Goals and Objectives	0.471**	0.654**	0.681**	0.429**	0.696**	0.603**	0.581**	0.584**	0.537**	0.478**	0.715**	
	13 Vision	0.294*	0.559**	0.591**	0.425**	0.573**	0.397**	0.497**	0.463**	0.343**	0.567**	0.517**	0.628**

** $P < .01$ (2-tailed)

The findings suggest that automotive organisations in turbulent times may increase their organisational performance with more attention to *adaptability* attributes (being customer focused, building organisational learning, and creating change). This may be more appropriate than focusing on *consistency* attributes (enhancing greater coordination and control or building and refining existing systems), which appear more attuned to the needs of organisations operating in a stable environment.

Multiple regression was then used to indicate how much of the variance in *business performance* can be explained by each cultural trait. Given the sample size is smaller than normally desirable for multiple regression, the results need to be reviewed with caution, so the adjusted R Square was used as it is a more accurate estimate of the influence of each trait on business performance (Anderson *et al*, 1999). Results showed that 44 percent of business performance variations could be explained by *creating change* (a subcomponent of *adaptability*) (See Table 8). The sub-components of *business performance* were broken down further to help identify which cultural traits explained their variations. This analysis identified that *creating change* (subcomponent of *adaptability*) was a major influence in all areas of *business performance* explaining 18 percent of *net profit* variations, 24 percent of *market share* variations, and 23 percent of *sales trends*. It was also a major factor in explaining *return on investment*, *efficiency trend*, and *customer satisfaction* variations (See Table 8).

When looking at the results of high performing organisations versus low performing organisations, one of the key findings was that all large organisations surveyed could be categorised as low performing organisations.

Table 8. Summary of Relationship between Business Performance and Cultural Traits

P Value	R Square	Creating Change
Business Performance	.44	0
Net Profit	.18	0
Customer Satisfaction	.31	.003
Market Share	.24	0
Return on Investment	.35	.003
Efficiency trend	.38	.011
Sales Trend	.23	0

The following paragraphs further outline these findings and potential implications in achieving high performance (See Table 7) for a detailed summary of the mean scores for all cultural traits and their subcomponents). It should be noted that the mean provided immediately after each trait subcomponent heading refers to the mean for the eighty organisations in this survey.

Consistency Trait

Respondents' opinions that *consistency* is the most important cultural trait, suggests their belief that a key to business success is to develop and maintain core values, have clear methods to reach agreement on issues, and maintain clear coordination and integration systems. Yet the study identified that this trait is least likely to lead to increased performance. Closer analysis of the sub-components of this trait revealed that high performing small to medium firms did things differently to low performing firms.

When it comes to *core values* (See Table 9), we found that small to medium high performing firms were more likely to demonstrate core values through having leaders and managers who promote their core values such as "practicing what they preach"; using a distinct management style and setting a clear code of practice, whilst conducting business in an ethical manner.

High performing small to medium firms were more likely to work hard to achieve win-win solutions when disagreements occurred; tended to reach *agreement* by consensus; and generally had clear *agreement* on the right and wrong way to do things, all within a strong culture. Interestingly, we found that low-performing small to medium firms were less likely to dispute key issues, suggesting top management decisions are perhaps not open for debate and criticism.

Related to *coordination and integration*, we found that high performing small to medium firms were more likely to have a consistent and predictable approach to business. They easily coordinate projects across the organisation. Such firms have the employees who feel comfortable working in cross-functional teams, sharing common perspective, and ensuring there is good alignment of goals across all areas of the business.

Adaptability Trait

The comparatively lower score of *adaptability* in the overall results indicates that the Australian automobile industry may not yet recognise the importance of adapting to environmental change in order to improve its business performance (Pennington, 2003). *Adaptability* is often considered as a key strength of firms that are able to make decisions quickly and be flexible.

Respondents confirmed the importance of *creating change* to business performance in their organisations as found in previous studies of Byus and Lomerson (2004) and Nwokah and Maclayton (2006). However, although this trait is identified as the most important one to achieve high performance, it is ranked lower than expected by respondents. A common response is that their organisations are not very interested in being innovative. Some respondents stated that this was due to the lack of delegated power to be innovative; lack of appropriate resources, in particular financial resources; and the failure by many organisations to provide an appropriate reward system to encourage innovation.

A higher score for *creating change* may be an indicator of an organisational core competence (Ljungquist 2007). However, given the current perception by respondents that *adaptability's* influence on business performance is lower than other factors, even though incorrect, it may be that some organisations do not understand the importance of developing *creating change* as potential core competency in a competitive environment. This situation appears to be typical for firms with small margins and lack of funding for innovation.

Table 9. Detailed Summary of the Mean Scores for all Cultural Traits and their Subcomponents

	Total Firms	Total SMEs	SMEs HP	SMEs LP	Large Firms	Summated Mean Difference
Consistency	3.76	3.82	3.99	3.58	3.3	20.5
Core Value	4.1	4.14	4.35	3.86	3.66	24.5
Agreement	3.65	3.75	3.97	3.45	3.03	26.0

*SMEs-small to medium firms; **HP- high performing firms, ***LP – low performing firms

Further analysis identified that high performing firms were more likely than low performing organisations to do things in a flexible, easy to change way; they respond well to competitors and other changes in the business environment; they adopt innovative ways to work. In such organisations, different sectors cooperate to create change.

Interestingly, through the interviews we found that low performing organisations were less resistant to change than high performing ones. Although this finding might seem surprising, it could also suggest low performing organisations may jump on each new opportunity to improve short-term performance, rather than build a long-term strategic direction.

Customer focus is seen by respondents to have a lesser influence on performance than other factors (See Table 9). This finding obviously conflicts with Allen and Helms (2002) who argue that customer satisfaction is critical for business success. Further analysis identified that although most organisations understand the link between customer focus and business performance, many respondents find unnecessary for all employees to have knowledge of their customer's needs; rather they need to have relevant knowledge to do their jobs. This finding suggests a potential dilemma for organisations to decide what level of customer knowledge their employees need to have. We found that in high performing firms, employees were encouraged to have direct contact with customers, to listen and act on customer comments; and have a deep understanding of customer wants and needs.

In accordance with Hyland *et al.* (2001) and Vakola and Rezgui (2000), the respondents identified *organisational learning* as significant for business performance, but not very important as other factors are. In

our study it did not rank highly compared to other factors. Many respondents state that full benefit of a *learning organisation* is not achievable because of the existing not stimulating reward systems.

According to our research results, the high performing firms are more likely to regard failure as an opportunity for learning. They encourage and reward innovation and risk taking. They also regard learning as an important objective in day-to-day work.

Mission Trait

Given the current economic situation, a slightly lower ranking of *mission* compared to other traits was not surprising.

From the point of view of *strategic direction*, we found that high performing organisations are more likely to have long-term purpose and goals linked to an overall strategy. They have mission with clear meaning and direction to pursue business activities, indicating an intention to be the industry leader.

Interestingly, the respondents from the low performing firms have more clear strategic direction than high performing firms, although they have less capacity to effectively follow that direction.

When it comes to *goals and objective*, the high performing firms are more likely to have agreed goals by all employees. They have leaders who publically declare their ambitious and realistic goals, and continuously track progress against goals.

Further, we found that high performing firms are more likely to have shared *vision* that creates excitement and motivation for employees; thus indicating the employees' involvement in the planning process. Their leaders have defined that long-term goals meet short-term demands without compromising long-term *vision*.

Involvement Trait

Involvement was considered very important by respondents, yet multiple regression identified it had little to do with explaining changes in business performance (See Table 7). Analysis between high performing firms and low performing firms identified the differences in *empowerment*, *team orientation* and *capability development*.

High performing firms motivate their employees to achieve superior results by making decisions at the level with the best available information, information sharing, and having an inclusive and on-going business planning process. Further, high performing firms have organisational structure based on teams. Thus, they encourage cooperation across the organisation through teamwork and they delegate authority, allowing the employees to act on their own. Recognizing capabilities of their employees as an important competitive advantage, these firms continually invest in improving their employees' skills.

Overall, the respondents' consideration of consistency as the highest importance of cultural traits to achieving high performance is not in accordance with our findings. We have found that automotive organisations may increase their organisational performance by paying more attention to *adaptability* attributes, and in particular to *creating change* through doing things in a flexible, easy to change way; responding well to competitors and other changes in the business environment; adopting innovative ways to work; and encouraging cooperation between different parts of the organisation.

From the point of view of high performing organisations and low performing organisations we found that the two variables with the greatest summated means difference were *creating change* (30.0) and *gaining agreement* (26.0). This finding is consistent with the findings of multiple regression analysis and further demonstrates the importance of firms being adaptable in times of rapid change.

CONCLUSIONS

The research project has revealed a link between corporate culture and business performance in the Australian automobile industry. *Adaptability* to environmental changes seems to be the key to sustainable business performance. This suggests that, the organisations should focus on all four cultural traits: *involvement*, *consistency*, *adaptability* and *mission*, as each plays an important, different and integrated role in achieving business performance outcomes.

Since the *adaptability* is identified as a key factor in enhancing business performance, a message to the Australian automotive industry is to concentrate on *creating change*, build strong customer focus, and become learning organisations. Low performing firms need to create an environment that encourages change, adopt new ways to do work, and improve teamwork.

When it comes to *involvement*, companies should encourage *team orientation* and employees' *empowerment*. For *mission* trade, the companies' goal setting should include employees' participation in the planning process.

Finally, for *consistency* trait improvement, companies should act more ethically.

Future research could focus on both internal and external environmental factors affecting business performance, their measurement and use to gain a sustainable competitive advantage.

THE EFFECT OF FAMILY CULTURE ON FAMILY BUSINESS: A RESEARCH ON FAMILY BUSINESS IN ISTANBUL CHAMBER OF COMMERCE

Canan Çetin
Ata Özdemirci
Erkan Taşkıran
Esra Dinç Özcan

Marmara University, Turkey

ABSTRACT

Turkish firms, especially the firms that carries the family traditions shows distinctive and unique cultural forms and this had been the main theme of a lot of research. But, the effect of family culture on family business and its reflections on organization and strategy is still stays untouched. The main object of this study is to examine the effect of family culture on corporate culture and Turkish business life. The universe of the study is the family firms in Istanbul Chamber of Commerce which are at least 10 years old and which have minimum capital of 250000 TL.

At the end of this study, it is seen that the effect of family culture is significant on the (perceived) firm performance. The effect of value attributed to individuals in family is positive and very high, and the effect of power of family culture is negative and high. Also centralism is still the most powerful management style in family business. Turkish style still looks like a “one man’s show”. Good performance needs valuable individuals more than power or influence of family culture.

Keywords: Family business, family culture, founder centralism, organizational culture.

LITERATURE REVIEW

In recent years, the term “corporate culture” has been used widely to describe shared attitudes, beliefs, values, and expectations that interact to create behavioral norms within the work environment. (Hanks and Sussman, 1990) Today, the companies are required to set own values which are different from the other companies and are not easily to be imitated by the others in order to align with rapidly changing environment conditions and to be ahead of their competitors. This necessity forces companies to have distinct beliefs, norms and values. When the culture, which is developed within the boundries of the company, unites with the employees, the new concept that is called organizational culture forms within the organization. The notion of organizational culture has been very important in the studies for the last decade. In spite of disagreements over some elements of definition and measurement, researchers seem to agree that culture may be an important factor in determining how well an individual fits an organizational context (O’Reilly, Chatman and Caldwell, 1991). According to Schein (1984:3), organizational culture can be defined as “the pattern of basic assumptions that a given group has invented, discovered, or developed in learning to cope with its problems of external adaption and internal integration, and that have worked well enough to be considered valid, and, therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems”. All the organizations have their own cultures when they share some specific values and this structure helps values align with the behaviors. Within this context, the companies who have strong organizational culture can observe the positive impacts of culture over the company’s performance.

In family businesses the role of culture stronger than in non family firms as family members tend to maintain and strengthen the founder’s value over the long term. (Casillas, Acedo and Moreno, 2007). Family businesses are accepted to be the corner stones of the economy especially in the developing countries. Although theoretical efforts to describe family business have been made (Astrachan and Shanker, 2003; Chua, Chrisman and Sharma, 1999), no single definition exists (Sharma, 2004). Brun de Pontet, Wrosch and Gagne (2007) defines family

business as a company whose ownership and management are concentrated in one family, with at least one member of the family at the helm of the business and another being groomed or considered for eventual leadership. With another definition, family business can be described as the business in which the family owns a significant part of the business and the family members are highly involved in the management and control of the business. Family businesses contribute a significant portion of the gross domestic production and employment. In many countries, family businesses contribute a substantial amount to their gross national production and provide the reduction of unemployment. It is evident that family businesses play a major role in most countries' economic development, yet very little research has been done on family businesses (Mwenja, 2006).

Organizational culture in the area of family business is especially complex, and thus the culture emerges not only from the relationships that exist at the heart of the firm itself, but also with regard to family members. Therefore, cultural values that belong to the family are mixed with those generated exclusively in the organization. (Casillas, Acedo and Moreno, 2007).

The family as a social unit achieves cohesion through the sharing of values, beliefs, perceptions, and expectations among its members. (Hanks and Sussman, 1990). Each family has own culture –unwritten operating rules that govern relationships, communication and decision-making. Although these qualities are non quantifiable they are very real and play an important role in the operation in the business and the way owners make their decisions. (Jurinski and Zwick, 2002) A family culture develops and is sustained through intergenerational transmission of myths, beliefs, and resources. Family culture is enacted in the rituals that represent family values. (Hanks and Sussman, 1990). Family members internalize values throughout their lives from parents. (Storey, 2000) Besides, maintaining the ability to create and spread organizational culture, which contains values, beliefs and norms, over generations and members of the family especially in terms of strategic sustainability is a primary concern of many family businesses (Salvato and Melin, 2008). It is expected from the family businesses to share the values and beliefs among the members of family and the executives so as to be rapidly institutionalized and developed. In family businesses, sustainability and succession is the main process that aims at sharing the values, beliefs and norms and ensuring competent family leadership across the generations (Mazzolo, Marchisio and Astrachan, 2008).

Overall, culture predominant in family businesses is formed as a result of family, background of the family and social relationships within the family. Transmission of these beliefs and values through generations shape the family and the valid cultural model of the family. All families construct their family paradigms according to their beliefs on life. This paradigm has an effect on ways of solving problems and families' viewpoints of relationships, and most of the time it determines not only the culture of the family but also the culture of the family business .(Akdoğan and Mirap, 2008)

The fact that the family has authorization to control and own the firm, the fact that the family and the entrepreneur have a great role on management of the firm causes their values and vision to be present in the firm, thereby making organizational culture dominant in family business. It has been argued that inimitable cultures can be source of sustained competitive advantage. Thus if owners can deeply inculcate values in family members that are conducive to organizational success, the family business may have a competitive edge. Further, the fact that family members may identify more strongly with the family business and have a network of family friends/business contacts to turn to can increase this advantage. (Storey, 2000)

Considering the companies in our country, Turkey, especially the companies whose family orientation has been maintained, it can be easily observed that they have their own cultural structures and these structures have been a major topics of various researches in the last decade. On the other hand, although many researches in international literature have yet been conducted about the effect of family culture upon organization culture, this subject has not been taken into account in our domestic literature. Within this frame, the main purpose of this research is to investigate comprehensively the effect of family culture upon the organization culture.

METHODOLOGY

The universe of the study is the family firms in Istanbul Chamber of Commerce which are at least 10 years old and which have minimum capital of 250000 TL. It's estimated that the population of the universe is approximately between 15000 and 20000.

In social sciences, for a strong sample to make generalization about the universe, you need

$n = t^2 pq / \epsilon^2$ samples. In here;

n: sample size

p and q: homogeneity of the sample. (this is 0,5 and 0,5 for heterogeneous sample)

t: 1,96 for %5

ϵ : 0,05

n=138 (this is our estimated sample size)

The type of the research is hypothetic research. Data collection method is survey. Sample selection method is coincidental. We used the scale of Klein (2005) "Family Influence on Business", scale of Koiranen (2002) for "Family Culture Influence on Business", the scale of Borgatti (1999) for "Founder/CEO Centralism" and the scale of Denison (2001) for "Family Culture / Organization Culture" factor. We also asked demographics and 10 questions about the firm's perceived performance. We have 67 items on the survey. Likert Scale-5 is used in all questions.

We made face-to-face survey as much as we can, but we'll also used mail and telephone survey for reaching maximum participation. We used factor analysis to determine the dimensions of the measures. We also made K-S test for normal distribution and Cronbach Alpha test for reliability. ANOVA, Scheffe, t test, Correlation and Regression tests are made with SPSS 17.0 to measure the power of our hypothesis.

Measures and Reliabilities

Table 1: Measures and Reliabilities

MEASURE	DEVELOPERS	ITEM NUMBER	Cronbach Alpha
FAMILY INFLUENCE ON BUSINESS (FPI)	Klein, 2005	3	-
FAMILY CULTURE INFLUENCE ON BUSINESS (FCI)	Koiranen, 2002	12	,934
FOUNDER / CEO CENTRALISM	Borgatti, 1999	12	,909
FAMILY CULTURE / ORGANIZATONAL CULTURE	Denison, 2001	12/ 12	,945 / ,896

Factors

Explanatory factor analysis is made for establishing the sub dimensions of measures. All factors have passed the KMO Measure of Sampling Adequacy and Bartlett test of Sphericity which means that our data set is appropriate for factor analyses. Principal components and varimax method are used in analysis. For all measures, items which have factor weight below 0,50; unique items in a factor; items with close factor weights are leaved out of evaluation. After this processes, factors which have initial eigenvalues over 1,00 and Cronbach Alpha over 0,65 are:

2 factors in Family Culture Measure (Cumulative Extraction Sums= %74,32) which can be called as "Power of Family Culture" and "Value Attributed to Individuals" and 3 factor in Organizational Culture Measure (Cumulative Extraction Sums= %70,02) which can be called as "Power of Organizational Culture", "Value Attributed to Individuals" and "Individual Initiatives".

Table 2: Correlations

	1	2	3	4	5	6	7	8	
1. FPI	1								
2. FCI	-,109	1							
3. Centralism	-,147	,907**	1						
4. Power of Org. Culture	-,091	,784**	,741**	1					
5. Value Att. to Individuals in Org.	,208*	,520**	,522**	,609**	1				
6. Individual Initiatives	-,105	,130	,136	,428**	,251**	1			
7. Power of Family Culture	-,035	,711**	,580**	,859**	,459**	,495**	1		
8. Value Att. to Individuals in Fam.	,028	,614**	,634**	,718**	,760**	,503**	,754**	1	
9. Performance	,025	,337**	,465**	,324**	,531**	,219*	,225*	,564**	1

N=106, *p<0,05, **p<0,01

When we look at the correlation table (Table 2), we see a significant positive correlation between Family Influence on Business (FPI) and Value Attributed to Individuals in Organization. There are strong positive correlations between Family Culture Influence (FCI) on Business and Centralism, Power of Organizational Culture, Power of Family Culture, Value Attributed to Individuals in Family. This shows us there is a big colinearity between our independent factors, because of the complexity and similarity of these concepts.

Although the significant correlations between our independent variables (FCI, Centralism, Power of Org. Culture, Value Att. to Individuals in Org., Individual Initiatives, Power of Family Culture, Value Att. to Individuals in Family) and dependent variable (Performance) we have to make a hierarchical regression test because of this colinearity.

Table 3: Hierarchical Regression Test- I

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2,122	,232		9,150	,000
	Value Att. to Individuals in Fam.	,462	,066	,564**	6,962	,000
2	(Constant)	2,548	,241		10,567	,000
	Value Att. to Individuals in Fam.	,749	,094	,913**	7,931	,000
	Power of Family Culture	-,367	,091	-,463**	-4,023	,000
3	(Constant)	2,283	,252		9,047	,000
	Value Att. to Individuals in Fam.	,648	,098	,790**	6,592	,000
	Power of Family Culture	-,417	,090	-,527**	-4,628	,000
	Centralism	,225	,081	,269**	2,784	,006

Dependent Variable: Performance; N=106, *p<0,05, **p<0,01

Table 4: Hierarchical Regression Test- II

	Adjusted R ²	S.E.	Δ R ²	Δ F	p
Model 1	,311	,48998	,318	48,472	,000
Model 2	,399	,45770	,093	16,187	,000
Model 3	,436	,44339	,042	7,752	,006

Hierarchical regression test shows that the most important independent variable on performance is the value attributed to individuals in family ($\beta=,790^{**}$), the second is power of family culture ($\beta=,527$), and the third is centralism ($\beta=,269^{**}$).

So, the effect of family culture is significant on the (perceived) firm performance. The effect of value attributed to individuals in family is positive and very high, and the effect of power of family culture is negative and high.

Also centralism is still the most powerful management style in family business. Good performance needs valuable individuals more than power or influence of family culture.

INTEGRATING BOTH NEGATIVE AND UNRECOGNISED POSITIVE IMPLICATIONS OF CULTURAL DIVERSITY FOR STRATEGIC MANAGEMENT OF COMPANIES OPERATING ACROSS THE BORDERS

Salih YEŞİL, Adnan ÇELİK, İbrahim AKBEN
Kahramanmaraş Sütçü İmam University, Turkey

ABSTRACT

Doing business across the borders provides companies with several strategic advantages along with many disadvantages. Capitalizing on the advantages and managing disadvantages is likely to determine the success of the international companies. Cultural diversity is one of the most important challenges that international companies face in global markets. Although cultural diversity is generally associated with negative connotations and outcomes, it is the source of positive outcomes. If both negative and positive outcomes of cultural diversity are well understood and managed, cultural diversity can be turned into strategic competitive advantages.

This study aims to integrate both negative and unrecognized positive outcomes of cultural diversity in order to better manage and achieve sustainable competitive advantages for companies operating across the borders.

Keywords: *culture, cultural diversity, cultural implications, competitive advantage, international companies*

INTRODUCTION

Crossing the borders provides companies with several strategic advantages, such as opportunities for expansion, growth and income along with various problems. Cultural diversity is one of the most important challenges that companies confront across the borders. Cultural diversity affects the business and has the potential to result in success and failure of the companies. This makes the topic very interesting and very important. Because of this, cultural diversity needs a special treatment form both the academic and business world. Therefore, the cultural differences and associated challenges should be taken into account if the companies are to be successful in the global economy. It is also necessary for the companies to learn how to manage these challenges and turn them into competitive advantage

Previous studies have generally concentrated on the difficulties, problems (Bassett-Jones, 2005; Dalyan, 2004; Early and Gibson, 1998; Hambrick et al., 1998; Salk, 1997, Watson et al., 1993), and failure of companies (Barkema et al., 1997; Hall, 1995; Lane and Beamish, 1990) due to cultural differences. The related literature draws attentions to only negative implications and connotations. This perspective does not reflect the full implications of cultural diversity. It should be recognized that cultural diversity is also associated with several positive outcomes. Cultural diversity can increase the creative and innovative capacity of the companies. When cultural diversity is the case, both negative and positive implications should be taken into account. If managed well, cultural diversity can be a source of competitive advantage for the international companies. If not managed well, it can be a source of failure ad many problems. Managing cultural diversity can also prove that several problems associated with cultural diversity can be diminished.

This study aims to investigate the cultural diversity and its full implications for the strategic management of companies operating across the borders. This study takes on an integrative approach and outline both positive and negative implications of cultural diversity that can affect the success and failure of strategic management of international companies. The study suggests that positive implications of cultural diversity rather than negative implications should be promoted to benefit most from cultural diversity. The study also explains how to manage cultural diversity so that cultural diversity based sustainable competitive advantages are realized and cultural diversity based negative implications are diminished. The study concludes with some recommendation for the companies

INTERNATIONAL BUSINESS IS A MANDATE WITH SEVERAL ADVANTAGES AND DISADVANTAGES

Alon and Higgins (2005) argue that conducting global, international, and cross-cultural business is a mundane reality for most contemporary large organizations. Regardless of the company size, the companies experience globalization through interactions with global participants that belong to at least one, or perhaps more, of these four key categories: customers, competitors, suppliers, or employees. Adler (1997) also noted that ‘the modern business enterprise has no place to hide, it has also no place to go but everywhere’. Today many companies across the world widened their horizons and involved in the cross-border business activities.

Although doing business across the borders is important and provides great advantages to companies, it also poses great challenges to companies (Mutlu, 1999). Nardon and Steers (2007) argue that today, a major challenge facing managers and entrepreneurs is how to deal with both partners and competitors abroad whom we simply don’t understand. More often than not, the problem is not just language differences; it is cultural differences. Cultural diversity affects the business in every aspect and may result in success and failure of the companies.

DEFINING CULTURE AND CULTURAL DIVERSITY

Culture has been defined in relations to the perspectives of various literatures. In the business literature, the most frequently used definition was provided by Hofstede (1984). According to him, culture is “the collective programming of mind, which distinguishes the members of one human group from another”. Similarly Trompenaars and Hampden-Turner (1997:2) defined the culture as “a shared system of meanings. It dictates what we pay attention to, how we act, and what we value”. Trompenaars and Hampden-Turner (1997:24) further argued that “culture is man-made, confirmed by others, conventionalized and passed on for younger people or newcomers to learn. It provides people with a meaningful context in which to meet, to think about themselves and face the world”. Culture is beneath awareness in the sense that no one bothers to verbalize it, yet it forms the roots of action (Trompenaars and Hampden-Turner, 1997:24). DiStefano and Maznevski (2003) defined the culture as a system of values, beliefs, assumptions and norms, shared among a group of people. The group could be a country, region, religion, profession, organization, even a generation or a social or sporting club. The group’s cultural system is a general agreement among people about what is important and how things will get done. Koçel (2003) argues that there is no such definition that can satisfy everybody. This is because of the fact that culture is studied in various disciplines and people who study culture take different perspectives and objectives. Koçel (2003:29) defines culture as the sum of learned and shared values, beliefs, attitudes and symbols.

The cultural studies conducted so far have surveyed human values world-wide to map the cultures of the nations (Chinese Culture Connection, 1987; Hofstede, 1980; Schwartz, 1994; Smith et al., 1996; Trompenaars and Hampden-Turner, 1997). Although cultural studies used different methodology in data analysis, surveyed different nations with different sets of respondents, there are some conceptual overlaps with regard to the cultural dimensions found (Goodwin, 1999; Smith and Bond, 1998; Smith et al., 1996). Two of these studies seem to dominate the business literature and have been widely used in several culture related researches. The most commonly used study is the Hofstede’s work, which surveyed work-related values across the countries. This study allocates cultural value scores to each country representing cultural tendencies. For example, one country may reflect individualistic cultural values; the other would prefer collectivist values. The other study is Trompenaars and Hampden-Turner’ country survey. Trompenaars and Hampden-Turner argue that cultures dance from one preferred end to the opposite and back. Such view seems to be in contrast with Hofstede’s study, which perceives cultures as static points on a dual axis map. Trompenaars and Hampden-Turner (1997:26) believe that “one cultural category seeks to manage its opposite and that value dimensions self-organize in systems to generate new meanings”. It should also be remembered that the value dimensions and value scores reflect national cultural tendencies and can not be assumed that these tendencies are valid for specific people in a particular country. In addition to these two studies, Maznevski and DiStefano (2003) developed a ‘cultural orientations framework’, which compares cultures on several important dimensions. The Cultural Orientations Framework identifies six basic issues that all groups must address and resolve in order to function effectively. The six issues are 1) relationship to the environment, 2) relations among people, 3) mode of activity, 4) human nature, 5) time and 6) space. Groups of people deal with these issues in different ways, and the combinations provide the patterns of cultural systems. A recent study has attempted to converge these cultural dimension to

simplify the existing various dimensions (Nardon and Steers, 2006). Nardon and Steers (2006) classified the existing dimensions into five common dimensions:

- Relationship with the Environment: Mastery vs. Harmony,
- Social Organization: Individualistic vs. Collectivistic,
- Power Distribution: Hierarchical vs. Egalitarian,
- Rule Orientation: Rule-Based vs. Relationship-Based,
- Time Orientation: Monochronic vs. Polychronic

The existing cultural studies indicate that differences exist among national cultures. Adler (1986) argued that cultural diversity exists within and among the cultures; but within a single culture, certain behavior patterns are favored and other repressed. Adler (1986) further argued that the norm for a society is the most common and generally most acceptable pattern of values, attitudes, and behavior. Certain behavior patterns are favored and others repressed. Showing disapproval in the society enforces those norms. DiStefano and Maznevski (2003) argued that people from different cultures will bring with them diverse expectations about the interaction. People's cultural backgrounds influence their assumptions about how work with other people should proceed. Culture also influences what we notice, what meaning we give to events and what actions we decide to take. Similarly Triandis (2006) argued that people differ in term of behaviors and perceptions.

When people from different cultural background comes together, different values, expectations, beliefs and behavior as a reflection of their culture will dominate the relationship. Different cultural values, attitudes and behavior will make it hard for the people to communicate, cooperate and work effectively. Cultural difference is likely to create different types of problems for the parties involved. This is also the case for the companies operating across the borders. They have to cooperate, communicate and work with people with different cultural background. When companies engage in cross the border business activities, cultural differences are likely to prevail and make the working relationship and cooperation more difficult. These companies need to understand culture, cultural differences and their full implications for a better strategic management

THE IMPLICATIONS OF CULTURAL DIVERSITY

When the companies do business across the borders, cultural differences and their implications becomes very important. The success in the global markets entails to understand cultural differences and their implications and turn them into advantages. .

Although cultural diversity is likely to result in both negative and positive outcomes, the related literature tends to less focus on the positive side of cultural diversity. It is common to associate cultural diversity with only negative connotations. This creates wrong impression and prejudices against cultural diversity. This in turn leads to bypass positive outcomes associated with cultural differences. People tend to view cultural differences as problems rather than seeing them as valuable competitive assets. Thus this perspective has to change and replaced with a positive view of cultural diversity.

The following sections integrate both negative and unrecognized positive implication of cultural diversity and show how to turn cultural diversity into strategic competitive advantages.

Cultural Diversity: Negative Implications

Cultural values affect the behavior of individuals, their opinions about how things are, and should be, and their sense of good and bad (Hofstede, 1984). Thus, differences in term of values, behavior, and opinions are reflected when individuals and organizations from different cultures do business. The cultural differences are likely to result in integration problems, communication difficulties and conflict, which in turn negatively affect cross-cultural interaction between people, organizations as well as people in multicultural teams.

When the people from various cultural backgrounds get together, cultural differences are likely to create integration problems. Cultural differences are likely to decrease social integration. For example, Wagner (1995) argued that the aspect of individualism and collectivism that concerns differences in personal independence and self-reliance has a direct effect on co-operation. Individualists who feel independent and self-reliant are less apt to engage in co-operative behavior, and collectivists who feel dependent and reliant on groups are more likely to behave co-operatively. Similarly, Adler (1986) argued that people are generally drawn to people who are similar.

When the people are dissimilar in terms of culture, lower interpersonal attractiveness, and stereotyping, more within-culture conversation is likely to occur in inter-cultural situations.

Cultural difference can also result in communication problems. DiStefano and Maznevski (2003) argued that cultural background affects the assumptions about how the interaction takes place among people. People with different cultural background are likely to have interaction difficulties with other people belonging to a different culture. Lane et al., (1997) argued that even the interaction within the same culture could be very problematic so it would not be hard to imagine how difficult it would be to communicate with people from other cultures. Interactions with people from different cultures present an even greater potential for distortions and misunderstanding. Trompenaars and Hampden-Turner (1997:85) argued that miscommunication is more likely than dialogue for international managers. Some studies have also shown that culture has an enormous impact on communication (Meyer, 1993). For example, relationship building, conversation style, meeting style, stereotypes and negotiating style reflect different patterns in different cultures (Adler and Graham, 1989; Tinsley and Pillutla, 1998). Therefore, people from various cultures have different communication style, conversation style and meeting style, which are likely to increase communication difficulties.

As a result of cultural diversity, companies engaging in international business activities are likely to experience different types of conflict. Early and Gibson (1998) noted that conflict is more likely in cross-cultural situations due to several reasons. Hofstede (1980) argued that the influence of culture on behavior and management systems is likely to create conflicts. Pfeffer (1983) noted that diverse people have the potential to experience more conflict with one another because they are likely to have fewer experiences in common, and more differences of opinion than similar ones. Distefano and Maznevski (2003) argued that people's cultural backgrounds influence their assumptions about how work and interactions with other people should proceed. This results in deep and difficult conflicts. Lane and Beamish (1990) argued that consensus decision-making takes time and creates conflicts within one single culture. The potential for misunderstanding and conflict across cultures can be enormous.

Cultural differences are also translated into different sorts of systems, policies, management practices, and interpersonal relationships. The theoretical and empirical studies in the literature confirm that management practices differ across cultures. Cultural differences are reflected through different managerial styles (Evans et al., 1989), HRM practices (Schuler and Rogovsky, 1998), and work values (England, 1995) When the companies from different cultures work together, problems will be inevitable. Supporting this argument, a study conducted by Schneider and DeMeyer (1991) found that managers from different cultures are likely to give different interpretations and responses to the same strategic issue due to their distinct cognitive perceptions of environmental opportunities, threats, and organizational weaknesses. Many studies also showed that management approaches, techniques along with organizational behaviors differ across the cultures.

INTEGRATING BOTH NEGATIVE AND UNRECOGNIZED POSITIVE IMPLICATIONS OF CULTURAL DIVERSITY

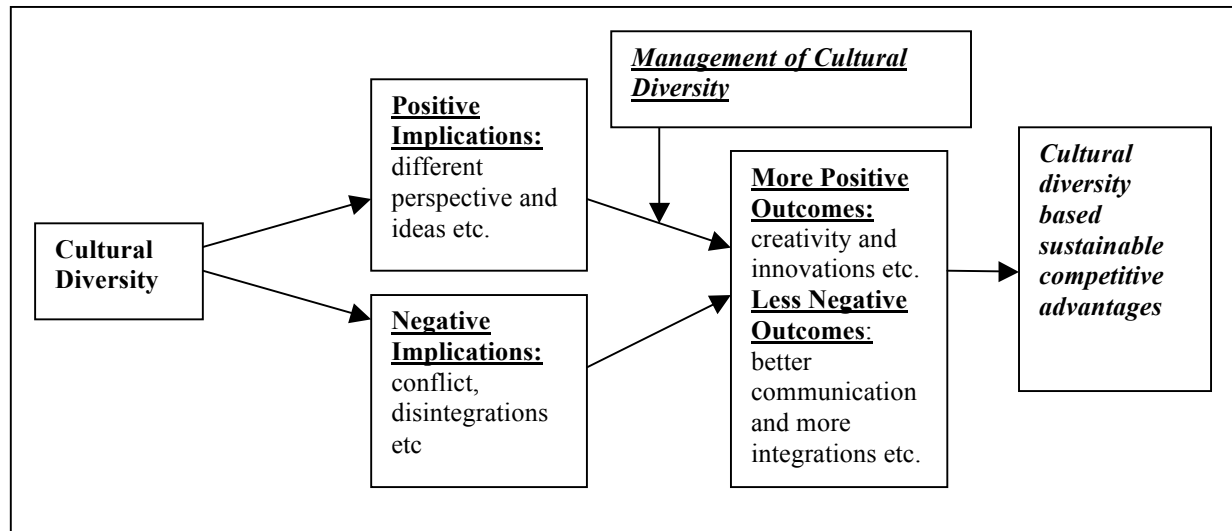

The main objective of this study is to integrate the both negative and positive implications of the cultural diversity. As shown in Exhibit 1, cultural diversity is not only associated with negative implications but also with positive outcomes.

Seeing cultural diversity as problems and observing only negative implications does not reflect reality. This perspective is likely to limit out understanding of cultural diversity and create more negative opinions about cultural diversity. Having such an idea will also frighten companies to enter into intercultural business relationship and consequently affect international business activities. This line of thinking is likely to increase the tension and limit the realization of positive outcomes of cultural diversity. One should see the real picture and uncover the potential embedded in cultural diversity. The academic and business world needs to see the cultural diversity from this perspective.

Instead of just seeing negative implication of cultural diversity, the attention should be on positive outcomes of cultural diversity. When talking about cultural diversity, positive outcomes of cultural diversity should come to the minds of people rather than negative ones. This perspective will bring positive awareness about other cultures, initiate desires for understanding other cultures and create positive connotation associated with cultural diversity. Cultural diversity based positive outcomes should be emphasized and promoted. International companies adopting this perspective will take positive perspective and approaches against cultural diversity. This in turn tends to create more healthy intercultural business relationships.

Associating cultural diversity with positive outcomes can help to realize the positive outcomes. If cultural diversity is seen and managed as a valuable competitive asset, cultural diversity based sustainable competitive advantages can be realized. As a result of positive perspectives toward cultural diversity and management of cultural diversity, negative connotation and outcomes can also be diminished. This will in turn generate more positive outcomes along with less negative outcomes for the international companies. The following sections explain unrecognized positive outcomes of cultural diversity and how to turn cultural diversity into cultural diversity based sustainable competitive advantage.

EXHIBIT 1: INTEGRATING POSITIVE AND NEGATIVE IMPLICATIONS OF CULTURAL DIVERSITY AND REALISING CULTURAL DIVERSITY BASED COMPETITIVE ADVANTAGE

Cultural Diversity: Unrecognized Positive Implications

Both theoretical and empirical studies show that cultural differences can benefit organization in various ways. Culture affects people’s values, attitudes and behavior (Hofstede, 1984). At the individual and group level, these differences are reflected through diverse perspectives and opinions, which in turn can increase creativity and innovation. Such diverse views are more likely to help to solve problem and to make better decision by creating more alternatives to the problems and decision-making. Schneider and DeMeyer (1991) argued that culture gives manager different knowledge bases and distinct perception. In their research, they found that managers responded and interpreted the same strategic issue differently. Dalyan (2004) argued that the potential for creativity and effective decision making will be enormous in multicultural teams. Nardon and Steers (2007) noted that interacting with others brings the possibility of learning more about ourselves, discovering new ways of doing things, and finding creative solutions to both new problems and old. Thus, cultural diversity is likely to increase the range of perspectives and ideas, improve problem solving, creativity, and innovation within culturally diverse groups (Adler, 1986; Hambrick et al., 1998; Kirchmeyer and McLellan, 1991; Natcher et al., (2005); Watson et al, 1993).

Cultural diversity can be beneficial to the companies as well. At the organizational level, the cultural differences can also be a source of competitive advantage. Adler (1986: 99) argued that cultural diversity can create multiple perspectives, increase openness to new ideas and bring in multiple interpretations. It can also increase creativity, flexibility and problem solving skills. Organizations can take an advantage of cultural differences. DiStefano and Maznevski (2000) argued that cultural diversity can be an important source for innovation. Adler (1986) summarized how cultural diversity can help organizations. Cultural diversity can decrease groupthink by bringing in multiple perspectives to decision-making and thus improving decision-making. Diversity also helps organization to expand its perspectives, its approach, its operations and product line. They can also help organization to reposition themselves in a new marketing plan, planning new operation, or assessing the trends from a new perspective. Cultural diversity increases responsiveness of the organization to world markets by better understanding their customers worldwide and accordingly their needs. Mead (1998) also noted that

companies hiring people with different cultural background can obtain competitive advantages in the area of problem solving, lowering cost and adapting to changing environment.

Cultural diversity can create positive outcomes but this does not come easy. Realizing cultural diversity based positive outcomes requires understanding culture, cultural diversity and its full implications along with taking a positive approach and management of cultural diversity.

REALIZING CULTURAL DIVERSITY BASED SUSTAINABLE COMPETITIVE ADVANTAGE THROUGH MANAGEMENT OF CULTURAL DIVERSITY FOR THE STRATEGIC MANAGEMENT OF INTERNATIONAL COMPANIES

Global competition along with complex and uncertain world market threaten the today's companies. In today's business world, it has become very difficult to adapt to the changing conditions and to survive. Success requires constant adaptation of every aspect of the business to the changing environmental conditions. Companies have to be more efficient and effective in all areas. They have to create more creative, innovative goods and services along with strategies and methods. Creativeness and innovation seem to be magic words that both academic and business world often use to reflect upon the need for creative and innovative product, processes and management techniques. In order for companies to survive they need to be creative and innovative in every aspect of their businesses (Salaman and Storey, 2002:147; Kaasa and Vadi, 2008). Companies that are creative and innovative are likely to obtain sustainable competitive advantages.

This study suggests that cultural diversity can play an important role to obtain required creativity and innovation which in turn can help companies to have sustainable competitive advantages. Creativity and innovation come from the cultural diversity related outcomes such as diverse opinions and perspectives. As shown in Exhibit 1, companies wanting to increase their creative and innovative capacities and consequently creating sustainable competitive advantages need to manage cultural diversity in the best possible way. If cultural diversity is managed well, it is likely that companies are able to create cultural diversity based competitive advantages. If cultural diversity is not managed well, negative outcomes is expected to dominate. Supporting line of thinking, Westwood and Low (2003) argued that a positive approach and effective management is necessary for creating positive outcomes from cultural diversity.

Effective Management of cultural diversity can create cultural diversity based sustainable competitive advantage

Effective management of cultural diversity involves recognizing culture, cultural diversity, and the full implications of cultural diversity, emphasizing positive outcomes of cultural diversity, taking a positive approach to cultural diversity, and constantly seeking the best way to manage cultural diversity. Effective management of cultural diversity tend to result in maximized cultural diversity related positive outcomes such as creativity and innovation, while at the same time minimized cultural diversity based negative outcomes such as better communication and more integration. Expected cultural diversity based positive outcomes such as creativity and innovation tend to lead to sustainable competitive advantages.

Adler (1986) argues that the perception of managers with respect to cultural differences and its associated implications define their approach to managing them. As outline above, the positive perception about cultural diversity is the prerequisite for realizing cultural diversity based sustainable competitive advantage. In managing the cultural diversity, the most important thing is to recognize and understand the cultural differences and associated challenges (Lane et al., 1997; Trompenaars and Hampden-Turner, 1997). Hence, managers need to understand and take a positive approach toward managing cultural diversity. Managers have to understand both their own culture and that of others. This approach is likely to eliminate some of the potential problems and to overcome the difficulties. After the managers understand their culture, that of others, recognize the cultural differences and take a positive attitude towards them, they need to use right strategy or right combinations of strategies to manage them.

A number of strategies can be utilized to manage cultural differences. One of the most important strategies has been the use of synergy in cross-cultural situations. Particularly when two or more companies involved in some sort of business activities such as international joint ventures, synergy approach can be an invaluable asset.

Companies can take an advantage of synergy approach in intercultural situations where the combination of “our way” and “their way” can provide the best way to organize and work (Adler, 1986; Elashmawi, 1998; Lichtenberger and Naulleau, 1993; Trompenaars and Hampden-Turner, 1993). Cultural differences can be integrated to create synergy (Adler, 1986; Ehtiyar, 2003; Trompenaars and Hampden-Turner, 1997). Trompenaars and Hampden-Turner (1997:186) argued that “in matters of culture, the differences can be the chief source of attraction. Italian design and Dutch engineering can lead to conflicts, yet they could also lead to a product made in heaven. In matters of cultural diversity there is always challenge, but where this challenge is met valuable connections results”. He also added “You can join Italy’s particularism to Germany’s universalism, or join American individualism and inner-directed creativity to Japanese rapid communitarian exploitation of new products and other-directed skills of customer satisfaction. Where countries specialize in what they do best, the transnational circuits can prove unbeatable.” Trompenaars and Hampden-Turner (1997) further argued that differences should be seen as complementary rather than obstacles. Thus such perception can lead to a managerial mindset, which constantly seeks ways to increase benefits from cultural diversity. Cultural differences are reflected through different managerial styles (Evans et al., 1989), HRM practices (Schuler and Rogovsky, 1998), and work values (England, 1995). From the organizational point of view, many argued that such differences could be a source of competitive advantage for the organizations. For example Hofstede (1985) noted that trans-national mergers (generally of two companies from different countries) have a notoriously low success rate but two British-Dutch mergers (Unilever and Shell) have been successful for decades. The British and Dutch are close on the “organizational” dimension of power distance and uncertainty avoidance, as well as on individualism, but the British culture is masculine while the Dutch is feminine. It could be that these masculine-feminine mergers guarantee a balanced attention to both achievement and relationship, which are complementary elements in organizational success. Park and Ungson (1997) reported that U.S-Japanese joint ventures are less likely to dissolve than national joint ventures. They attributed this result to Japanese cultural values (trust, learning, and a long-term horizon) that maximize stability of the joint venture. Joint ventures help American partners to achieve strategic objectives such as entering the Japanese market, which consequently results in stability of the joint venture between American and Japanese partners. In another example, Tiessen (1997) argued that attributes of individualism and collectivism could contribute entrepreneurship. He argued that individualist produce breakthrough that collectivist implement and improves. Individualist shows proclivities for new venture formation and making major innovations. Collectivist generates variety through group-based, incremental improvement and changes. Similarly Morris et al. (1994) found that a balanced individualism-collectivism in organizations would foster entrepreneurship. Associated with synergy approach, some strategies can be helpful in managing cultural differences such as compromising and implementing of corporate goals that satisfy the multicultural business needs of each partner (Elashmawi, 1998). Relationships build upon trust, friendship, understanding cultural differences (Meyer, 1993; Park and Ungson 1997), understanding the values and behavioral expectations of each other along with consensus seeking (O’Keefe and O’Keefe, 1997; Walsh et al., 1999) can be great way of managing cultural differences and related challenges. Moreover, understanding, accessing, and adopting innovative practices can diminish the compounding effects of cultural differences (Park and Ungson, 1997).

Another important strategy is to adopt ‘A Model of Intercultural Effectiveness for People and Teams’ suggested by Lane et al, (1997). According to this model, first people understand their own culture and that of other, bridge the difference through communication, and manage the differences by integration. People first understand the nature and components of culture and how they affect the behavior and management systems and that of others so that differences can be identified and mapped. After this stage, these differences can be bridged by communication. Three important communication elements have been offered to help to bridge the differences. First, people should be able to have motivation and confidence in communicating across a cultural boundary both to be understood and to understand others. The other communication element is to establish a common reality and agreeing on common rules. The last component of effective communication involves decentering without blame. This means sending and receiving messages with other person’s cultural code in mind (perspective-taking) as well as making blame free and correct attributions about problems and conflicts. The next thing to do is to move forward and build on ideas. At this stage, exploration of ideas should be encouraged with the conscious attempt to invent new ideas and to build on ideas initially created. Finding solutions to issues or problems that are acceptable to all parties from various cultural backgrounds are likely to increase the synergy.

Another strategy is to develop, prepare and equip manager with required competencies and skills to manage cultural diversity. Managers are the ones who confront cultural difference and challenge. Therefore, companies should be careful in selecting and developing managers for cross-cultural business assignment. The managers need to have some special competencies, enabling them to better cope with the potential problems in cross-

cultural business interactions. Some managerial traits such as an interest in communicating and non-authoritarian leadership style can help managers to ease the tension and strain in managing the cultural challenges. Having a positive view of cultural diversity will enable them to realize the cultural based competitive advantages. Cross-cultural orientation and training programs are offered to better handle cross-cultural situations and associated problem. These are language training, brief lectures, group discussions, role-playing, video presentations, multimedia presentations and case studies (Elashmawi, 1998; Meyer, 1993). These programs can help companies to recognize and understand the cultural differences and its influence on people, management, and interpersonal relationship. These programs in general can also help managers to recognize and respect cultural diversity, which in turn create a healthier and successful intercultural business relationship. They can help to create intercultural competencies. This in turn can help to bridge the differences and obtain the best solutions to the problems faced. Language training programs can increase communication effectiveness. Some researchers also argue that successful interactions across cultures require cultural intelligence (Early and Mosakowski, 2004; Maznevski, 2006; Triandis, 2006). Tan (2004) argue that the global workplace requires individuals to be sensitive to different cultures, to interact appropriately with people from different cultures, and to analyze new cultures as they are encountered. To do all this, individuals, whether they are at home or abroad, need cultural intelligence. Earley and Ang (2003) defined cultural intelligence (CQ) as an individual's capability to deal effectively in situations characterized by cultural diversity. Earley and Ang (2003) conceptualized a multifactor concept of cultural intelligence that includes mental (metacognitive and cognitive), motivational, and behavioral components. Mental intelligence includes metacognitive and cognitive capabilities (cognitive processes and cognitive knowledge); motivational intelligence acknowledges that most cognition is motivated and that the magnitude and direction of an individual's energy represents motivational intelligence; while behavioral intelligence focuses on what individuals do (their overt actions) rather than what they think or feel (thoughts and emotions). In parallel fashion, metacognitive CQ reflects the processes individuals use to acquire and understand cultural knowledge. Cognitive CQ is general knowledge and knowledge structures about culture. Motivational CQ is magnitude and direction of energy applied toward learning about and functioning in cross-cultural situations. Behavioral CQ is the capability to exhibit appropriate verbal and nonverbal actions when interacting with people from different cultures. Trompenaars and Hampden-Turner (1997:195) also suggested that the managers should acquire transcultural competence to be successful in cross-border activities. He argued that such competence could be achieved by being aware of cultural differences, respecting them, and ultimately reconciling them. Cultural awareness means understanding states of mind, your own and those of people you meet. Genuine self-awareness recognizes the fact that people from different culture operate with different mental programs. Trompenaars and Hampden-Turner (1997:195) suggested several ways to employ in developing respect for cultural differences. For instance, he suggested looking for situations in our life in which we would behave like a person from another culture. Reconciling requires to be ourselves, but at the same time to see and understand and how other's perspective help our own. Seeing the cultures complementary rather than conflicting opposites can be useful method to help to reconcile the differences. As mentioned above synergy approach can be adopted to help to bridge the differences. Trompenaars and Hampden-Turner (1997: 210) argued that when two values work with one another, they are mutually facilitating and enhancing. Companies adopting this kind of approach in managing cultural diversity can turn cultural differences into competitive advantages.

Companies need to consider the strategies outlined above and choose the right strategy based on nature and characteristics of their international business activities. An effective management sometimes requires the best combination of the strategies rather than only one strategy. Choosing and using the right strategies in an effective manner is likely to determine the extent of cultural diversity based sustainable competitive advantage that the companies can attain from cultural diversity. .

CONCLUSION

There seems to be no way that the companies can hide from the global business realities. They need to face and capitalize on the global markets and try to prosper. Yet, this is not an easy task to accomplish. Companies are struggling to survive in today's global business world. They need to be effective and efficient as well as creative and innovative in every aspect of their business. They need to manage various challenges and take an advantage of opportunities in the best way.

Cultural diversity seems to be one of the most important challenges that companies face across the borders. Cultural diversity is generally seen as problems and related to negative connotations. It is regarded as the main factor behind failure of international business relations. However, this does not reflect real picture and refrain the companies to obtain cultural diversity based competitive advantages. Although cultural diversity produces dual outcomes, the related literature focuses mainly on negative outcomes and neglects the positive outcomes.

This study showed the full implications of cultural diversity which in turn enabled the researcher to integrate both positive and negative implications of cultural diversity. This study suggests that instead of focusing on negative implications of cultural diversity, emphasis should be placed on positive outcomes. This study also suggests that companies doing business across the borders should not see cultural diversity as only problems and associated with negative outcomes. Instead, they should see cultural diversity as a source of sustainable competitive advantage. Moreover, this study also argues that emphasizing and promoting positive outcomes can in turn help to wipe out the negative connotation and prejudices related to cultural diversity.

This study also revealed the secrets of how to turn cultural diversity into sustainable competitive advantages. This entails recognizing culture, cultural diversity, and the full implications of cultural diversity, emphasizing positive outcomes of cultural diversity, taking a positive approach to cultural diversity, and constantly seeking the best way to manage cultural diversity. Taking a positive approach to cultural diversity and managing them is likely to increase creative and innovative capacity of international companies. This in turn enables companies to realize cultural diversity based competitive advantages. Managing cultural diversity in the best possible way will also help to diminish cultural diversity based negative implications. Taking a positive approach and managing cultural diversity is likely to reduce cross-cultural tensions, misunderstanding and miscommunication and consequently lead to create and increase more healthy cross-cultural business relationships.

Several strategies and method are commonly available in the literature to manage cultural diversity. Companies need to choose right strategy or right combinations of strategies based on nature and characteristics of their cross-cultural operations. Using the right strategies is likely to ensure the expected cultural diversity based sustainable competitive advantage. The successful cross border operations of companies requires a totally different mindset set out in this study. Unless the companies obtain this type of mindset, manage and capitalize on the cultural diversity, cultural diversity is likely to continue to be the main factor behind problems and failure of the many cross-border business relationships and operations.

THE STRATEGIC BENEFITTS OF USING ITEMS PARCELS ON AD HOC GOODNESS-OF-FIT INDECES

Tarek Kandil and Dababrata Chowdhury
University of Plymouth, UK

ABSTRACT

The impact of using item parcels on ad hoc goodness-of-fit indexes in multi-group confirmatory factor analysis was examined using the two different cultural multi group questionnaires to test scale. Different numbers of parcels per factor and different numbers of items per parcel were used. To the effect of culture on cross-border banks mergers and acquisitions long-term performance in both the British and Egyptian banks. The data collection process was carried out between January 2007 and January 2008 and was divided into three phases: 1) desk research on the banks that carried out mergers and acquisitions; 2) 13 interviews and questionnaires at the four acquired sites in Europe, and 3) 5 interviews and 3172 of 6 returned questionnaires surveys and case studies in relation to the purposes of this enquiry. Noted that parcelling can increase the fit between the sample and the implied by the model covariance matrices by (a) reducing the size of the covariance matrices of the unique factors (C_{uu}), the unique and the common factors (C_{cu}), and the transposition of the unique and the common factors (C_{uc}); (b) trimming the contribution of these matrices to the sample covariance matrix; and (c) reformulating variance due to cross-structure/pattern coefficients.

INTROUDUTION

The practice of item parceling (combining items into small groups of items within scales or subscales) has received much recent attention in the structural equation modeling literature (Bandalos, 2002; Bandalos & Finney, 2001; Little, Cunningham, Shahar, & Widaman, 2002; Nasser & Takahashi, 2003). Perhaps, a reason for its recent popularity is its potential to serve as a data analysis panacea for a variety of data problems, primarily non-normality, small sample sizes, small sample size to variable ratio, and unstable parameter estimates (Bandalos & Finney, 2001). There are as many forms of item parceling as there are reasons to conduct parceling. In fact some of the proposed methods of item parceling would appear to be having opposite effects (i.e., creating multidimensional parcels and creating unidimensional parcels). This paper seeks to clarify the methods of item parceling that are empirically based and illustrate how to form item parcels for optimum modeling capacity in structural equation models.

Rationale Regarding Item Parceling

Bandalos and Finney (2001) report that the three most common reasons researchers cite for using item parceling are to: increase the stability of the parameter estimates (29%) improve the variable to sample size ratio (22.6%), and to remedy small sample sizes (21%). The empirical evidence that parceling is a desirable correction to these data problems is mixed, however. In the majority of studies assessing the effectiveness of item parceling to solve these data problems, item parceled solutions have been compared to disaggregated analyses without item parcels. Bagozzi and colleagues, in a series of studies, reported that parceling was actually preferred to disaggregated analyses in most cases because the measurement error is reduced with parceled sets of items (Bagozzi & Heatherton, 1994; Bagozzi & Edwards, 1998). Yet, they recommend careful consideration to validity, unidimensionality, and level of specificity when constructing item parcels.

A rationale for item parceling that is often stated is to reduce the effects of nonnormality and likelihood of forming difficulty factors in factor analyses with binary items. Thompson and Melancon (1996) demonstrated that using item parceling with nonnormal data did result in more normally distributed item parcels and improved

model fit. Their method of item parceling was to create parcels of items with opposite skew in an iterative procedure that resulted in parcels with less skew than the original items.

Nasser and Takahashi (2003) examined the behavior of various fit indices as they varied both the number of parcels and number of items per parcel Using Sarason's Reactions to Tests instrument. Their results support the use of parcels rather than individual items and using a strategy to construct item parcels in which there are fewer parcels but more numbers of items per parcel. They indicate that solutions from parceled data with more items per parcels results in more normality, validity, continuity, and reliability than from parceled data with fewer items per parcel. Although, they indicated that some indices (i.e., χ^2/df and RMSEA) were less consistent and generally had better fit when more parameters in the model were estimated. As MacCallum, Widaman, Zhang, and Hong (1999) point out, parceled solutions can be expected to provide better models of fit because a) they have fewer parameters to estimate, b) they have fewer chances for residuals to be correlated, and c) they lead to a reduction in sampling error. Little, Cunningham, Shahar, and Widaman (2002) list three reasons that parceling can be advantageous over using the original items: 1) estimating large numbers of items is likely to result in spurious correlations, 2) subsets of items from a large item pool will likely share specific sources of variance that may not be of primary interest, and 3) solutions from item-level data are less likely to yield stable solutions than solutions from parcels of items. However, if the latent construct is not unidimensional, it is likely that the item parcels will also be multidimensional that that it will be difficult to define what the latent construct actually is because the structure will be a confounding of the primary factor and systematic variance that is shared across parcels. In sum, when parceling with multidimensional structures, the parceling can mask many forms of model misspecification. The other caveat of item parceling that Little et al. suggest is that the unstandardized parameters may be meaningful in clinical practice and norms may be established based on the scale of the original items and these norms may not translate to the reparameterized model with item parcels.

Studies with Known Population Structure

The aforementioned studies have relied on analyses of actual data and theoretical explanations, yet, fewer studies have been conducted in which the population structure of the underlying model was known. This is critical, as it is not known in applied studies if better model fit is necessarily a desired goal, as would be the case with a misspecified model. In simulation studies with known population parameters, it can be determined if the increase in model fit with parceling methods is due to the increased sensitivity of the parceling method to a fully specified model, or whether the increase in fit is in error in a misspecified model.

Marsh, Hau, Balla, and Grayson, (1998) and Yuan, Bentler, & Kano, (1997), in separate simulation studies, demonstrated that it was advantageous to parcel rather than to use the same number of individual items; the fit indices were higher and results were more likely to yield a proper solution when parcels were used, rather than the same number of individual items (e.g., six parcels vs. six items). However, if the total number of individual items were used (e.g., 12 items instead of six 2-item parcels), the individual items were more likely to result in a proper solution.

Hall, Snell, and Singer Foust (1999) determined, in a simulation study of item parceling under various structural models with different parceling strategies, that when a secondary factor structure exists parceling can obscure the true factor structure and result in biased parameter estimates and inflated indices of fit. However, this depends on how the secondary factor structure is modeled; if the items that all load on a secondary factor are parceled together (*isolated parceling*) the fit is not inflated. It is when the items with a secondary influence are parceled with items without the secondary influence (*distributed parceling*), that the fit is inflated. Hall et al. explained this phenomena by suggesting in the latter case that the influence of the secondary factor is distributed across parcels and this creates common variance among these parcels and hence the loadings on the primary factor increase and partially reflect the influence of the secondary factor (i.e., the influence of the secondary factor confounds the loadings on the primary factor). Yet, when the items with the secondary influence are parceled together, the common variance is not inflated since the secondary structure influence is not across all the parcels; hence the error variance increases to reflect the influence of the secondary structure and fit indices are consequently lower, relative to the distributed parceling strategy. Hall et al. further suggested that the inflated indices of fit with distributed parceling methods helps to explain why past authors in the educational testing literature (e.g., Kishton & Widaman, 1994; Lawrence & Dorans, 1987; Manhart, 1996; Schau, Stevens, Dauphinee, & Del Vecchio, 1995; Thompson & Melancon, 1996) have suggested that distributing like items across different parcels can help improve the model fit and have therefore recommended this method. As Hall et al.'s simulation work indicates, however, this strategy artificially inflates model fit and therefore Hall et al. recommend putting like items *together* when creating parcels (i.e., putting items that have high loadings on a factor together).

Bandalos (2002) in a comprehensive simulation study that varied number of items per parcel, degree of nonnormality, number of categories in original items, n sizes and correct and misspecified models, investigated the effect of item parceling under conditions of nonnormality, an oft cited reason for item parceling. The findings indicated that item parceling produces higher fit indices, less parameter bias in disturbance terms, and less Type I errors than analyses of the original items when nonnormality is introduced. The higher the level of nonnormality, the larger the discrepancy was between the parceled and non-parceled solutions, favoring the parceled solution. Bandalos concluded that model fit improvement is due to better distributional characteristics (e.g., less nonnormality and less coarse measurements) in the item parcels and a reduction in the number of variance/covariance parameters that are modeled. The caveat is that this only holds true when the factors have underlying unidimensional structures. Both Hall et al. (1999) and Bandalos (2002) have shown that when even small influences of secondary factors are present (e.g., a misspecified model) the method of item parceling makes a great deal of difference in whether the misspecification can be identified or not. Bandalos concluded that item parceling should only be done on unidimensional structures. Hall et al. also recommended parceling within unidimensional structures, and suggested that this can sometimes be achieved by factor analyzing items within factors to be parceled or by a rational analysis of item content to determine like items or items that may share method variance.

Recommended Item Parceling Techniques

The preponderance of evidence from applied studies, theoretical studies of item parceling, and studies with known population structure, indicate that item parceling can be an advantageous tool in the study of the underlying structure among latent variables (Bagozzi & Heatherton, 1994; Bagozzi & Edwards, 1998; Bandalos, 2002; Bandalos & Finney, 2001; Hall et al., 1999; Kishton & Widaman, 1994; Lawrence & Dorans, 1987; Little et al., 2002; MacCallum et al., 1999; Manhart, 1996; Marsh et al., 1998; Nasser & Takahashi, 2003; Schau et al., 1995; Thompson & Melancon, 1996; Yuan et al., 1997). Item parceling can reduce the dimensionality and number of parameters estimated, resulting in more stable parameter estimates and proper solutions of model fit (Bagozzi & Heatherton, 1994; Bagozzi & Edwards, 1998; Bandalos & Finney, 2001; Little et al., 2002; MacCallum et al., 1999). Further, when original items are severely nonnormal or are coarsely categorized, research suggests item parceling improves the normality and continuity of the indicators and estimates of model fit are enhanced as compared to the original items (Bandalos, 2002; Thompson & Melancon, 1996). Almost all studies concur on the issue of dimensionality of the item parcels. Item parcels work best when constructed on unidimensional structures. If secondary structures exist, there is not a consensus on how the items should be parceled. Although many authors have suggested that the distributed strategy of forming parcels is advantageous because it can improve model fit (e.g., Kishton & Widaman, 1994; Lawrence & Dorans, 1987; Little et al., 2002; Manhart, 1996; Schau, Stevens, Dauphinee, & Del Vecchio, 1995; Thompson & Melancon, 1996), the simulation work in this area clearly indicates that distributed parceling can mask underlying secondary structures and provide misleading indices of model fit (Bandalos, 2002; Hall et al., 1999).

Compiling this evidence leads to the following recommendations when constructing item parcels:

1. Check the dimensionality of the factors to be parceled to determine if there is a unidimensional or multidimensional factor structure. Confirm the factor structure through replication with multiple samples or with rationale review of item content. Parcel items together that represent similar facets of a construct.
 - a. If the factor is unidimensional, random methods of combining items can be used to create item parcels.
 - b. If the factor is multidimensional, use isolated parceling strategies to capture similar facets of the structure into the same item parcel (i.e., Different facets would be separated into different parcels.)
2. Check the normality/difficulty of the original items to be parceled. If very nonnormal, combine items in such a way as to maximize the normality of the resulting parcels.
 - a. For continuous or ordered categorical items, this can be accomplished by combining items with opposite skew or distributional shape.
 - b. For binary items this can be accomplished by combining items with opposite item difficulties.
3. Parcel more items per parcel rather than more parcels, *as long as the unidimensionality* of each parcel can be preserved.
4. If underlying structure to be parceled is not known or not clear, do not parcel, as the parceling may obscure the true underlying structure.

THE CURRENT RESEARCH

In the current research has two samples size. we analysis the Egyptian banks middle managers and their followers who have recently undergone M&A in the Egyptian banking sector during the period of banking reforms, the banks included registered M&A taking place in the Egyptian banking sector during the period from 2004-2007. The sample focused on acquiring banks, not target banks, due to the unavailability of financial information. The sample was composed of 10 banks in total and was divided based on the home-country of the acquiring bank, producing two main groups; Cross-Border M&A and Domestic M&A. Of the sample banks, 4 had undergone Domestic M&A (namely National Société Générale Bank(NSGB), Banque Misr, Arab African International Bank and the National Bank of Egypt)while the remaining 6 had undergone Cross-Border M&A in the Egyptian banking sector (namely Blom Bank, Audi Bank, Union National Bank, Ahli United Bank, Intresa San Paolo (San Paolo at time of M&A), and Piraeus Bank). Table 1 provides the list of acquirers, targets, dates and value of M&A.

Measures of Independent variable and mediating

1-Independent Variable: We operationalise the construct of strategic leadership as an independent variable, by identifying attributes underlying the strategic challenges in the organisational context using data and measures of leadership effectiveness from the GLOBE scale survey (House et. al., 2004). All the five dimensions scales of the leadership behaviours that related to the context of the strategically behaviours scales employed in presenting the data are based on the Arabic version of the GLOBE questionnaire, which contained 21 dimensions with 57 items in total .The leadership items assessed the extent to which the behaviour described was perceived in executives by their subordinates, measured on a five-point Likert scale ranging from “strongly disagree ” to “strongly agree” where 1 meant “Strongly disagree” and 5 meant “Strongly agree”.

2- Shared understanding values were measured by using a scale based on the ideas of Senge (1990); Hays and Hill (2001); Voss et al. (2005) It incorporates the following two dimensions: 1) our employees work closely among inter-departments to support its visions, and 2) our employees understand the results of service performance.

The measuring items of the two dimensions of shared understanding values instrument was translated from English into the native language of the participating managers, then back-translated back into English by another person, and finally approved or corrected by two members of staff of the University of Plymouth-Business School.

Data collection:

In this paper we used a combination of data collection modes. Modes of data collection appear to affect respondents' answers or the respondents' willingness to answer questions honestly (Holbrook et al., 2003). The researcher used self-administered questionnaires (SAQs), in which respondents are invited to complete either a paper questionnaire, often as part of a postal survey(free post envelop return completed forms); or a questionnaire hosted on the Internet (sometimes referred to as web-based computer-assisted self-questionnaires or web-CASI) (Holbrook et al., 2003). Ethical approve had helped the researcher to raise the respondents confidence to complete even more employees questions in the second questionnaire.

Questionnaires were distributed to middle managers of financial , human recourse and customer services departments in each bank and 3- 4 branches throughout Egypt of and subordinates in ten Egypt.

The result was a total of 253 usable responses, from 183 employees (78 men – 105 women) and 70 (34 men -36 women) middle managers.

Data Analysis

Confirmatory factor analysis was performed using Amos 17 to assess the overall measurement model and unidimensionality of the scales. Discriminate validity was shown by comparing the lowest correlation for a particular item and any other item within the factor (within factor correlations) to correlations of that item and all items outside of the factor (between factor correlations) (Campbell and Fiske, 1959). If a within-factor correlation is less than a between-factor correlation, it is a violation. The number of violations should be less than half of all comparisons, which is considered as an indication of discriminate validity (Campbell and Fiske, 1959).

Table1: Confirmatory Factor Analysis of Strategic Leadership Styles in Egyptian Acquired Banks

Dimensions	% of variance	Cronbach α	Composite Reliability
D1-Participative and Autocratic	19.768	0.820	0.923
D2-Orderly Organizer	19.37	0.813	0.918

Item Parceling and small sample size in SEM

While the model developed shows that each of the constructs is measured by at least six items except for the performance construct and that the preliminary factor analysis was based on this loading matrix, it was considered prudent to reduce the number of indicator variables per construct. Because of the small sample size achieved, it is considered wise to use fewer items per construct as sample size and complexity are some of the major factors that affect the validity of results (Hair et al 1998). Reducing the number of items simplifies the model. The use of composite item parcelling is recommended in literature as a way of reducing the number of indicator variables (Schumacher. and Lomax 2004 and Hau and Marsh 2004). Item parcelling involves forming composite items from a number of items, thereby reducing the number of items while still accounting for all. In this research we attempted to reduce the number of Leadership behaviour items by including single factor analysis, which involves pairing off items with highest and lowest loadings as first composites based on a single factor solution. The next set of items would be the second highest and the second from the bottom. This procedure continues until all items have been parcelled. The following table shows the first new variable SLS1.

Tale3: Model constructs item parcelling

Construct	Item parcelling (new Variables)	Variables	Factor Loading
D1- Participative and Autocratic	(SLS 1)	orderly	0.781
		administratively skilled	0.766
		organized	0.734
		good administrator	0.722
		autocratic	0.708
		dictatorial	0.680
		bossy	0.655
		elitist	0.638
		enthusiastic	0.638

RESULT

Research Structural Models

The research framework, illustrated in Figure 1, was tested using Amos 17, to explore the relationships between variables simultaneously. The structural model was evaluated on the basis of Maximum Likelihood estimation model and goodness-of-fit indices such as the non-normed fit index (NNFI) (Bentler and Bonnet, 1980), the comparative fit index (CFI) (Bentler, 1990), the root mean square error of approximation (RMSEA), and the χ^2/df ratio. NNFI and CFI represent a good fit if they are between 0.80 and 0.90, and show a very good fit if they are greater than 0.90 (Segar and Grover, 1993). The recommended maximum value of RMSEA is 0.10 (Chau, 1997; Hair et al., 1998). The χ^2/df ratio provides a rough estimate of the statistical fit (i.e. the error present) versus the number of parameters estimated (i.e. df.). Better models exhibit a low ratio such as less than two (Heck, 1998). The results of the structural model indicated that there was sufficient model-to-data fit (χ^2

=217.66, df = 114, NNFI = 0.969, CFI = 0.974, RMSEA = 0.034, with the 90 percent confidence interval for RMSEA being 0.067 to 0.10, and χ^2/df 1.90).

H1 : suggested that there is positive relationship between strategic leadership behaviours and post financial performance. The results of the model supported it statistically because the path coefficient was 0.28 (P value, 0:002). Strategic leadership behaviours was significantly has a is positive relationship with mergers and acquisitions post financial performance of Egyptian banks.

H2: suggested that there is a strong positive relationship between strategic leadership behaviours and employees shared understanding values. The results of the model supported it statistically because the path coefficient was 0.66 (p** value , 0:000). Strategic leadership behaviours have strong positive relationship between strategic leadership behaviours and employees shared understanding values.

H3: suggested there is a positive relationship between employees shared understanding values and post financial performance. The results of the model supported it statistically because the path coefficient was 0.34 (P value 0.001). Strategic leadership behaviours has a positive relationship between employees shared understanding values and post financial performance

CONCLUSION

What factors influence the dynamics of strategic Leadership styles and thus result in shared understanding values and financial gains? With the latest Egyptian banking sector reforms began in 2004 in hopes of strengthening the sector and increasing its robustness to be able to face global and regional competition and to act as a base and infrastructure for the overall economic reforms, there has been corresponding proliferation of research. Managing banking mergers and acquisition that leads to creates new paradigm of styles that leaders should have to keep having financial gains and a better post- financial performance, which is a complex and persistent challenge.

There is a need for a more in-depth understanding. In light of the endeavors, this research contends that designing better services needs to consider elements of strategic leadership styles , shared understanding values , and financial performance.

The main finding of this research is that employees are a critical element to enhance strategic leadership. It is a hard task to manage shared understanding value directly, consistently, and reliably as banking services have the characteristics of intangibility, perish ability, and simultaneous production, delivery, and consumption (Hays and Hill, 2001).

THE INFLUENCE OF HISTORIC, GEOGRAPHIC AND CULTURAL FACTORS AS AN IMPORTANT EXPLANATION FOR CORPORATIVE CULTURE AND ECONOMIC DEVELOPMENT: A COMPARISON BETWEEN LATIN AMERICA AND THE UNITED STATES.

Paulo Roberto Feldmann

University of São Paulo- Business and Economics School - Brazil

ABSTRACT

The text deals with the influence of history, geography and cultural factors on economic development focusing on how companies are managed. The emphasis of the paper is Latin America. After a summary about the history of the region, regarding the economic aspects, the text attempts to analyze some habits and customs of Latin Americans and explains how they influence the enterprises and the way they are managed. The objective is to demonstrate how the capacity to manage institutions and corporations, public or private, is affected by cultural factors and the reason why this ends up having an enormous impact on the degree of economic advance in the respective countries. In order to get these explanations, the article mentions many different authors that have made comparisons with other regions in the world. Special attention is dedicated to a comparison between Latin America and the United States from the point of view of Corporate Culture.

KEYWORDS: National Culture, Corporative Culture, Management, Latin America, Innovation

INTRODUCTION

During the last few years, the theme “cultural diversity” has attracted considerable attention. The reason for this is that the global market extends to several hundred countries and many different cultures. Thus, the large international companies perceive that, in order to effectively operate in the numerous diverse countries, it is fundamental to recognize that it might be necessary to perform differently in each of these.

The objective of this article is to demonstrate how the capacity to manage institutions and corporations, public or private, is affected by cultural factors and the reason why this ends up having an enormous impact on the degree of economic advance in the respective countries.

The question orienting this article is: Is there a Latin American way of managing businesses? Or, in other words, is there a Latin American way to manage a business that is so clearly different from the North-American way of managing businesses?

As we will later see, we can conclude that yes, there is. Based on the classical book by Michael Porter, “The Competitive Advantage of Nations” (“A Vantagem Competitiva das Nações”- Porter, 1993, p.126), supported by his extensive research which included companies originating in 15 countries, it has been determined that domestic circumstances affect the manner by which companies are directed and that each nation has its unique characteristics in managing their respective companies. Unfortunately, none of the 15 countries studied by Porter were located in Latin America.

This article proposes to establish how some typical characteristics of the manner in which Latin American companies are managed are related to the geographic and cultural aspects that affect the region. The objective of this is to contribute to the analyses explaining the reasons for the slowdown of economic development on the continent, indicating the absence of greater discussion about the questions that involve productivity and corporate management in the region and, principally, the differences that exist in managing corporations between Latin Americans and North-Americans.

With this article we intend to demonstrate that the culture of a people is a vital component in defining the capacity of a nation to prosper as this formats the individual's thoughts regarding risks, rewards, opportunities and, consequently, regarding progress.

PROBLEM DESCRIPTION

Since Max Weber (1930) it has been heard that culture weighs on, determines, tends towards and ends up determining which nations prosper and which are condemned to poverty, as long as their populations do not alter their habits, beliefs and values. Weber affirmed that the Protestant ethic was responsible for the fact that Germany and Switzerland experienced much greater economic success than did the Catholic counties such as Spain and Portugal in the XIX century.

More recently, Lawrence Harrison (2000) placed the peoples' values and attitudes as the principal factors responsible for the phenomena of persistent instability and inequality in Latin America.

David Landes (Landes, 1998, p 13) likewise a renowned specialist in "Economic History" stated that if there is anything to learn about a nation's economic development it is that culture makes a difference. It is undeniable that History and Geography play an enormous role in the culture of a people. In turn, culture and, consequently, uses and customs affect economy and, notwithstanding, can not be modified by decree or government policy and must, therefore, be more profoundly understood.

A nation's History defines values that have perpetuated for generations and resulted in determining the behavior of its citizens. In other words, it is because of these values that the individuals are willing to assume greater or lesser risks, feel more or less patriotic, are willing or not to share profits, and so forth. The geographic location also impacts a people's habits and customs and, therefore, their level of economic progress.

Jeffrey Sachs (Sachs in Harrison & Huntigton, 2000, p 31-32), currently one of the most frequently cited economists, states that Geography is of such importance that social scientists should dedicate more time looking at maps to better understand the roots of economic development.

THE LATIN-AMERICAN CONTEXT

With an enormous variety of political cultures and socio-economic structures, Latin America extends from Rio Grande to Antarctica, occupying a land area of more than 18 million square kilometers that are inhabited by more than half-a-billion people. The 33 countries of the region, despite having problems and aspects that differ one from the other, they do have many similar economic challenges. As such, the 200 million living in the region that are considered poor are present in all of the countries, as is the enormous social inequality. Corruption is endemic in the region. The economic history of the countries in Latin America is shared entirely, from the substitution of importations in the 60's and 70's, to the increasing inflation of the 80's and decreasing in the 90's to the solution given for foreign debts, all of the questions are more or less common to all of the countries and, generally, had occurred around the same time.

Notwithstanding, Latin America is far from constituting a homogeneous group of sub-developed States. The colonial economic structures and the forms of integration to the international market after each nation's independence generate important differences among them. Therefore, we can say that four countries; Argentina, Brazil, Chile e Mexico- had achieved important industrial advances not obtained by the other countries that had left these latter very dependent on elementary economic structures.

What truly characterizes all of the countries that compose Latin America and which makes them different from North America is their historic formation, in other words, the type of colonization to which they had been submitted, beginning in the XVI century, by the European powers of that time. Whereas in Canada and the United States there was a prevalence of what we call colonial settlements, in Latin America there was a predominance of colonial exploitation. In these, the objective was to serve the economic interests of the parent-state, in the case of Portugal and Spain. The wealth and the well-being of the colonized people were of little importance. What was imperious was the wealth of the parent-state. While, in the colonial settlements, the objectives were others; the colonizers came to the new land in search of a new fatherland and not to be enriched. For this reason, in Canada as well as in a good part of the United States, the colonization was neither achieved with the hand of slave labor nor to produce low cost basic commodities. But, it happened, due to the enormous

masses of Europeans who left their continent because of conflicts and the religious wars at that time, they came to North America devoid of any mercantile interests.

The type of colonization applied to Latin America, exploitative and mercantilist, had left profound scars in the society that have remained until today. As such, for example, the need to speed up and make contacts with the Court more flexible resulted in the population always trying to be close to the coastal towns and the ports that accessed the parent-state; or, using the best soil to cultivate agricultural commodities for exportation, while the worst would be used to produce the foods that was consumed by the local population. Also resulting from that time, the nations of the region acquired the characteristic of exporting their raw material and importing the manufactured products from the parent-state.

Another legacy of colonization that occurred in Latin America was the enormous concentration of rural land in the hands of very few property owners, characterizing the well-known “landed estates”, which is a registered trademark of the region, generating a chronic lack of alimentary commodities while, at the same time, millions of farming families had no land to cultivate. According to Hobsbawn (1999, p. 38) “It is very difficult to conceive that the impressive social inequality in Latin America could have no relation with the also impressive absence of a systematic agrarian reform in its countries.”

BIBLIOGRAPHIC REVIEW

More than 40 years ago, when he analyzed the economies of the Asiatic countries, Myrdal (Myrdal, 1968, p.104) concluded that the cultural factors profoundly influenced by the region were the main obstacles to modernizing that part of the world.

Fleury (1997, p.95 and 107) calls attention to the fact that the highly-praised Japanese and Korean models of management stem from specific historical traits of these two nations. One of these traits common to both nations is that of a strong national identity, and another is the historic rivalry between the two countries which resulted in the fierce economic competition between both.

Michael Porter (1993) concluded that there is no universally adequate administrative system, as the successful sectors of each country will be those in which the administrative organization and practices are adjusted and adequate to the sources of competitive advantage for that sector. In other words, administrative practices vary from country to country.

When speaking of the United States, Porter indicates the competition and intense rivalry existing among the companies in this country as one of the most outstanding aspects. According to him, this intense competition results in these companies mutually pressuring one-another for the progress of all. Even the North-American laws, such as the Anti-trust law, for example, reflect a national consensus in favor of competition.

However, it is not only this aspect that characterizes a type of paternalism, as defined by Lindsay & Fairbanks (Fairbanks e Lindsay 2000, p. 132-136): “The Latin American businessmen frequently choose to allow the government to make highly-complex decisions which refer to their own businesses. It is common practice for lobbies and business associations to pressure public officials in order to obtain protective tariff rates to block the entrance of imported products or favorable conditions in the exportation of products, including even exchange rate devaluation.”

Lindsay & Fairbanks emphasize that the relationship between government and businessmen is a fact of enormous importance in the region, and it is very common for public officials to be manipulated in order that determinate companies or sectors obtain competitive advantage, which, generally, end up being ephemeral.

The fact of always being able to put the blame on others is such an important Latin-American trait that it was even mentioned by Landes (Landes in Harrison & Huntington, 2000, p.4-6) upon ironically commenting that the most successful export from the region, in terms of economic doctrine, was the famous “Theory of Dependence”, in which the theoretical exponent is the, then, sociologist Fernando Henrique Cardoso. Said theory attributed the roots of Latin-American problems to the most advanced countries of North America and Europe. According to Landes, he states: “Upon instigating a pathological propensity to attribute blame to all others except to the one or ones denouncing, these doctrines promote economic impotence. Even if they were true, it would be better to retire them.”

Lastly, we should highlight the presence of the State in Latin America. Fukuyama (Fukuyama, 1996, p. 52), upon mentioning the three societies where the State has a greater influence, and excluding all the socialist countries, he cites France, Mexico and Brazil and makes it a point to emphasize that even in Japan, a country with a very strong government presence, the involvement of the government was always very limited if compared to the three countries, two of which are leaders in Latin America, in terms of economic power.

Other important authors have dedicated themselves to examine the relationship between state and entrepreneurs in Latin America. One of the most important tests of the "spirit" in Latin America was made by Carlos Alberto Montaner in the chapter that he wrote the book "Culture Matters", edited by Lawrence Harrison & Samuel Huntington (2000). Montaner describes how the elites behave in Latin America and focuses especially on the role and mode of action of entrepreneurs. He said one important characteristic of entrepreneurs in the region is their preference for exercising political influence rather than compete in the marketplace. Seeking government support is another feature that predominates in the typical Latin American business. Entrepreneurs and executives from major industry sectors lost in meetings with ministers and officials valuable time that could be better spent if they devoted themselves to seek the effective increase in the productivity of their companies.

This political influence is most often achieved by means unethical and Montaner says that it is very easy for the entrepreneurs to find civil servants that get tariff exemptions or loans at subsidized interest rates or concede market reserves. All these advantages are always very ephemeral and they fail to provide effective and competitive advantages in order to get productive enterprises. Montaner stressed that corruption is not exclusive to Latin America but stresses that the frequency with which it occurs in this region, and especially the impunity are of serious concern because their societies do not seem to realize how much these facts turn out to raise the prices of goods and services they they acquire and consume.

COMPARING LATIN AMERICA TO THE UNITED STATES

It is opportune to compare Latin America with the United States to understand the reasons for some very important behavioral differences, including why the colonization of Latin America and that country were so completely different. There is a philosophical posture that clearly demonstrates the big difference in the Latin-American way and the North-American way to manage companies. Certainly, the alterations are linked to the historic role that the companies had in the economic development in the two regions. While in the United States, the companies and businessmen assumed a predominant role even during the process of territorial acquisition and integration, in the XVIII and XIX centuries, as seen by the grand railways, almost all privatized, in Latin America, all colonization, territorial acquisition and integration in the principal countries, occurred under the aegis of the State, with the private initiative being totally absent.

In other words, we could say that, if the United States had been colonized by Spain or Portugal, this internalization would have been totally conducted, implanted and operated by the government. Some rare cases of entrepreneurial businessmen, such as the Baron of Mauá (Fausto 2006, p211-213), in Brazil, were treated in a hostile manner by the other businessmen at the time and were even boycotted by the Empire. This posture began in the XVIII century by the initiative of the Crowns of Spain and Portugal and continued intact after the political independence of the various nations.

One of the most characteristic and, likewise, one of the most problematic features is the fact that almost the totality of the large Latin American companies have their controlling stock in the hands of one individual or, when many, in the hands of one or two families. This results in a relaxation of the controls related to results and the absence of management professionalization, in other words, the stockholders frequently do not cover results because they themselves are the executives. It is common for the owners of the companies to not clearly separate the limits between the company and the family.

Contrary to that which happens in the USA, where the capital of a large company is much more pulverized and the minority stockholders apply great pressure, demanding consistent results. In the Latin-American companies, it is difficult to find a separation between the Board of Directors and the Managing Director. While, in a good part of the North-American companies it is very difficult to discover who the owner of these same are, such is the pulverization of the stocks, in the Latin-American companies there is practically always an owner, and is always well-known.

The mentality of “company owner” has the result that, at times, instead of taking their profits from distributed dividends they prefer to take them via indirect earnings, for example, setting up personal corporations that are suppliers of the principal group. Therefore, it is common that the cost of transference of services among companies of the same group is determined by a group of individuals that are controlling stockholders of the group’s holding company which, at the least, distorts the profitability of the business. Such facts end up being equally negative to the development of the stock market, being that the minority stockholder, generally, receives very little protection. It is interesting to note that, even in the North-American way of managing companies, with a strong influence of the minority stockholder, there are situations which escape control and are transformed into a nightmare for all, as we have seen in the recent sub-prime crisis.

Mixing business with friendship is common in Latin America. The contract, at times, is not as important as the committed word. While in the United States there is the cult of lawyers, everything focuses on contracts, in Latin America there is the cult of “personality”, in other words, everything depends on whom you are doing business with. As such, in Latin America, a contract does not have the same significance as it does in the United States. In fact, for Latin-Americans in general, personal relationships are of extreme importance.

Continuing to compare to United States it is important to note that in this country there is the “culture of the winner” . In North America society everybody wants to win . Much more than in other societies and in sharp contrast to the Latin America society ,in United States the personal and professional success is valued as the greatest goal in life of any individual . The worst blame you can accuse a north-american citizen is that he is a loser . This culture does not exist in Latin America , by the contrary , success often gives rise to suspicion and distrust.

Perhaps the principal characteristic of Latin behavior affecting the way the region’s companies are managed is that which has to do with the extensive networks of personal relationships. Contrary to North-Americans, the Latin Americans have a negative view of individual competition, but give enormous importance to the social groups of which they are a part. There is a current phrase that says Americans do business and then, if possible, make friends; while the Latin Americans first verify if they are friends to then do business afterward.

If there is a notable Latin American trait, it is the ever-present need of a superior leadership to make important decisions. Perhaps this is why almost all of the countries of the region have presidential regimes while the parliamentary regime, found in developed countries, with the exception of the USA, did not take root in the region. The search for an answer to everything through an authoritarian leader is something that has pervaded history in practically all of the Latin American countries. This is probably why management decisions are frequently taken by one person in a central and decisive manner.

IMPACT ON ECONOMIC DEVELOPMENT

One of our objectives with this article is to demonstrate that not all that is said with respect to a nation’s economic development can be explained by traditional economic theory. There are numerous factors that are not part of the economist’s habitual tooling and which have a decisive influence about the economic backwardness or advance of a country. We have seen that the History of a nation defines values that perpetuate for generations and end up defining the behavior of its citizens. In other words, it is because of these values that individuals will be willing to assume greater or lesser risks, will be more or less patriotic, will be willing or not to share profits, and so forth. The geographic location also has an impact on the habits and customs of a people and, therefore, on the level of economic progress.

Latin America comprises 9% of the world population, while responding for only 5 % of the global GDP. And, perhaps even worse than this, among the 1000 largest international companies, approximately 25 of these are Latin American, or if you will, merely 2.5%. Why are there so few companies from this side of the world that have achieved any international projection? Is it an economic structural problem? There has already been much analysis of the economy of Latin America and all its countries, from a structural point of view and, principally, from a macroeconomic point of view, but rarely have there been attempts to explain the backwardness of this continent from the point of view of its companies and the manner in which they are administered.

Perhaps because of the fact that, in the past, almost all of the countries in Latin America had lived with very high rates of inflation, it is interesting that nowadays, the debate about economic growth is always under the background of reduced inflationary rates and is almost always centered on three themes: devaluation of the currency to stimulate exports; reduction of interest rates; and cuts in government spending. They are all very important macroeconomic themes, however very little has been discussed, for example, regarding the low efficiency of Latin companies as being a factor that is also responsible for the backwardness of the region; almost nothing is said about the little technological production of the companies of the region; and rarely is their

discussion about the value chains where these Latin American companies perform. These are all themes that are linked to the way in which the companies are managed.

Fairbanks & Lindsay (2000) upon analyzing the reasons for the backwardness of the Latin American countries are clear: "What has been most difficult for the Latin American leaders and, in reality, for a great part of the leadership in developing economies, is to perceive that in order to improve the perspective of the domestic companies their governments need to master the details as to how the successful global companies create competitive options, strategic options, in an era of global markets and information technologies that are network interlinked.. Now, the leaders need to learn complex strategy and option theories on an entrepreneurial level, as well as the new microeconomic theories indicated for a new economy; they need to learn the manner in which the wealth generation chains are, in fact, formed and how global companies opt to participate in them.

After all, a country can not be competitive if the companies are not productive. .

IMPACT ON TECHNOLOGY DEVELOPMENT

The abundance of natural resources in Latin America has been identified as an important explanation for low concern about the innovation that prevails in the region. Fairbanks & Lindsay (2000) found that local businesses tend to wrongly assume that the advantages in natural resources, abundant raw materials and cheap labor, will provide them with leadership positions in export markets and thus fail to create conditions for innovation

Adopting this philosophy, Latin American countries are constantly overtaken by countries in Asia or Africa. These countries often can further cheapen the cost of its workforce, or entering the international market by selling a natural resource at a price even lower than had been practiced by Latin American . Moreover, Lindsay & Fairbanks (2000) point another important reason for the lack of innovation: It is the poor cooperation between the companies. They say that there is no culture of cooperation among enterprises in the region. Unlike countries like Italy, where the existence of clusters, promote cooperation and encourage companies, for example, to jointly pursue foreign markets, or launch a new brand, or jointly invest in R & D-Research & Development. But Latin American entrepreneurs , almost invariably, only see the competitors as an enemy that should be eliminated.

This contribute to a climate of distrust within each sector that always annihilated any possibility of cooperation. Constitute notable exceptions to the automakers and its relationships with suppliers of auto parts in Argentina, like Brazil or Mexico. But this deviation from the rule, probably due to the fact that these are industries where there is the predominance of foreign capital companies .

This lack of business cooperation also explains the small number of clusters in the region and reaffirm as Fairbanks and Lindsay (2000): "... we noticed a profound lack of clusters of related industries or support, and a corresponding lack of innovation: companies not cooperate are not able to learn from each other"

FINAL CONSIDERATIONS

Thus, we hope to have answered our initial question, if there is a Latin American way of managing businesses and if it is different from the North-American way? It seems clear that all of these geographic, historic and cultural aspects result in affecting and molding the way business is managed in each of these two regions.

The Latin-American countries come from a society of aristocratic and oligarchic formation. This society was always centered on the wealthiest classes whose families, of patriarchal foundations, were responsible for the emergence of the first important companies of the region. It is natural that the way these companies were organized would be similar to the way people in families relate to one-another. On the other hand, for many centuries, agricultural activity was the only economic activity, the result of which was that the feudal system predominant in the fields ended up deeply rooted in the Latin-American culture.

The lack of professionalization of the companies can be another important explanation for the small number of world-class Latin-American companies. Lastly, family and friendships are among the greatest values of all the people of Latin America. Knowing the people involved is part of every business transaction and familial or personal links or friendship can easily cross the corporate hierarchical divisions. Nonetheless, to survive and be efficient in the international market, Latin-American companies must be administered as professionally as

possible and globalization tends to more negatively affect the companies that are managed by families than those that are not.

Latin America is very rich in natural resources and in general labor is cheap. These are the main ingredients which encouraged large firms originating in the region, with rare exceptions. Because of these factors, this continent boasts some powerful companies, but almost always at work in sectors that were important in the nineteenth century, but no longer relevant in this century. Being a global player in industries such as beverages, cement, mining, agriculture, fishing or steel is not all bad, but not enough. Nowadays the more advanced countries have companies in sectors that now dominate the world economy as telecommunications, software, hardware, medical equipment or pharmaceutical industry. In other words, we can say that even the big Latin American companies in general are out of high-tech sectors, with rare exceptions such as the Brazilian Embraer. Companies in Latin America sometimes can scale and projection for operating in the global world but almost always they are in low-technology industries and in most cases producing commodities. The Brazilian Petrobras and the Mexican Cemex are prime examples.

In finalizing, family management, lack of professionalism, paternalism, manipulation of politicians, defensive and non-ethical attitudes are some of the main ingredients that foster the companies of the region, with rare exceptions. This style of administration does not benefit the demands of global competition in the XXI century. The large global companies and, especially, the North-Americans that dominate the international competitive scenario are professional, transparent, non-dependent on governmental favors and, in many cases, their stockholders are not known, in other words, they do not have an “owner”.

We hope to have demonstrated the standard of cultural behavior of Latin-American businessmen and executives. This could help those of the region that are currently involved in the process of internationalizing their companies. But, it is also important for those that are outside of Latin America. Knowing the unique characteristics of the Latin Americans, the international companies working on this continent can chart their performance better and have a greater understanding of that which could affect the management of their companies in this region.

ETHICS AND SOCIAL RESPONSIBILITY

DEVELOPING HYPERNORMS FOR CORPORATE CODES OF ETHICS

**Timo Herold,
University of Ulm**

**Christopher Stehr,
Karlshochschule International University, Germany**

ABSTRACT

With regard to the economic globalization, there are no obligatory rules at the global level. The problem for a company is determining which norms and values the company should follow. Should it comply with norms of the country of origin or with norms of the host country?

In this paper, norms will be developed and justified. For this reason, international regulations such as the human rights or the labor standards of the International Labor Organization (ILO) will be consulted. Norms for global corporate ethics will be derived from these codes. To verify and falsify respectively the established norms, the method of expert interviews is used. The interview partners are experts in the fields of religion, culture and persons from non-governmental organizations and company representatives.

Keywords: *business ethics, code of ethics, hypernorm, international standards, multinational corporations*

INTRODUCTION

Business ethics has become a focus of corporate management's attention in recent years. This is caused on the one hand by public pressure and on the other hand by a change of the strategy of the companies to respond to this pressure (Usrey, 2007). Both were activated by a public notice of scandals, like corruption or a violation of working or environmental standards (Zelizer, 2007 and Boatright, 2007). In light of such incidents, companies are compelled to deal with ethical questions just in the same way they do with their well-known business strategic questions (Déniz-Déniz, Garcia-Falcón, 2002).

In times of economic and entrepreneurial globalization, companies do not act nationally but internationally or globally. Thus, an adjustment of the corporate ethics to an international or global framework is necessary.

The globalization of companies is a challenge for corporate ethics. There are no compulsory laws at the global level because of an asymmetric development of the political and economical processes of globalization (Stiglitz, 2006). The companies cannot align their behavior to a global valid framework of norms and laws (Chan, 2007). There are no obligatory rules on global level to which a company could comply. Only some rudiments like the OECD guidelines for multinational corporations exist.

On the other side, national legislation is losing its influence on companies. If a company is acting on global level it is possible for the company to choose the system of laws which are best for the company.

The managers of these firms have to decide to which norms and values they want to conform in their daily work (Abländer, Brink, 2008). This decision meets the areas of external legitimating of the companies behavior and the internal coordination of the employee's behavior. Figure 1 shows that the deficient international law and the loss of influence of national law lead to the necessity of a voluntary self-commitment.

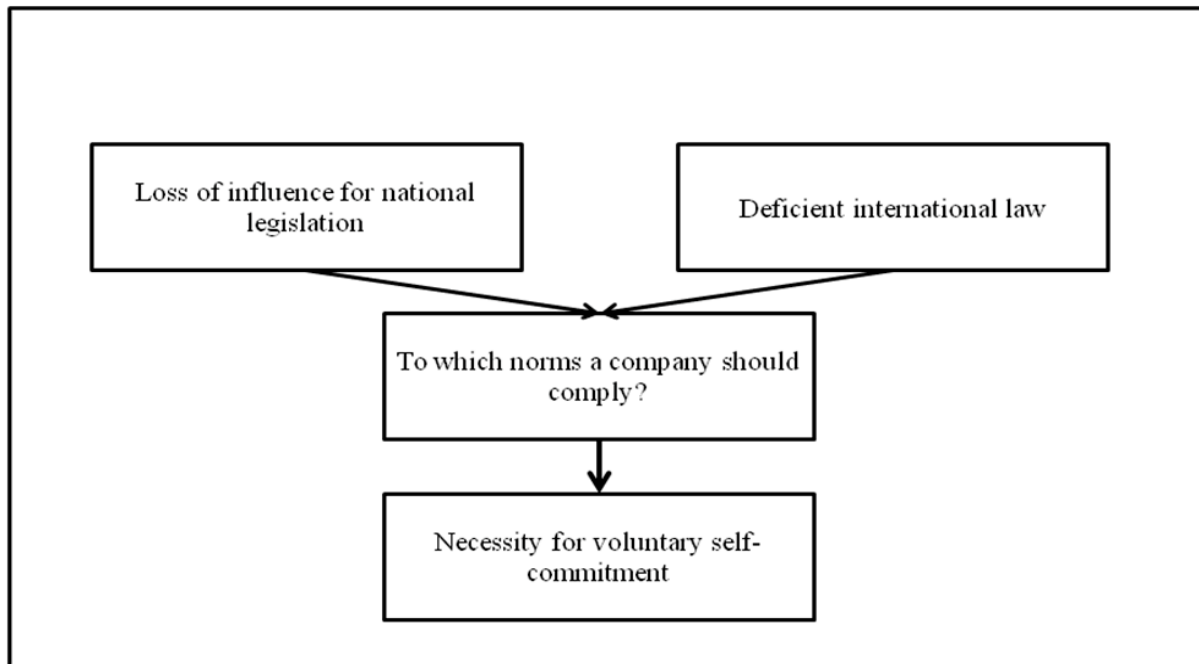

Figure 1: Necessity for voluntary self-commitment (own drawing)

Developing norms for a corporate code of ethics is the central goal of this research. These norms should take the challenges of entrepreneurial globalization into account. They should be applicable at the global level for companies. Do such norms exist? This is one of the central questions of this research.

In theory, such norms are called hypernorms. To find such hypernorms for business is necessary to develop a global code of ethics for companies. Linked to this are the questions: what are hypernorms and how can they be identified?

Based upon the theory of hypernorms by Thomas Donaldson and Thomas Dunfee (1999) this article presents a process for developing such norms. In the following step the process is used to point out hypernorms.

In a further step this article shows a code of ethics consisting of the norms which are derived from the process. This code of ethics can be a base for international or global companies to develop their own code.

METHOD

According to Donaldson and Dunfee (1999), hypernorms can be identified by a conformance of a norm with two criteria of a catalog, posted by these two researchers.

With regard to this theory, the method for the article was developed. In a first step, norms are derived from existing guidelines for companies at the international level. Examples for such guidelines are the 'guidelines for multinational corporations' of the organization for economic cooperation and development (OECD) or the Social Accountability 8000 standard (SA 8000), a standard developed and audited by a civil society organization. Figure 2 shows a compilation of all guidelines used. In the figure the guidelines are divided in those from governmental organizations like the UN or the OECD and in those of non-governmental organizations (NGOs).

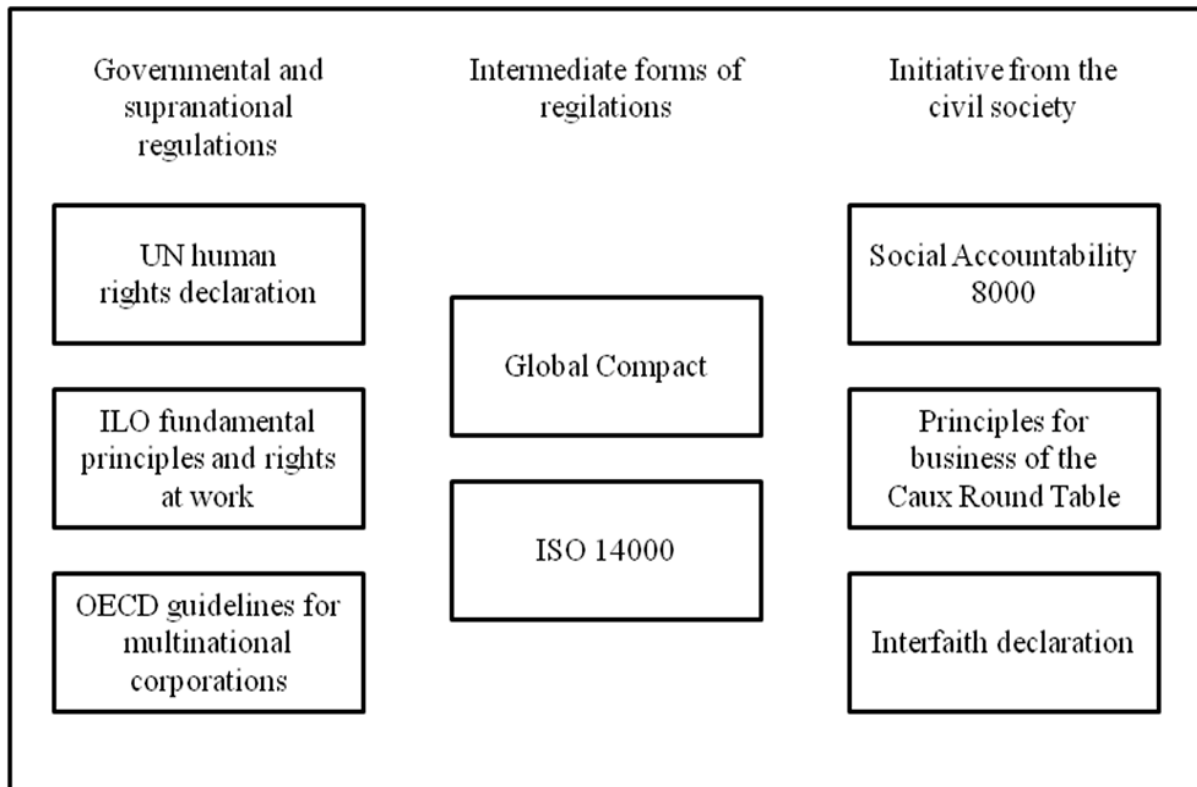

Figure 2: Sources for hypernorms (own drawing)

In a second step, the evolved provisional catalog of norms is verified by interviews. For this purpose, the method of structured interviews is adopted. The interviews were done with a questionnaire and administrated via phone.

The sample of interview partners is also caused by the theory of Donaldson and Dunfee. The interview partners are from the fields of religion, business and civil society. Overall, 13 persons were interviewed.

The interview partners were informed about each norm and asked about their accordance to the norm. They could evaluate the norms on a scale from one to ten. One in this case means 'full rejection' and ten means 'full acceptance'.

The results of the interviews were analyzed with Microsoft Excel. The answers are recorded in an Excel-Sheet. A norm was excluded by three categories. First, a norm cannot be a hypernorm if the arithmetic mean is less than eight. Second, a norm cannot be a hypernorm if two of the interview partners point their degree of acceptance with a five or lower or third, if one interview partner points his or her degree of acceptance with three or lower. This acts on the assumption that a low evaluation does not fit with a universal acceptance of a norm.

GLOBALIZATION AND ETHICAL NORMS

Possible strategies

In the process of entrepreneurial globalization a company has to make a decision to which ethical norms it would comply (Rothlin, 2006). There is an intercultural challenge because of a discrepancy in the system of ethical norms in different societies, caused by different cultural and religious traditions (Gurbaxani, Frühbauer, 2001).

For determining ethical norms in an international or intercultural context three possible strategies can be distinct, ethnocentrism, relativism and universalism.

In an ethnocentric view the ethical norms and values of one's own culture or society are superior to those of another culture or society (Messick, Bazerman, 1996). Accordingly, one's own moral conception could be transferred to the other culture without any problems (Schmid, 1996). The ethical norms of one's own culture

have an absolute validity in every other culture (Schäfers, 2004). The consequence for a company is that it had to follow the ethical norms of its country of origin. This can cause problems in the host country because the employees of the host country are in conflict with their local ethical norms.

The theory of relativism says that there is no preference for different systems of ethical norms. Two contradictory norms are on the same level and neither of them can be judged as ethically right or wrong (Hofstede, 2006). Because there are no criteria for judging a norm, a company has to follow the norms which are valid in the country the company operates (Beauchamp, Bowie 2001 and Kreikebaum et al. 2001). If local and home country norms conflict, the company should follow the local norms. For a company this can cause problems because of different expectations of the global stakeholders.

In the theory of universalism a system of ethical norms for all humans exists, independent from cultural or religious traditions. Respectively, universalistic norms are autonomous from time and space (Nill, 1994). The validity is not limited by national or cultural borders.

Hypernorms

The term hypernorm was coined by Donaldson and Dunfee (1994 and 1994). A hypernorm can be defined as a fundamental moral rule for all humans. Hypernorms are reflected in the religious, philosophical and cultural beliefs (Donaldson, Dunfee, 1994). They are those norms which are concretized in the respective social and cultural context and become manifested in the community (De George, 2006). The common validity of hypernorms is assumed (Donaldson, Dunfee 1995) and “hypernorms take precedence over the local norms.” (Spicer et al., 2004)

Because this research is based on the concept of hypernorms by Donaldson and Dunfee their theory is discussed deeper in this section. Hypernorms play an important role in the ‘Integrated Social Contracts Theory’ (ISCT). The concept of hypernorms limits relativism. At the same time, hypernorms are not exclusive because they take into account that there can be a difference in the cultural specification. Not every ethical norm can be traced back to a hypernorm and not all existing differences in the system of ethical norms are caused by a different cultural, religious or philosophical imprint (Dunfee, 2006). Therefore, hypernorms are a concept between the conflict of relativism and universalism. “ISCT avoids the extremes of either position by recognizing the dynamic relationships among the authentic ethical norms of diverse communities, bounded in turn by universal principles.” (Donaldson, Dunfee, 1999) Those universal principles are called hypernorms which are key limits on moral free space.

In ISCT they distinguish hypernorms in three categories, procedural, structural and substantive hypernorms. Procedural hypernorms are defined as “conditions essential to support consent in microsocial contracts” (Donaldson, Dunfee 1999). Second, structural hypernorms are necessary for political and social organization. They are principles that establish essential background institutions in society. The final category is substantive hypernorms. This substantive hypernorms are fundamental concepts of the right and the good. The substantive hypernorms are those hypernorms that apply to economic activity. (Donaldson, Dunfee, 1999). For this reason, the hypernorms mentioned and developed in this article are substantive hypernorms. Every time when the term hypernorm is used it refers to the definition of substantive hypernorms by Donaldson and Dunfee.

In their book “Ties that bind” Donaldson and Dunfee provide some norms that they have identified as hypernorms. They give examples for international bribery, gender discrimination, market research and workplace safety. The only claim that there are substantive hypernorms concerning those points but they don’t provide a formulation of such a hypernorm.

CORPORATE CODES OF ETHICS

Definition

Codes are the most popular measure to institutionalize ethical principals in business (Talaular, 2006). A code is a catalog of norms, which are binding standards for human behavior (Kunze, 2008). There are different names for codes of ethics in practice, such as corporate guidelines, business principles or codes of conduct. In this article the term code of ethics is used to summarize all its variable denotations.

The content of a code of ethics are the written business principles, ethical norms and values and rules of conduct of a company. It describes the responsibility for the internal and external stakeholders (Kunze, 2008). This content provides information about which behavior is thought of as ethically right or wrong in a company (Remisova, 2007 and Schwartz, 2004). In every case a code of ethics is a voluntary self-commitment (Kunze, 2008).

Besides corporate codes of ethics there are other codes of ethics in business, such as codes of branches or codes of profession. A code of branch is a self-commitment of a whole branch to follow specific ethical principles. Similarly, a code of profession describes the ethical guidelines of a profession like accountants (Ulrich et al., 1998).

The impact of codes

A code of ethics is addressed to different stakeholders. It regulates the relationship of a company to its employees, customers or suppliers. Other aspects such as environmental protection can be part of a corporate code of ethics as well (Kaptein, Schwarz, 2008).

If a code of ethics describes the desired behavior of the employees it can be considered as a guideline for behavior, which shows the employees what is thought of as ethically right or wrong. This guideline has an impact on the behavior of the employees if they accept the codified norms (Kunze, 2008). A code of ethics coordinates the individual activities in a company. As a result, the behavior of the employees is harmonized by a code of ethics (Talaucar, 2006). Therefore it is a part of the corporate culture, which also can be a source of information for new employees and help them to integrate into this corporate culture (Kunze, 2008).

A company can signalize its moral responsibility and define the range of the responsibility the company wants to take with a code of ethics (Kaptein, 2004). It is possible to name the ethical areas which seem to be important for the company (Talaucar, 2006).

In a global context, a code of ethics can help to complete the imperfect framework of regulations. In this context a company can strengthen its credibility and legitimate its activities and so generate trust from its stakeholders (Kreikebaum, 1996). The need to legitimate a company's activities is caused by the multifaceted ways companies are integrated in social communities and institutions and their dependence upon them (Logsdon, Wood, 2002). For this reason, companies strive to keep their social acceptance. Codes and linked ethical programs show the cognition of expectations of the society. Respectively, codes can legitimate the company's activities in a global environment (Weaver et al., 1999).

Challenges for a global corporate code of ethics

A corporate code of ethics is a part of the corporate culture. If a company wants to act internationally or globally with settlements in foreign countries, a company's own corporate culture will come into contact with the culture of the host country. The challenge at the global level for a code is the possible conflict between the codified norms and the ethical norms of the host country in which the code is transferred (Weaver, 2001). If the code is based on an ethnocentric view the code can cause problems with the employees of the host country. Either they do or do not accept the norms, but they have troubles with their conscience because of different cultural norms in their family. The codified norms should not be contradictory to the ethical norms in the host country.

A harmonization of the ethical corporate culture of the head office and the corporate culture of the settlements is possible only to a certain degree. A differentiation with respect to the host country's culture, grounded on a common base of ethical norms, can help to avoid a conflict. On the other side a desired harmonization effect is achievable by the common base, if the base is big enough (Jöstingmeier, 1994). Hypernorms can be a possible opportunity for a common base (Jackson, 1997). In an empirical study Spicer et al. (2004) show, that a hypernorm can be an orientation for managers when they are confronted with ethical decisions.

DEVELOPING HYPERNORMS FOR A CODE OF ETHICS

Donaldson and Dunfee say that there is evidence for norms to be hypernorms. If two or more of the indicators are fulfilled a hypernorm status is supported. For this purpose they posted the following list with eleven indicators for a hypernorm (Donaldson, Dunfee, 1999).

1. Widespread consensus that the principle is universal.
2. Component of well-known global industry standards.
3. Supported by prominent nongovernmental organizations such as the International Labour Organization or Transparency International.
4. Supported by regional government organizations such as the European Community, The OECD, or the Organization of American States.
5. Consistently referred to as a global ethical standard by international media.
6. Known to be consistent with precepts of major religions.
7. Supported by global business organizations such as the International Chamber of Commerce or the Caux Round Table.
8. Known to be consistent with precepts of major philosophies.
9. Generally supported by a relevant international community of professionals, e.g., accountants or environmental engineers.
10. Known to be consistent with findings concerning universal human values.
11. Supported by the laws of many different countries.

The empirical part is oriented on these indicators. With the study a minimum of two criteria should be fulfilled for each norm.

For this reason, the norms are derived from well-known industry standards (2) like the “SA 8000”, standards supported by regional government organizations (4) like the OECD “guidelines for multinational corporations” and standards supported by global business organizations (7) like the Caux Round Tables’ “principles for business”. Further the UN declaration of human rights is also used because it can be considered as universal (1 and 10).

To review the norms interviews are made with representatives from different religions (6), like Buddhism, Christianity, Hinduism, Islam, Judaism and Confucianism. Further the interviews are done with representatives from non-governmental organizations (NGO), like Transparency International or Amnesty International (3) and with representatives from companies (9).

With the design of the study the requirement to meet two of the criteria can be guaranteed. Figure 3 shows the process of developing a norm with regard to this requirement.

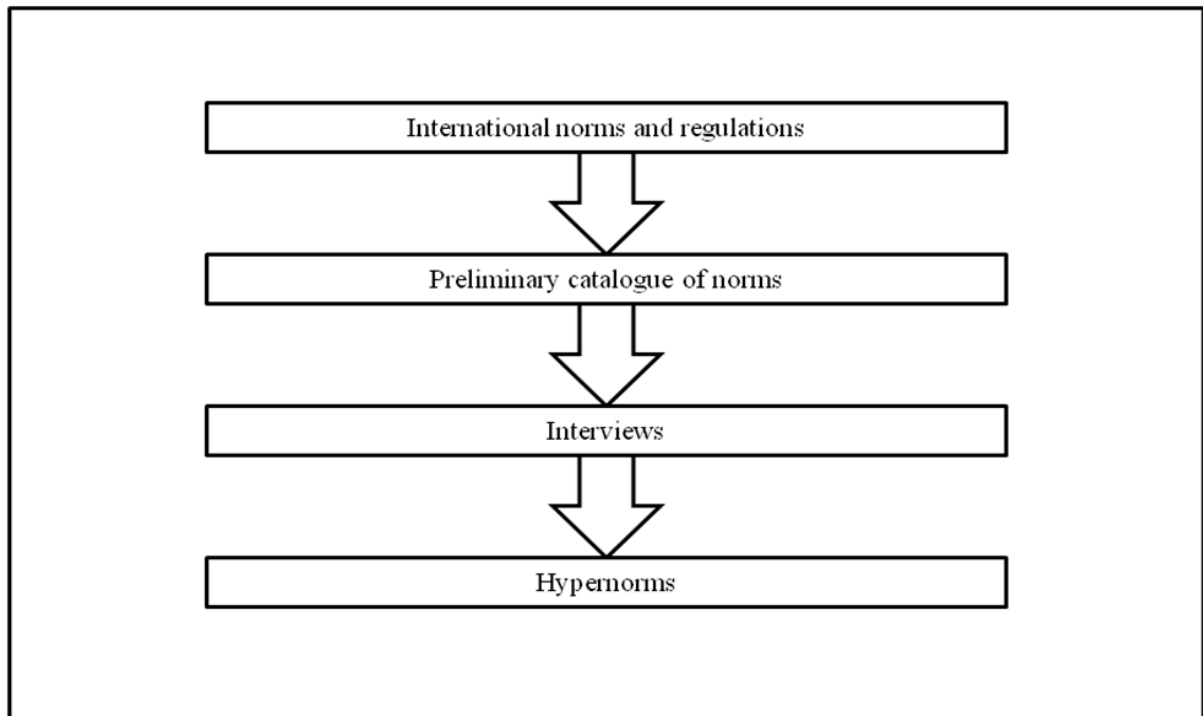

Figure 3: Process of developing a hypernorm (own drawing)

In a first step a catalogue of norms is derived out of the mentioned sources. This catalogue is proved by interviews with experts in the fields of religion and also with representatives from companies and NGOs. This approach is discussed more deeply in the method-section of this article.

RESULTS

By deriving norms out of the named standards it was possible to develop a preliminary catalogue of norms. This catalogue consisted of 35 norms. The norms described the responsibilities for the stakeholders of a company. In the first step the norms are separated in the following areas:

1. Responsibility for the employees
2. Responsibility for the costumers
3. Responsibility for the suppliers
4. Responsibility for the environment
5. Responsibility for the society

The reviewing of the norms with interviews leads to an exclusion of some norms. These norms are identified as inconsistent with the principles of religions, standards supported by NGOs or as not practicable for companies. In the end 16 norms could be identified as hypernorms with the definition given in this article. Some of the areas of responsibility are combined because in these areas only one or two norms are left. Following are the norms shown by their area of responsibility.

Responsibility for the employees

In the first interviews six norms could be developed as hypernorms for business.

1. A company must not put physical or psychological pressure on its employees. This means every type of physical punishment and physical or mental coercion.

2. A company has to provide conditions of work, which are not a danger for the health and security of its employees.
3. A company has to provide a remuneration, which makes it possible for its employees and their families to cover their basic need of food, clothing, accommodation and health care.
4. A company must not discriminate against its employees on the basis of race, color, gender or religious denomination
5. A company must not benefit from compulsory labor. Compulsory labor should be defined according to the ILO convention 39.
6. A company has to build a framework which makes it possible for its employees to act ethically, e.g. with a code of conduct.

Responsibility for customers and suppliers

The areas of responsibility for customers and suppliers are combined because of elimination of norms by interviews in these two areas. For this combined area a set of the following norms could be identified.

1. A company must provide its customers the quality and service agreed.
2. A company must provide all relevant information for the correct use of its products to its customers.
3. A company must commit itself not to conduct fraud or deception regarding the characteristics of its products.
4. A company must pay its suppliers according to the terms of price and date agreed.

Responsibility for environment and society

The two areas environment and society are combined to one area. In this combined area the following six norms are included.

1. A company has to commit itself to use as few natural resources as possible for its production. On the other side it has to recycle as many resources as possible.
2. A company has to review its business strategic decisions regarding possible environmental risks of its production process, products or services.
3. A company has to review its business strategic decision regarding its effects on the society where the company operates, e.g. plant closure.
4. A company must not be involved in corruption or support corruption by its employees.
5. A company has to make a contribution to the public budget by paying taxes in the country it operates. For this reason it is necessary to know and to comply with the tax laws of the different countries.
6. A company has to respect the intellectual property of other companies or persons.

CONCLUSION

The introduced hypernorms can be a basis for internationally active companies in developing their own code of ethics. They are a common basis for discussion in designing a code of ethics in an internationally active company. Such a code is the first step for a company to signalize its corporate social responsibility. Amending culturally specific ethical norms in every country is necessary because of the ethical norms that exist beyond the hypernorms. Hypernorms can serve conflicts which are thought to be illegitimate in every country. In situations where an action is thought to be right in one country and wrong in another, hypernorms are not in use. They are

just adaptive for culturally universal conflicts. The goal of this research was to develop and to justify hypernorms. It should face critique by Hartmann et al. (2003) or Soule (2002), who have said that the concept of hypernorms presented by Donaldson and Dunfee is too imprecise. The result must be noted differently. On the one hand we can say, that it is possible to develop hypernorms with the aforementioned process. On the other hand is the small sample of interview partners. Because of the small sample there can be no final conclusion as to whether the presented norms are universally valid. This research should give an impulse for further research in the area of norms for international or globally active companies.

ABSTRACT

Corporate social responsibility and business ethics are attractive research topics in the business literature. Several authors probed the effects of corporate social and ethical behavior on business performance, by investigating market, customer and employee responses. Although some equivocal findings do exist, extant literature shows a general support to the positive relations between corporate social behavior and business performance. However, experimental studies probing the interrelation between corporate social responsibility and questionable firm behavior (i.e. unfair treatment to customers and employees) are relatively scarce.

Accordingly, in this study, we examined the joint effects of a company's prosocial behavior and its unfair business practices on: (a) customers' assessments of the company and, (b) employees' intentions to seek employment with the company. For this aim, we conducted two experimental studies in the banking industry. We manipulated the information about a bank's level of commitment to prosocial behavior and its way of treatment to customers and employees; and examined how different combinations of these factors affect customers' evaluations of and employees' intentions to seek employment with the company. Research results showed that commitment to social and environmental causes can not smooth over the negative responses to unfair treatment to neither customers nor employees. When they are faced to make a choice between "everybody's goodwill" or "their own interests", both customers and employees are keen on their own benefit.

Keywords: Corporate Social Responsibility, Social Performance, Prosocial Behavior, Business Ethics, Customer Loyalty, Employee Commitment, Experimental Methodology

INTRODUCTION

Over the past 50 years, there has been a growing interest in the concept of Corporate Social Responsibility (CSR). Although there was opposing views in the past (Lewitt, 1958; Friedman, 1970); today, CSR is widely recognized as a strategic tool that enables firms to gain a competitive advantage (Drucker, 1984; Porter & Van der Linde, 1995; Porter & Cramer, 2006; Shrivastava 1995). The number of empirical studies which focuses on the impacts of CSR on business management has been continuously increasing. There is a rich literature on the relationship between a company's social performance and business performance, (Cochran & Wood, 1984; Orlitzky, Schmidt & Rynes, 2003; Pava & Krausz, 1996; Stanwick & Stanwick, 1998; Waddock & Graves, 1997). In spite of the fact that CSR is one of the most researched topics in the business literature, joint effects of a company's prosocial behavior and the way it treats its customers and employees, is currently under researched. Besides, most of the empirical work on corporate social responsibility and business ethics originate from developed countries. Research from underdeveloped or developing countries is relatively scarce. Still, a vast majority of the empirical research used the survey (questionnaire) method to investigate the issue of prosocial corporate behavior and its impact on customer attitudes and behavior. Experimental studies pursuing the effects of prosocial corporate behavior and business ethics on stakeholder responses are also rare. This study aims to

make up this shortcoming to some degree, by providing experimental evidence from a developing country (Turkey). Particularly, in this study we examine the joint effects of a company's prosocial behavior and its way of treatment to customers and employees on: (a) customers' assessments of the company and, (b) employees' intentions to seek employment with the company by using an experimental design. In the next section we provide a literature review on corporate social responsibility and business ethics. Following the literature review, experimental methodology and data analysis are presented. The paper is finished by concluding remarks and research implications.

CORPORATE SOCIAL RESPONSIBILITY (CSR)

Although its roots go back to early 20th Century, the modern concept of CSR has evolved since the 1950s, formalized in the 1960s and proliferated in the 1970s (Carroll, 1999). Many authors have tried to give a full definition to CSR however, an exact definition of CSR is elusive and yet to be pursued. There are two main schools of thought about the responsibilities of corporations. According to the shareholder view, the only responsibility of a business is maximizing its profits within the boundaries of the law (Lewitt, 1958; Friedman, 1970). On the other hand, the stakeholder view takes a broader scope of business responsibilities toward the society. Freeman's (1984) stakeholder theory posits that a corporation is composed of stakeholders that have, or claim, ownership, rights and interests in a corporation and its activities. Under this framework, anyone who might affect the business objective and anyone who might be affected by its realization are considered as stakeholders. A corporation's business activities may affect-directly or indirectly-the well-being of many stakeholders including shareholders, employees, customers, suppliers, local communities, natural environment, government and general society. Thus, a corporation has more responsibilities towards the society, than simply producing profits for its shareholders; and it must behave in a socially responsible manner. Socially responsible behavior includes a broad range of activities such as treating customers, employees and business partners fairly, supporting societal causes, protecting and improving the natural environment, and so on. In this respect, CSR is a broad term that has been defined in various ways. Among others, Carroll's definition depicting the four basic categories of corporate social responsibility enjoyed wide popularity. He proposed the following definition: "The social responsibility of business encompasses the economic, legal, ethical and discretionary expectations that society has of organizations at a given point of time" (Carroll, 1979). Later, he revised this definition and proposed a three domain model depicting economic, legal and ethical responsibilities (Schwartz & Carroll, 2003).

A considerable amount of academic research was pursued to identify the direction and magnitude of the relationship between prosocial corporate behavior and business performance (Aupperle, Carroll, & Hatfield, 1985; Balabanis, Phillips & Lyall, 1998; Cochran & Wood, 1984; McGuire, Sundgren, & Schneeweis, 1988; McWilliams & Siegel, 2000; Orlitzky, Schmidt & Rynes, 2003; Pava & Krausz, 1996; Waddock & Graves, 1997). But, these studies revealed equivocal results (Margolis and Walsh, 2001). On the other hand, a number of academic researches indicate a positive relationship between a company's CSR actions and consumers' purchase intentions and attitudes toward that company (Murray and Vogel, 1997; Creyer and Ross, 1996; Brown and Dacin, 1997; Lafferty and Goldsmith 1999; Auger, Burke, Devinney, and Louviere, 2003; Bhattacharya and Sen, 2003; Mohr and Webb, 2005). These studies indicated that a company's positive contributions to societal and environmental issues had a significant effect on attitudes toward the company and its brands, and increased the purchase intentions. However, some others found that CSR activities are not always directly related to consumer purchase intentions. The effectiveness of CSR activities may vary depending on the perceived motivation of the CSR (Barone, Miyazaki, & Taylor, 2000; Ellen, Mohr, & Webb, 2000). Another important finding is that, consumers are found to be more sensitive to negative CSR information about a company than positive CSR information (Sen & Bhattacharya, 2001).

Research examining the effect of CSR on employee behavior is relatively scarce. However, another set of academic research indicates a positive relationship between CSR and employee behavior (Cropanzano, Byrne, Bobocel, & Rupp, 2001; Rupp, Ganapathi, Aguilera, & Williams, 2006). Research by Turban and Greening (1997) and Greening and Turban (2000) documented that job applicant and employee perceptions of a firm's CSR affects how attractive these individuals perceive the firm to be. A field experiment by Sen, Bhattacharya and Korschun (2006) revealed that awareness of a company's CSR is associated with a greater intention to (a) consume the company's products, (b) seek employment with the company, and (c) invest in the company.

Most of the existing studies approach the issue of CSR with an "all-or-nothing way" and probe the impact of its existence or non-existence on business performance. Indeed, CSR has several aspects (i.e. societal, environmental, customer and employee relations) and a company may lack some aspects of CSR while it carries

out the others. For example, a company which takes action towards environmental sustainability may mistreat its employees at the same time, or the opposite may be true in practice. Thus, studying the interrelations between various aspects of CSR may provide important insights. In this perspective business ethics, in terms of how a company treats its customers and employees should also be examined.

BUSINESS ETHICS

Concern for ethical issues in the business world has significantly increased over the last four decades. Corporate scandals (from Watergate to Enron and recently Goldman Sachs) and catastrophic environmental accidents (i.e. Exxon Valdez and BP Oil Spill) have triggered both public and government scrutiny into business actions. Similar to public concern, an entire volume of academic research in business management has been devoted to ethics and social responsibility. Ethics most often refers to a domain of inquiry, a discipline, in which matters of right and wrong, good and evil, virtue and vice, are systematically examined (Brinkmann, 2002). Ethics is the "inquiry into theories of what is good and evil and into what is right and wrong, and thus is inquiry into what we ought and ought not to do (Beauchamp and Bowie (1983; 3). Business ethics is a set of established rules, standards, or principles for morally "right" behavioral conduct in specific situations (Stajkovic and Luthans, 1997). It requires that the organization or individual behaves in accordance with the carefully thought-out rules of moral philosophy (Robin and Reidenbach, 1987). When a company is described as being ethical, then, this is usually referring to the degree to which it behaves in a moral or fair way (Cacioppe, Forster, Fox, 2008). Most of the models that have emerged are the products of scholars in psychology or related disciplines, including organizational behavior and marketing (Tseng, Duan, Tung, Kung, 2009). Among others, Trevino (1986) proposed a general theoretical model whereas Ferrell and Gresham (1985), Hunt and Vitell (1986), and Dubinsky and Loken (1989) offered models that focus on marketing ethics. Another considerable amount of academic research is devoted for identifying the consequences of corporate social and ethical behavior.

Extant research shows that responsible and ethical business practices pay off in the long run in better customer and employee relations (Alexander, 2002; Creyer and Ross, 1996; Folkes and Kamins, 1999; Smith and Cooper-Martin, 1997; Whalen et al., 1991). A growing number of polls, commercial reports and academic research indicate the positive effects of CSR on business performance and stakeholder responses. According to Cone's "Cause Evaluation Survey", more than two-thirds (69%) of Americans say they consider a company's business practices (such as impact on the environment, treatment of employees and financial transparency) when deciding what to buy (Cone, 2007). Murray and Vogel (1997) found that CSR actions significantly predict purchase intentions. Creyer and Ross (1997) determined that consumers' purchase intentions were related to whether the company's ethics record exceeded their expectation. Auger, Burke, Devinney, and Louviere, (2003) found that consumers expressed willingness to pay more for ethically made products.

As good practices of business ethics may carry benefits, questionable or unfair business practices may create serious penalties for companies. The recent spate of corporate scandals in the USA, Europe, South-East Asia and Australia have demonstrated that unethical and immoral behavior by business organizations can have significant negative consequences for shareholders, employees, pension investment funds, customers and the many small businesses that had been trading with these companies (Cacioppe, et al., 2008). Unethical behavior may harm sales, worsen employee fraud, productivity and the risks from scandals. It may worsen employee retention, absenteeism and sabotage behavior (Josephson Institute, 2009). Employee attitude and behavior are heavily influenced by fairness of organizational actions towards them (Cropanzano, Byrne, Bobocel, & Rupp, 2001). Unethical firm behavior may damage firm reputation and decrease consumer trust.

Corporate social responsibility and business ethics are intertwined subjects and both of them affect business performance. Besides, they interrelate and complement each other. However, serious criticism rose from various academicians towards CSR and business ethics. According to the most famous opponent, Milton Friedman, ethics only concerns individuals, and only people can have responsibilities. There is one and only one social responsibility of business- to use its resources and engage in activities designed to increase its profits so long as it engages in open and free competition without deception and fraud (Friedman, 1970). According to Henderson, CSR is hostile to capitalism and the market economy, putting undue pressure on businesses (Henderson, 2001). Some others took a more cynical perspective and argued that the genuine interest of CSR activities is not philanthropy. They believe that CSR programs are undertaken to distract the public from ethical questions posed by their questionable operations. They also argue that some corporations start CSR programs for the commercial benefit they enjoy through raising their reputation with the public or with government (McKibben, 2006). From this perspective CSR is a precarious tool that may be used to deceive different stakeholders such as customers,

employees, government and the general public. When taking the opponents' view (who says that the genuine interest in the concept of CSR is still profit maximization by deceiving the society) into account, there is an important question to be answered: Can prosocial corporate behavior be (mis)used to conceal unfair business practices? In order to answer this question, we designed two experimental studies to explore whether the CSR activities can be used to smooth over the negative responses to unfair business practices such as mistreating customers and employees. Since they were exploratory studies, no specific hypotheses are developed in advance.

STUDY 1: CSR AND TREATMENT TO CUSTOMERS

Research Design

A 2X2 between subjects experimental design was used to examine how CSR activities and way of treatment to customers interactively affect customers' evaluations of a company. The first experimental factor was the information about a bank's prosocial behavior (strong vs. weak). The second factor was information about how the bank treats its customers (fair vs. unfair). These factors were oppositely manipulated in a short story, where the name of the bank was disguised. Research instrument was a questionnaire, which had the short story on one side, and the relevant questions on the other side. Two versions of the short story were produced for generating the experimental conditions. In the first version (prosocial but unfair to customers), the bank's approach to social matters was described in a positive perspective (depicting a strong social performance), whereas its way of treatment to the customers was described in a negative manner (i.e. showing an outrageous commitment to profit maximization by charging high annual membership fees, excessive transaction fees and high interest rates) in the same story. In the second version (fair to customers but not prosocial), it was the opposite. (The Bank treats its customers fairly with an acceptable profit orientation but it is criticized for not being responsible to the natural environment and to the needs of the community).

A convenience sample of 120 adults (customers of a multinational bank functioning in Turkey) participated in this study. Experiments were conducted by a bank officer, who had been instructed about the study. The mean age of subjects was 33 years (range:18-59; sd.=8.55) and 62% were male. Subjects were randomly and evenly assigned to either experimental condition. The dependent variable was subjects' assessments of the focal bank (perceived service quality, overall image, intention to become a customer), which were assessed with 9 Likert type scales. Level of agreement or disagreement with items were reported on five point scales, ranging from 1= Completely Disagree to 5= Completely Agree. Scale items were generated by the researchers from relative literature. In order to check the effectiveness of the manipulations, a direct question was asked at the end of the questionnaire.

Data Analysis and Results

In order to check the experimental manipulations, subjects were asked to indicate the weakest aspects of the narrated Bank. In the "Prosocial but unfair to customers" version, a majority of the respondents (80%) indicated "customer orientation" as the weakest aspect of the focal firm. In the "Fair to customers but not prosocial" version, a majority of the respondents (82%) indicated "corporate social responsibility" as the weakest aspect of the focal firm. These results show that experimental manipulations worked properly.

Subjects' evaluations of the focal company were measured by using a nine-item scale. Factor and reliability analyses were carried out to examine the dimensionality and reliability of the dependent measure. Scale dimensionality was assessed by exploratory factor analyses. This single factor explained 77.8% of the total variance (eigenvalue=7.005). Thus, a composite measure was created by averaging the responses on nine items. The composite variable was named as "Customer Evaluations". The Cronbach alpha reliability of the composite measures was .96. Table 1 shows means and standard deviations of the scale items for different experimental conditions.

Table 1: Customer Evaluations: Scale items' means and standard deviations according to different experimental conditions

SCALE	ITEMS	Prosocial but unfair		Fair but not prosocial	
		(n=60)	(n=60)	(n=60)	(n=60)
		Mean	Sd.	Mean	Sd.
	This bank has a good reputation amongst customers	2,40	1,14	3,83	0,94
	This bank provides high quality products and services	2,88	1,35	4,20	0,75
	This bank keeps its promises	2,83	1,23	3,92	0,91
	Overall image of this bank is positive	2,68	1,19	3,18	1,10
Customer Evaluations	I would love to be a customer of this bank	2,45	1,06	3,88	0,99
	I can safely entrust my money and other savings to this bank	2,77	1,11	3,85	0,88
	I would recommend this bank to my friends and relatives	2,50	1,07	3,63	0,97
	If I was a customer of this bank, I would never think to switch to another	2,48	1,14	3,82	0,98
	This bank has a good reputation amongst customers	2,40	1,14	3,83	0,94
	OVERALL	2,57	0,98	3,78	0,82

Mean scores of the dependent variable in different experimental conditions were compared by using independent samples t tests. T test results indicated a significant difference between the different experimental conditions ($t(118) = 7.299$; $p < 0.001$). "Prosocial but unfair to customers" treatment attained a mean score which was lower than the mid-point ($M = 2.57$; $sd = .98$). "Fair to customers but not prosocial" version attained a relatively higher mean score ($M = 3.78$; $sd = .82$). These results show that a strong social performance is not sufficient to smooth over the negative customer evaluations to unfair business practices.

STUDY 2: CSR AND TREATMENT TO EMPLOYEES

Research Design

A similar 2X2 between subjects experimental design was used to examine how CSR activities and way of treatment to employees interactively affect employees' intentions to work for a company. The first experimental factor was the information about a bank's prosocial behavior (strong vs. weak). The second factor was information about how the bank treats its employees (fair vs. unfair). These factors were oppositely manipulated in a short story, where the name of the bank was disguised. Research instrument was a questionnaire, which had the short story on one side, and the relevant questions on the other side. Two versions of the short story were produced for generating the experimental conditions. In the first version (prosocial but unfair to employees), the bank's approach to social matters was described in a positive perspective (depicting a strong social performance), whereas its way of treatment to employees was described in a negative manner (i.e., laying-off employees, reducing their wages and salaries or hindering personal development under the pretext of the global financial crisis) in the same story. In the second version (fair to employees but not prosocial), it was the opposite (The Bank treats employees with respect and dignity but it is criticized for not being responsible to the natural environment and to the needs of the community).

A convenience sample of 165 adults (employees of a public bank functioning in Turkey) participated in this study. Experiments were conducted by a mid-level bank administrator, who had been instructed about the study.

The mean age of subjects was 29 years (range:22-39; sd.=3.73) and 50% were male. Subjects were randomly assigned to either experimental condition. The dependent variable was subjects' intentions to work for the narrated bank, which were assessed with 9 Likert type scales. Level of agreement or disagreement with items were reported on five point scales, ranging from 1= Completely Disagree to 5= Completely Agree. Scale items were generated by the researchers from relative literature. In order to check the effectiveness of the manipulations, a direct question was asked at the end of the questionnaire.

Data Analysis and Results

In order to check the experimental manipulations, subjects were asked to indicate the weakest aspects of the narrated Bank. In the "Prosocial but unfair to employees" version, a vast majority of the respondents (99%) indicated "quality of workplace" as the weakest aspect of the focal firm. In the "Fair to employees but not prosocial" version, all of the respondents indicated "corporate social responsibility" as the weakest aspect of the focal firm. These results show that experimental manipulations worked properly.

Subjects' intentions to work for the focal bank were measured by using a ten-item scale. Factor and reliability analyses were carried out to examine the dimensionality and reliability of the dependent measure. Scale dimensionality was assessed by exploratory factor analyses. This single factor explained 86.9% of the total variance (eigenvalue=8.69). Thus, a composite measure was created by averaging the responses on nine items. The composite variable was named as "Employment Intentions". The Cronbach alpha reliability of the composite measures was .98. Table 2 shows means and standard deviations of the scale items for different experimental conditions.

Table 2: Employment Intentions: Scale items' means and standard deviations according to different experimental conditions

SCALE	ITEMS	Prosocial but unfair (n=78)		Fair but not prosocial (n=87)	
		Mean	Sd.	Mean	Sd.
Employment Intentions	I would love to work for Bank XYZ	1,59	0,65	4,46	0,55
	I would accept a lower salary to work for Bank XYZ	1,88	0,56	4,30	0,55
	I would be proud to work for Bank XYZ	1,32	0,52	4,32	0,47
	If I worked for Bank XYZ, I would never think to quit.	1,53	0,57	4,22	0,44
	If I worked for Bank XYZ, my job performance would be on the top	1,41	0,63	4,25	0,44
	If I worked for Bank XYZ, I would perform with high loyalty	1,86	0,50	4,69	0,54
	If I worked for Bank XYZ, I would be satisfied with my job	1,37	0,61	4,67	0,47
	Working for Bank XYZ would satisfy me emotionally	1,54	0,57	4,47	0,55
	Working for Bank XYZ would be a pleasure for me	1,55	0,57	4,59	0,58
	If I worked for Bank XYZ, I would be highly committed to my job	1,88	0,53	4,03	1,32
OVERALL		1,59	0,34	4,40	0,18

Mean scores of the dependent variable in different experimental conditions were compared by using independent samples t tests. T test results indicated a significant difference between the different experimental conditions ($t(163) = 66.535$; $p < 0.001$). “Prosocial but unfair to employees” treatment attained a mean score which was significantly under the mid-point ($M = 1.59$; $sd = .34$). “Fair to employees but not prosocial” version attained a relatively higher mean score ($M = 4.4$; $sd = .18$). These results show that a strong social performance can not smooth over the negative responses to unfair treatment to employees.

OVERALL RESULTS AND CONCLUSION

In this study, we examined the joint effects of a company’s social performance and its way of treatment to customers and employees on: (a) customers’ evaluations of the company and, (b) employees’ intentions to seek employment with the company. For this aim, we conducted two experimental studies in the banking industry. We manipulated the information about a bank’s level of commitment to prosocial behavior and its way of treatment to customers and employees; and examined how different combinations of these factors affect customers’ and employees’ responses.

In the first study, data analysis revealed that no matter how deep the bank is involved in social responsibility activities, unfair treatment to customers (commitment to profit maximization rather than customer satisfaction) damaged the perceived reputation of the bank, and significantly decreased respondents’ intentions to purchase services from that bank. Customer evaluations of the focal bank was significantly unfavorable in the “prosocial but unfair to customers” condition, compared to the “not prosocial but fair to customers” condition. The second study revealed similar results concerning the employee responses. It is found that commitment to social and environmental causes could not smooth over the negative responses to unfair treatment to employees. Intentions to seek employment with the focal bank was significantly lower in the “prosocial but unfair to employees” condition than the “not prosocial but fair to employees” condition.

These results provide important managerial implications for the banking industry, concerning the issue of corporate social responsibility and ethical treatment to customers and employees. It is seen that, when they are faced to make a choice between “everybody’s goodwill” or “their own interests”, both customers and employees are keen on their own benefit. CSR activities can not conceal unfair business practices nor they can help reducing negative responses to unfair business practices. Yet, taking the opponents’ view (who says that the genuine interest in the concept of CSR is still profit maximization by deceiving the society), these results imply that banking executives must be very careful when defining their expectations from the CSR activities. Help from CSR can not be sufficient to repair the damage to their reputation which is caused by unfair treatment to customers and employees.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

The study has some limitations. First of all, it was conducted with the use of a convenience sample in a contrived setting. Using artificial narratives about a hypothetical bank in a questionnaire may have created a higher level of task involvement than a natural setting would do. But this does not compromise the internal validity of the experiment, since we believe that this factor might have affected the different treatment groups in a similar way. However, there is a need to replicate this research with the use of a more representative samples. Future studies would gain external validity by using probability samples of wider populations. We also used a fictitious company to avoid any effects due to previously acquired knowledge. In future research, more realistic experimental settings may be designed by using real reports or news about factual firms.

WHO'S MOBBING WHOM

Fatma Zehra SAVI
Behiç ÇELEBİ

Kastamonu University, TURKEY

ABSTRACT

The term “mobbing”, which includes workplace terrorizing, pressure, frightening, belittling and psycho-terror, is defined as the presence of systematic, directed, unethical communication and antagonistic behaviour by one or more individuals. This research was conducted as a descriptive and cross sectional study with the purpose of determining the mobbing experienced by womens who work in banking sector in Turkey. The research participants were 400 women working in banking sector of whom 220 employees and 180 employee in public and private banks. A questionnaire developed by the researchers in the light of information in the literature was used for data collection and had four sections including the participants’ demographic characteristics and questions asking about mobbing behaviours, reaction to mobbing incidents and actions taken to escape from the mobbing. The overwhelming majority (86.5%) of the women workers participating in the research reported facing mobbing behaviour in the work place in the last 12 months. The women employees working at the bank faced statistically significantly more mobbing behaviours than women employee ($p \leq 0.02$). It was determined that the empolees who faced mobbing behaviours gave various physiological, emotional and social reactions to these incidents.

INTRODUCTION

Mobbing is the word which originates from English verb “to mob”, which means to crowd around andjstle or annoy, especially in anger or to crowd into or to attack in large numbers and overwhelm. We use it for the systematic persecution of an individual employee aimed at forcing him to quit his job. This has been often preceded by an effort of employee to get his legal rights.

No generally accepted definition of workplace mobbing or bullying exists, but most definitions refer to persistence and negative effects perceived by the victim. Mobbing is mentioned when persecution becomes regular, at least once per week, lasting 6 months or longer. Leymann (2004) states that “Psychological terror or mobbing in working life involves hostile and unethical communication which is directed in a systematic manner by one or more individuals, mainly toward one individual, who, due to mobbing, is pushed into a helpless and defenseless position and held there by means of continuing mobbing activities. These actions occur on a very frequent basis (statistical definition: at least once a week) and over a long period of time (statistical definition: at least six months’ duration). Because of the high frequency and long duration of hostile behavior, this maltreatment results in considerable mental, psychosomatic and social misery”.

Other definition by Einarsen and Skogstad (1996) is: “Bullying and harassment occurs when one or more individuals, repeatedly over a period of time, are exposed to negative acts (be it sexual harassment, tormenting, social exclusion, offensive remarks, physical abuse and the like) conducted by one or more other individuals. There must also exist an imbalance in the power relationships between the two parties. The person confronted has to have difficulties defending him/ herself in this situation. It is not bullying if two parts of approximately equal “strength” are in conflict or the incident is an isolated event”.

Mobbing is offensive behavior through vindictive, cruel, malicious or humiliating attempts to undermine an individual or group of employees. Mobbing is also persistently negative attacks on personal and professional performance, typically unpredictable, irrational and often unfair. This abuse of power or position can cause such chronic stress and anxiety that the employees gradually lose belief in themselves, suffering physical ill-health and mental distress as a result. Mobbing is a significant factor in stres at work, accounting for between a third and half of all employment-related sickness absence due to the stress. It is an emotional injury that impacts a target's mental and physical health. Mobbing is a workplace safety and health issue (Davenport, Schwartz, Elliott, 1999).

According to International Labor Organization, the most important problem in the work place is psychological abuse at the beginning of the new millennium. Psychological abuse has become more widespread because of legal regulations, particularly in public facilities, against physical violence. For this reason victims of mobbing are subjected to attitudes and behaviours that can be psychological abuse, such as, terrorizing, annoying, excluding, being considered parenthetical, belittling, being deprived of some organization resources, isolating, being treated unjustly in the use of organizational resources, being prevented from or delayed from claiming rights (Leymann 1990, Einarsen 2000, Cowie et al. 2002). These behaviours towards the individual can be from the facility's management, superiors, coworkers in the same position, or subordinates (Einarsen 2000, Fox & Stallworth 2003). The individual or individuals administering psychological abuse mount an organized front against the individual for systematic, long-term, frequently occurring bullying behaviours that also affect others. Others who work in the facility act as if they do not see these behaviours, close their eyes to them or even provoke them and the victim feels helpless facing so many powerful people and mobbing occurs (Leymann 1990, Einarsen 2000, Cowie et al. 2002).

These actions, which occur frequently and over a long time, are the most serious and effective causes of workplace stress. During the mobbing the targeted individual is helpless, unprotected and alone in the workplace (Leymann 1990). Individuals who are exposed to psychological abuse experience various physiological, psychological and social problems related to high levels of stress and anxiety. The victims have decreased quality of life and work, their health is affected and their social relationships are damaged. The victims who lose their jobs and, most importantly, their health, in this process are affected economically, physically and emotionally.

METHODOLOGY

The phenomenon of mobbing is being analyzed for three decades in the West. Leymann(1990, 1993, 1996) the scientist from Sweden is considered to be the initiator of the research. The term 'mobbing' is defined as antagonistic behaviors with unethical communication directed systematically at one individual by one or more individuals in the workplace. This cross-sectional and descriptive study was conducted for the purpose of determining the mobbing behaviors encountered by women staff in banking sector in Turkey, its effect on them, and their responses to them.

Data were collected through questionnaire. The constructs in our study are developed by using Leymann Inventory of Psychological Terrorization (LIPT; Leymann 1990). LIPT is a 45 item scale that contains items concerning mobbing at work to be completed by women victims. Respondents indicate how often they experience each item at work using 5 point ("Never" to "Daily") scale. Of the victims who participated in the research 220 (%55) were employees and 180 (%45) were employee. Data were collected between January and February 2010. The purpose of the present study is to find out who performs the mobbing act by examining the issue mainly from the viewpoint of women employees. In other words, the study aims at answering the question of whether the women employees are the victims or the offenders of the mobbing acts.

A four section questionnaire was used in data collection that was prepared after a literature review. In the first section the participants demographic information (age, education, length of time employed in banking, length of time employed in current facility and position etc.) were requested. In the second section questions were asked about mobbing behaviours, in the third emotional, physiological and organization behaviours experienced in reaction to mobbing and the fourth section is about the women is the object or the subject of mobbing.

Statistical analysis of the data was conducted with the SPSS 16.0. The reliability test was conducted to verify the internal consistency of the variables obtained through the questionnaire. The Cronbach's alpha value (α) is found 0.8677, which is higher than the minimum acceptable level suggested by Nunnally (1978). Descriptive statistics were used in particular in the data analysis (frequency, percentage, mean, standart deviation). Correlation and multi-regression analysis were conducted to determine the relationship between "mobbing behaviours" and womens demographic characteristics. The last analysis was carried out with independent sample t-test to determine whether or not there was a difference in mobbing between employees and employee.

DEMOGRAPHIC FEATURES

The participants mean age was 30.56 years (std.dev.6.83), their total years of employment in banking 10.55 (std.dev.7.00) and their number of years of employment in their facility was 8.48 (std.dev.6.58). A large number of participants %40 were graduates of university, %31.7 were two year associate degree and the others were graduates of high school.

MOBBING BEHAVIOURS

Statistical information about the participants experiences with mobbing behaviours are shown in Table 1. The item total score correlations varied between 0.44 and 0.65 and the correlation for all of the items was at a statistically significant level ($p \leq 0.01$). The Cronbach's alpha internal consistency for all the items was determined to be 0.93.

Table 1. Frequency, mean, standard deviation (SD) and item total correlation of participants reports of 'mobbing behaviours'				
	% experienced at all (N=400)	Mean	SD	r*
Having someone speak about you in a belittling and demeaning manner in the presence of others	55,2	1,31	1,37	0,64
Having untrue things said about you	45,7	1,06	1,33	0,59
Having someone behave in a demeaning manner (using body language) towards you in the presence of others	40,4	0,93	1,30	0,63
Having someone suggest that you are not psychologically well	15,8	0,32	0,84	0,53
Being forced to do a job that will negatively affect your self-confidence	30,5	0,70	1,21	0,58
Having your honesty and reliability questioned	31,1	0,71	1,21	0,58
Having false rumours said about your private life	23,6	0,52	1,07	0,49
Being verbally threatened	35,8	0,72	1,15	0,46
Facing behaviours such as slamming fist onto table	21,8	0,46	1,01	0,45
Always having your performance evaluated negatively	31,3	0,69	1,16	0,61
Being blamed for things you are not responsible for	50,5	1,20	1,40	0,57
Being held responsible for negative results of work done with others	42,6	0,96	1,27	0,50
Always having errors found in your work and work results	46,1	1,12	1,62	0,47
Always having your professional adequacy questioned in the work you do	30,5	0,66	1,21	0,55
Having unfair reports written about you	17,0	0,30	0,77	0,44
Having you feel like you and your work are being controlled	50,1	1,36	1,59	0,38
Not being given an opportunity to prove your self	31,3	0,85	1,40	0,61
Having the decisions and recommendations you have made criticized and rejected	41,4	1,01	1,38	0,65
Having duties that you are responsible for taken from you and given to others in lower positions	14,5	0,33	0,92	0,56
Being inspected by others in positions below yours	19,4	0,46	1,09	0,51
Considering the work you have done as without value and importance	40,8	1,20	1,60	0,52
Not being informed about social meetings that are organized	24,6	0,61	1,20	0,56
Not being able to get an answer to your request for a meeting and to talk	19,4	0,48	1,11	0,56
Being treated at your workplace as if you aren't seen and don't exist	27,7	0,73	1,31	0,63
Frequently being interrupted while you are speaking	32,1	0,81	1,29	0,63

Not receiving an answer to e-mail you have sent and telephone calls	13,5	0,34	0,92	0,60
Preventing or forbidding coworkers from talking with you	11,1	0,26	0,83	0,54
When you enter an area knowingly leaving the area where you are	15,5	0,31	0,82	0,52
Holding you responsible for work more than your capacity	37,5	0,93	1,41	0,48
Pressuring you to quit your job or change your workplace	14,7	0,33	0,94	0,50
Hiding information, documents and material from you that you need for your job	13,1	0,33	0,95	0,59
Harming your personal things	7,9	0,16	0,59	0,44
Having physical violence used	7,3	0,14	0,54	0,46
Total mobbing behaviors	86,5	22,25	21,95	Total $\alpha = 0,93$

The most common mobbing behaviour experienced by the participants was determined to be “having someone speak about you in a belittling manner in the presence of others” (%55.2). When asked from whom they experienced this behaviour, %75.8 of participants reported that it was from their employee, %24.2 was from customers. The second most common mobbing behaviour experienced was “being blamed for things you are not responsible for” (%50.5). This behaviour was from employee by %69.4, from customer %30.6. The third most commonly experienced mobbing behaviour was “having you feel like you and your work were being controlled” (%50.1). This behaviour was most frequently from their employee (%86.8) followed by customers (%13.2).

REACTION TO MOBBING

Statistical information about the participants reactions to mobbing behaviours are shown in Table 2. The item total score correlations varied between 0.36-0.77 and statistically significant correlation was shown between the items ($p \leq 0.01$). The Cronbach's alpha internal consistency coefficient for all the items was determined to be 0.95.

	% experienced at all (N = 400)	Mean	SD	r*
I feel extremely sad when I remember the hostile behaviours towards me	58,8	1,43	1,58	0,64
I repeatedly remember/relive the behaviours that were done	56,2	1,24	1,43	0,75
I am afraid vvhhen I go to vvork, I do not want to be at work	40,1	0,79	1,22	0,70
I feel lonely	44,0	0,94	1,32	0,68
I do not trust anyone at my workplace	48,6	1,10	1,43	0,65
I feel like I have low self-confidence and respect	33,7	0,66	1,12	0,63
I feel decreased commitment to my work	46,2	1,00	1,34	0,70
My work life is negatively affecting my Life away from work (my marriage and family)	54,7	1,36	1,68	0,67
I feel guilty most of the time	36,6	0,56	0,88	0,58
I feel like I really want to cry	52,5	1,00	1,26	0,77
I feel like I have been betrayed	36,0	0,75	1,20	0,70
I have a fear that something bad is going to happen for no apparent reason	43,6	0,90	1,30	0,74
I feel very disturbed and easily frightened	35,8	0,70	1,18	0,69
My sleep is disturbed	48,5	1,27	2,43	0,50
I spend most of my time vvith subjects not directly related to my work	45,3	1,02	1,39	0,49
I give the appearance of being very busy even when I have not done	13,7	0,26	0,76	0,45

anything				
I move slowly vvhen I need to do something	15,3	0,27	0,76	0,38
I take out the pain I have suffered on others by belittling them	75	0,14	0,59	0,36
I have conflict with my coworkers at my workplace	36,9	0,58	0,90	0,55
I have trouble concentrating on a task	38,4	0,66	1,01	0,66
I am not able to do any work at my workplace	16,8	0,27	0,70	0,51
I am making mistakes in my work	32,1	0,46	0,79	0,45
Sometimes I think about taking revenge on people vvho have acted against me	31,1	0,52	0,93	0,53
I am receiving support from a psychologist because of the behaviours I have been exposed to	14,3	0,27	0,76	0,38
I curse those who have done these things to me	31,2	0,71	1,30	0,52
I have uncontrolled movements/tics	16,0	0,33	0,88	0,45
I experience changes in my blood pressure	39,4	0,89	1,32	0,54
I have gastrointestinal complaints	52,9	1,38	1,62	0,65
I want to eat excessively or I have decreased appetite	53,5	1,42	1,63	0,70
I am using alcohol, cigarettes or drugs (substances)	36,2	1,03	1,60	0,48
I feel stressed and tired	72,9	2,13	1,69	0,69
I have headaches	69,5	1,84	1,61	0,64
I have chest pain, heart palpitations	44,0	1,01	1,45	0,66
I think I am depressed	50,1	1,19	1,50	0,73
Total reaction to mobbing behaviours	85,1	42,06	32,88	Total □= 0,95

It can be said that physiological reactions were the most frequent reactions of the participants to the mobbing behaviours. Their reactions included feeling tired and stressed (%72.9), having headaches (%69.5), eating excessively or not having an appetite (%53.5) and having gastrointestinal complaints (%52.9). In addition most common emotional reactions were that they they experienced extreme sadness when they remembered the behaviours against them (%58.8), they frequently remembered the behaviours (%56.2), thier lives away from work were negatively affected by these (%54.7) and they felt like they wanted to cry (%52.5).

DIFFERENCE IN MOBBING BETWEEN WOMEN EMPLOYEES AND WOMEN EMPLOYEE

Much studies in literature show men attack men and women attack women. In our study all of our participants were just only the womens. We tested this thesis in our women employees and % 61 of victims said their mobber were men. %70.9 of the women employees were mobbed by a women employee. More mobing behaviours were experinced by employees (20.65 Std.Dev.22.77) compared with employee (25.12 Std.Dev.20.14) and this difference was found to be statistically significant ($t=-2.20; p \leq 0.02$)

Regression analysis was used to examine the difference in mobbing between women employees and women employee ($\beta=0.16; F=6.38; p < 0.002$). It was determined that %12 ($p < 0.005$) of the employees facing of mobbing behaviour was effected by their working with a women employee and %11($p < 0.05$) was effected by their being in a lower position.

CONCLUSION

This paper discussed mobbing from the perspective of women employees and women employee in banking sector. In this study a large percentage of employees (%86) who participated in the research had faced bullying behaviours one or more times within the last 12 months and the majority of these behaviours were from their managers. Women are especially at risk of being targeted particularlyly by other women. The highest incidence of abuse was perpetrated by women against other women %84 of the time. Moreover, those women in management and supervisory positions may be particularly susceptible. Furthermore, it is claimed that women employee keep competent women from being noticed and promoted with “underhanded” or cover

behaviours. These covert behaviours include spreading rumours and hearsay and making unjustified accusations that discredit the targeted employees performance and abilities.

Mobbing behaviours in the work place need to be defined and appropriate policies and procedures need to be developed and shared with all employees to prevent the development of these behaviours. Managers should adopt an open managerial approach to prevent the development of these behaviours. In an open management style instead of having an autocratic management style everyone who works at the facility has access to all information and every document, participates in meetings that are of interest to them, has freedom of speech and thought and does not fear that their freedom or they themselves are at threat when institutional goals and policies are decided on together. It is recommended that both qualitative and quantitative research be conducted for the purpose of determining detailed factors that influence the development of mobbing behaviours and the mobbing formation process in banking sector.

There should be a punishment for mobbing. Mobber must know the victim has a conscious to report attack to management and it will be punished.

ABSTRACT

Workplace bullying which is frequently in discussion at organizations and academia, and effects badly quality of both work and private life of victims and witnesses can be prevent if the antecedents of the phenomenon is known. Some researchers stress on organizational and individual antecedents while some others refuse personality factor. School-based studies found significant relationship between personality and bullying which is the start point for workplace bullying studies about personality factors. The study is done in order to investigate the relation between workplace bullying and personality of employee being exposed to such behaviors that is stated as "victim". Because there are few academic studies in Turkey about workplace bullying, which is just new and less known issue and personality of victim, by investigating international researches, personality of victim is found to have taken into consideration as one of antecedent of workplace bullying. A cross sectional survey is done in a single company in order to investigate the relationship between variables and similarly to the international researches significant correlations found.

Keywords: Workplace Bullying; Mobbing; Personality

INTRODUCTION

While explaining antecedents of workplace bullying most researchers stress on organizational and social factors; Leymann indicated that organization of work and quality of leadership are the main antecedents of workplace bullying (Einarsen, Hoel, Zapf, Cooper, 2003, p.165), studies by Keashly and Jagatic (2000) and Varita (1996) suggest that communication and cooperation problems, low morale and negative social climate are the main organizational causes of bullying, another study is done by Hoel and Salin (2003) reports that at the condition wherein job and promotion opportunities decrease and competition, pressure and responsibilities increase, bullying find place itself (Beswick, Gore, Palferman, 2006, p.21-23). Varita (2001), Hoel & Cooper (2000) found relationship between bullying and 'high workload (Beswick, Gore, Palferman, 2006, p.24) and Rayner (1997a) found in his survey similar results (ACPR, p.16). Beside these such as, "role ambiguity and role conflict" (Beswick, Gore, Palferman, 2006, p.23), "low status workers" (Hodson, Roscigno, Lopez, 2006, p.407) and "low control over time" (Beswick, Gore, Palferman, 2006, p.22; ACPR, p.16), several variables are investigated as antecedents of workplace bullying.

However investigating victims' personality is a divisive issue for researchers; for example Leymann strongly against the idea that personality of a person can be reason for being victim because victims develop changes in personality due to workplace bullying; the symptoms of bullying are misunderstood and interpreted as being that which the individual brings into the organization in the first place (Coyne, Seigne, Randall, 2000, p.337). Brodsky says that if organizational climate doesn't permit, workplace bullying can't be occur (Shin, 2005, p.11.). According to Zapf, the responses of the target can be thought at least in the early phases of conflict, but he stress on not to blaming victim (Salin, Ekonomi Och Samhalle, 2003, p.18).

Contrastly to these, school based bullying studies (e.g. Olweus, 1993) found victims' personality as an effective factor (Einarsen, Hoel, Zapf, Cooper, 2003, p.165), and Randall (1997) said that these results can be possible for adult bullying (Coyne, Seigne, Randall, 2000, p.337). According to Einarsen and others organizational factors

naturally important (Einarsen, Hoel, Zapf, Cooper, 2003, p.165) but can't explain the whole of the picture without individual side (Rayner, Hoel, 1997, p.186). The experiences of being bullied which is a cognitive process of evaluation affected by both situational and personality variables (Matthiesen, Einarsen, 2001, p.470), hence personality of victim is investigated in this study.

Firstly, literature is reviewed, research model is structured in the light of the literature, personality is the independent variable, workplace bullying or mobbing is the dependent variable and demographic variables are investigated in the research model then hypothesis are developed. After main information about the subject is given and discussed their theoretical implications in the study, to find answer to the research question "Is there a significant relation between being exposed to workplace bullying and victim's personality", statistical analysis are done. Finally, research findings obtained, and then compared with recent researches.

WORKPLACE BULLYING AND PERSONALITY

Workplace Bullying

Heinz Leymann used the term "mobbing" for the first time to define specific type of aggressive behaviors such as hostile and unethical communication styles directed to one employee at the workplace. According to him physical actions can be named as "workplace bullying" (Davenport, Schwartz, Eliot, 2000, p.14). However some of the researchers define two types of bullying behaviors: physical which contains physically pressure or assault their victims in some way; secondly psychological bullying that bullies use subtle, underhand strategies to undermine their victims, mentally or emotionally (Richards, Freeman, p.7).

Some researchers used the term mobbing to explain the phenomenon (like Leymann, Einarsen), some others define mobbing as a type of bullying (Tehrani, 2005, p.9), another approach to the terminology is that when the action occurs one-on-one, calls it bullying, harassment or abuse; but if it happen by the others participation then is defined as mobbing (Martin, 2001, p.31). In addition to these, like workplace aggression- Neuman & Baron, 2003 (Fox, 2005, p.439) and abusive disrespect- Hornstein, 1996 (Blase, 2002, p.674) different terms are used in the literature. Generally while European authors prefer the term bullying, Americans use both mobbing and bullying and Sweden has used victimization for the same phenomenon. Different terms are used in Turkey as well but mobbing is seen usually agreed for Turkish literature.

However workplace bullying (Westhues, 2006, p.1; Douglas, 2001, p.4) is used largely in the international studies and general idea accepting all terms synonym, in this study the way followed and workplace bullying is used to define the action.

The following definition of workplace bullying seems to be widely agreed upon (Einarsen et al., 2003, Einarsen, 2000; Einarsen and Skogstad, 1966; Leymann, 1993b; Zapf, 1999a) and it is accepted for this study: Bullying at work means; "...harassing, offending, socially excluding someone or negatively affecting someone's work tasks. In order for the label bullying (or mobbing) to be applied to a particular activity, interaction or process it has to occur repeatedly and regularly (e.g. weekly) and over a period of time (e.g. about six months). Bullying is an escalating process in the course of which the person confronted ends up in an inferior position and becomes the target of systematic negative social acts. A conflict cannot be called bullying if the incident is an isolated event or if two parties of approximately equal 'strength' are in conflict" (Einarsen, Hoel, Zapf, Cooper, 2003, p.103).

Personality

In spite of lack of universally accepted definition of personality (Ewen, 1998, p.1) most of investigators agree by the following definition; and it is the accepted definition for this study; "personality is a dynamic and organized set of characteristics possessed by a person that uniquely influences his or her cognitions, motivations, and behaviors in various situations. It can also be thought of a psychological construct- a complex abstraction that encompasses the person's unique genetic background (except in the case of identical twins) and learning history and the ways in which these factors influence his or her responses to various environments or situations. So many investigators regard the study of personality as primarily the scientific analysis of individual differences. That account for why and how people react uniquely, and often creatively, to various environmental or situational demands" (Rckyman, 2000, p.5-6).

Prevalence of Workplace Bullying

A range of studies has reported that there is a higher prevalence of bullying in public administration, health, social work, teaching and prison officers (Irish Taskforce on the prevention of Workplace Bullying, 2001; Leymann, 1996) (ACPR, p.9) our sample is one of risk sectors.

Direction of workplace bullying: Researches on the prevalence of workplace mobbing showed that downward mobbing-mobbing by a supervisor against a subordinate – is the most prevalent (Vanderkerckhove, 2006, p.53), in the study 60% of those self-identifying as bullied reported one or more supervisors as the perpetrators and research found that bullying from supervisors is more hurtful than from co-workers (Keashly & Neuman, 2005; Keashly, Neuman, & Burnazi, 2004; Schat et al., 2006) (Sandvik, 2006, p.31).

Gender: Most large-scale studies have reported fairly equal victimization rates for both men and women (Einarsen & Skogstad, 1996; Hoel & Cooper, 2000; Leymann 1992a; Varita, 1996). Gender reveals is the position and gender of bullies; generally men are bullied by male supervisors, women report being bullied by both superiors and colleagues and by both men and women in approximately equal proportions (Eriksen & Skogstad, 1996; Hoel & Cooper, 2000; Leymann, 1992b) (Salin, 2005, p.2). Most of sexual harassment derogates and rejects victims based on sex rather than solicits sexual relations with them (cf. Fitzgerald et al., 1988; Schultz, 1998; U.S. Merit Systems Protection Board, 1981, 1988, 1995). Men that endorse male dominance are more likely to harass the opposite sex, and the person who is in such environment exposes to bullying more frequently (Berdahl, 2007, p.641).

Age: Some researchers found no significant difference between young and old employees in frequency of being bullied (Quine 2002). However Einarsen and Rankes (1997), Hoel and Cooper (2000) and Quine (1999) discovered that employees at young ages were at more risk of being a victim. Contrastly to these findings, it was reported at Einarsen and Skogstad's (1996) study that older employees were exposed to being bullying more than the younger employees (Einarsen & Skogstad, 1996, p.195).

Organizational status: Researches about the role of organizational status indicated different results. In a Swedish nationwide study, senior managers were over-represented among bullying victims; the differences with regard to hierarchical position were not statistically significant (Leymann, 1992a). Beside this, in a large Finnish survey, upper white-collar employees reported somewhat more bullying than lower white-collar employees or workers (Pirainen et al., 2000). Contrastly Hoel, Cooper and Faragher (2001) based on a large-scale study in the UK although they found few differences in the experience of self-reported bullying between employees in different hierarchical positions; they indicated that workers and supervisors were more often exposed to predefined negative acts than managers. (Salin, 2005, p.2).

Lead of the studies above cited, demographic properties are asked to the participants. Differences between demographic properties and being exposed to workplace bullying are investigated by the hypothesis. "H₁: There is any difference depending on demographic variables in being exposed to workplace bullying".

The Relationship between Workplace Bullying and Victim's Personality

There are a few structured empirical researches about personality of victim (Coyne, Seigne, Randall, 2000, p.337), some researchers with different methods or scales found similar victim profiles, some others found no difference between being victim and non-victim. In the following some leading researches and their findings take place and main hypothesis is developed on the basis of the literature.

Brodsky (1976, as cited in Varita, 1996) by looking at a working context described victims as conscientious, literal-minded, paranoid, rigid, and compulsive. According to Einarsen et al. (1994) in a Norwegian survey it is found that victims coping and conflict management skills are lower than others as well as shyness contributed to being bullied. As another research Varita (1996) in a survey in Finland reported that victims were higher in neuroticism than non-victims but when work environment and climate were controlled the relation was reduced. 16PF personality profiles in a sample of 30 self-selecting Irish workplace victims were found lower in emotional stability and dominance and higher in anxiety, apprehension, and sensitivity than non-victims. Another study Zapf (1999) in German sample found that victims of bullying had pre-existing symptoms of anxiety and depression and lower social skills than others, and avoided conflict by tending to give away (Coyne, Seigne, Randall, 2000, p.337). In the study of Coyne, Seigne, and Randall (2000), 60 Irish victims of bullying, using a comprehensive measure of personality based on a Five-Factor model, is found less extroverted and independent than control sample of non-victims, in addition to this, victims are more unstable and conscientious. According to Thylefors (1987) victims could be characterized by the fact that in conflict situations they reacted in a more

active and aggressive way than non-victims. Victims of bullying at work have been shown to portray a poor self-image as well as being anxious in social situations (Einarsen, Raknes, Matthiesen, & Hellesey, 1994) (Matthiesen, Einarsen, 2001, p.469).

In addition to these researches; according to Davenport et al., interviews with victims show that the victims are exceptional individuals. They have positive qualities such as intelligence, competence, creativity, integrity, accomplishment and dedication. They are emotionally intelligent as Daniel Goleman's words. Victims have a high degree of loyalty towards their organizations and highly identified with their work or by their work. Because they are creativity, they promote new ideas which may challenge others and they are seen a threat to high-positions, so they may be seen target for bullying. Westhues, found in his study that the victims who were ganged up on tend to be trusting, naïve, politically inept, high achievers (Davenport, Schwartz, Eliot, 2000, p.70). Jacqueline Randle in his study on healthcare professionals found victims as clear thinking and proactive individuals (Randle, 2006, p.26).

Contrastly to the findings, Gandolfo's (1995) study has utilized comprehensive measures of personality. Gandolfo's sample is Americans who claimed compensation from insurance companies for harassment in the workplace. In the study victim's personality profiles were studied by means of MMPI-2 and compared with those of a control. In five of the ten personality dimensions an elevated personality was identified in the victims indicating severe psychological and emotional disturbance. The results for the non-harassed group were similar on four of these five scales in the study. Therefore in the study no significant difference between harassed and non-harassed was found (Matthiesen, Einarsen, p.469).

Victims and their spokespersons have claimed that bullying is mainly caused by the psychopathic personality of the bully (e.g. Field, 1996) (Einarsen, Hoel, Zapf, Cooper, 2003, p.165). However both bullies and victim's colleagues frequently report that the personality and manners of victim play important role in bullying (Einarsen, Raknes, Matthiesen, & Hellesoy, 1994) (Matthiesen, Einarsen, p.470). Not a few researchers are agree on that victims react and affected by differently to similar workplace bullying conduct (Davenport, Schwartz, Eliot, 2000, p.39). Moreover some characteristics within an individual may predispose victims those to be bullied (Randall, 1997). They may be selected because of their personality (Varita, 1996) that is the predatory selected the victim because he sees the lack of social skills as well as tendency to avoid conflict (Zapf, 1999), inability to cope (Einarsen, 1999). In addition to these, victim may provoke the predatory by aggressive behaviors (Einarsen, 1994) these differences is thought by some researchers as relate to whether the victim experiences predatory or dispute-related bullying. At school-based bullying provocateur victims and specific personality types of victims are reported as well (Coyne, Seigne, Randall, 2000, p.337).

As well the victim's personality can't explain the bullying behavior; it is certain that personality effects how she or he experiences and interprets incidents and possibility of mastering the problems at work (Einarsen, 2000). Victim's personality may affect the degree of the negative behavior. As Lakey, Tardiff, & Drew, 1994 stated that; although the experience of being exposed to bullying is based on a real situation, such an experience doesn't represent an objective description of the environment without the personality factor (Matthiesen, Einarsen, 2001, p.470).

After all, the main hypothesis "H₂: There is a significant relationship between personality and being exposed to workplace bullying or mobbing" is determined and investigated by questionnaire method.

RESEARCH DESIGN

The research is applied in a company in order to provide the victim's to be in the same organizational conditions. The company's total employee number is 242, and 186 valid questionnaires are used in the study. The convenience sampling method was used. The questionnaires were prepared as hard copies and a link has prepared in order to send questionnaire through e-mail to the employees' of the company. Data was collected in June 2008. The questionnaire contains three parts; the first part is asking demographic properties of participants.

The second is about personality traits; in 1975 Eysenck & Eysenck composed The Eysenck Personality Questionnaire (EPQ) (H. J. Eysenck & S. B. G Eysenck, 1990, nu 22). Because originally the full version of Eysenck Personality Profiler with 440-item was too long, shorter versions were created. The Eysenck Personality Questionnaire- Short Form (EPQR-S) is developed in 1985 by Eysenck, Eysenck & Barrett (Forrest, Lewis, Shevlin, 2000, p.580). Lastly Francis et al, in 1992 shorten to 24 questions; The Revised- Abbreviated version of the Eysenck Personality Questionnaire (EPQR-A). Some argues that the EPQR-A version's value is lower than

the longers but it's acceptable and the main advantage of the questionnaire is that it is valuable when administration time is limited, and a relatively complete description of personality is required (Francis, Jackson, 2004, p.1664) and it is translated to Turkish by Karancı et al. (Karancı, 2007, p.2). The questionnaire contains three subscales (extroversion, neuroticism, psychoticism) and by a lie subscale was designed in order to hinder subjectivity at the answering period and controlling validity. All factors contain 6 questions, at total participants answer 24 questions for the scale and the answers were yes (1) - no (0) so the points for every factor was between 0 and 6. By the cultural scales the validity and reliability for adopting Turkish literature was examined and the scale was found reliable and valid (Karancı, 2007, p.7).

The third part of questionnaire assesses negative behaviors that are exposed in the workplace, which is Workplace Bullying Questionnaire (WBQ). The questionnaire contains 36 questions; it is designed by A. Dikmen and H. Sinangil by using the Leymann Inventory of Psychological Terrorization- LIPT (www.leymann.se), Einarsen et al's Negative Act Questionnaire- NAQ (Notelaers, Einarsen, Witte, Vermunt, 2006, p.290) and interviews with employees that exposed to negative behaviors at work (Dikmen, p.26). WBQ is designed as a five- point likert type, after a pilot analysis it reduced to four points (from "never" to "about daily"). The questionnaire also contains direction of workplace bullying, as "superiors", "colleagues" and "subordinates, if participants exposed to the workplace bullying it was asked from whom by the part.

DATA ANALYSIS AND HYPOTHESES TEST RESULTS

Demographic Distribution of the Sample: Demographic profile was determined by frequency analysis; male (53,2 %), female (46,8 %), age allocations are below 30 (68.3 %), between 31 and 40 (22,6 %) and above 41 (9,1 %). Educational level was asked to participants and primary school (9,1 %), high school (30,1 %), university (52,7) and lastly (master / doctorate 8,1%). Organizational status of participants are classified as employee (50,5 %), specialist (27,4 %), supervisor (17,7 %) and manager (4,3 %).

Factor Analysis of WBQ: Factor analysis with principal component by varimax rotation, that was performed to find out the factor structure, revealed 9 factors. Because some items were below 0.45 or having collinearity with more than one factor, and some factors contain one item it was continued to perform factor analyzing by removing the items one by one till the ideal table. And totally 13 items removed, rest of the items naturally revealed 5 factors. The five factor and rested items explained 60,394 % of the total variance. Kaiser-Meyer-Olkin Measure of Sampling result was .855 (>.70) and significance level was $p = .00 (<.05)$, Bartlett's Test of Sphericity value was found 1877.618 ($df = 253$) so the result was acceptable. 5 factors found as; 1) organizational measures, 2) isolating and humiliating behaviors 3) physical violence 4) verbal violence 5) attacking on personal attributes parallel to literature. All factors' factor loadings and variance values are can be seen in Table 1. And reliability results of the factors are acceptable (Table 2). WBQ original version removed some items as we do. And when looked into international researches, Leymann found in a sample 4 and in other 5 category, Zapf found 7 category, Einarsen et al reported 5 category, and they agreed on 6 category but as it is stated, while some categories can be in some cases, some are not, because of cultural reasons or just about sample (Einarsen, Hoel, Zapf, Cooper, 2002, p.120).

Direction of Workplace Bullying: Bullying behavior's direction are asked participants and commonly victims exposed to workplace bullying by supervisors and in some factors by colleagues; rarely subordinates are reported as bully. International researches generally report supervisor bullying is more prevalent (Vanderkerckhove, 2006). The results were pictured by mean values at Table 3.

Independent T-Test and One Way Anova Results for WBQ and Demographic Variables

Gender: Whether gender is effective on being exposed to workplace bullying is investigated; independent samples t tests results didn't found any difference between genders and being exposed to workplace bullying; in literature most studies have reported fairly equal victimization rates for both men and women as well.

Age: One-way anova test was used for the variables when the difference was looked into the variable "age" and the five factor of WBQ. As it was seen from significance values, there was significance difference between dependent variable, the first factor, "organizational measures" $F = 8.325$, $p = .00 (< .05)$ and the independent variable; age (Table 4). But for the other factors of workplace bullying there was not any significant difference depending on age. When the source of the difference for factor 1 (organizational measures) is investigated, Scheffe test shows (Table 5) that the difference between ages range 1 (below 30 and 30) and ages range 2 (the ages between 31-40) $p = .003 (<.05)$, mean value was .59919451, that was significant. And similarly there was

significant difference for the first and third category (ages 41 and upper); $p = .03$ and mean was found as .66393534. Age range 1, comparing to other age ranks, was significantly effective on being exposed to workplace bullying for the factor “organizational measures”. That was *the employee whose ages were below 30 was exposed bullying more than older ones*. The same table shows at the same time that there was no significant difference for the other two age ranks. The significance between the other two age ranks were .973 ($> .05$) and mean values were .06474084. As a result our Hypothesis was accepted. In the literature different results found about age; however Einarsen and Rankes (1997), Hoel and Cooper (2000) and Quine (1999) parallelly discovered that employees at young ages were at more risk of being a victim.

Educational Level: One-way anova results for “organizational measures”, “isolating and humiliating behaviors”, “verbal violence” from the dependent variables was statistically insignificant ($p > .05$), results shows that being exposed to workplace bullying didn’t changed due to educational level for these factors (factor 1,2,4). However the significance for “physical violence” was $p = .006 (< .05)$ and $F = 4.316$ shows that this factors of workplace bullying was effected from educational level (Table 6). When looking to Post Hoc test results (Table 7) the difference was seen in detailed. There was statistically significant difference for the dependent variable “physical violence” between the educational level 1(primary school), and educational level 2 (high school), $p = .014 (< .05)$, $F = .89354137$. And educational level 1 and educational level 3(university level) was considerably different $p = .011$, $F = .86585189$ but there was not a significant difference between educational level 1 and educational level 4 (master /doctorate level). From all it could be said that *being at primary school level employee was significantly effective on being exposed to workplace bullying in the factors “physical violence” comparing to being both in high school and university level but not being at master or doctorate level*. One-way Anova results for factor 5, “attacking on personal attributes” (Table 6) were; $p = .007 (< .05)$ and $F = 4.150$ shows significance difference for this dimension; when looking into the Post Hoc results, the source of the difference could be seen (Table 7). The values between educational level 2 (high school level) and educational level 3 (university level) $p = .037$ and $F = .48117694$. *There was significant difference between the high school and university level employee on being exposed to workplace bullying on “attacking on personal attributes” factor, high school level employees are being exposed to workplace bullying more than university levels*. But the other p and F values for primary and master / doctorate level employee didn’t point to a significant difference between any variable for the “attacking on personal attributes”.

Organizational status: Because all significance values at .05 confidence level was $> .05$ there was no difference for WBQ factors depending on organizational status, that is not effective on being exposed to workplace bullying according to one-way Anova results. Literature indicates different results for organizational status, the differences with regard to hierarchical position were not statistically significant (Leymann, 1992a) in parallel with our findings.

Gender, age, educational level and organizational status are investigated for demographic hypothesis for the study. Some demographic variables such as age and educational level there are significant differences, so our hypothesis “ H_1 : There is any difference depending on demographic variables in being exposed to workplace bullying” is accepted.

Forming EPQR-A: The items of EPQR-A were calculated by compute method. The internal consistency, test-retest reliability and construct validity of the questionnaire was done by Karancı et al. in 2007 and found acceptable the values for using the scale. Because the questionnaire was designed as yes-no format, for the reliability Kuder-Richardson 20 method was used. Kuder-Richardson alpha values were seen in the table 8. The alpha values of the original Turkish version was compared to the study’s result and extroversion factor was $KR-20 = .78$ (our result was .845), lie was .64 (our result was equally .644), neuroticism was found .65 (our finding was .691), and finally psychoticism factor result was .42 (our result was .549), this refers to validity of our study. The psychoticism factor reliability result wasn’t found higher, as well as the other studies done other countries (Francis et al. 1992, Katz & Francis 2000, Lewis et al. 2002, Karancı et al. 2007). Because of generally lower results, the reason was thought to be because of expressions could be insufficient, that was not about translation (Karancı, 2007, p.7) in this study reliability coefficients are found acceptable for analysis.

Correlation Analysis for WBQ factors and EPQR-A sub-scales: Lastly correlation analysis was done to analyze the main hypothesis; the five factor of WBQ and three subscale of EPQR-A was analyzed for a statistical relation between the variables; results shows that three factors of WBQ (factor 2, 3 and 5) and EPQR-A subscales didn’t refer to any significant correlation.

As it can be seen in Table 9, neuroticism and first factor of WBQ correlation, $p = .00 (< .05)$, $r = .302$. There was a correlation between the factor 1 “organizational measures” and neuroticism. Being exposed to workplace bullying by organizational measures and being a neurotic person is positively related to each other. It can be said

as well, neurotic people are exposed to such behaviors more than others. This is parallel to some empirical studies (Varita 1996) and as found in school bullying (Byrne, 1994; Maynard & Joseph, 1997; Slee & Rigby, 1993).

In addition to this, factor 4 “verbal violence” and psychoticism results referred to statistically significant $p = .003$ ($<.05$), positive and strong relationship $r = .214$ (Table 9). So being a psychotic person and being exposed to verbal violence are in relation with each other.

The results suggest that personality traits may explain why such people target to workplace bullying or which type personality defines such behaviors as workplace bullying. In literature studies about workplace bullying are done with different scales at different dimensions, as far as we reached, because EPQR-A hasn't been used for the relation of workplace bullying, preferred for the study. The other most known scales 16 PF, Five-Factor Model and MMPI-2 were used by the researchers. But to sum up neuroticism is found as affective personality type as well as psychoticism. Our main hypothesis accepted in this condition, “H₁: There is a significant relationship between personality and being exposed to workplace bullying or mobbing. A simple figure is illustrated in the following in order to summarize the correlations.

CONCLUSION

Personality can be affective because of being subjective; while someone feels being exposed to workplace bullying by a behavior type, some other feels nothing that is, find natural the behavior; the important thing in that position is, what is felt. Because all psychological unwanted results is occurs because we felt like that, no matter what is done to us if we didn't affected from the behavior. Because everybody is part of the society and being healthy is due to every circle of the chain, every one of us is part of the problem; while someone is source, some other one is solution; some is affected directly or someone's husband effect; some is alone in the difficult situation, some loose his/ her family, friends and the most importantly loses health; moreover life. While the results are such serious, all factors should be taken into consideration.

It can be said from this study that, it is possible to be a relation between personality and being exposed to workplace bullying. The researchers are in the process of designing a commercial tool will be able to identify those most at risk of workplace bullying. By being able to identify these people, managers will be able to ensure that individuals are suitably supported by the organization; Personality results could be helpful for placing the employee to the suitable department according to risk of being exposed to workplace bullying too, so this knowledge can be helpful for healthy employee and decreasing negative atmosphere in the organization in today's and tomorrow's work life.

EXHIBITS

Table 1: Factor Analysis of Workplace Bullying Questionnaire

Factor 1: Organizational Measures:		% variance: 22,378%
Item No	Content	Item Loadings
26	I am obliged to do meaningless tasks.	.820
27	I am ordered to do pointless tasks.	.779
25	I am ordered to work overtime.	.732
29	I am ordered to work above my capacity level.	.717
22	I am ordered to work above my physical capacity level.	.715
19	My efforts directed to work have not been taken into consideration.	.689
30	At my workplace, I am exposed to verbal violence.	.656
28	Although I deserve, I am not getting upgraded.	.535
1	I am restricted to reach information necessary for my work.	.532
4	My works are not being appreciated.	.467

Factor 2: Isolating and Humiliating Behaviors:		% variance: 11,325
Item No	Content	Item Loadings
7	Appropriateness of my age to my work is being judged.	.738
6	I am criticized for working little.	.638
10	At my workplace, I feel externalized.	.608
24	I am not given responsibility about my work tasks.	.588
18	My decisions about work are questioned.	.507
Factor 3: Physical Violence:		% variance: 9,242 %
Item No	Content	Item Loadings
35	At my workplace, I am exposed to physical violence.	.849
36	At my workplace, my physical characteristics and appearance are teased.	.731
Factor 4: Verbal Violence:		% variance: 8,61%
Item No	Content	Item Loadings
23	I am exposed to sexual (verbal, visual, physical, etc.) harassment.	.729
34	At my workplace, I receive aggressive telephone calls.	.687
14	At my workplace, I receive physical violence threats.	.674
Factor 5: Attacking on Personal Attributes:		% variance: 8,488%
Item No	Content	Item Loadings
17	Some of my personal attributes are being teased.	.607
16	I am criticized about my religious and political views.	.547
15	There are rumors about me.	.496

INVESTIGATING CORPORATE SOCIAL RESPONSIBILITY OF TURKISH COMPANY WEBSITES THROUGH CONTENT ANALYSIS

Deniz KAĞNICIOĞLU
Anadolu University, Turkey

ABSTRACT

Corporate social responsibility (CSR) has become a much-discussed subject in the business world. The internet has become one of the basic tools for CSR information disclosure. This study focused on companies interested in documenting their commitment to CSR or related concepts. To assess how their CSR initiatives are communicated online, The Fortune 500 (www.fortuneturkey.com/fortune500_main.asp) which is a list ordering the country's largest corporation according to their sales revenues and includes manufacturing, commerce and service sector were used as sample in Turkey. The results of the study revealed that of CSR do not have great importance for Turkish companies yet. The findings indicate that the number of companies with CSR information on their websites is quite low and these leading companies do not use the websites to their advantage in terms of CSR communication.

Keywords: *Corporate social responsibility; Global Reporting Initiative (GRI); corporate websites; content analysis; Turkey.*

INTRODUCTION

Corporate social responsibility (CSR) is one of the much discussed subjects in the business world. Since the 1990s, individual stakeholders and non-governmental organizations (NGOs) have increasingly called for companies to act in a socially responsible way. Companies are no longer assessed solely on the financial gains achieved for shareholders but also on the contributions they make to stakeholders and society (Schafer, 2005:108).

While corporate social responsibility is increasingly attracting attention from the business world, a number of issues have arisen, such as CSR communication. According to Morsing and Schultz (2006:323), messages regarding corporate ethics and social initiative have the power to awake strong positive reactions among stakeholders. As a result, corporations are increasingly concerned with communicating to diversity of stakeholder group in an ethical and responsible fashion (Wanderly et al., 2008:370).

Companies can use their website, sustainability reports, advertising campaigns on television, billboards as communication tools for voluntary disclosure of non-financial information, such as ethical behavior, to their various stakeholders, including share holders, employees, customers, suppliers, media, and the government and to develop a particular brand image for the organization (Waller, Lanis, 2007:2). Corporate websites is increasingly becoming the main tools for communicating the economic, environmental and social goals of the corporation, for mobilizing stakeholder support, and for enhancing the reputation of the firm (Paul, 2008:64). In one of the first studies of corporate websites, Smith and Taffler (1992:98) found a positive relationship between the clarity of a firm's website and its financial performance. Etridge et al. (2002:367) found corporate websites used to attract investors, while Willis (2003:34) found them used in the social screening of investments.

Unlike traditional media (newspapers, magazines, billboards, television and radio), the internet allows the company to publicize detailed, up to date information. Moreover, the information remains permanently available on the web, allowing the Internet user to choose which subject he/she wants to access and as often as he/she

wishes. It allows companies to publicize more information less expensively and faster than ever before. Corporate websites provide an official perspective regarding CSR within the corporation for all its stakeholders.

There is a growing awareness of the importance of corporate social responsibility in Turkey. According to a survey which was conducted by Akgeyik (2005:2), the Turkish companies are getting more interesting in corporate social responsibility activities. Companies in Turkey try to integrate CSR into their mainstream business strategy. Both the international issues and the economic and social crises in Turkey created an environment for the discussion of CSR where business had the major role to play and the civil society to monitor and benefit. This paper investigates the ways in which the top 100 companies of Fortune 500 in Turkey disclose information on CSR through their corporate websites. A further aim is to determine whether there is any link between CSR information disclosure and industry sector.

CONCEPT OF CORPORATE SOCIAL RESPONSIBILITY

There has been a radical change in the relationship between business and society since 1990s. Key factors of this change have been the globalization of trade, the increased size and influence of companies, the repositioning of government and the rise in strategic importance of stakeholder relationships, knowledge and brand reputation. CSR is a response to contemporary circumstances of globalization, in which capitalism is expected to play a social role rather than merely making profits for business owners (Wanderley et al., 2008:371).

The relationship between companies and civil society organizations has moved on from paternalistic philanthropy to reexaminations of the roles, rights and responsibilities of business in society. (Mamun, Ahmed, 2009:633). Milton Friedman contributed to the creation of a general CSR Theory by asking questions such as “Should companies take responsibility for social issues?” According to Friedman, there is only one type of social responsibility: using resources and engaging in activities designed to increase profits so long as it stays within the rules that have been identified (Kok, et al., 2001:287). Consequently, the use of organizational resources for the larger good is detrimental to the firms since it may decrease profitability or increase product prices or both (Pinkston, Carrol, 1996:202). However, business organizations have some obligations to the society, as they created some of the problems in their competition races, and these problems need to be addressed properly. So, corporate executives, employees, shareholders, consumers and other publics interested about business operations, today expect organizations to be engaged in some social issues like: reasonable price and quality living of consumer and employee, fair wage, employee safety, fair advertisement, etc (Waddock, 2004:13,14).

Companies are aware that they can contribute to sustainable development by managing their operations in such a way as to enhance economic growth, increase competitiveness and ensuring at the same time environmental protection and promoting social rights (Mamun, Ahmed, 2009:634). Thus, CSR is a concept whereby companies integrate social and environmental concerns on their business activities. There are three levels of CSR for looking at social responsibility from the point of view of the company

- Minimum legal compliance: managers comply with the minimum social requirements of the law.
- Enlightened self –interest: managers use social responsibility programs as a strategic weapon to communicate to the market that they are better than their competitors. The interest in social responsibility is expected to give long-term profitability.
- Proactive change: managers use its assets actively to improve society independent of a direct benefit to the firm; they are taking positions far beyond the requirements of the law (Kok, et al., 2001:287).

The operationalisation of social responsibility requires that its meaning is considered. Academic literature contains many definitions of CSR. According to Mosley (et al, 1996) “Corporate social responsibility refers to management’s obligation to set policies, make decisions and follow courses of action beyond the requirements of the law that are desirable in terms of the values and objectives of society”. Kok (et al, 2001:287) defines CSR as “the obligation of the firm to use its resources in ways to benefit society, through committed participation as a member of society at large and improving welfare of society at large independently of direct gains of the company.”

The definition of CSR used in this study is taken from Green paper in 2001 by European Commission. According to Green paper “Being socially responsible means not only fulfilling the applicable legal obligations, but also going beyond compliance and investing "more" into human capital, the environment and relations with stakeholders.” Jenkins (2004) mentioned that CSR activities provide businesses with the advantages of an improved image and reputation, an improved trust, a more prominent profile, a better market position, more

business, increased employee motivation, increased attractiveness to potential recruits, cost savings and increased efficiency, and an improved company culture. Companies are facing more clearly articulated expectations from customers and consumers regarding their contributions to sustainable development, which puts pressure on them to maintain transparency and be proactive in communicating with their publics. The need for a proactive communication approach in the global economy is considered as central to corporate reputation and relationship building (Chaudhi, Wang, 2007:235).

Reporting is a necessity if companies are to know and understand their social and environmental impacts. These companies that disclose information regarding this topic have to follow the international guidelines. Because the non-financial reporting has known a fast growing, in 1997 the Global Reporting Initiative was developed by the Coalition for Environmentally Responsible Economies and the Tellus Institute through a joint project. Supported also by the United Nations Environment Program, the GRI (Global Reporting Initiative) promotes the international harmonization of reporting of relevant and credible corporate environmental, social and economic performance information to enhance responsible decision-making. The GRI have developed and disseminate a globally harmonized reporting framework for so called sustainability reporting, or non-financial reporting (NFR). In 2006, after a development process involving thousands of stakeholders worldwide GRI released the third iteration of its Sustainability Reporting Guidelines (G3 Guidelines).

While corporations want stakeholders to be aware that they are socially responsible, they are reticent about communicating their actions. However, stakeholders want to find out about the corporations behind the brands and products they purchase (Wanderley, et al, 2008:370). The internet is gaining ground as a new communication for companies to present themselves as socially responsible. The need for transparent and proactive communication of CSR is a key issue of concern. According to Esrock and Leichty (1999), corporate web sites allow companies to engage in multi-stakeholder dialogue, a practical challenge of CSR communication. While web sites provide an option for corporations to set and present an agenda on CSR, corporations are not using internet for their CSR communication effectively. According to a 2004 CSR Online Survey of Financial Times Stock Exchange companies, although many companies included CSR information on their web sites, “all too often, CSR material is hidden in hard to reach places, or presented in huge PDF downloads (Coope, 2004).

Since the corporate web sites’ visitors have diverse interests; its format requires some attention to the likely competing interests of its broad readership. With interest from diverse stakeholders, the remit of communicating with the web site reader is a complex one. Hence, a communicative form has creative potential for both the individual and organizing process (Coupland, 2005:356). The web can certainly be used to share information, but it can also serve as a catalyst for discussion and change (Lee, et al, 2009:144).

SOCIAL RESPONSIBILITY IN TURKEY

While CSR is newly understood concept in developed countries, it is not surprise for developing countries to face some obstacles to CSR. Wanderley (et al, 2008:370) states a number of factors which prevent the development of CSR in developing countries as civil society is not well organized, the government does not face strong, constant pressure; and the press has yet to assume the role of CSR. According to Kemp (2001), institutions, standards and systems, which are the foundation of CSR in Europe and the USA, are comparatively weak in developing countries.

In Turkey, academic researches about CSR are still limited, but there is some evidence that confirm these statements for Turkey. According to Ararat (2005:253), most of the institutional driving forces for CSR, including the legal framework, societal and organizational culture and market mechanisms through CSR are not sufficiently developed, and variables for non market institutions such as non-governmental organizations (NGO) activity and academic research and teaching are not yet mature enough. Environics International conducted a global study in 2001 and found that Turkish consumers value business ethics, labor practices, and environmental impacts and demonstrated social responsibility much less than brand quality when forming an impression of a company. Another survey conducted by Açıgil also found that 53 % of the managers would not give priority to ethical considerations if these would negatively impact economic performance (Ararat, 2005:253).

According to Turkey Corporate Social Responsibility Baseline Report (Göçenoğlu, Onan, 2008:58) which was conducted for European Commission and The United Nations Development Programme, awareness of the importance of corporate social responsibility is growing in Turkey. Both the international issues and the economic and social crises in Turkey created an environment for the discussion of CSR where business had the

major role to play and the civil society to monitor and benefit. In the recent years, the adjustments of Turkish Association Law to the European Union accelerated the change processes in the NGOs and created a better environment for civil participation. Multinational companies also positively affect the CSR practices in Turkey. The MNCs put positive pressure to their local branches and their suppliers, and this process set trend for Turkish companies.

Both Göcenöglü and Onan (2008:58,59) and Ararat (2005:253) emphasized that CSR in Turkey is supported by external drivers such as the international organizations and NGOs. Local initiatives such as NGOs and customers are needed to be developed and encouraged to create pressure on companies. CSR as a component of corporate reputation in Turkey has been in an increase since 1999. According to a survey which was conducted by Akgeyik (2005:2) the Turkish companies are getting more interesting in corporate social responsibility activities. Companies in Turkey try to integrate CSR into their mainstream business strategy. Akgeyik (2005:2) found that improving the company's image is the basic reason of CSR in Turkey. As corporate social responsibility practices are different between developed and developing countries, the nature and patterns of company information about CSR vary between different sectors. Besides that the literature has provided little empirical examination of patterns of corporate social responsibility in Turkey. For this reason this study aims on current situation of social responsibility practices as qualitative and quantitative indicators in Turkey.

METHOD

To assess how their CSR initiatives are communicated online, The Fortune 500 (www.fortuneturkey.com/fortune500_main.asp) which is a list ordering the country's largest corporation according to their sales revenues and includes manufacturing, commerce and service sector were used as sample in Turkey. The corporate websites of the top 100 companies of Fortune 500 were analyzed. The search was limited to websites areas that directly referred to the responsibilities and commitment of the company either to society in general, or specific stakeholder groups. Links to these relevant areas were searched for either in the home page or in a section providing general company information (Maignan, Ralston, 2002:6). The array of terminology used in the broad CSR range consists of corporate social responsibility, social responsibility, corporate citizenship, corporate responsibility, stakeholder engagement, and community development. In order to establish a set of indicators for CSR information disclosure on the web, content analysis of corporate websites was applied. Corporate websites were examined for terms and concepts drawing from Paul (2008:67), Chaudhri and Wang's (2007:237), listed below starting from the more general, to the intermediate level, to the specific:

- stakeholders
- social responsibility/corporate social responsibility
- sustainability
- citizenship/corporate citizenship
- CSR report
- CSR project
- Code of conduct/code of ethic
- CSR partnership
- United Nations Global Compact
- Global Reporting Initiative (GRI)
- Social responsible investment
- human rights
- environment
- awards/ sponsorship
- labor
- productivity
- society
- supplier

One of the most important principles of CSR is reporting that complies with international standards and that satisfies the stakeholder expectations concerning its social, economic and environmental responsibilities. Consequently, in this study, CSR reports also were analyzed to discover the disclosure of the CSR performance indicators drawing from GRI G3 Reporting Guidelines. As CSR performance indicators, environment, working life, human rights and product responsibility were chosen to asses CSR reports. Economic performance was excluded as an indicator in this study.

FINDINGS

The websites of each of the 100 companies were analyzed for the terms and concepts identified from previous studies. If a company did not have any CSR information on its corporate Web site, the companies were excluded from the analysis. Of the 100 companies identified as the sample, 74 were subjected to further analysis because 26 companies' web sites did not mention any of terms and concepts for CSR information. Of the 74 companies, 39 (53%) had the primary link for CSR on their corporate home page.

Companies producing or marketing consumer goods were expected to mention these terms more frequently than companies producing industrial or commercial products, since a reputation of social responsibility might be expected to be more important when marketing to consumers than when marketing to businesses. Companies in newer, high- tech fields were expected to have more frequent use of these terms than companies in agriculture or industrial fields, because the newer companies would have been more influenced by recently developed thinking on CSR and similar topics (Paul, 2008:68). For evaluating if there is a difference among sectors based on CSR information on web sites, the companies were categorized under 13 sectors which was derived from statistics of Ministry of Labor and Social Security. As seen from the table, of the 100 companies 25 were multinational and 75 were domestic companies. This information was used to compare domestic companies' CSR information with multinationals' on their web sites.

Striking point of Table 1 is that number of companies which had no information on CSR quite high, approximately 25 % of the total. Especially technology and communication field is quite high which is reverse what was expected. Moreover, it is remarkable that 26 of companies which had no information on CSR, only two of them were multinational companies. It means that 75 of domestic companies, 24 of them (33%) had nothing about CSR on their corporate web sites. 92 percent of the multinational companies have mentioned CSR on their websites. So, 23 multinational and 51 Turkish companies were analyzed to assess how their CSR initiatives communicated online

Table 1. Companies by CSR Information on Their Web Sites

SECTOR	CSR Information	Non CSR Information	% of companies including CSR	TOTAL
Petroleum, Chemical and Rubber	13	3	81	16
Technology and telecommunication	7	5	58	12
Metal	12	4	75	16
Transportation	2	3	40	5
Food	7	3	70	10
Energy	3	1	75	4
Commercial/retail	10	4	71	14
Automotive	6	-	100	6
Mining	3	1	75	4
Agriculture and forestry	-	2	0	2
Construction/cement	7	-	100	7
Textile	1	-	100	1
Health	3	-	100	3
TOTAL	74	26	74	100

As it is seen from the table, the lowest percentage for CSR information is agriculture and forestry (0%). Transportation (40%) and Technology and telecommunication (58%) have the next lowest percentages for CSR information. Surprisingly, CSR information in industry/manufacturing is higher than the service sector like telecommunication and transportation.

Table 2. Companies by Sector and Origin

SECTOR	DOMESTIC	MULTINATIONAL	TOTAL
Petroleum, Chemical and Rubber	7	9	16
Technology and telecommunication	10	2	12
Metal	14	2	16
Transportation	5	-	5

Food	6	4	10
Energy	4	-	4
Commercial/retail	11	3	14
Automotive	3	3	6
Mining	4	-	4
Agriculture and forestry	2	-	2
Construction/cement	6	1	7
Textile	1	-	1
Health	2	1	3
TOTAL	75	25	100

Of the 74 companies, 39 had the primary link for CSR on their corporate home page. Among the companies that had a link on their home page, 25 were domestic (64%) and 14 were multinational companies (36%). These web links were named differently. The most frequently used ones are social responsibility and corporate social responsibility, sustainability followed them as web link. Social investments, corporate governance, contribution to society were some other statements preferred by companies.

According to Paul (2008:70), the number of coded terms used in any website should be considered, since these terms are most frequently found in the literature and tend to provide the basic philosophical orientation of company. In this study, the maximum number of times these concepts were observed in a company was 17 which were found just only one websites of a company in industrial fields. None of the websites include all of 18 items. The frequency of these terms is shown in Table 3.

Table 3. Number of Different Coded Terms Observed in Website

Number of terms in website	Number of companies
0	26
1	12

11	1
12	5
13	6
14	2
15	2
16	1
17	1

Table 4 shows the total distributions of terms and concepts on the websites. Social responsibility/corporate social responsibility/ corporate responsibility were the most frequently observed term. If stakeholder and sustainability were considered the main concepts of CSR, it is possible to mention that it was hard to find basic instruments of CSR in Turkish companies. All 23 multinational companies having CSR information on their websites mentioned social responsibility or corporate social responsibility and 9 of them mentioned it along with stakeholder. 51 of the Turkish companies having CSR information on their web sites, 34 mentioned social responsibility or corporate social responsibility and 15 mentioned stakeholder. The number of Turkish companies mentioned both concepts were 14. Only 7 Turkish companies were mentioned all three concepts together: social responsibility, stakeholder and sustainability. It is quite remarkable that sustainability was not preferred concept for both Turkish and multinational companies although environment got the highest score as a CSR indicator. Of 74 companies, 21 mentioned sustainability, 11 of them are Turkish companies the rest of them (10) are multinational companies. It could be suggested that “sustainability” might not become the preferred term in the future.

Further examination of the corporate websites brought out some trends in CSR perception of the companies in Turkey. Nowadays, stakeholders need more information than the one provided by the financial statements. There exist growing requirements for companies to not only disclose financial information by financial statements, but also non-financial information such as social and environmental impacts of their activities. This study revealed that Turkish companies are not aware of the importance of CSR reporting. Of 51 Turkish companies, only 7(14%) reported their CSR activities and 2(4%) of them used GRI G3 Guidelines as the reporting framework. In Turkey, CSR reporting has no framework and has not been yet regulated at national level. It is interesting to see that even if Turkish companies did not mention sustainability term on their websites, they called non financial reports as “Sustainability Report”. A few companies disclose information regarding CSR gave place to financial or annual reports.

Table 4. CSR Terms and Concepts Used by Companies

Terms and Concepts	Number of Companies Using Term and Concepts
Stakeholders	24
Social responsibility/corporate social responsibility	57
Sustainability	21
Citizenship/corporate citizenship	2
CSR report	16
CSR project	29
Code of conduct/code of ethic	13
CSR partnership	19
United Nations Global Compact	14
Gobal Reporting Initiative (GRI)	8
Social responsibility investment	14
Human rights	15
Environment	54
Awards/ sponsorship	50
Labour	24
Productivity	21
Community	38
Supplier	17

Community issues were the most mentioned concept by Turkish companies concerning CSR. While 21 Turkish companies (41%) referred community on their websites, the protection of the environment was the issue by far most mentioned by 33 Turkish companies (65%). For Turkish companies, CSR works rather as a public relations tool and they presented sponsorships and donations as CSR initiatives. Turkish companies seemed eager to present them as social responsibility process. Education, arts sport and culture were the issues which companies tended to pay most attention in their promotional CSR activities. Labour relations and work conditions were not the one of the main issues of CSR for Turkish companies. And there is not so much information about human rights and labour relations. The majority of companies focuses this issue on giving information about employee health and safety. Just 15 companies of which 6 Turkish and 9 multinational (20%), mentioned human rights on their websites.

UN Global Compact is one of the most important international criteria for CSR activities. Of 51 Turkish companies, only 6(12%) referred UN Global Compact on their web pages. Moreover these companies referring this also mentioned many of CSR indicators like human rigths, environment, labor rigths and product and supplier responsibility. International documents are good motivators for companies to emphasize CSR initiatives broadly.

The expectations about the salience of these terms and concepts for consumer- oriented companies versus business-oriented companies were not realized. This study confirms the findings of Paul (2008:71) that many of the websites with a large number of coded items were industrial and manufacturing companies. Moreover, high-tech companies were not particularly exemplary in mentioning the coded topics, as had been anticipated. For instance, 5 of 12 companies do not mentioned CSR on their websites and many of the Turkish companies which

signed the UN Global Compact were industrial and manufacturing companies. Supplier responsibilities were mentioned by only 6 Turkish companies. It could be stated that when presenting CSR initiatives, companies referred community, employees and customers.

CONCLUSION

It is clear that the corporate commitment to social responsibility is no longer an option but rather an expectation or even a requirement in the near future. This study focused on companies interested in documenting their commitment to CSR or related concepts. First, while the sample does not allow generalizations about Turkish companies, it is possible to state that the number of companies that have CSR information on their Web sites is strikingly low. Our survey of the companies listed on Fortune 500 actively showed that disclosure of CSR information does not generally belong to the strengths of Turkish companies at the present.

It is possible to say that issues of CSR do not have great importance for Turkish companies yet. On the other hand, the information on the topics highly dispersed and that the level of the presence of the various related themes is not uniform across websites. Capriotti and Moreno (2007:233) emphasized the same findings for Spanish companies. The reason for the divergence between the importance that is granted to corporate responsibility and dispersion and heterogeneity of the information on this topic that is placed on corporate websites may be that most of the companies present a reduced conception of corporate responsibility, focusing primarily on issues of social and environmental action, rather than reflecting a broad understanding of concept.

The basic instruments of CSR, such as codes of conducts and social responsibility reporting are hard to find in Turkish companies. For this moment, CSR is preferred as public relations tool for companies and the concept has slowly spread among Turkish companies. Results of this study revealed that charity programs were most popular for the community involvement dimension followed by cash donation programs. Product development and quality assurance is the largest part engaged in the product responsibility dimension of CSR. Pollution control was broadly reported in environmental dimension. Referring to CSR dimensions, environmental dimension has the highest score. The community involvement is the second highest, followed by labor and product dimension. These findings reveal that Turkish companies are more concerned with environment than for the other dimensions of CSR. While protection of the environment and education remain a top priority for a large majority of companies, these issues are not overtaken as CSR issues.

This study also revealed that although multinational companies' CSR performance is better than Turkish companies', CSR presentations of them on the websites are not good enough. This result confirm that a global company with operations in both developing and developed economies is likely to communicate more extensively in the developed region as opposed to the lesser developed market (Chaudhri and Wang, 2007:243).

Silberhorn, Warren and Marsteller (2007:358) mentioned that external pressures and an increasing awareness among companies of their regular business activities' impact is the major driver for large companies to communicate a considerably broader CSR notion. According to a research (Ararat, 2005:254) Turkish managers do not differentiate between legal and ethical responsibility and they still think that customers are the most important stakeholders of companies. As Saleh (2009:136) emphasized, it is highly recommended that future studies should also collect primary data through interviews because the CSR perceptions of managers could be the main reason of insufficiency for disclosing CSR in Turkish firms.

THE RELATIONSHIP BETWEEN PERCEPTIONS OF ETHICAL CLIMATE TYPES AND AFFECTIVE COMMITMENT: THE CASE OF TURKISH HOTEL EMPLOYEES

Adem Ogut
Selcuk University, Turkey

Metin Kaplan
Nevsehir University, Turkey

ABSTRACT

Affective commitment is crucial to hotel businesses due to the critical role that employees play in the provision of hospitality services. In this study, we investigate the relationship between ethical climate types (caring, law and code, rules, instrumentalism and independence) and affective commitment in hotel businesses in Cappadocia. The findings of the research indicated that caring, law and code and rules were positively and significantly correlated with affective commitment. According to correlation analysis; on the other hand, negative relationship between instrumentalism and affective commitment was revealed. No significant relationship between independence and affective commitment was found out. Regression analysis results show that caring and rules had positive effect on affective commitment while instrumentalism had negative effect on affective commitment. Moreover, practical implications are discussed, and suggestions for the future research are made.

Key words: *Ethical Climate, Affective Commitment, Hotel Businesses*

INTRODUCTION

Hotel businesses having various client characteristics should plan and manage the human resources effectively by means of coordinating different services such as main, supporting and facilitating simultaneously in the rapidly developing environmental conditions. Obtaining sustainable competition advantage is based on the effective utilization of human capital they have in current business condition where competitors imitate physical components easily. Therefore, providing affective commitment has crucial prominence. Since the output of services basically depend on human performance, this situation is much more vital for hotel business.

Formation of affective commitment is based on some individual and organizational antecedents. This study focuses on perceptions of ethical climate which is a prerequisite of sustaining organizational continuance in terms of adapting newly employed staff, developing efficiency and productivity of current employees, and required integration between the employees and the organization.

In this frame, the aim of the study is to investigate the relationship between ethical climate types (caring, law and code, rules, instrumentalism, and independence) and affective commitment in the hotel businesses of Cappadocia.

Ethical Climate

The ethical climate is a component of the general organizational climate and has been described as ‘the shared perceptions of what ethically correct behaviour is and how ethical issues should be handled’ (Elçi and Alpkın, 2009: 298). Ethical climate is a concept that describes the shared perception of organizational norms, values and behaviour (Rasmussen et al., 2003: 85). A firm's ethical climate refers to the prevailing attitudes about the firm's standards concerning appropriate conduct within the firm (Kelley and Dorsch, 1991: 56) and reflects employee perceptions of morally appropriate actions and policies observed in the workplace (Lopez et al., 2009: 595). Ethical work climate is a holistic construct which encompasses the catalogue of organizational socio-moral factors (Ruppel and Harrington, 2000: 314).

Victor and Cullen's (1988) ethical decision making framework describes theoretical ethical climates that are based on two dimensions: ethical criterion and locus of analysis (Weber and Seger, 2002: 72). Figure.1 shows ethical climate types according to a two-dimensional typology. **The first dimension** represents the ethical criteria used for decision-making inside an organization. 'Egoism' is characterized by decisions intended to maximize self-interest, 'benevolence' is characterized by decisions that aim to maximize joint interest, while 'principle' is characterized by decisions, which adhere to rules, laws, and standards in the normative expectations of a social unit (Kim and Miller, 2008: 942-943). The **second dimension** represents the locus of analysis used as a reference point in ethical decisions (Weber, 1995: 512). At the individual level, the ethical climate of the organization supports an individual-level source for normative standards regarding ethical reasoning. The local level is supported by organizational norms favoring reference groups within the organization itself. The cosmopolitan ethical climate is supported by norms favoring external sources for ethical reasoning (Barnett and Vaicys, 2000: 352).

FIGURE 1

As shown in Figure 1, a firm's ethical climate can be characterized in terms of five theoretically based and empirically supported dimensions: caring, law and code, rules, instrumentalism, and independence (Victor and Cullen, 1988: 111-113). The dimensions are defined as follows:

Caring: A caring climate is utilitarian based where employees have a sincere interest in the well being of others inside and outside the organization (Deshpande et al., 2000: 212) and pertains to displays of kindness toward the employees, the firm, and the world (Kelley and Dorsch, 1991: 56). At work, caring climate reflects concern for all organizational stakeholders affected by their decisions (Shapira-Lishchinsky and Rosenblatt, 2009: 719). Studies assessing an employee's preferred work climate most frequently indicate favor for a caring climate (Martin and Cullen, 2006: 179).

Law and Codes: Employees in a law and code ethical climate are expected to adhere strictly to the codes and regulations of their profession or government (Wimbush et al., 1997: 68). Organizations guided by law and codes accommodated external standards and principles in decision making (Suar and Khuntia, 2004: 12).

Rules: In rules ethical work climate, the principles employed are company based (i.e. company policies, procedures, rules, norms) (Wyld and Jones, 1997: 467). Employees are expected to adhere precisely to the rules and imperatives of their organization or departments (Erben and Güneşer, 2008: 959). Organizational decisions are guided by a set of local rules or standards such as codes of conduct (Tsai and Huang, 2008: 567).

Instrumentalism: The instrumental climate involves the egoistic criterion and is primarily based on the maximization of self-interest (Tsai and Huang, 2008: 567). In an instrumental climate, employees look out for their own self interest (Deshpande et al., 2000: 212), first and foremost, even to the exclusion of interest of others who may be affected by their decisions (Wimbush et al., 1997: 68). Actors perceiving an instrumental ethical climate see their organizational unit as having norms and expectations that encourage ethical decision-making from an egoistic perspective (Martin and Cullen, 2006: 178).

Independence: This dimension concerns the individual's personal rules of acceptable behavior (Kelley and Dorsch, 1991: 56). In an independent climate, individual standard of moral judgment provided the criteria for decision making (Suar and Khuntia, 2004: 12).

Ethical climate has various functions in organizations. Perceptions of ethical climates increase affective commitment (Tsai and Huang, 2008), achievement level of dealing with ethical issues (Bartels et al., 1998), organizational citizenship behaviour (Elçi, 2005), job satisfaction (Elçi and Alpkın, 2009), supervisory trust (Mulki et al., 2006) and performance (Weeks et al., 2004) while decreasing intent to leave (Schwepker Jr., 2001), and role conflict (Schwepker Jr. and Hartline, 2005).

Ethical climate is likely to influence employees' work behavior. The types of ethical climates existing in an organization or group influence what ethical conflicts are considered, the process by which such conflicts are resolved, and the characteristics of their resolution. For example "socio-moral atmosphere" of an organization has a significant impact on the moral decision making of individuals (Victor and Cullen, 1988: 105). The more employees perceived their organizations as showing concern for ethics, acting ethically and rewarding ethical behavior, the more positive was the resulting influence on their commitment to organizations (Suar and Khuntia, 2004: 12).

Affective Commitment

Affective commitment refers to the employee's emotional attachment to, identification with, and involvement in the organization (Allen and Meyer, 1990: 2). Affective commitment is the extent to which employees are involved with and have attached emotionally to their organizations because they identify with the goals and values of their organizations (Addae et al., 2008: 569).

Affective commitment is the affective bond an individual feels toward the organization, characterized by identification and involvement with the organization as well as enjoyment in being a member of the organization (Bergman, 2006: 646). Individuals with a high level of affective commitment continue to work for an organization because they *want to* (Meyer and Allen, 1997: 11).

Affective commitment develops mainly from positive work experiences, such as job satisfaction and organizational fairness, and is associated with desirable outcomes, such as higher levels of organizational citizenship behaviors, and lower levels of withdrawal behaviors like absenteeism and tardiness (Wasti, 2002: 526).

Affective commitment has the strongest bearing to the hospitality industry due to the critical role that employees play in the provision of hospitality services (Curtis et al., 2009: 254-255). In this context, the research objective of this study is to investigate the relationship between ethical climate types (caring, law and code, rules, instrumental and independence) and affective commitment in tourism industry.

There have been few studies which have demonstrated the relationship between ethical climate types and affective commitment. Suar and Khuntia (2004) investigated the effect of ethical climate on organizational commitment and administrators' performance in two public sector and two private sector manufacturing industries located in eastern India. According to the results caring had positive effect on affective commitment and administrative performance. Tsai and Huang (2008) found out positive relationship between instrumentalism and continuance commitment, on the contrary negative relationship between instrumentalism and affective commitment in the research on nurses employed in Taiwan. Another result of the study showed that caring and rules have positive correlation with normative commitment. On the other hand, results indicate that although low and code has the highest rate, it has no effects on organizational commitment.

Shafer (2009) investigated the relationship between the ethical climate, organizational-professional conflict and affective organizational commitment in Chinese certified public accounting firms. According to the results, there is negative and significant correlation between egoistic/individual climate and affective commitment while benevolent/cosmopolitan and principle/cosmopolitan correlate with affective commitment positively and significantly. On the other hand, no relationship between egoistic/local climate and affective commitment was found out.

In the light of these findings, the following hypothesis will be tested:

- H1:** There is a positive relationship between caring and affective commitment.
- H2:** There is a positive relationship between law and code and affective commitment.
- H3:** There is a positive relationship between rules and affective commitment.
- H4:** There is a negative relationship between instrumentalism and affective commitment.
- H5:** There is a positive relationship between independence and affective commitment.

METHODOLOGY

Sample

The sampling consists of middle managers and employees in hotel businesses licensed by the Tourism Ministry in the Cappadocia Region, Turkey. 20 hotels (five-star, four-star) take place in the region of Cappadocia. Nearly 967 middle managers and employees are estimated to serve in these hotels. 967 questionnaires were distributed. 413 questionnaires were returned. This represented an overall response rate of 43%. This rate is an acceptable response rate for this kind of study (Pierce and Henry, 1996).

The sample consisted of 27.4 percent females and 72.4 percent males. Almost 77.7 percent of the respondents were younger than 35 years old. 59.8 percent of the respondents were married and 40.2 percent were single. In

terms of educational levels, 22.0% of the respondents had graduated from primary school, 53.5% from secondary school, 15.3% from high school, 8.5% held Bachelor of Science degrees, and 0.7% had Master's degrees. Furthermore, nearly half of the participants completed the tourism and hotel management training (49.6%). Respondents held a variety of positions in hotel businesses. They included middle manager (19.4%) and employees (80.6%). When star classifications of the hotels are taken into consideration, it is seen that the participants to the survey are employed in four star hotels (62.5%) and five star hotels (37.5%). 38.5% of the respondents had more than 3 years of job experience in the present hotels.

Measures

A questionnaire was structured to gather primary data from middle managers and employees in hotel businesses. Affective commitment was designated as the dependent variable in this study, while ethical climate types (caring, law and code, rules, instrumentalism and independence) were considered as the independent variables. To measure ethical climate types, we used the 26 items Ethical Climate Questionnaire (ECQ) developed by Victor and Cullen (1988). The items were classified in terms of the five dimensions of caring, law and code, rules, instrumentalism and independence. Participants responded on a 5-point Likert-type scale dictating to the extent which they agreed with each statement as it reflected their present work environment (1= strongly disagree, 5= strongly agree). Cronbach's alphas were as follows: 0.84 for caring, 0.86 for law and code, 0.89 for rules, 0.75 for instrumentalism and 0.74 for independence.

On the other hand, affective commitment was measured with six items 5-point Likert scale (1=strongly disagree, 5=strongly agree) developed by Meyer and Allen (1997). The scale showed adequate reliability. The Cronbach's alpha coefficient was 0.88. In general, a value of 0.70 in the Cronbach's alpha is considered adequate in order to ensure reliability of the internal consistency of a scale (Nunnally, 1978).

RESEARCH FINDINGS AND DISCUSSION

Table 1 reports means, standard deviations, correlations among variables, and cronbach's alpha coefficients.

TABLE 1

As predicted, caring, law and code, and rules were positively and significantly correlated with affective commitment at the 0.01 level. The results supported H1, H2 and H3. In this frame, these results were consistent with the study results of Shafer (2009). Also, there was a positive but not significant correlation between independence and affective commitment. Thus, H5 was not supported. On the other hand, instrumentalism was negatively related to affective commitment. Namely, H4 was supported. This finding was similar to the study results of Tsai and Huang (2008).

The regression analysis was carried out to determine the efficacy level of the perceptions of ethical climate types on affective commitment. Multi-collinearity should be analyzed for a better regression model. In order to detect the presence of multi-collinearity, the tolerance and the variance inflation factors (VIFs) values (Akman et al., 2008: 108) are calculated. Small tolerance and high variance inflation factors (VIFs) values denote that there is a multi-collinearity problem among independent variables (Kalaycı, 2009: 268). We can assume that multi-collinearity is not a problem in data since all significant variables in Table 2 have much higher tolerance values than 0.10 (Ozgener and Iraz, 2006: 1362) and have lower variance inflation factors (VIFs) than 5.0 (Bozic, 2007: 117).

TABLE 2

The results of regression analysis in Table 2 suggest that the overall model was significant (Adjusted $R^2 = 0,290$; $F_{(5,407)} = 34,652$; $p < 0,01$). The interrelation of five independent variables (caring, law and code, rules, instrumentalism and independence) was taken into account, and the $R^2 (0,290)$ was significant at the 0,000 level. This means that 29.0% of the variance in affective commitment was significantly explained by the independent variables. Among independent variables, caring was found to be the most important in explaining the variance in affective commitment as the highest beta value was 0.377. Namely, rules were found to significantly predict of affective commitment ($\beta = 0,225$; $t = 4,925$; $p = 0,00$). Instrumentalism was also found to significantly predict of affective commitment ($\beta = -0,170$; $t = -3,865$; $p = 0,00$).

The results show that caring ($\beta = 0,377$) and rules ($\beta = 0,225$) had positive effect on affective commitment. Suar and Khuntia (2004) also found out that caring had positive effect on affective commitment. In this frame, this finding was similar to the study results of Suar and Khuntia (2004). On the other hand, instrumentalism had a negative and significant effect on affective commitment ($\beta = -0.170$; $p < 0.01$).

The following suggestions can be offered for ethical climate in order to increase affective commitment level of hotel businesses staff;

- Public authorities should carry out necessary arrangements and provide an effective control mechanism in order to lead the organizations to form professional ethical codes.
- Quality and quantity qualifications should be determined for the staff to be employed
- A comprehensive and joint ethical counsel should be founded in order to form professional codes, determine the standards, and supervise the applications.
- Higher administrative staff should be a model via their expressions and behaviors in the adaptation process of ethical behaviors for the whole staff.
- Human resources policies and applications, which have a crucial role in the formation of organizational commitment, should be developed in accordance with the exemplary hotel business applications.
- Organizational socialization process should be provided in order that the employees can learn organizational policies, rules, norms, and procedures on an interactive basis.
- In-service training programs required for conveying the information about ethical codes and organizational values determined by the administration should be supplied.
- Award and penalty system should be constituted and this system should be applied objectively.

Unless these issues are taken into account, turnover will increase, service quality will decrease, client satisfaction will be affected negatively, disadvantage of competition will occur, and consequently businesses will face the threat of withdrawing.

The findings of this study need to be interpreted with the following limitations in mind. First limitation is that the results can not be strictly construed to be representative of all middle managers and employees in hotel businesses around the world, because this study has been conducted in a specific region of Turkey, Cappadocia. Therefore, the study needs to be replicated in different tourism destination, industries and countries to be able to generalize the findings. Second, participants may have been biased to present positive aspects of their businesses.

This research aimed to investigate the relationship between ethical climate types and affective commitment in hotel businesses. For the upcoming research, it is possible to investigate the issue of ethical climate in different industry settings. Moreover, it would also be interesting to analyze the possible relationships between ethical climate and job satisfaction, turnover intention, organizational citizenship behavior, psychological well-being for different industries or organizations.

THE ROLE OF CORPORATE SOCIAL PERFORMANCE/RESPONSIBILITY IN BUILDING AND PROTECTING CORPORATE REPUTATION

A. Asuman AKDOĞAN
Erciyes University, Turkey

Ayşe CİNGÖZ
Nevşehir University, Turkey

ABSTRACT

Reputation is a perceptual representation of a company's past actions and future prospects that describes the firm's overall appeal to all of its key constituents when compared with other leading rivals. Reputation is shaped basing on some direct and indirect interactions between organization and its stakeholders, and is attributed to organization. In order to build a good reputation, one of the basic tasks that can be done is to enhance "corporate social performance (CSP)" or "corporate social responsibility (CSR)". Corporate social performance can be defined as the extent to which businesses meet the economic, legal, ethical, and discretionary responsibilities imposed on them by their stakeholders. This study aims to explain corporate reputation (CR) and social performance in a theoretical way and to examine the relationship between corporate reputation and social performance empirically. Data was obtained from private corporations operating in Kayseri (Turkey). Regression analysis was used to examine the relationship between corporate reputation and corporate social performance/responsibility, and to test the research hypothesis. The results of regression analysis provided support for hypothesis.

Key Words: Corporate Reputation, Corporate Social Performance (corporate social responsibility)

INTRODUCTION

Crisis is a situation that threatens organizational survival and valuable organizational sources. One of the important sources that are threatened by crisis is corporate reputation (Akdoğan and Cingöz, 2009: 7). Reputation is "a perceptual representation of a company's past actions and future prospects that describes the firm's overall appeal to all of its key constituents when compared with other leading rivals" (Watricks, 2002: 374). Reputation is the strongest determinant of corporate sustainability (Firestein, 2006: 25). Having good reputation creates many advantages for a firm. It provides competitive advantage, makes it difficult to be imitated, attracts new customers to organization, affects the political and legal relations positively, and increases financial performance and profitability by reducing transaction and marketing costs and helping to raise sales revenue (Gray and Balmer, 1998: 698; Greyser, 1999: 178, Smaiziene, 2008: 720). As can be seen, positive corporate reputation is an important source that affects financial performance and relationships with stakeholder of firms. Therefore, it is required to be given a great importance to the development and protection of reputation.

Since it leads people to develop negative thoughts about organization, one of the major challenges for reputation is crisis situation. Some negative news made in crisis times cause the company to be perceived as less reliable, and may damage corporate reputation. Reputation damage may create financial losses and affect organizational survival, negatively. In another words, if crisis can not be managed correctly, it may cause firms to lose many benefits that are accepted as advantages of reputation (Akdoğan and Cingöz, 2009: 5). On the contrary, since corporate reputation is a matter that is related to perception of stakeholders, good reputation may be an important instrument that protects organizations from some risks during a crisis. It may shape attributes concerning with crisis and enable organization and brand to be preferred in depression periods. In addition, reputation is a major sign of confidence. Accordingly, it can be a significant mechanism that helps risks about organization to be evaluated and creates environment of trust in relations with stakeholders.

In this respect, organizations that want to overcome crisis period with minimum damage should accept corporate reputation as an exit strategy that decreases negative effects of crisis, and should carry out some activities in the

direction of improving and protecting a good corporate reputation. In order to build a good reputation, one of the basic tasks that can be done is to enhance “corporate social performance” or “corporate social responsibility”.

Corporate social performance can be defined as “the extent to which businesses meet the economic, legal, ethical, and discretionary responsibilities imposed on them by their stakeholders” (Maignan and Ferrell, 2000: 284). Corporate social performance actions can play a significant role in promoting favorable relationship with primary stakeholder groups and affect corporate reputation positively (Brammer and Pavelin, 2006: 437; Gümüş and Öksüz, 2009: 2132). Corporate social performance helps to meet expectations of both managers and other stakeholders and it also provides good opinions about organization to be developed in community (Brammer and Pavelin, 2006: 438).

Good reputation is a valuable source that helps business to overcome crisis periods with minimum damage. Building and protecting of this valuable source largely depend on how good citizen businesses are and on their corporate social performance in society. Thus, businesses that want to affect on perceptions of stakeholders positively should understand and try to meet their economic, legal, ethical and, social expectations. Our objective in this study is to explain corporate reputation and social performance in a theoretical way and to examine the relationship between corporate reputation and social performance empirically.

The relation between corporate social performance and corporate reputation has been researched in a few theoretical studies in Turkish literature (Gümüş and Öksüz, 2009). But there are very limited studies that try to explain this relation empirically. Therefore, this study will become very useful to fill in this gap that is determined in Turkish literature. Also, this study guides managers who work under uncertainty and crisis conditions through how to develop and protect corporate reputation and how to increase corporate social performance.

THEORETICAL BACKGROUND AND HYPOTHESIS

Reputation is a perceptual representation of a company’s past actions and future prospects that describes the firm’s overall appeal to all of its key constituents when compared with other leading rivals (Waddock, 2002: 374). Reputation is shaped basing on some direct and indirect interactions between organization and its stakeholders, and is attributed to organization (Dolphin, 2004: 79). Therefore, corporate reputations are cumulative representations of stakeholders’ opinions of firms which depend on their success in meeting the expectations of those stakeholders (Fombrun and Gardberg, 2000: 13; Waddock, 2000: 340; Brammer and Pavelin, 2006: 437).

Among these definitions two key points can be emphasized (Quevedo-Puente et al., 2007: 63):

- Reputation has a perceptual nature. It is related with the organization’s perceived capacity by the environment. Every stakeholders group gathers and processes information about a firm’s past actions and draws conclusions about its future prospects.
- Corporate reputation is a net or summative perception by company’s stakeholders.

Briefly, there is a general consensus within the literature that reputation can be defined in terms of its perceptual nature (Inglis, et al., 2006: 935). Additionally, a good corporate reputation should have following characteristics (Smaiziene, 2008: 720-721):

- Reputation as a signal of trust: Reputation creates trust in relations with the stakeholders of firm.
- Reputation as a risk evaluating mechanism: Corporate reputation gives ability to anticipate and evaluate future behaviour of the company. So, it helps to anticipate future prospects of companies.
- Reputation as surrogate for deficient information: Reputation is important for information asymmetry. It provides the essential information to investors and stakeholders.
- Reputation as supporting force: Reputation’s value of a company and potential to impact competitiveness might show up through its support to marketing decisions and activities.

Corporate reputation that is created to provide these benefits will affect on behaviors of all individuals and groups that are associated with firm. Concordantly, reputations of firms are effective in many decisions such as making investment decisions, career decisions, and product choices. Reputations signal publics about how a firm’s products, jobs, strategies, and prospects compare to those of competing firm (Fombrun and Shanley, 1990: 233). Therefore, a firm that has a good reputation owns a valuable asset (Caruana, 1997: 109) because its intangible nature makes copy by competing firms more difficult (Dolphin, 2004: 80).

Considering the several aspects of reputation, there are many benefits of good reputation. Reputation is seen as an important asset which could be used as a competitive advantage and a source of financial performance (Zyglidopoulos, 2003: 13; Inglis, et al., 2006: 934). It attracts new business partners and customers, increases

financial performance and investors' satisfaction and loyalty, helps insulate and protect the firms' organization/brand during a crisis, influences political and legal affairs, allows easier entry to new markets and brand extension, enables successful mergers and acquisitions, helps to reinforce relationship with suppliers and distributors and other direct stakeholders, and enhances relationship with NGOs or corporate activists (Greysen, 1999: 178; Davies, 2002: 414; Dalton, 2003: 14-15; Brissette and Power, 2005: 24; Helm, 2007: 22). Furthermore, good reputation makes it difficult to be imitated, makes an organization more transparent, affects the political and legal relations positively, and increases financial performance and profitability by reducing transaction and marketing cost and helping to raise sales revenue (Gray and Balmer, 1998: 698; Fombrun and Gardberg, 2000: 17; Dolphin, 2004: 77-78; Smaiziene, 2008: 720).

As can be seen, positive corporate reputation is an important source that affects financial performance and relationships with stakeholder of firms. Therefore, it is required to be given a great importance to the development and protection of reputation. There are several factors that can be used to build and preserve corporate reputation such as financial performance, innovation and creativity, vision and leadership, employee satisfaction to CEO performance, employee satisfaction and loyalty, developing core competencies, establishing collaborative network and alliances, and social performance and corporate citizenship (Dalton, 2003: 10).

In order to build a good reputation, one of the basic tasks that can be done is to enhance "corporate social performance" or "corporate social responsibility". In previous researches, antecedents of a good reputation have been suggested to include embracing CSR standards, philanthropic giving and the development of trusting relationship with stakeholders (Hillenbrand and Money, 2007: 261).

Corporate social responsibility and the related concepts of corporate social performance, corporate citizenship, and corporate social responsiveness have been addressed both in philosophical and practical terms. These concepts are so closely related that they are often used interchangeably. They have also been addressed as components or phases of each other (Küskü and Fraser, 2004: 57; Valor, 2005: 191). Corporate social responsibility or performance is the organizations' voluntary participation in solutions of social problems (Brammer and Pavelin, 2006: 437) and to meet obligations towards an organizations' social environment (Quevedo-Puente et al., 2007: 61). Also corporate social performance can be defined as the extent to which businesses meet the economic, legal, ethical, and discretionary responsibilities imposed on them by their stakeholders (Maignan and Ferrell, 2000: 284). This definition incorporates Carroll's (1979: 499) classification of four main corporate social responsibilities. Carroll's CSR model explains four types of responsibilities for the corporation: (1) the economic responsibility, (2) the legal responsibility, (3) the ethical responsibility, (4) the philanthropic responsibility (Carroll, 1979: 499; Carroll, 1983: 604; Matten and Crane, 2005: 167). Four components of corporate social responsibility and society's expectations these dimensions are showed in Table 1.

According to Carroll, economic responsibilities include the obligations to be productive, to be profitable, and to meet consumption needs. Legal responsibilities require that businesses fulfill their economic mission within the framework of legal requirements. Ethical responsibilities concern society's expectation that businesses follow established moral standards. Ethical responsibilities concern society's expectation that businesses follow established moral standards. Discretionary responsibilities reflect the desire to see businesses involved in the betterment of society beyond economic, legal, and ethical responsibilities (Carroll, 1979: 499; Maignan and Ferrell, 2001a: 39).

As suggested by Carroll, the main social responsibility of businesses is economic (Carroll, 1979: 500; Pinkston and Carroll, 1994: 159). Commercial organizations are expected to produce the goods and services that society desires, and thereby to create sustainable economic wealth. Businesses also have to meet philanthropic expectations of community and follow the rules of behavior considered appropriate by society, whether these rules are stated in laws or are defined by ethical standards (Maignan and Ferrell, 2001b: 459).

Table 1. Four Components of Corporate Social Responsibility

Type of Responsibility	Societal Expectation	Examples
Philanthropic Responsibilities	Desired of business by society	Corporate contributions Programs supporting Community/education Community involvement/ Improvement; volunteerism
Ethical Responsibilities	Expected of business by society	Avoid questionable practices Respond to “spirit” of laws Assume law is floor of behavior; operate above minimum required by law
Legal Responsibilities	Required of business by society	Asset ethical leadership Obey all laws; adhere to regulations Environmental laws Consumer laws Law affecting all employees Fulfill all contractual expectations
Economic Responsibilities	Required of business by society	Be profitable Maximize sales revenue Minimize costs (administrative, production, marketing, distribution) Make wise strategic decisions Be attentive to dividend policy

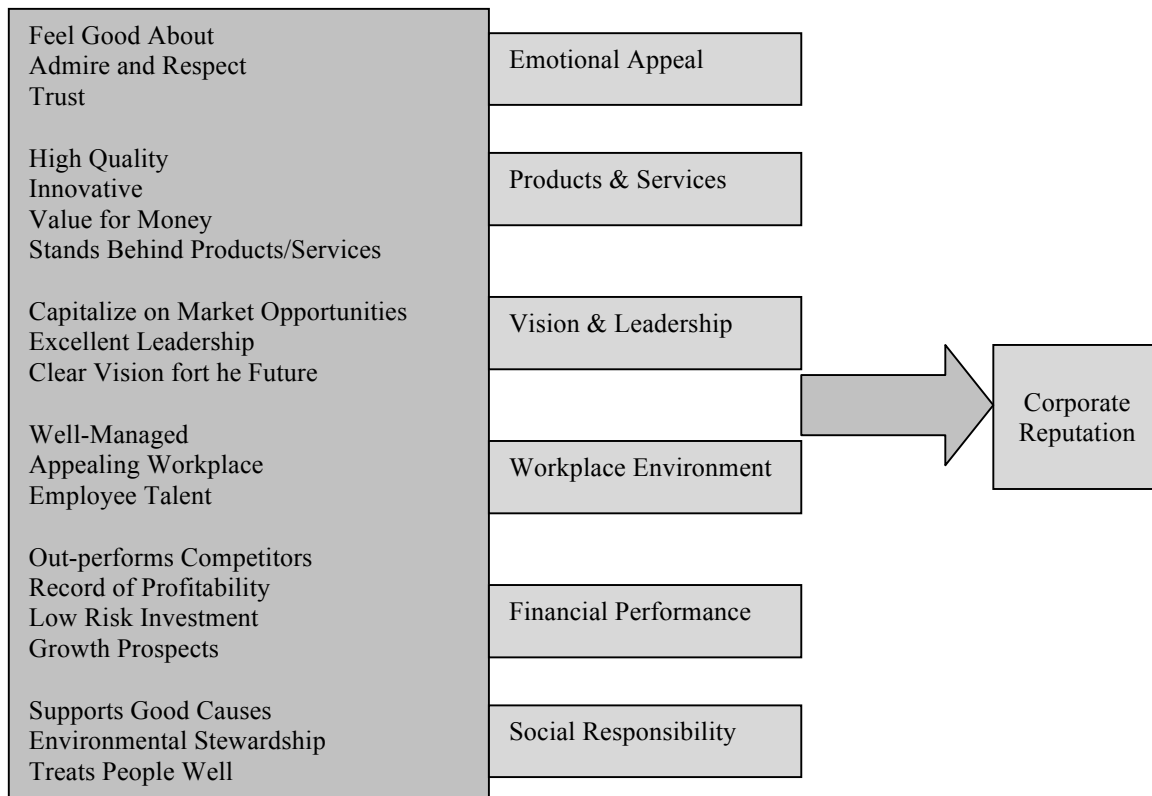

Pinkston, T. S. and Carroll, A. B. (1994), Corporate Citizenship Perspective and Foreign Direct Investment in the US, *Journal of Business Ethics*, 13(3), p. 160

Implementing social responsibility practices can help reduce cost, anticipate change and risk to open up new markets. All these can be real sources of competitive advantage that will lead to an improved picture and the relevant advantages in terms of competitiveness, performance, and reputation (Grigore, 2009: 95). As mentioned in the earlier studies, corporate social performance actions can play a significant role in promoting favorable relationship with primary stakeholder groups and affect corporate reputation positively (Riordin et al., 1997: 401; Brammer and Pavelin, 2006: 437; Gümüş and Öksüz, 2009: 2132).

Corporate social performance helps to meet expectations of both managers and other stakeholders and it also provides good opinions about organization to be developed in community (Brammer and Pavelin, 2006: 438). Research on corporate social performance and on corporate reputation has developed along parallel theoretical lines, with both concepts broadening theoretically to include all stakeholder relations (Quevedo-Puente et al., 2007: 61). CSP, however, is an objective variable whereas CR is a perceptual variable. That is, CSP is a comprehensive assessment of firm’s fulfillment of stakeholders’ expectations, whereas CR is the firm’s perceived capacity to meet stakeholders’ expectations. In essence, CSP describes how the firm delivers value at a moment of time among stakeholders and CR is the perception of how the firm is going to deliver value in the future. One is objective, the other perceptual; one describes the past, the other predicts the future. Because past fulfillment of stakeholders expectations generates an expectation of future fulfillment, CSP can be an antecedent of CR (Quevedo-Puente et al., 2007: 68). Hillenbrand and Money (2007: 262) suggested that CSP is preceding reputation, or in other words as a key element of reputation.

Fundamentally, corporate social performance takes place among main factors that compose reputation. Schnietz and Epstein (2005), for example, identify social responsibility as a key dimension of corporate reputation; Tucker and Melewar (2005) see social responsibility as a critical element of reputation (Hillenbrand and Money, 2007: 261). According to Fombrun, there are six elements (i.e. emotional appeal, vision and leadership, products and services, financial performance, workplace environment and social responsibility) that have effects on perceptions of stakeholders regarding the organization. (Fombrun and Gardberg, 2000: 13). These dimensions and their components are showed in Figure 1.

Figure 1. Dimension of Corporate Reputation

Fombrun, J. C. and Gardberg, N. (2000), Who's Tops in Corporate Reputation?, *Corporate Reputation Review*, 3(1), p. 14.

As explained in Figure 1, social responsibility is a component of corporate reputation. Since social behavior has an impact on perceptions of reputation (Zyglidopoulos, 2003: 12; Gardberg and Fombrun, 2006: 331; Grigore, 2009: 96-98;). In addition, most of the dimensions of corporate social responsibility that are determined by Carroll are among the components of reputation. Both social-financial responsibility and expectations towards product and services have an important place in corporate social responsibility. In this respect corporate social responsibility or performance can be thought as one of the main antecedents of reputation.

As can be seen, good reputation is a valuable source that helps business to overcome crisis periods with minimum damage. Building and protecting of this valuable source depend on how good citizen businesses are and on their corporate social performance in society. Thus, businesses that want to affect on perceptions of stakeholders positively should understand and try to meet their economic, legal, ethical and, social expectations. In this context, we suggest the following hypothesis.

Hypothesis: Corporate social performance/responsibility has a positive impact on corporate reputation.

METHOD, RESULTS AND DISCUSSION

Sample and Measurement

Data is obtained from one of the top executives of each 43 private companies in Kayseri, Turkey, and structured questionnaire forms were used. We examined corporate social performance (or responsibility) with four-dimensional scale developed by Maignan and Ferrell (2000). Their scale was based on the classification of responsibility proposed by Carroll (1979), and was used in Turkish literature by Ksk and Fraser (2004) previously. In addition, corporate reputation was measured by scale that was used by Carmeli and Tishler (2005). This measure was based on Fortune Magazine's 'Annual Survey of America's Most Admired Corporations'. All survey measures will be assessed with 5-point Likert scales ranging from 1-strongly disagree to 5-strongly agree.

Regression analysis was used to examine the relationship between corporate social performance/responsibility and corporate reputation.

Analysis and Test of the Hypothesis

Cronbach's alpha scores for each variable exceeded 0.70 (corporate social performance/responsibility ($\alpha=0.922$) and corporate reputation ($\alpha=0.796$)), which is an acceptable level of reliability.

TABLE 2^a
Results of Descriptive Statistics, Correlation, and Regression Analyses

Variables	Mean	s.d.	1	R ²	Adjusted R ²
1. Corporate Social Performance/Responsibility (independent variable)	4.02	0.417			
2. Corporate Reputation (dependent variable)	4.13	0.440	0.62**	0.526*	0.514*

^an= (43 organizations), * $p < .05$, ** $p < .01$

Means, standard deviations, correlation, and regression among the variables are presented in Table 2. According to our analysis, research variables are positively and significantly correlated with each other. Therefore, the more corporate social performance increases, the more corporate reputation increases. This finding supports result of previous study (Brammer and Pavelin 2006). Corporate reputation is the sum of stakeholders' perceptions of the firm's capacity to fulfil their interests. Stakeholders have some economic, legal, ethic, and discretionary expectations from firms. Meeting these expectations may affect stakeholders' perceptions in a positive way and contribute to improvement of corporate reputation. That is, when a company supports CSR activities, their stakeholders of the companies are likely to evaluate the company more positively.

Antecedents of a good reputation have been suggested to include corporate social performance or responsibility in recent studies (Hillenbrand and Money, 2007: 261). In addition, corporate social performance takes place among main factors that compose reputation. Schnietz and Epstein (2005), for example, identify social responsibility as a key dimension of corporate reputation. Also these factors may cause corporate reputation to improve.

Regression analysis was used to examine the relationship between corporate social responsibility and corporate reputation and to test research hypothesis. According to the results of regression analysis, the relationship between the corporate social responsibility (independent variable) and corporate reputation (dependent variable) is statistically significant ($R^2 = .526$). Corporate social responsibility can explain the changes on corporate reputation on 52.6%. Therefore, research hypothesis indicating "corporate social performance/responsibility has a positive impact on corporate reputation" is supported. That is, corporate social performance/responsibility has positive and significant effects on corporate reputation. In this context, our study provides empirical support for the argument that organizations are able to build and protect corporate reputation by increasing corporate social performance.

CONCLUSION

Corporate reputations are summative representations of stakeholders' opinions of firms which depend on their success in meeting the expectations of those stakeholders. One of the main factors that can help to increase corporate reputation is corporate social performance or responsibility. Corporate social performance can be defined as the extent to which businesses meet the economic, legal, ethical, and discretionary responsibilities imposed on them by their stakeholders. Corporate social performance actions can play a significant role in promoting favorable relationship with primary stakeholder groups and affect corporate reputation positively. In this context, we examined corporate social performance/responsibility and corporate reputation in a theoretical way and researched the impacts of corporate social performance on corporate reputation empirically.

The results of our analysis show that corporate reputation is significantly and positively related to corporate social performance/responsibility. The more corporate social performance/responsibility increases, the more corporate reputation increases. In this respect, our study provides empirical support for the argument that organizations are able to build and protect corporate reputation by increasing corporate social performance.

Results of this research are restricted with the sample. More different findings could be obtained from broader samples. Future research may examine how dimensions of corporate social performance/responsibility affect corporate reputation.

ABSTRACT

Engagement of companies in socially responsible activities is considered to be a significant factor for the attainment of sustainable corporate performance. This has intrigued many academicians and practitioners to focus on the issue and empirically test the debate regarding the impact of Corporate Social Responsibility (CSR) on performance. The relationship between ethical commitment and performance has mainly been evaluated from the perspective of two basic categories, which are accounting based and stock-market based measures. However, Economic Value Added (EVA) is included in this study due to its close representation of shareholder wealth maximization that is regarded to be the main purpose of the existence of corporations. The purpose of this study is to evaluate the impact of CSR activities on the corporate EVA with a two step methodology introducing a lag into the analyses. To achieve this objective, empirical analyses are performed on a sample of 40 non-financial firms listed on the Istanbul Stock Exchange Index 100 (ISE Index 100) for the consecutive four years from 2005 to 2008. In order to eliminate the impact of several firm specific characteristics, control variables have been introduced into the model to more clearly gauge whether CSR activities have a potential to enhance EVA. The results of the analysis indicate a positive and significant relationship between the measure of CSR and EVA. Moreover, further analysis is applied to differentiate the impact of various CSR dimensions on the associated performance measure and the findings reveal that certain dimensions have a more pronounced effect on EVA. This study adds to literature by utilizing EVA as the measure of financial performance, which lacks in recent empirical CSR research. The measurement of CSR activities has been a controversial issue in literature due to the problems of quantification. However, application of a theoretically accepted methodology utilizing content analysis reveals that annual reports of companies can be used to quantify CSR in an emerging market without relying on an established CSR index as those of the developed markets. Furthermore, the methodology employed provides significant additional insight by evaluating CSR activities with a detailed perspective using a theoretically accepted breakdown. This paper is unique as there are not many studies conducted in emerging markets regarding CSR, specifically in Turkey.

Keywords: *corporate social responsibility, economic value added, sustainability, emerging market, content analysis*

INTRODUCTION

The emphasis given to socially responsible actions undertaken by the corporations have increased in the last decades, specifically due to the recent financial scandals. CSR appears to have become more ubiquitous and has been perceived as being relevant to corporations all over the world in the past two decades (Aras and Crowther 2008). Driven by the significant costs of these activities and the potential performance improvements, the impact of CSR on financial performance has become a frequently investigated topic of academic research. The significance of the research area can be seen from the study of Margolis and Walsh (2003), which evidences that the link between CSR and financial performance has been investigated by one hundred twenty-seven empirical studies between 1972 and 2002. More recent studies regarding this issue can be listed as those of Ngwakwe

(2009), Jackson and Parsa (2009), Makni et al. (2008) and Fauzi et al. (2007). However, the results of the empirical studies are not found to be consistent. Even though most of these studies have documented a positive relationship between these two variables (McGuire et al. 1988, Peters and Mullen 2009; Verschoor 2003; Ruf et al. 2001), there are also studies that have documented a negative linkage (Spicer 1978; D'Arcimoles and Trebucq 2002). Furthermore, some studies even document that there is no relationship between financial performance and CSR (Nelling and Webb 2009; Chen and Metcalf 1980).

Most of the previous empirical analyses have examined the relationship between CSR and financial performance with traditional measures like ROA, ROE and ROS. As the primary aim of the company is widely accepted to be shareholder wealth maximization, the financial performance measure employed in this study is chosen to be EVA, specifically due to its direct linkage to the creation of shareholders' wealth. Various studies have been conducted in literature employing shareholder value as the dependent variable to investigate the impact of CSR on value creation. Godfrey et al. (2008) conduct an event study covering a period of 11 years from 1993 and 2003 and conclude that engagement in CSR activities creates value for shareholders measured by stock price. The relationship between CSR projects and creation of value for the firm has been investigated by Husted and Allen (2007). Evaluating CSR on the basis of visibility, appropriability, and voluntarism in their study, they emphasize that designing CSR projects is necessary for shareholder value creation. Another study performed by Becchetti et al. (2009) focuses on this issue and examines the reactions of the stock market to a company's entry into or exit from Domini 400 Social Index, which is a CSR benchmark index in Finland, between the years 1990 and 2004. The findings indicate a significant and negative reaction of abnormal returns in the case of an exit from the index. However, limited number of empirical analyses has been conducted regarding the relationship between CSR and EVA (Mittal et al., 2008; Kim and Dam, 2003). Mittal et al. (2008) study the impact of CSR activities on the economic performance measures of EVA and market value added (MVA). Conducting an analysis on a sample of 50 companies during the period between 2001 and 2005, they explore whether commitment to ethical actions enhance these performance measures. The results are controversial and provide little evidence in terms of a positive relationship. The relationship between CSR and EVA is found to be negative and significant for two years, whereas; that for CSR and MVA is found to be positive and significant for three years of the overall analysis period.

In this study, EVA is utilized as the dependent variable of the analyses due to its predominance over other financial performance measures. The close relation of EVA to shareholder wealth maximization is considered to be one of the most crucial issues in strategic business management. Bhattacharyya and Phani (2004) argue that EVA has a higher correlation with firm's market value than the traditional financial performance measures revealing its superiority. Abdeen and Haight (2002) point out that EVA highlights residual wealth creation in a firm after all costs and expenses have been charged including the firm's cost of capital invested. Furthermore, O'Bryne (1996) states that EVA is systematically linked to market value, thus, it provides a better predictor of market value than the other performance measures. In this study, we first try to investigate whether the companies' CSR activities, which are derived from their annual reports, enhance the following year's EVA. Further analysis is conducted to reveal what kind of CSR activities are more closely related with following year's EVA.

This paper is organized as follows; first an introductory part including recent literature is provided focusing on the linkage among CSR activities, EVA, and the control variables employed; then the research methodology is set out together with the data, sample selection and statistical techniques; lastly the results are evaluated and concluding remarks are provided together with theoretical and managerial implications.

METHODOLOGY

Data and Sample Selection

The sample used in this study is composed of the firms listed on the ISE Index 100 for the consecutive four years from 2005 to 2008. The empirical analysis is conducted on 40 listed firms which are selected after removing all of the firms in the financial sector and two firms in the automobile sector since the format of their annual reports differ significantly from those of the non-financial firms. The data regarding the CSR activities is derived from the annual reports of the associated companies, whereas; data regarding the measurement of EVA is generated from the financial statements of these companies together with the footnotes to the statements.

Variables

The dependent variable used in this study is chosen to be EVA mainly due to its superiority to other performance measures as it takes into account both the cost of debt and equity capital, in other words, how much economic

value in monetary terms the firm is creating. EVA is calculated by deducting the capital charge or cost of capital of an investment over a certain period from the Net Operating Profit After Tax (NOPAT) for that period. Therefore, EVA is calculated as follows;

$$\text{NOPAT} - (\text{WACC} * \text{Debt and Equity Capital})$$

From the above equation it is clear to see that net operating profit is adjusted for accounting distortions and a charge on capital employed at the rate of weighted average cost of capital. Thus, EVA aims to reveal what happens to the wealth of shareholders.

Estimation of the cost of capital is considered to be the most challenging component of EVA calculation. The cost of capital is the cost of raising additional funds from debt and equity sources and represents the opportunity cost or the rate of return demanded by the investors. Furthermore, companies create value for their stakeholders by earning returns on invested capital which exceed the cost of the capital of the firm. The Weighted Average Cost of Capital (WACC) is determined by using appropriate weights (in terms of market value) for each component of long-term capital. The calculation of EVA is provided in Table 1 in detail.

This study employs CSR as the explanatory variable of the analysis to explore the relationship between engagement in social responsibility activities and firms' performance determined by EVA. Content analysis methodology, which is first utilized by Bowman and Haire (1975), is applied in the analyses to determine the level of CSR in line with various other studies in literature (Hughes et al., 2001; Hackston and Milne, 1996).

There are two main processes related to the content analysis methodology referred to as the development of a categorization scheme and determination of the rules to be used as a guide for the decision of what and how to code (see also Milne and Adler, 1999; Aras et al. 2010). The themes, which generate a detailed breakdown of CSR activities, can be listed as environment, energy, products/consumers, community, and employee health and safety, employee other, general. Table 1 below also lists the CSR themes and associated explanatory variables together with their unit of analysis, which is the number of the sentences related to the CSR disclosures in the companies' annual reports (Hackston and Milne, 1996).

Several firm specific factors have been controlled for in the analysis to clearly evaluate the relationship between social responsibility and firm performance. As a proxy for firm size, log of net assets is employed. ROE is used as a proxy of accounting based measures of financial performance. Stock market based performance measures are controlled by market to book ratio, price earnings ratio and market value. Furthermore, foreign ownership variable is also added to the model to generate additional insight and take into account firms' ownership structure.

The Models Employed

Two types of models are utilized with cross sectional regression analysis. For the first type of model, the dependent variable is chosen to be EVA whereas the explanatory variable is chosen to be CSR. The control variables are the same for both of the models. The difference of the second model arises only from the explanatory variable, which is denoted by the breakdown of CSR. The two models can be seen on Table 2 in detail.

It is important to note that a lag of one year is introduced into the two models to more clearly analyze the impact of socially responsible activities on corporate EVA. Therefore, EVA refers to that of the year 2007, whereas; CSR and all control variables refer to the year 2006.

Table 1: Summary of Variables, Abbreviations and Definitions

Variables	Abbreviations	Definitions
Dependent Variable		
Economic Value Added	EVA07	NOPAT – (WACC * Long Term Debt and Equity Capital)
Net Operating Profit After Taxes	NOPAT	Operating Income *(1- tax rate)
Weighted Average Cost of Capital	WACC	$WACC = (re * we) + (rd * wd)$
The Cost of Equity	re	$re = rf + \beta * (rm - rf)$
Return on Treasury Bills	rf	Risk free rate
Firm's Beta	β	The covariance of stock versus market returns is divided by the variance of the stock market.
Return on ISE-100	rm	The average return of last 100 days of ISE-100 index
The Weight for Equity	we	Equity / Total Debt + Equity
The Cost of Debt (After Tax)	rd	$(Interest Expense / Long Term Debt) * (1-t)$
The Weight for Debt	wd	Long Term Debt / Total Debt + Equity
Explanatory Variables		
The Level of Corporate Social Responsibility	CSR06	The number of sentences constituting a CSR activity
CSR Themes:		
Environment	CSRenv	The number of sentences constituting the environment theme of CSR
Energy	CSRengy	The number of sentences constituting the energy theme of CSR
Products/Consumers	CSRprcn	The number of sentences constituting the products/consumers theme of CSR
Community Involvement	CSRcom	The number of sentences constituting the community involvement theme of CSR
Employee Health & Safety	CSRempsf	The number of sentences constituting the employee health & safety theme of CSR
Employee Other	CSRempoth	The number of sentences constituting the employee other theme of CSR
General	CSRgen	The number of sentences constituting the general theme of CSR
Control Variables		
Firm Size	lnasset	The log of net assets
Return on Equity	ROE	The ratio of net income to total equity
Market to book ratio	MB	The ratio of market value to book value
Price Earnings Ratio	PE	The ratio of share price to earnings per share
Market Value	lnmarket	The log of market value
Foreign Ownership	FDI	The percentage of shares that are held by foreign owners

Table 2: The Models Utilized in the Analysis

Model	Dependent Variable	Explanatory Variable	Control Variables
1	EVA07	CSR06	*6 control variables
2	EVA07	CSR Themes: CSRenv CSRengy CSRprcn CSRcon CSRempsf CSRempoth CSRgen	

*The control variables used in the models are the same and can be listed as log of assets, return on equity, market to book ratio, price/earnings ratio, log of market value and the percentage of shares that are held by foreign investors

Empirical Results

This subsection is dedicated to the results of the empirical analyses that investigate whether engagement in CSR activities enhance firms' EVA depending on the results obtained from cross sectional regression analysis. The outcomes of the two models are displayed on Table 3 below.

Interpretation of the results regarding the first model reveals that the coefficient of the explanatory variable, CSR activities in the year 2006, has a positive and statistically significant impact on the dependent variable EVA of the following year, 2007. This finding implies that the companies that act in a socially responsible manner have demonstrated better performance in terms of EVA during the observation period. Therefore, it can be stated that investment in activities which are regarded as being socially responsible have the tendency to act in line with the shareholder wealth maximization notion.

As the table represents, the control variables used in this study have certain significant impacts on firms' EVA. The results of the first model show that all of the control variables other than FDI have statistically significant coefficients. Thus, the structure of ownership, which is considered from the perspective of foreign owners, has no impact on EVA. Firms' size denoted by *Inasset*, the accounting based performance measure ROE and the stock market based performance measure MB have a positive and significant influence on EVA. As can be seen from the coefficient of the control variable ROE, the impact of this performance measure is the highest on the dependent variable. Meanwhile, the significant and negative coefficients of PE and *Inmarket* reveal the reverse relationship between these variables and EVA.

The results of the second model provide a more detailed perspective on social responsibility as it includes the breakdown of the CSR activities. The only two dimensions that have a positive and significant impact on EVA are displayed as being *CSRenv* and *CSRprcn*. This finding implies that socially responsible actions regarding the environment and products/consumers have enhanced firms EVA rather than the other dimensions. However, this should not be considered as investment in the other dimensions is meaningless in terms of EVA improvement. The period of the analyses, the sample taken into account and, more importantly, what is reported in the annual reports have the potential to influence these findings. Thus, it can not be stated that the CSR activities should only focus on the environment and the products/consumers when dealing with EVA. Table 3 also shows that the signs and significance statuses of the control variables' coefficients in the second model are the same with those of the first one displaying no major difference in their magnitudes. Therefore, the explanations provided for the first model also hold true for the second one.

Concluding Remarks

The purpose of this study is to add to literature by focusing on two very significant issues, which are CSR and EVA with a perspective from an emerging market. Numerous analyses have been conducted regarding the relationship between social responsibility and financial performance; however, few have employed EVA as the dependent variable of the models. CSR is considered to contribute to the value creation of the firm by emphasizing that the company cares about the society as a whole while trying to generate sustainable corporate performance. As EVA is regarded to be a crucial tool of strategic business management in terms of shareholder wealth maximization, companies should be devoted to engage in any actions that have the potential to boost this notion. Therefore, it is not difficult to become aware of the interrelation between these two notions.

Two models are developed and the overall results suggest that socially responsible firms display enhanced performance in terms of EVA. As the findings of the analyses clearly demonstrate, conducting socially responsible activities is one of those tools of shareholder wealth maximization, thus, should be considered as a crucial element of firms' agenda. Furthermore, there are certain significant implications of this study for the managers. As the findings establish that CSR enables firms to focus their strategic goals to value creation, more attention should be given to how CSR activities are communicated to the stakeholders. As the annual reports are one of the most important tools of increasing the awareness of the investors, how CSR is being reported is utterly important.

EFFECTS OF CORRUPTION ON REINVESTMENT DECISIONS: A WORLD WIDE ANALYSIS WITH MNEs

**Martina McGuinness
Nizamettin Bayyurt
Mehmet Demirbag**

University of Sheffield, England

ABSTRACT

A range of studies have found that corruption has a significant impact upon FDI decisions, however to date there has been little investigation into longer term investments made by firms. Utilizing 2005 World Bank Enterprise Survey data, this study explores the relationship between corruption and the strategic decision to reinvest. Drawing together institutional and transaction costs approaches, we find variation in the different dimensions of corruption and their impact upon relationship between corruption and reinvestment. We find that pervasive corruption impacts negatively upon reinvestment whilst bribery is not found to be significant. Perceived robust legal institutions have a positive correlation with reinvestment. Firm level attributes of increased size and age are important factors in positive reinvestment decisions but export orientation is not significant.

INTRODUCTION

This study explores the relationship between the institutional environment and firm growth, and more particularly, the impact of corruption upon re-investment decisions in multinational enterprises (MNEs). There is consensus in the literature that corruption has a negative impact upon foreign direct investment as well as local investment. However, to date, there has been very little work carried out on subsequent sequential investment decisions and the impact corruption might have upon these. This research addresses this gap in the literature and utilizes empirical data to provide novel insights into the longer term strategic investment decisions made by MNEs. We demonstrate that this picture is more complex than one might expect and we indicate key managerial implications which emerge from our analysis.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

Corruption has long been a subject of interest for researchers, however, interest in the area has grown over recent years. Some early work indicated corruption had positive benefits for economic growth by allowing firms to circumvent bureaucratic delays (Leff, 1964; Huntington, 1968). More recently, a keen awareness has emerged of the obstacle to business posed by corruption (Brunette et al, 1997; Pfeffermann & Kiskunko, 1999), its negative impact upon economic growth (Mauro, 1995) and in particular the influence corruption has upon inhibiting foreign direct investment (Habib & Zuravicki, 2001; Robertson & Watson, 2004).

Conceptually, scholars have sought to understand corruption utilizing a variety of theoretical frameworks; for example, causality (Ades & Di Tella, 1999), the perspective of public economy and ethics (Rose-Ackerman, 1999; 2002), transaction-cost economics (Husted, 1994; 1999) and governance (Hellman et al, 2000). Empirical work has also scrutinized this phenomenon from a range of dimensions such as; direct and indirect costs (Doh et al, 2003), pervasiveness and arbitrariness (Doh et al, 2003; Rodriguez et al, 2005, Uhlenbruck & Rodriguez, 2006), transparency (Zhao et al, 2003) and perceptions of host country corruption (Wilson, 1996; Habib & Zuravicki, 2001).

This paper provides a novel contribution to the growing body of research in the area of corruption in two ways. Conceptually, our analysis is underpinned by an integration of transaction costs with institutional theory, as

advocated by North (1990). This allows us to broaden our focus from the technical environments of individual transactions, as suggested by transaction cost theory, and place these strategic decisions within the wider institutional context. Such an approach is invaluable as it is impossible to understand corruption separate from the institutional environment within which it exists. Secondly, the key relationship of corruption and re-investment is a novel focus for investigation. Whilst much work has been carried out on the impact of corruption upon foreign, direct investment, mode of entry and ownership strategies, the strategic issue of re-investment has been neglected. So, whilst scholars such as Habib & Zuravicki (2001) found that corruption impacts less upon local, rather than foreign, direct investment, and it can vary by region (Asiedu & Freeman, 2009), little work has explored the longer term issue of re-investment. Institutional factors have been found to be significant for re-investment decisions (Johnson et al, 2002; Cull & Xu, 2005) but these investigations have focused upon factors such as access to external finance and secure property rights. Whilst Cull & Xu found that the reliability of contract enforcement did impact upon re-investment, they did not explore this within additional dimensions of corruption.

Our study examines the institutional domain within which corruption exists and which provides the context for re-investment decisions. We also incorporate firm level variables of age and export orientation and put forward a number of hypotheses such as; firms are less likely to re-invest in countries with pervasive corruption and strong legal institutions encourage re-investment and higher levels of bribery.

Corruption is distortionary; it increases perceived levels of environmental uncertainty and also adds to the organization's transaction costs (Shleifer & Vishny, 1993; Wei, 1997). It has long been recognized as a key influence in the FDI investment decision, particularly in emerging markets (Rodriguez et al, 2005; Uhlenbruck et al, 2006). It has been argued that the contribution of corruption to perceived levels of environmental uncertainty is underpinned by a number of factors, of which pervasiveness and arbitrariness are key dimensions (Lee & oh, 2007; Rodriguez et al, 2005; Uhlenbruck et al, 2006; Wei, 1997). The pervasiveness of corruption is seen as more of a deterrent to the initial investment decision because it increases the *known* costs of investing. In contrast, corruption that is *unknown* i.e. uncertain, does not act as a such a deterrent to investment because it is perceived as part of the uncertainty of operating a new market (Cuervo-Cazurra, 2008). In making strategic decisions around re-investment, incumbent firms have additional knowledge of the institutional environment developed through their operating experience post FDI. This is with particularly important with respect to both pervasiveness as it means that the level of uncertainty regarding this dimension has decreased further and therefore managers are less likely to misjudge or ignore the costs (Doh et al, 2003). Consequently, their knowledge regarding the transaction costs associated with pervasive levels of corruption is likely to be well developed. Therefore, we hypothesise that

H1: In countries with pervasive corruption firms are less likely to re-invest

As institutions provide the context within which the firm's transactions take place, it is not surprising that a number of scholars have noted the importance of positive and robust host government institutions (Henisz, 2000; Meyer, 2001). Central in this institutional infrastructure are those structures which provide the legal frameworks which facilitate the existence and operation of businesses (Rose-Ackerman, 2002). Previous research has investigated the importance of robust legal institutions in influencing IJV partner selection, concluding that confidence in the ability to capture rents was highly significant. Such confidence is inherently linked with managerial perceptions of the host country's legal institutions to provide adequate safeguards against arbitrary rulings as well as shaping an environment where wrongdoers are captured and punished (Roy & Oliver, 2009). 'Administrative quality' in the form of control of corruption as well as the investment-friendly profile of administration, law and order is an important influence in decisions about resource commitment (Aysan et al, 2007). Quite simply, strong legal institutions are critical in securing property rights and integrity of contract (Haggard & MacIntyre, 2008). Logically, firms are unlikely to commit *further* resources in markets where they perceive that property rights are not respected and contracts unenforceable.

H2: Strong legal institutions encourage re-investment by firms

Laws against bribery abroad, such as the OECD Anti-Bribery Convention, aim to reduce the supply of bribes by foreign investors by increasing the costs of bribing abroad (Cuervo-Cazurra, 2008). In other words, anti-bribery laws increase the firm's transaction costs and therefore act as a disincentive to engaging in corruption in host countries (Cuervo-Cazurra, 2006). Hines (1995) found that after the enactment of the U.S. Foreign Corrupt Practices Act, American business activities in bribe-prone countries decreased sharply. Even if firms continue to transact business in countries riven by bribery, they are likely to find themselves disadvantaged in comparison to

competitors who do pay bribes. So, firms operating in countries with high levels of bribery are likely to find their transaction costs are increased whether or not they pay bribes. Hence,

H3: Higher levels of bribery lead to lower levels of re-investment

MNEs with a longer tenure of operations are significantly more likely to make additional investments (Mudambi, 1998). Through longevity, the firm may develop experience-based capabilities, refined routines and the ability to adapt (Baum & Shipilov, 2006; Henderson, 1999). Such skills are of even greater value in environments which are characterised by high degrees of uncertainty within the institutional domain. Over time, organisations have the opportunity to build networks and relationships with institutions (Hoskisson et al, 2000) thereby reducing the negative impacts of corruption on transactions costs (Makhija & Stewart, 2002; Makhija, 2003). For example, age can confer specific advantage in terms of the institutional embeddedness of the organization leading to a reduction in perceived institutional uncertainty as a result of corruption, or the opportunity to manipulate the environment to its needs (Zimmerman & Zeitz, 2002), for example, older firms may have developed greater bargaining strength leading to public officials demanding fewer bribes (Svensson, 2003). At the most basic level, for those older firms actively participating in corruption, they know who to pay and how much; for those firms not actively engaging in corruption, they are fully apprised of the implications and are therefore in the optimal position to make judgements regarding cost implications.

H4: The older the firm, the less likely that corruption shall mitigate against reinvestment

Larger firms have greater resources available to them than smaller firms and therefore are better able to pay bribes (Svensson, 2003). Increased size also provides advantages such as enhanced contacts, clout and the ability to make credible threats of retaliation to host governments should property rights be violated (Acs et al, 1997). The impact of corruption on transaction costs is likely to be disproportionately greater for small and medium sized enterprises (SMEs) than for large MNEs. Further, SMEs are more sensitive to the heightened uncertainty and levels of risk which are characteristic of corrupt institutional domains (Ghosal & Loungani, 2000; Lskavyan & Spatareanu, 2008) and consequently would be less likely to commit additional resources through reinvestment.

H5: The larger the firm, the less likely that corruption shall mitigate against reinvestment

Examining a sample of Swedish firms, Hakkala and her colleagues (2008) discovered that corruption impacted differently upon vertical FDI, that is investment made primarily to produce goods for export to destinations outside the host country when compared to horizontal FDI. Corruption impacted negatively upon firms engaging in horizontal investments aimed at local sales. In contrast they did not find any robust effects on vertical and export platform investments.

H6: The more export oriented the firm, the less likely that corruption shall mitigate against reinvestment

METHODS

This study draws upon the 2005 World Bank Enterprise Survey Data and utilizes a random sample of 23 countries, 1128 firms of which more than 5% belongs to a foreigner partnership. After removing missing values, outliers and “don’t know”s, a sample of 423 firms remained. These countries are categorized as follows; transition-non EU members (127 firms), transition-EU (153 firms), big emerging (44 firms) and developed-EU (99 firms). The home countries of the firms are included in the analysis as well and firms are classified in three groups according to their size. The sample comprises 4 sectors: manufacturing, construction and real estate, wholesale, trade, repair of motor vehicles, household goods and others. In the survey, responses were measured on Likert scales (5 and 7 point) to statements such as “corruption is obstacle or not for operation and growth for the business”. Firms answering “don’t know” are excluded from the analysis and the others are recoded as 1; no (from 1, 2 and 3) and 2; yes (from 4, 5, and 6). Regression analysis searches for the effects of corruption, bribery, court system reliability, industry, exports, home country, and size on reinvestment. Industry and home countries are dummies. Reinvestment and firm age are logarithmic and the exports variable is in square root in the analysis.

ANALYSIS

The aim of the analysis is to investigate the impacts of corruption on reinvestment decisions of multi national companies (MNE). Table 2 shows binary correlations between variables. It is seen that variables of which effect on reinvestment decisions analyzed in this study have significant correlations with reinvestments.

The regression analysis results of these variables are given in table 3. The model searching the effect of corruption, bribery, court system reliability, industry, exports, home country, and size on reinvestment is significant as a whole ($R = 0,653$, $P < 0,0001$). Industry and home countries are dummies. Reinvestment and firm age are logarithmic and exports square root is in the analysis. The results given in table 3 display that while corruption has negative effect, honesty and uncorrupted court system has positive effect on reinvestment decisions of MNEs. Among the control variables, age and size are statistically significant on reinvestment but export is not.

FINDINGS AND CONCLUSIONS

Our results show that while pervasive corruption has a negative effect upon reinvestment, the perceived honesty and uncorrupted court system has a positive effect on reinvestment decisions of MNEs. Bribery is not found to be significant and we suggest that this may be linked to the effectiveness of institutional enforcement. We find that age is a significant variable and older firms are more likely to reinvest. This may be associated with the level of institutional embeddedness conferred through longevity. The more embedded the firm is in the institutional environment, the greater the level of predictability of that environment and consequently the decision to reinvest is perceived as less risky. We also find a correlation with size which is in keeping with other research which suggests that smaller firms have less bargaining power and thus are more sensitive to uncertainty and risk (Ghosal & Loughani, 2000; Lskavyan, & Spatareanu, 2008; Svensson, 2003).

THE RELATIONSHIP AMONG CHARISMATIC LEADERSHIP, ETHICAL CLIMATE, JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT IN COMPANIES

Cemal ZEHİR
Ebru ERDOĞAN
Dogan BASAR

Gebze Institute of Technology, Turkey

ABSTRACT

The aim of this study is to survey the relationship between the ethical climate, leadership behavior in terms of charismatic leadership and organizational commitment regarding affective and continuance commitment. It is noted that this examine is based on a survey of 626 people who work in national and multinational companies in Turkey for comparing relationship between the factor analysis, reliability, correlations and regressions. As a consequent, all hypotheses are supported and positively related.

Key Words: Leadership, Job Satisfaction, Ethical Climate and Organizational Commitment

INTRODUCTION

The main purposes of this research are investigating: (i) the dependant variables that influences on independent variables as job satisfaction and organizational commitment; (ii) the effects of job satisfaction on organization commitment; and (iii) the mediator effects of job satisfaction.

In addition, a positive relationship between job satisfaction and organizational commitment has been reported in several studies (Bartle, Dansby, Landis and McIntyre 2002; Redfern, Hannan and Norman 2002; Kim, Leong and Lee 2005).

The links between employees' commitment to their organizations and satisfaction with their jobs have been the subject of a large amount of empirical research, and still there seems little agreement about the causal connections between these two important employee attitudes (Rayton, 2006). Job satisfaction is one of the most researched phenomena in organizational behavior literature, and it is defined as the extent to which a worker feels positively about his or her job (Odom, Boy and Dunn 1990).

The purpose of this paper is to examine the relationship between organization's ethical climate, leadership behavior as charismatic leadership and job satisfaction and organizational commitment as it can be seen in Figure 1. If there is a significant relationship between job satisfaction and organizational commitment existing independent outcome variables, there may be a positive ethical climate through charismatic leadership that brings out satisfaction and commitment.

LITERATURE REVIEW AND RESEARCH HYPOTHESES

Figure 1: Research Model.

The paper begins with a theoretical background, followed by an explanation of the research design and continues with express research methods and results. Finally, results are discussed in the light of previous theory.

Ethical Climate

Climate refers to the ways organizations operationalize routine behaviors and the actions that are expected, supported and rewarded (Schneider and Rentsch, 1988). On the other hand, due to differences in individuals' positions, work groups, and employment histories, perceptions of organizational climate may vary within the firm (Victor and Cullen, 1988). According to Schneider (1975) there is no single type of work climate depending on this statement; an organization, subunit and work group may consist of many different types of climates-including an ethical climate (Schneider, 1975). Furthermore, whereas such evidence suggests that unethical climates exist, it adversely implies that not all organizations' climates are perceived as unethical (Schwepker, 2001).

The organizational ethical climate has also been defined as 'the shared perceptions of what are ethically right behavior and how ethical issues should be handled' by Victor and Cullen (1988), and there are two dimensions that explain employee perception of ethical events, practices and procedures. The first dimension is named as the ethical criteria including three possible levels of ethical decision making, which are, egoism (hedonism), benevolence (utilitarianism) and principled (deontology). The second dimension is named as the loci of analysis based on three diverse referents in ethical decisions. These three loci represent individual, local and cosmopolitan in decision-making. Lastly Victor and Cullen (1987) used the 3 x 3 matrix of nine theoretically possible ethical climate types. Each of these nine cells proposes an ethical criterion to the firms for helping on decision making.

Apart from the behavior of top management, ethical codes play a major role in clarifying ethical climate to organizational members in firms. The ethical codes have been suggested as a means for promoting an ethical climate within an organization (McDonald, 1999). Higher levels of ethical behavior have been found in firms where codes of ethics are in place and enforced (Ferrell and Skinner, 1988). When codes become an active part of an employee's working knowledge, they are more likely to affect the individual's ethical decision making (Hegarty and Sims, 1979). Additionally, codes that are effectively communicated (i.e., understood) are likely to result in greater ethical behavior (Weeks and Nantel, 1992). Company policy likewise affects an individual's opportunity to behave unethically and impacts the organization's ethical climate (Schwepker, 2001).

Ethical climate and ethical attitudes are differing in content. Organizational ethical climate is defined as a composite of organizational members' perception of the ethical attitudes and how to deal with an issue. Several studies have shown that there is a relationship between the organization's ethical climate and employees' ethical attitudes. If there is inappropriate behaviors shown on top management which affect employees', the ethical attitudes are negatively affect the work groups' ethical climate. The first step of minimizing unethical behavior in work group is to consider the data of ethical climate at that time (Zehir, et al., 2003).

Creating an ethical climate via ethical codes, ethical policies and reward/punishment should reduce the chance of unethical choices as defined by the organization (Schwepker, et al., 1997). They want to create an ethical climate which aimed to impact the organization's climate.

Organizational Commitment

The studies about organizational commitment have been growing from 1970 and even its history started in 1950's. Due to significantly increasing performance in Japanese companies, American researchers have been investigating the success depending on commitment. Organizational commitment had been described as a state resulting from 'side-bets' or investments that a person accrues over time while working for an organization such as non-vested retirement benefits, job security, accrued vacation (Becker, 1960). On the other hand organizational commitment is commonly defined as employees' interest in, and connection to, an organization (Hunt et al., 1989; Meyer and Allen, 1997; Mowday et al., 1979).

Steers (1977) defined organizational commitment as the relative strength of an individual's identification and involvement in a particular organization. According to Porter (1979) organizational commitment can be measured by: (1) a strong belief and acceptance of the organization's goals and values, (2) the strong desire to belong to organization and (3) the willingness to display effort on behalf of the organization. At first Meyer and Allen (1984) initially proposed that a distinction be made between affective and continuance commitment, with affective commitment denoting an emotional attachment to, identification with, and involvement in the organization and this employee commits to the organization because he/she "wants to" (Allen and Meyer, 1990) while with continuance commitment denoting the perceived costs associated with leaving the organization and this employee remains a member of the organization because he/she "need to" (Allen and Meyer, 1990). Later, Allen and Meyer (1990) later suggested a third distinguishable component of commitment, normative commitment, which reflects a perceived obligation to remain in the organization and this employee stays with the organization because he/she "ought to" (Allen and Meyer, 1990).

Job Satisfaction

Job satisfaction has been a topic of great interests for researchers; therefore it has been studied across several decades. Job satisfaction can be defined as the "pleasurable or positive emotional state resulting from the appraisal of one's job and job experience" (Locke, 1976). On the other hand job satisfaction can be explained as individual's feeling about their job and its related aspects. According to Schneider and Snyder (1975), job satisfaction is consisted of individual's intrinsic responses that they develop as a result of their understanding of the job.

Smith, Kendall, and Hulin (1969), identify five variables of job satisfaction; the work itself, pay, and opportunity for promotion, supervision and coworkers while Churchill et al. (1969) developed seven components of job satisfaction with overall job, co-workers, supervision, company policy and support, pay, promotion and advancement and customers. In our study, one components of job satisfaction is chosen, which is the job itself.

According to Schwepker (2001), satisfaction is partially determined by policies and supervision and a firm's ethical climate are affected by both of them. The top management decides the policies depending on what they view as appropriate or inappropriate behavior. Regardless, managers like leaders play a major role in determining the organization's ethical climate and play a significant role in affecting employee's ethical behavior (Ferrel and Gresham, 1985). Therefore, the ethical climate is formed by management and becomes an important force driving not only ethical behavior but also job-related outcomes.

Charismatic Leadership

The early theoretical models have been proposed since the late 1970's (Bass, 1985; Conger and Kanungo, 1987; House, 1977; Roberts, 1985; Zaleznik and Kets de Vries, 1975). Charisma is simply one of several components of transformational leadership. Therefore, the terms of transformational and charismatic leadership became intertwined in the organizational literature (Conger and Kanungo, 1994).

In recent times, Conger and Kanungo (1987, 1988, 1992) developed a model that based on several behavioral dimension of charismatic leadership within organizations. Due to the model, charismatic leadership is an attribution relies on followers' perception of their leader's behavior. Because of their ability, they may have difference from other leaders such as formulation and articulation of inspirational vision, behaviors and actions that foster an impression. The Conger- Kanungo model proposed several distinguishing behavioral components in three diverse stages of the leadership process. The stage one (environmental assessment stage) explains environmental opportunities, constraints and followers' needs via the status quo while the stage two explains vision formulation stage. In stage three (implementation stage), managers who perceived as charismatic are tended to lead as an example to subordinates.

Ethical Climate and Job Satisfaction

As can be seen in many studies, ethics and satisfaction at the workplace are positively related (Victor and Cullen, 1987, 1988; Vitell and Davis, 1990; Deshpande, 1996; Joseph and Deshpande, 1997; Viswesvaran and Deshpande, 1996, 1998; Babin et al., 2000; Koh and Boo, 2001; Schwepker, 2001; Schwepker and Hartline, 2005; Valentine and Barnett, 2003; Weeks et al., 2004; Woodwine, 2006). Although these evidence support the positive relationship between job satisfaction and ethical climate, Schwepker(2001) found that there is no relationship between the rules of dimension and ethical climate which depends on and, did not particularly measure ethical policies while the study revealed that there is a positive association between a professional standards and job satisfaction. According to these findings the following hypothesis is offered:

H1: There is a positive relationship between ethical climate and job satisfaction for employee perception of organizations.

Charismatic Leadership and Job Satisfaction

Empirical evidence has demonstrated that charismatic leaders are viewed by their bosses as higher performers than less charismatic leaders (Hater and Bass, 1988). Bateman and Crant (2000), found that self-reported proactive personality is positively associated with supervisors' independent ratings of charismatic leadership and are positively related to participants' most significant personal achievements. Leaders are largely responsible for communicating direction and meaning among employees (Schein, 2004). Especially, transformational and charismatic leadership behaviors have been shown to have a significant effect on a work unit's collective attitudes and behavior (Judge and Piccolo, 2004). A recent study has shown that the strength of this relationship- though always positive- depended a great deal on how criteria were conceptualized, aligned and constructed (Whitman et al., 2010). So according to research in this area leads to the following hypothesis:

H2: There is a positive relationship between charismatic leadership and job satisfaction for employee perception of organizations.

Organizational Commitment and Job Satisfaction

Although there are ambiguous findings, and strong evidence exists, the organizational commitment is positively affected by job satisfaction (Dubinsky and Hartley, 1986; Johnston et al., 1990; Brown and Peterson, 1993). In addition to this outcome, another study examined the role of job satisfaction in employees' reactions to any troubles in the organization (Hagedoorn et al., 1999).

While Schwepker (2001), looked at the seven dimensions of satisfaction related to organizational commitment, but did not provide a detailed look at which dimensions individually impact organizational commitment. In addition to this study Rutherford et al. (2009), research those individual dimensions of job satisfaction influence organizational commitment. According to results; three dimensions of job satisfaction were related positively to organizational commitment, and only one dimension of job satisfaction with overall job is related to both organizational commitment. Based on these findings as well as other supporting literature, the following hypothesis is formulated:

H3: There is a positive relationship between job satisfaction and organizational commitment for employee perception of organizations.

Organizational Commitment and Ethical Climate

Research generally suggest that low levels of organizational commitment may be dysfunctional to both the organization and the individual, while high levels may be positive effects (Mathieu and Zajac, 1990) and for that reason, organizational commitment's antecedents must be identified at first if managers want to create an positive impact (Morris and Sherman, 1981; Randal, 1987).

Despite having limits, a research about marketing managers shows that the firm's ethical climate is equally related to organizational commitment. Similarly, a study done with executives found that a positive relationship between a rules-based dimension of ethical climate and organizational commitment (Schwepker, 2001). As a result, if employees perceive that their organizations are ethical, they will be more committed and research in this area leads to the following hypothesis:

H4: There is a positive relationship between ethical climate and organizational commitment for employee perception of organizations.

Organizational Commitment and Charismatic Leadership

Charismatic features of both charismatic and transformational leadership have been defined as highly associated with positive work outcomes (Avolio & Bass, 1988, 1995; Avolio, Waldman, & Einstein, 1988), i.e., level of performance (e.g., Bass, 1985, 1999; Bass et al., 2003; Kon, Steers, & Terborg, 1995), job satisfaction (e.g., Hater & Bass, 1988; Shamir et al., 1993), and organizational commitment (e.g., Pillai & Williams, 2004). Possibly the most outstanding consequence of charismatic leadership is the highest level of commitment on behalf of the leader and the followers to a common vision, mission and goal (Bennis and Nannus, 1985; House et al., 1991). According to Degroot, Kiker and Cross (2000), when the leader becomes the model of behavior to follow (Bass and Stogdill, 1990), the inspired employee should become more committed to their organization.

Commitment to change has been identified as an important aspect of behavioral intention to support change (Herscovitch and Meyer, 2002; Fedor et al., 2006). Recent studies examined the effects of charismatic leadership and trust in top management on employees' commitment to actual changes and their innovation implementation behavior and the study indicates that trust in top management is stronger related to affective commitment to change than charismatic leadership (Michaelis et al., 2009). According to these findings the following hypothesis is offered:

H5: There is a positive relationship between leadership behavior (Charismatic leadership) and organizational commitment for employee perception of organizations.

RESEARCH METHODOLOGY

Data Gathering and Analysis

This study is performed in Turkey for comparing the relationship between leadership behavior and ethical climate, which incorporates job satisfaction and organizational commitment. In this study, all the data gathered by interviewing and face to face, from 626 people who work both national and multinational companies.

A majority of the participants are males (%59,7) and the average age is about 30- 45 and slightly over one third (%37,1). Just over half (%52,7) have at least university graduate. More than half (%52,4) have 5 years working experience while almost one third (%29,8) have less than 10-year experiences. The fair of respondents are mid-level manager (%42,7).

The collected data were analyzed by the Statistical Package for the Social Sciences (SPSS) computer program and version 16.00 for the evaluation of our data. Factor analysis, correlation analysis, reliability tests, the means of the variables and regression analysis are used to analyze the relationship between variables of the research model. First of all the frequencies of demographic variables were analyzed then the average and standard deviations were calculated.

Measures

This study is developed by measurement scales, which were taken from prior studies. Five-point Likert scales has been used during the measurement which have 1 (strongly agree) to 5 (strongly disagree)

Ethical climate was ranked for 7 items with a five-point Likert scale, which developed by Qualls and Puto (1989) and used by Schwepker et al (1977).

Job Satisfaction can be defined as how the employees feel about their job and various theories have been developed for measuring job satisfaction. The Job Descriptive Index and The Job in General Index are commonly accepted also Minnesota Satisfaction Questionnaire can be found in literature. However, in our study job satisfaction was measured with the 3-item of the scale that developed by Churchill et al (1974) and Comer et al (1989) and even though the scale assesses the job itself, promotion, supervisor, payment, company policy and fellow workers, in our study the job itself used.

Although Allen and Meyer declared three dimension of commitment as affective, continuance and normative, in our study Commitment was measured with the 12-items of Allen and Meyer's (1990) model of commitment and the terms of affective and continuance commitment items were taken for the study.

A number of theoretical models have been proposed about Charismatic Leadership (e.g. Zaleznik and Kets de Vries, 1975; House,1977; Roberts,1985; Bass,1985;Conger and Kanungo,1987;). Conger and Kanungo(1987,1988,1992) developed a charismatic leadership model that focuses on several behavioral dimensions that depends on organization and followers' perceptions in our study we use the model of Conger-Kanungo (C-K) 's Charismatic Leadership Scale, including 23-item of environmental sensitivity, sensitivity to member needs, vision and articulation, personal risk, unconventional behavior and status quo.

Reliability and Factor Analysis

Descriptive statistics were used to summarize the variables while alpha coefficients were computed to assess the reliability of the scales. Single and multiple regressions were the analytical technique to test the hypotheses. Correlation analysis was used to generate the correlation matrix to understand the relationship among the variables.

Table 1: Coefficient Alfa, Means, Standard Deviations and Correlations

Correlation is significant at the 0,01 level (2-tailed) ; Values in parenthesis are Cronbach's Alfa

Results and Findings

Table 1 shows the reliabilities, means, standard deviations and correlations for the variables in the study. Hence, as can be seen along the diagonal of the correlation matrix, each scale have satisfactory reliability with Cronbach alfa above 0,70. The correlation matrix of the variables in the regression model is also given in Table 1 and all the variables are significant and positively correlated among themselves.

Correlation analysis is conducted to research the relationship among the dependent variables -Job satisfaction, organizational commitment- and the independent variables -ethical climate, charismatic leadership-. As shown in Table 2, the hypothesis 1 and 2 are performed the single regression among the independent variables –ethical climate, charismatic leadership- with dependant variable -job satisfaction-. The variation of job satisfaction can be explained by the variation in ethical climate with %6,7 while the variation of charismatic leadership dimension explain by %11,4. As offered in the hypothesis, there is a positive relationship among variables except the two dimensions of charismatic leadership such as unconventional behavior and sensitivity to member needs are non-supported while overall, the model is significant. Next, the positive association is found with ethical climate ($\beta = ,262^{***}$). Hence, H1 and H2 are supported clearly also depending on correlation matrix.

***p<0,001; **p<0,01; *p<0,05

The associations with organizational commitment and the independent variables are displayed in Table 3 whereas the job satisfaction added as a mediator in the next step. The model is significant which can be explained and seen the rest of the hypothesis. The results show that charismatic leadership is not completely related to organizational commitment. The three dimensions of charismatic leadership; vision and articulation ($\beta = -,021$), sensitivity to member needs ($\beta = ,061$) and personal risk ($\beta = ,054$) are non-support, in terms of continuance commitment; as unconventional behavior ($\beta = -,026$) and personal risk ($\beta = ,049$) are non-supported in case of affective commitment.

Moreover, the model is significant when job satisfaction is the standing role, as a mediator ($F= 13,947$; $F=56,466$). However job satisfaction has no impact on continuance commitment while there is a partial mediator effect on affective commitment ($\beta=, 006$; $\beta=, 398^{***}$).

Discussion

By contrast, we could not get the precise results that we had expected diversity between National and Multi-national companies. It must be taken into account that for the increasing globalization, diversity management has emerged as an important workplace issue, even in the traditionally non-diversified companies of Turkey. Even though we could not get the expected result in companies, what we got the result with our hypothesis.

Even though Deshpande (1996) found no relationship among job satisfaction and ethical climate, Schwepker (2001) found that ethical climate associate with pay to satisfaction. Moreover the rules (i.e., codes, policies, reprimands) creating an ethical climate are positively related to job satisfaction as we offered in our hypothesis (H1) and supported by the findings. According to Koh and Boo (2001), organizational ethics affect job satisfaction, which in turn promotes favorable job attitudes and organizational outcomes. As expected there is a positive association between job satisfaction and charismatic leadership for employee perception of organization as supported in our hypothesis (H2).

Studies have consistently reported a strong association between organizational commitment and job satisfaction (Blegen 1993; Al-Aameri 2000; Fang 2001). Meanwhile, job satisfaction was proved to positively effect on organizational commitment (Bartle et al. 2002; Redfern et al. 2002; Kim et al. 2005). Namasivayam and Zhao (2007) examined the relationships of three sub dimensions of organizational commitment were investigated and it was found that the affective commitment has stronger direct effects on job satisfaction than normative commitment; and continuance commitment had no effect. In addition to these findings, so H3 is supported with the positive relationship in our study between job satisfaction and organizational commitment while job satisfaction mediating no affect found on continuance commitment.

As expected we found a positive relationship between organizational commitment and ethical climate for employee perception of organization, similar to recent studies (Schwepker, 2001; Cullen et al., 2003). So our hypothesis (H4) is supported.

Several studies examine leader effectiveness resulting from charisma, when perhaps subordinate effectiveness is what interests most organizations. Hence, the main of effective leadership is increased positive results from subordinates and the resulting effects on desired organizational outcomes. (Degroot, Kiker and Cross, 2000). Again in a recent study charismatic leadership has been well supported in its positive influences on organizational commitment (Huang, Cheng and Chou, 2005). According to these studies Charismatic Leadership is positively related to subordinate organizational commitment like supporting in our hypothesis (H5) as supported.

Future Direction

Future research may want to compare differences between national and multi-national companies. The fact that the current study also surveyed these companies, we could not find the distinction. In further research, the sample may be enlarged to other business sectors and also

Furthermore, future research may want to examine the other dimension of job satisfaction in the same model. In our study, the job itself dimension was chosen, therefore the other dimensions relations may be examined with the same variables that we used. Similarly, as the two-dimension of organizational commitment was taken for the study, the third dimension –normative commitment-can be also added in the model. Hence, the relationship between the dimension of all dependant and independent variables should be considered.

STRATEGIES FOR HEALTHCARE MANAGEMENT

THE STRATEGY OF MANAGED CARE HEALTH FUNDS

Yaffa Machnes
Bar-Ilan University, Israel

ABSTRACT

The study investigates the strategic management of managed care health funds. These non profit organizations are tightly regulated and face competition. They have a fixed budget but must supply patients the best medical services. The structure of the healthcare market differs among countries but they all have social responsibility. We analyze data about the quantities of drugs supplied along five years by Israeli managed care health funds organizations when prices of pharmaceuticals went down significantly. Our findings reveal the strategy of these organizations.

Kong (2009) presented a theoretical model showing that under the existing insurance schemes in the USA, the demand for brand name drugs will increase after introduction of the generics. But, in fact, most people do not hold such an insurance contract and, in most cases, the opposite happened in the USA, where the portion of generic drugs increased according to Rizzo and Zeckhauser (2009), from 19% in 1984 to 47% in 2001. The overall substitution between brand name and generic drugs cannot be studied only in a theoretical way due to the role of insurance in the reimbursement of costs, and requires an empirical investigation, which was done by several economists. The papers of Hollis (2002), Magazzini et al. (2004), Buzzelli et al. (2006), and Brekke et al. (2009) present important aspects of the trend to increased use of generic drugs.

The Israeli government agreed with the union of drugs manufacturers (pharma-Israel) that the regulated price in Israel will be the minimum price in the following eight countries: UK, Germany, Belgium, France, Spain, Portugal, Poland, and Hungary. We followed the official prices and quantities along the years 2003-2008 of four drugs whose patent protection expired during the beginning of this period, their generic substitutes appeared in the market and their price went down significantly. As for the summing of quantities, we gathered all drugs based on the same molecule and referred to the Defined Daily Dose (DDD). All these data were used to estimate the demand for pharmaceuticals by the managed care health funds.

It was found that managed care health funds were price sensitive. The total expenditure for each molecule was constant along the five years. The significant decrease in price was followed by a parallel increase in quantity in a way that the budget allocated to each molecule was kept constant. We discover that the strategy of the funds' managers was to allocate a fixed budget for each medical procedure. This strategy raises ethical issues: does the managed healthcare fund takes care on the health or whether the fund is taken care of. Patients believe that when they need medication, they get the best available treatment but the study reveals that prices of drugs are a significant factor in the supply of medication. The managed care funds administrated thousands of physicians and well controlled the supply of drugs.

THE ISRAELI HEALTH CARE SYSTEM

The first Sickness Fund was established in the Land of Israel in 1911 by young Jewish pioneers who emigrated from East Europe to Palestine, which was held by the Ottoman Empire. During 1918–1948 Palestine was administered by the British Mandate. When the State of Israel was founded in 1948, it inherited its juristic system from the British, but the health care system was more similar to that of Germany, where most of the doctors got their education before immigrating to Israel. After 18 failed attempts to introduce a National Health Insurance bill, it was finally enacted in 1995. The government collects payment for health insurance through the National Insurance Institute. All Israeli inhabitants are insured by one of the four Healthcare Funds that supply services and must insure every legal inhabitant who applies. (For reference, look at the survey, written by the Ministry of foreign Affairs (2002). There exists an official basket of services including pharmaceuticals that the Healthcare Funds provide to patients according to the *National List of Health Services (NLHS)* defined by the government, but Healthcare Funds still have degrees of freedom on the quantity of particular drugs they purchase, as the diagnosis and severity of illness cannot always be measured objectively. According to Bin-Nun (2006), during 2002 pharmaceuticals were 17.5% of the total national health expenditure, amounting to \$2.3 billion and a per capita cost of \$345. During 2002, patient co-payments represented 55% of the national expenditure for drugs. Locally manufactured drugs were 35% of the total; imports

accounted for 65%. Generic medications accounted for only a quarter of the expenditures, while brand name medications were the other three quarters.

Each of the Healthcare Funds buys pharmaceuticals as a single buyer and the largest one, Clalit Healthcare, buys more than \$900 million of medications a year (Lubort & Barel, 2009). While Clalit buys drugs for its 14 hospitals, the other 17 hospitals and clinics that belong to the government or to non-profit organizations own a purchasing company, *Sarel*, which buys pharmaceuticals and medical equipment and maintains inventory. These organizations also buy directly from manufacturers if they find a better deal.

New pharmaceuticals approved by the Ministry of Health are introduced by manufacturers to doctors, the Healthcare Funds, and the "basket committee" that defines the *NLHS*. The National Health Insurance bill expressed the need for an additional budget allocation for new technologies, but the Healthcare Funds have had to fight for it. In 2007, when Healthcare Funds introduced supplementary insurance for drugs that are not on the *NLHS*, the government prohibited such an insurance, which can increase inequality, and promised an annual endowment of about \$120 million for new technologies. The "basket committee" has to choose which drugs and technologies will be included in the *NLHS*. Pharmaceutical manufacturers present their new drugs with an estimation of the number of patients who can benefit from it. The committee takes into consideration the health benefits, prices, and total cost. Thus, the lower the number of patients in need, the greater the chances that a new drug will be included in the *NLHS* as the committee faces a fixed budget.

THE ISRAELI MARKET FOR PHARMACEUTICALS

Since 2007, the union of pharmaceutical manufacturers selling in Israel, Pharma-Israel, contracted with The Ministry of Health (2006) that the maximum price of pharmaceuticals sold in the country would be equal to the minimum price in eight European countries: UK, Germany, Belgium, France, Spain, Portugal, Poland, and Hungary. After checking prices in these eight countries each quarter, the Ministry of Health publishes the list of regulated prices of all pharmaceuticals sold in Israel. At the same time, a private company named *Yarpa* (cure in Hebrew) publishes a list of prices for more than 2000 drugs. On *Yarpa's* list, several medicines are less expensive than their regulated price as manufacturers compete and suggest prices that are lower than the regulated price for drugs that have substitutes. Prices quoted by *Yarpa* cannot exceed the regulated price and they serve as a basis for co-payment by patients.

The Healthcare Funds and hospitals are usually charged lower prices than the published *Yarpa* prices. There are no official published data about the actual price paid to manufacturers. The difference between *Yarpa* price and the actual negotiated one is estimated by Lubort and Barel (2009), who serve in the Ministry of Finance, as 15% and by Lifshitz et al. (2009; from the Ministries of Health and Law) to be larger, about 40%. Because of the missing data about the quantities and prices, the estimations differ and in 2009 the government requested the Healthcare Funds to reveal the relevant confidential data about their purchases of pharmaceuticals. Recently, files were submitted but the data have not yet been published. (Lubort and Barel and Lifshitz et al. were MBA students in Bar-Ilan and gave their personal, estimations in their theses).

As for in-patent drugs, manufacturers hold a monopoly power and can discriminate in pricing among the Israeli buyers, similar to the discrimination among different countries according their demand. The regulations that require a license to ship pharmaceuticals make price discrimination inside and outside countries feasible. Only licensed pharmacists are allowed to sell drugs and it is illegal to trade with drugs in the market. The risk of buying false drugs decreases the demand for buying drugs outside official pharmacies. Healthcare Funds and hospitals try to decrease prices either by their own administration or through *Sarel*. Development of a new drug is associated with huge sunk costs and when a new drug is ready to market the marginal costs are relatively low. Thus, manufacturers are ready to negotiate about the price with big buyers such as governments and Healthcare Funds, and to reduce the price when quantity is significant. The Israeli government would like to know the real costs, as it authorizes money to the Healthcare Funds according to the official *Yarpa* price and the number of patients reported before the inclusion of the drug in the *NLHS*. The Healthcare Funds on their part claim that the number of patients who need the drug has gone up since a new drug was included in the *NLHS* list. Klang et al. (2006) from the Clalit Healthcare Fund show the enormous increase in costs of three new drugs during 2000–2005. Though the Fund got a fixed allowance for each new drug, the number of patients treated by the new drugs increased significantly after doctors became familiar with the new medication.

PRICES OF PHARMACEUTICALS

As medicines are grasped by the public to be a necessity, they are seen by the people as a public good that the government should supply to its citizens at an affordable cost. The media, like the comptroller (2009), investigate the prices of drugs and the reimbursement system to the Healthcare Funds and to patients.

Patient co-payments vary among the Israeli Healthcare Funds. Before 2009, for a drug listed on the *NLHS*, they were paying a nominal price equivalent to \$3 a unit in Clalit Health Fund, and 15% of the price published price by *Yarpa* in the other three Funds. Since 2009, the Clalit Health Fund has also adopted the co-payment used by the other funds and is charging 15% of the *Yarpa* listed price. Like other goods and services, there is an added value tax on pharmaceuticals, which makes them even more expensive.

Similarly to other countries, pharmaceuticals are divided between in-patent drugs and generic or older brand name drugs that are no longer protected by a patent. After a drug loses its patent protection, the market witnesses competition by the generic substitutes. Kong (2009) presented a theoretical model showing that under the existing insurance schemes in the USA, the demand for brand name drugs will increase after introduction of the generics. But, in fact, most people do not hold such an insurance contract and, in most cases, the opposite happened in the USA, where the portion of generic drugs increased according to Rizzo and Zeckhauser (2009), from 19% in 1984 to 47% in 2001. The overall substitution between brand name and generic drugs cannot be studied only in a theoretical way due to the role of insurance in the reimbursement of costs, and requires an empirical investigation, which was done by several economists. The papers of Hollis (2002), Magazzini et al. (2004), Buzzelli et al. (2006), and Brekke et al. (2009) present important aspects of the trend to increased use of generic drugs.

The choice of medication depends on the insurance scheme. When managed care organizations supply drugs to their patients, for each drug they choose the less expensive drug, as shown by Katzir et al. (2009) in the case of the Israeli Maccabi Healthcare Fund. Patients who want to take the brand name drug instead of their generic substitutions have to pay half of its *Yarpa* price. This pricing system increases the proportion of generic drugs and saves resources of the Maccabi Healthcare Fund.

THE DEMAND ELASTICITY

Estimations of the demand elasticity for pharmaceuticals attracted several economists. For an example, see Rovira et al. (2001). There are several difficulties in finding a measure for thousands of products while the basket of medicines is changing rapidly as new expensive medicines appear along time. There is also a problem to define the product due to the emergence of generic substitutions for medicines whose patent has expired. The measurement of quantity is also complicated due to the different frequency of taking a dose: for example; there are medicines that patients take 4 times a day and others, once in 6 months. Economists debate about the appropriate price index: should it be the historic basket named after Laspeyres (2010) or the actual basket, which might be more relevant – the Paasche (2010) price index. Contrary to the impression that the basket of drugs changes dramatically along time, Mansley (2008) measured the use of drugs that are in the market 5 years after their patent expired in the United States and found stability in the consumption of old drugs.

Danzon and Chao (2000) made international comparisons and reached the following estimations about the price elasticity in different countries.

Country	Price Elasticity (1992)
USA, Germany, Canada	1.29
UK	0.91
Japan	0.76
France	0.67
Italy	0.36

Sattere and Vernon (2006) found that elasticity depends on the time interval of the measurement of the changes in prices and that the demand for pharmaceuticals in the USA was inelastic. When changes were measured during the forty years 1960–2000, they estimated the elasticity to be only 0.68–0.92 and for shorter periods they estimated even lower price elasticity.

Due to the development of generic substitutions, all products were defined by their molecules without distinguishing between the brand name and the generic substitution.

When price elasticity is one, it means that expenditure for each molecule remained the same after its price went down due to the increase in the consumed quantity.

In order to estimate the demand price elasticity we collected data about prices and quantities consumed. We recorded the official *Yarpa* published lists of prices during 2003–2008. As several drugs are based on the same molecule, we referred to the average price of the aggregate product and computed the average price of medicines that are based on the same molecule. The supplied quantities were registered in the center district of the country by the distributors. As for the summing of quantities, we referred to the Defined Daily Dose (DDD) and multiplied the ratio of patients who consume each molecule in our sample by the whole Israeli population.

Our findings for four drugs are shown here in Figures 1–4. On the horizontal axis is the date and the vertical axis measures price and quantity. The expenditures for these four molecules account for about one-quarter of the total expenditure on drugs that became generic in Israel during the period 2003–2008.

EXHIBIT 1

The quantity of the last medicine decreased in 2007 because of possible side effects that were found. The arrows in the four figures point to the time the drug lost its patent and generic substitution was used in Israel. In these four examples, we find that along time, the products of price and quantity are almost fixed. We have here estimations of the demand price elasticity of the four molecules. We learn that after the price went down, for the same expenditure, the decrease in price of each molecule allows a larger basket of drugs and services. When the total expenditure is constant, the price elasticity is *one*. It means that the Israeli Healthcare Funds spent a fixed budget for each of the four molecules and the reduction in price allows prescriptions of a larger quantity. Elasticity of 0.91- almost a unity was found in the UK from whom Israel inherited the juristic system, and many other ideas about public decision making. For the whole basket of pharmaceuticals, we would agree that the total budget is constant, but patients who are insured by the Healthcare Fund will not agree with the fact that the price of a drug determines the treatment they get. One would agree with a unit elasticity with a value of about one for the whole basket of pharmaceuticals, but the idea of keeping a fixed budget for each single molecule cannot be understood.

EXHIBIT 2

The price reduction and induced change in quantity can be seen, leading to changes in the production function of health, as can be seen in Figure 5. The decrease in price increased the purchasing power of the Healthcare fund and its real budget. The decision to use the additional purchasing power to buy more of molecule X, can be seen by moving from point A to point C by increasing the quantity supplied of molecule X from *a* to *b*. Such specific types of changes cannot be explained by a general production function of health and were not found in any econometric estimation of a production function of health. The decrease in price is exogenous to the Healthcare Funds and calls for increased use of the less expensive drug. Nevertheless, there is no medical reason to keep the expenditure on a specific molecule constant. One would expect the Israeli Healthcare Funds to find the optimal basket of services along the new feasible real budge and to consider a possible increase in the other alternative services included in *NLHS*.

CONCLUSION

The Israeli Healthcare Funds are trying to reduce prices but prices of in-patent drugs are quite rigid. Along time, when the patent expires and generic drugs appear in the market, the funds adjust the prescribed quantities to the changes in the price. The data show that the budgets allocated to the specific molecules are well-controlled by the Israeli Healthcare Funds and the quantity of pharmaceuticals provided to patients depends on their price.

RELATIONSHIP MARKETING APPROACH AND AN APPLICATION IN SERVICE SECTOR: KARAMAN PRIVATE HEALTH ORGANIZATIONS

**Selda Başaran Alagöz
Nezahat Ekici
Mahmut Sami İşlek**

Karamanoğlu Mehmetbey University, Turkey

ABSTRACT

The concept of relationship marketing is embraced as a solution for increasing competition conditions, the markets which have sophisticated, participative and demanding consumers and the goods/services which have shorter life-cycles. The necessity to generate consumers who are satisfied beyond the expectations and even to conduct a company – customer relationship which can be defined as an affinity has appeared in a market where such conditions exist.

Nowadays, companies' efforts to have sustainable competitive advantage have become intensified. These efforts are both more considerable and more apparent in the service sector companies. This is related to intangible being of service and concurrent production and consumption feature of service. Here, at this point, the necessity to use relationship marketing approach commonly appears for the service sector companies. Long-termed, close and one-to-one customer relations in service sector have a key significance in terms of creating customer loyalty. Like in other service companies, conducting close relations with customers and increasing the level of provided service are inevitable situations in health sector. In this study, the being of relationship marketing approach and its reflection on customers have been tried to be measured. For this purpose, the literature background of relationship marketing has been given first, and then, at the research part, a survey has been applied in Karaman, Turkey and the data has been analyzed statistically.

Key Words: *Relationship Marketing in Service Sector, Private Health Organizations, Relationality*

INTRODUCTION

Nowadays, increasing competition conditions have obligated a long-term relationship between company and customers. This relationship which is called as "Relationship Marketing" in marketing literature is embedded on substantial essentials (Yurdakul, 2007 : 1).

Companies are looking for new marketing strategies to survive and see their future due to the rising competition in world trade. Particularly, since substitute goods have close prices and product quality to each other, companies proved the way of using different marketing strategies to sell the products. These different marketing strategies congregate as modern marketing in marketing literature. So, relationship marketing is one of these modern marketing strategies which is old as an opinion but conceptually a recently developed marketing strategy (Gülmez and Kitapçı, 2003 : 81).

After mid-1990's, most of the companies see customers as assets. The main reason to see customers as assets is the challenge to reach new customers due to the conditions of competition and the cost of this is much more than keeping the existing customers. Relationship marketing emerged as a natural result of this need (Kulabaş and Sezgin; 2003; 2). Again, 1990s is seen as a period that the concept of relationality is accepted due to the fact that resemblance, competition, customer knowledge have been increased and besides the price of traditional advertising media has decreased. Whereas some executives state that; it is needed to focus on keeping the consumer and increasing the number of consumers, some academicians argue that relationship marketing is a new marketing paradigm (Selvi; 2007 : 8).

The Concept of Relationship Marketing and Service Sector

Even though relationship marketing concept has so many definitions, generally it is compared with other approaches of marketing in many academic studies. Relationship marketing is first defined by Berry in 1983. Berry defines relationship marketing as “attracting, maintaining and – in multi service organizations – enhancing customer relationship” (Berry, 1983 : 236). Grönroos’ definition of relationship marketing, which is commonly in use, indicates the efforts to reach the parties goals, to conduct, keep alive and develop long-term relationships between the parties which are the subjects of the business relationship (Grönroos; 1996: 5). As wider definition, Morgan and Hunt define the relationship marketing as follows: “Relationship marketing is conducting and developing good relationships with one or more of goods suppliers, service suppliers, competitors, non-profit organizations, public organizations, ultimate consumer, intermediary customers, functional departments, employees and units of the company and all marketing activities to maintain these relationships” (Morgan ve Hunt, 1994 : 21-22). As is understood by these definitions, strengthening the relationships, making consumers loyal and converting the bunch of unknown faces to continuous consumers are the focus point of relationship marketing approach . (Karakaş, Bircan ve Gök, 2007 : 5) .

In current competition condition, companies digress to evaluate customers just with a commercial relationship and think that customers are members of the company who advocate the goods and services and also partners (Kotler, 2000:197). The long-term relations which are conducted to the consumer by relationship marketing applications provide benefits not only for service providers but also for consumers. From the service provider point of view, these relations set an obstacle to competition, decrease the price competition and provide to gain more revenue from each customer by reducing the costs. Another benefit is the effect of word of mouth marketing. Treating to the customers so as to gain advantage from them in long-term will cause long-term customer loyalty and positive word of mouth marketing effect. Consumers who have long-term relationship with the company have three kinds of benefits next basic service provided from company; (Selvi; 2007 : 45 – 46)

- Benefits gained from trust
- Social benefits
- Benefits gained from special treatment

Relationship marketing is a marketing approach which argues those consumers who are also natural players of marketing channel should be active like seller at least. This requires more cooperation between two sides (Tek; 1999 : 57). In this respect, companies are trying to understand and adopt so many new concepts. These concepts are intimacy, interaction, loyalty and partnership. These concepts are the result of desires of companies’ conducting one to one relationships with the customer, being partner with the customer and having and maintaining long-term relationship with the customer (Erbaşlar, 2009 : 1). These results are supporting Grönroos’ statement which is “relationship marketing is the marketing efforts which are based on relations, communication and connections”.

Customer satisfaction and customer loyalty are very significant concepts in relationship marketing approach. While customer satisfaction is related to how the performance goods/services compensate the customer expectations, customer loyalty is related to if the customer prefer the company again and want to maintain his/her relationship again with the same company. According to this, while customer satisfaction is prerequisite for having customer loyalty, customer loyalty is prerequisite for relationship marketing. Creating customer loyalty to keep customer satisfaction at high levels is only possible when the needs and wants of the customer is learned correctly and produce private service and show the value given to the customer with close relationships (Karakaş, Bircan and Gök, 2007 : 7) .

Relationship marketing is a marketing approach that changes the company culture and adds new values to it (Bakıştaş; 2008 : 232). One of the key points of the implementation of relationship marketing is adopting the relationship marketing approach from the whole business organization. This brings organizational change. To actualize the organizational change, employees head to change and personal responsibility and on the other hand focus on the customers. Concurrently, the employee needs to disremember him/herself in some manner and have the real capacity to overcome complex actions to have a cooperation (Alagöz ; 2004: 3). At this point, for implementing the relationship marketing approach effectively, the organizations’ need of having a customer-focused approach emerges. (Yurdakul and Dalkılıç; 2006 : 258).

In banking, insurance and tourism businesses; relationship marketing implementations are in use constantly. In these sectors, long-term, close and one to one customer relationships are so important. Just like other service

sectors, conducting a close relationships with the customers and increasing the service quality are inevitable in terms of competition. Service approach and implementations in health sector are becoming more and more important day by day. Due to the fact that the subject is human, service demander should be active at least as service providers. It is seen that there are relationship marketing implementation in the sector, but these implementations are more successful in private sector.

The Research

Within the context of the research, a survey was implicated for measuring the being and reflections of relationship marketing implications in private health organizations which are located in Karaman. For preparing the survey questions, former studies and especially the research made by Kılınç (2008) were used. The questionnaire form is composed by 5 demographic questions, 27 statements and 5 directional questions. To adjust answers and expectations aimed at statements about doctor, nurse, other employees and general services, fivefold Likert Scale (1. Totally disagree – 5. Totally agree). Due to time and cost constraints, research was held only in Karaman's private health organizations and sample extend was determined as 300 participations, but 210 evaluable surveys were collected. The results of the research were evaluated with SPSS 16.0 software program. The reliability of the research was measured by alpha coefficient and alpha coefficient of 27 answers was found 0.826. In the evaluation of the research results, frequency dispersion was used for the questions which were designed in nominal scale and arithmetic average and standard deviation was used for the questions which were designed in likert scale. Considering 5 directional questions which were used to establish the research hypothesis, in testing the hypothesis, t-test was used.

Results of the Research

According to Table 1; 37,6 % of the participants are women, 62,4 % are men; 28,1 % are between 36 – 45, 22,4 % are between 46 – 55, 18,6 % are between 26 – 35 years old; 46,7 % have high school, 25,2 % have bachelor, 24,3 % have primary school degree and 30,5 % have 1001 – 1500 TL and 16,5 % have 1501 – 2000 TL income per month.

Table 1: Demographic Features of the Participants

Income per Month	Frequency	Percentage	Sex	Frequency	Percentage
Less than 500 TL	23	11,0	Female	79	37,6
501-1000 TL	62	29,5	Male	131	62,4
1001-1500 TL	64	30,5	Total	210	100,0
1501-2000 TL	34	16,5	Age		
2001-2500 TL	18	8,9	18-25	22	10,5
2501+ TL	9	4,3	26-35	39	18,6
Total	210	100,0	36-45	59	28,1
Education Status			46-55	47	22,4
Primary	51	24,3	56-65	34	16,2
High school	98	46,7	65+	9	4,3
Bachelor	53	25,2	Total	210	100,0
Master	8	3,8			
Total	210	100,0			

According to Table2 , when participants' social security systems are measured, it is seen that 27,1 % of them have SSK (Social Insurance Institution), 21,4 % of them have Bağ-Kur (Social Security Organization For Artisans And The Self-Employed), 14,3 % Emekli Sandığı (Government Retirement Fund) and 11,9 have private insurance.

Table 2: Participants Social Security Sytems

Which social security system do you have?	Frequency	Percentage
SSK(Social Insurance Institution)	57	27,1
Bağ-kur(Social Security Organization For Artisans And The Self-Employed)	45	21,4
Green Card	14	6,7
Private Insurance	25	11,9
Mercenary	17	8,1
Emekli sandığı (Government Retirement Fund)	30	14,3
None	22	10,5
Total	210	100,0

According to Table 3; when the patients' expectations about doctor services devoted to relationship marketing approach are examined, it is found that patients consider "Attention in the sense of secrecy of patient information" statement significant ($\bar{X}=3,14$) and they have high expectations about "The availability when it is needed" ($\bar{X}=2,60$), "Kindness in sense of attitude and behavior" ($\bar{X}=2,21$) and "Precision in the sense of feeling him/herself responsible to the patients" ($\bar{X}=2,19$).

Table 3: Dispersion of the Patients' Expectations about Doctor Services Devoted to Relationship Marketing Approach

Statements about Doctor Services Devoted to Relationship Marketing Approach	N	Average	Standard Deviation
1. The availability when it is needed	210	2,60	1,593
2. Kindness in sense of attitude and behavior	210	2,21	1,180
3. Sufficiency in the sense of time for a patient	210	1,50	0,854
4. Sufficiency in the sense of paying attention to the patient	210	1,48	0,740
5. Service and advice sufficiency after the examination	210	2,28	0,746
6. Sufficiency in the sense of personal cleanness and hygiene	210	1,25	0,497
7. Competence about communication	210	1,79	0,743
8. Perfection in doctor's own field	210	1,76	0,621
9. Precision in the sense of feeling him/herself responsible to the patients	210	2,19	1,596
10. Attention in the sense of secrecy of patient information	210	3,14	1,379

According to Table 4; when the patients' expectations about nurse services devoted to relationship marketing approach are examined, it is found that the patients have high expectations on "Paying attention effectively in emergency" ($\bar{X}=3,42$), "Attention to the patient privacy during the examination and care" ($\bar{X}=3,04$) and "Frequency of paying attention to the patient" ($\bar{X}=2,81$).

Table 4: The Dispersion of the Patients' Expectations about Nurse Services Devoted To Relationship Marketing Approach

Statements about Nurse Services Devoted To Relationship Marketing Approach	N	Average	Standard Deviation
1. Attitude towards the patients	210	2,51	1,551
2. Sufficiency in the sense of meeting the expectations	210	2,63	1,569
3. Frequency of paying attention to the patient	210	2,81	1,414
4. Availability when it is needed	210	2,64	1,519
5. Paying attention effectively in emergency	210	3,42	1,255
6. Attention to the patient privacy during the examination and care	210	3,04	1,425

According to Table 5; when the patients' expectations about other employees services devoted to relationship marketing approach are examined, it is found that the patients have high expectations on "Attention and delicacy to patients' personal problems" ($\bar{X}=3,30$), "Sufficiency in the sense of meeting the expectations" ($\bar{X}=3,01$) and "Enable the check in – staying – check out operations" ($\bar{X}=2,85$).

Table 5: The Dispersion of the Patients' Expectations about Other Employees Services Devoted To Relationship Marketing Approach

Statements About Other Employees Services Devoted To Relationship Marketing Approach	N	Average	Standard Deviation
Attitude to the patients	210	2,76	1,528
Sufficiency in the sense of meeting the expectations.	210	3,01	1,443
Attitude to patients' relatives	210	2,25	1,565
Attention and delicacy to patients' personal problems	210	3,30	1,460
Enable the check in – staying – check out operations	210	2,85	1,168

According to Table 6; when the patients' expectations about hospital's general services devoted to relationship marketing approach are examined, it is found that the patients have high expectations on "Lay out of the hospital" ($\bar{X}=3,30$), "Physical condition of hospital (rooms , labs)" ($\bar{X}=3,08$) and "Services of hospital during the overtime period" ($\bar{X}=2,80$).

Table 6: The Dispersion of the Patients' Expectations about Hospital's General Services Devoted to Relationship Marketing Approach

Statements about Hospital's General Services Devoted To Relationship Marketing Approach	N	Average	Standard Deviation
1- The Physical condition of the hospital (rooms , labs)	210	3,08	1,215
2- Comfortable and peaceful condition of the hospital	210	2,64	1,458
3- Services of the hospital during the overtime period	210	2,80	1,660
4- Lay out of the hospital	210	3,30	1,484
5- Asking or evaluating the level of complaints and pleasures	210	1,97	1,622
6. Transportability of the hospital	210	2,38	1,549

According to Table 7; when the patients' reactions to relationship marketing implementation are examined, the answer of "While considering the services you have in hospital, which of the following defines you best?" question is as follows: a guest is 61 %, patient is 30,5 % and partner is 8,6 %. With the light of these answers, we can say that Karaman's private health organizations are successful on developing good relationships with customers that can even be described like an affinity.

The question of "If you have trouble about the services of the hospital, would you prefer to go another one?" is answered as 58,6 % yes and 41,4 % no. This result makes us think that hospitals serve additional values except from service quality to keep the customers. When the answer of "Do hospital's services meet the expectations?" question is examined, it is seen that participants say yes in 53,3 % and no in 46,9 %. At this point, it can be said that there is a good level of satisfaction but it is not at the desired point. Another statement which is "Do you recommend to the others the hospital that you get the service now?" has dispersion like 64,8 % yes and 32,2 no. As is understood by the results, the customer who is satisfied is willing to state his/her satisfaction. These results bring us to the result of word of mouth effect which comes along with good designed relationship marketing implementations.

Tablo 7: The Attitudes of Participants after Having the Service within Relationship Marketing Implementations

While considering the services you have in hospital, which of the following defines you best?	Frequency	Percentage
Patient	64	30,5
Guest	128	61,0
Partner	18	8,6
If you have trouble about the services of the hospital, would you prefer to go to another one?		
Yes	123	58,6
No	87	41,4
Total	210	100,0
Do hospital's services exactly meet your expectations?		
Yes	112	53,3
No	97	46,9

Total	210	100,0
Do you recommend to the others the hospital that you get the service now?		
Yes	136	64,8
No	74	32,2
Total	210	100,0

According to Table 8; when the attitudes of the participants after the services within relationship marketing are measured by independent sample t-test, it is found that there is no significant difference between the groups ($p>0,05$) and the hypothesis of there is no difference on the attitudes of participants after the services within relationship marketing with respect to sex has been accepted.

Table 8: The Attitudes of the Participants after the Services within Relationship Marketing with Respect to Sex and Independent Sample T-Test

	N	Sex	Arithmetic Average	Standard Deviation	T	Significance Level**
If you have trouble about the services of the hospital, would you prefer to go to another one?	131	Male	1,37	,484	-1,961	0,051
	79	Female	1,51	,528		
Do hospital's services meet your expectations exactly?	131	Male	1,46	,500	-0,664	0,507
	79	Female	1,51	,528		
Do you recommend to the others the hospital that you get the service now?	131	Male	1,32	,469	-1,394	0,165
	79	Female	1,42	,522		

*Scale : 1.Yes – 2. No

According to Table 9; when the attitudes of participants after the services within relationship marketing are measured by independent sample t-test, it is found that there is no significant difference between the groups ($p>0,05$) and hypothesis of there is no difference on the attitudes of participants after the services within relationship marketing with respect to educations status (between high school and lower level and upper level) has been accepted.

Table 9: The Attitudes of Participants after the Services within Relationship Marketing with Respect to Education Status and Independent Sample T-Test

	N	Education Status	Arithmetic Average	Standard Deviation	T	Significance Level**
If you have trouble about the services of the hospital, would you prefer to go to another one?	149	High School -	1,41	,493	0,433	0,666
	61	High School +	1,44	,533		
Do hospital's services meet your expectations exactly?	149	High School -	1,52	,536	0,879	0,380
	61	High School +	1,46	,500		
Do you recommend to the others	149	High	1,32	,466	1,940	0,054

the hospital that you get the service now?	149	School -	1,32	,466	1,940	0,054
	61	High School +	1,46	,535		

*Scale : 1.Yes – 2. No

According to Table 10; when the attitudes of participants after the services within relationship marketing are measured by independent sample t-test, it is found that there is no significant difference between the groups ($p>0,05$) and hypothesis of there is no difference on the attitudes of participants after the services within relationship marketing with respect to income status (between lower 1500 TL and upper 1500 TL) has been accepted.

Table 10: The Attitudes of Participants after the Services within Relationship Marketing with Respect to Income Status and Independent Sample T-Test

	N	Income	Arithmetic Average	Standard Deviation	T	Significance Level**
If you have trouble about the services of the hospital, would you prefer to go to another one?	149	1500TL -	1,44	,551	-,772	0,441
	61	1500TL+	1,38	,489		
Do hospital's services meet your expectations exactly?	149	1500 TL-	1,50	,515	-,908	0,365
	61	1500TL+	1,43	,499		
Do you recommend to the others the hospital that you get the service now?	149	1500 TL-	1,37	,498	-,553	0,581
	61	1500TL+	1,33	,473		

*Scale : 1.Yes – 2. No

CONCLUSION

Relationship marketing as an idea that enables to manage company – customer relationship better aims to sustain the relationship not only with new customers but also with existing customers. In today's competitive environment, only goods/services focused strategies are not sufficient and customer focused strategies are needed as well. Especially, it is clearer to be seen in service sector. Another deliberative point in this issue is customer focused strategies are not embraced for customers and it is the benefit that both parties have in the long run. For this purpose, companies should identify the components of the relationships well and analyze the concepts of mutual interaction, trust, partnership, loyalty, service quality and shared values again and again in the axis of relationship marketing.

The results of the study which is performed for the being of relationship marketing approach in Karaman private health organizations and its reflection to the customer show that customers are willing to have a closer and trust-based relationship with doctors, nurses, other employees and general health services. When the expectations in the sense of doctor services are examined, it is seen that participants have expectations about "The availability when it is needed", "Attention in the sense of secrecy of patient information" and "Kindness in sense of attitude and behavior". When the expectations in the sense of nurse services are examined, just like the same matter in "doctor issue" it is seen that participants have expectations about "Attention to the patient privacy during the examination and care" and also "Paying attention effectively in emergency" and "Frequency of paying attention to the patient". When the expectations in the sense of other employee services are examined, it is seen that participants have expectations about "Sufficiency in the sense of meeting the expectations", "Attention and delicacy to patients' personal problems" and "Enable the check in – staying – check out operations". In the meaning of general services, they state that they give importance to issue of providing service in overtime period.

In the scope of the research, when the attitudes of participants after having the service within relationship marketing implementations is examined;

- They stated that they feel like a guest as an answer of “While considering the services you have in hospital, which of the following defines you best” question. This result represents that there is a relationship which is appropriate to the relationship marketing purpose and cooperation which is based on mutual benefit and trust.
- When participants were asked “If you have trouble about the services of the hospital, would you prefer to go to another one” question, participants answered like 58,6 % “Yes” and 41,4 % “No”. This result makes us think that there are some additional values except from service quality that keep the customers. In small cities like Karaman, besides from service quality, affinity and know one another well are also the factors which tie the customers to the company with strong connections. High percentage of “No”, which is 41,4 %, can be explained with these kinds of reasons.
- When the question of “Do you recommend to the others the hospital that you get the service now?” is asked, participants say “Yes” in 64,8 % and “No” in 32,2 %. As is understood by the results, the satisfied customer is willing to indicate his/her satisfaction. This result brings us to the result of word of mouth effect which comes along with good designed relationship marketing implementations.

When the attitudes of participants after the services within relationship marketing with respect to sex, income status and education status are examined with independent t – test, significant differences could not be found. As is mentioned before, this study is a pilot study due to the time and cost constraints. To make the study in large scales and in the environment where possibly more health organizations have will give us deeper knowledge about the issue.

ABSTRACT

Word-of-mouth (WOM) strategy in marketing is a key area because many consumers in various sectors rely on the product experiences and advice of the competent people. In health care sector, WOM is also an important indicator as advertising tool. The main purpose of this study revealed dimensions health based WOM and relationships the dimensions and between encouraging, discouraging, and satisfaction. Results of the study revealed three dimensions, which are “tie strength and relationship”, “health knowledge and experience”, and “similarity and preference awareness”. The results of the study suggest that these WOM dimensions related to health have significant effects on level of satisfaction, encouraging, and discouraging. The study has significant implications as to how well health marketing practitioners and managers implement WOM marketing strategies and advice dimensions of health practices.

Keywords: *health, health care, health marketing, word-of-mouth, WOM, WOM marketing*

INTRODUCTION

In the health care industry, there are several factors that affect who, why, and when consumers utilize health care services (Cooley and Madupu, 2009). Consumers find word-of-mouth as compelling source of information. Although the concept of word-of-mouth (WOM) had been described as early as 1898, it had to wait until early 2000 are to reemerge as a popular subject (Graham and Havlena, 2007). In today, many of consumers in variety sectors receive information from different sources, such as physical surroundings, mass media, and other persons. Information from other persons about goods and services may come from sales personnel or from other consumers. In marketing, word of mouth (WOM) is an important strategy and normally used to describe advice from other consumers. The interactivity, speed, and lack of commercial bias of WOM make it a very effective source of information about prospective consumer choices, particularly with regard to services for which prepurchase experience may be limited. In consumer choice, WOM is often the dominant factor; for example, Keaveney (1995) observed that positive word of mouth (PWOM) was the main source of information when people found a new service supplier.

Despite WOM's re-emerging role in marketing communications and relatively sufficient number of books published on the subject; the academic researches and publications on WOM related to health sector are still limited. However, there is a growing effort from practitioners of researching different aspects of WOM (Mangold et al., 1999). In this study, the researchers investigated the dimensions related to word-of-mouth on physician preferences and, satisfaction, positive and negative word-of-mouth behaviors based on referrals from reliable sources.

LITERATURE REVIEW

The literature on direction of effects of WOM has two streams. These are positive and negative WOM (Anderson, 1998; Richins, 1983). In a study that compares positive and negative WOM, scholars report an interesting finding. The researchers found that number of people producing positive WOM is bigger than individuals who produce negative WOM, and the occurrence of positive as well as negative WOM in some instances is positively related to market share (East et al., 2007). Based on the reasons discussed above and considering literature research, the researchers have come up with the following WOM dimensions that are believed to play a role in a success of a physician health service. These dimensions are as follows: (1) Tie Strength and Relationship, (2) Health Knowledge and Experience and (3) Similarity and Preference Awareness.

Tie Strength and Relationship

The main one factor affecting WOM is the power of relationship between decision maker and recommendation source. Duhan et al. (1997) pointed out that recommendation sources used in consumer decision heuristics are usually studied under the rubric of word-of-mouth (WOM) communication. WOM recommendation sources can be categorized according to the closeness of the relationship between the decision maker and the recommendation source, or the "tie strength" (Brown and Reingen, 1987). The tie strength of a relationship is defined as strong if the source is someone who knows the decision maker personally. The tie strength of a relationship is defined as strong if the source is someone who knows the decision maker personally (Duhan et al., 1997). So, many of consumers rely on WOM to evaluate credence qualities of services (Berry, 1980; Cooley and Madupu, 2009), such as health, movie, education etc.

Health Knowledge and Experience

Many of consumers have an experience or familiarity about a good or service. In this manner, the concept of prior knowledge is defined in terms of the extent of these experiences or involvement (Duhan et al., 1997). The knowledge and experience on good or services has been widely researched (e.g., Alba and Hutchinson, 1987; Brucks 1985; Duhan et al., 1997; Herr, 1989; Murray, 1991; Park, Mothersbaugh and Feick, 1994) and commonly refers to information that is before external search occurs. Johnson and Russo (1984), and Brucks (1985) founded that there have been a significant relationship between prior knowledge and ability to process new information. According Park and Lessig (1981) and, Duhan et al. (1997) prior knowledge has been defined in at least three conceptually different ways: experience-based prior knowledge, subjective prior knowledge, and objective prior knowledge.

The tie strength of relationship between WOM source and receiver is related to knowledge and experience about a specific subject. If knowledge and experience of health services is high, the trustworthiness also will be high. According to Duhan et al. (1997), the type and level of prior knowledge will be important indicators in terms of next consuming behavior.

Nelson (1970) argued experience dimension of WOM and suggested that the inclusion of experience qualities were necessary because people would give more personal recommendations (WOM) of products possessing experience qualities as they have tried them and can better explain the product to the next person (Cooley and Madupu, 2009).

Similarity and Preference Awareness

A rational customer often also considers how likely that the recommendation will succeed, that is, meet the purpose of the application of the recommendation. Therefore, not only do we need to observe the requirements of the customer, we also have to consider their preferences. One of the early studies on the effect of the positive and negative WOM on movie appreciations reports that negative WOM has a significant effect on movie preference (Burzynski and Bayer, 1977). The researchers found that the negative WOM is so affective even in some cases respondents reported that they redeem their tickets immediately after being exposed to negative information on a movie.

Ranaweera and Prabhu's (2003) study asserts that there is a positive correlation between satisfaction and the word of mouth. Rust et al. (1996) claimed that word-of-mouth recommendations from friends, family and colleagues who are satisfied with a company or service have a measurable impact on sales. Mittal and Lassar

(1998) find that satisfied customers outnumber dissatisfied customers by more than four to one in the health care and car repair services (East, Hammond and Wright, 2007). Three hypotheses were developed for empirical investigation of effects of WOM factors about in advising consumers to going a physician, encouraging or discouraging consumers after positive or negative WOM, and satisfaction after WOM, based on the review of literature, implication, and discussions. These hypotheses are:

H1: The dimensions related to word of mouth on health are positively associated with advising to go a physician.

H2: The dimensions related to word of mouth on health are positively associated with the level of satisfaction that a person gets from a physician.

H3: The dimensions related to word of mouth on health are positively associated with discouraging to go a physician after negative word-of-mouth.

METHOD

Research and Questionnaire Design

The questionnaire form developed for this study consists of three parts. The first part of the questionnaire contains 17 statements which are related to characteristics of word-of-mouth senders. Five point Likert Scale (“5” Very Important, “1” None Important) was used by respondents in responding to WOM statements about physicians. To generate statements that consisted of the domain of opinions about advice contents three focus groups were conducted to 34 health consumers. In constructing the sample of focus groups, respondents were selected based on being represented the population in terms of demographic characteristics and, physician going and advising behaviour. In focus group studies, judgmental sampling is employed. In judgmental sampling, the decision of who will be included in the sample group is decided by the researchers. In addition to the focus groups interviews, statements used in this part were adapted from previous studies related to general and health dimension of WOM, (e.g., Anderson, 1998; Cooley and Madupu, 2009; Duhan et al., 1997; Richins, 1983) and were designed according to types and applications of advice strategies. Then, researchers generated a total 17 items. The second part of questionnaire included three single item measures relating to referring to encouraging going a physician, discouraging after negative WOM and satisfaction after WOM. The participants were also asked to indicate their level of agreement on these four items on five-point Likert scale with 5 being “strongly agree” and 1 being “strongly disagree”. The last part included demographic variables (gender, age, occupation, income etc.), and WOM receiving status.

Sample

The sample of this study is comprised of people living in the province of Eskisehir, Turkey. A self-administrated and researcher-aided questionnaire was distributed by sixteen trained researchers. The questionnaires were answered by respondents in the researchers’ presence. In lower educational groups and for groups of respondents who needed further explanations in filling out the questionnaires, researchers helped the respondents fill out the forms to a greater degree than they did for respondents with higher educational levels. Questionnaires were distributed and answered in homes, in business venues, and on streets. The researchers first approached potential respondents. Due to the importance and sensitivity of the issue, researchers first briefly explained the research purpose, and then gave the questionnaires to willing participants. In cases of refusal, the researchers thanked the individual and approached another candidate. The explanation and the filling out of the questionnaire took approximately 15 minutes. A total of 2000 questionnaires were distributed, 1680 of which were completely answered, resulting in a return rate of 84 percent.

FINDINGS AND RESULTS

Table 1 indicated characteristics of the respondents of the study. According to the results, %51,5 of the respondents were male and %48.5 of the respondents were female. % 34.1 of the respondents’ income was between 501-1000, followed by who had lower than 500 USD with %34.1. Most of the respondents’ ages were between 18-25 (36.4%), The other groups were 26-35 (%29.5) and 36-45 (16.7%). %25,5 of the participants were students, %13,3 of them were public officials, %11.2 of them housekeeper and %10 of them were workers.

Table 1: Characteristics of respondents

	<i>Frequency</i>	<i>Per cent</i>
<i>Gender</i>		
Male	865	51.5
Female	815	48.5
<i>Average Household Income Status (Monthly)</i>		
500 USD and <	558	33.2
501 – 1.000 USD	571	34.1
1.001 – 1.500 USD	345	20.5
1.501 – 2.000 USD	133	7.9
2.001 USD and >	73	4.3
<i>Age</i>		
18-25	612	36.4
26-35	496	29.5
36-45	280	16.7
46-55	189	11.3
56-65	89	5.3
66 and >	14	0.8
<i>Occupation</i>		
Public Official	223	13.3
Laborer	168	10.0

Manager	83	4.9
Tradesman	153	9.1
Self-employed	126	7.5
Student	428	25.5
Other	200	11.9
<i>n=1680</i>		

Dimensions of Health Based WOM

The scale related to word-of-mouth contains a total of seventeen items, thus principal component factor analysis was used to sort out and classify these variables as well as to convert them into main factors. To apply factor analysis on items related word of mouth on movies, it is necessary to test the Kaiser-Meyer Olkin (KMO) measure of sampling adequacy (Zhang et al., 2003). For the attitude variables, Kaiser-Meyer Olkin (KMO) was 0.902, indicating that the sample was adequate for factor analysis (Kaiser, 1974). The Bartlett Test for Sphericity (BTS) was 11267.904 ($p < .001$), indicating that the hypothesis variance and covariance matrix of variables as an identity matrix were rejected; therefore, factor analysis was appropriate. According to principal axis analysis, three factors (dimensions) had an Eigen value equal to or greater than 1.0 (Kaiser, 1960), explaining a total of 58.073 percent of the variance. The three dimensions were termed, respectively: “Tie Strength and Relationship”, “Health Knowledge and Experience”, and “Similarity and Preference Awareness”. Reliability coefficients of 0.70 or higher are considered adequate (Nunnally 1978). For all 17 items, the alpha value was 0.88. Cronbach’s alpha values of each dimension were above 0.78, indicating a satisfactory level of internal consistency among items in each construct.

Table 2: Factors and items on WOM related health

<i>Factors</i>	<i>Factor Loadings</i>			<i>Eigenvalues</i> (% of variance)	<i>Alpha</i> (α)
	(β)	<i>Mean</i>	<i>S.D.</i>		
<i>Factor 2: Tie Strength and Relationship (7 items)</i>					
Referring person is close to me	.583	3.86	1.06	5.991 (35.243)	.85
Referring person's level of trustworthiness	.586	3.47	1.17		
Referring person is my body	.765	3.52	1.10		
I know the referring person	.812	3.57	1.07		
I have previous referral experiences with this person	.805	3.30	1.11		
I have a social relations with referring person	.778	3.36	1.08		
Referring person is in my social network	.628	3.03	1.24		
<i>Factor 1: Health Knowledge and Experience (6 items)</i>					
Referring person is a reliable source on health	.494	4.19	0.95	2.420 (14.237)	.84
Referring person deals with health	.740	3.96	1.051		
Referring person is a public official in medical services	.758	3.99	1.14		
Referring person's body of knowledge level on health	.846	4.11	0.97		
Referring person's health experiences	.724	3.89	1.03		
Referring person closely follows developments in health sector	.761	3.96	0.99		
<i>Factor 3: Similarity and Preference Awareness (4 items)</i>					
Referring person knows well my attention	.808	3.86	1.03	1.461 (8.593)	.79
Referring person values my usual health preference	.821	3.80	1.02		
Referring person is similar with me	.576	2.99	1.21		
Referring person know my health situation	.763	3.84	1.07		
Cumulative % of variance				58.073	
Internal consistency of the scale (17 items)					.88
S.D. Standard Deviation; 1= Non-important 5= Very important					

Table 3 featured the results of correlation matrix, mean and standard deviation of the three dimensions. According to the results, it can be seen that relationship among three factors are statistically significant. I can also be seen that the mean for health knowledge and experience (mean: 4.02) was higher than the means of the other factors. In terms of mean, this factor was followed respectively by strength and relationship (mean: 3.64) and similarity and preference (mean: 2.44)

Table 3: Correlation matrix and descriptive (mean, std. deviation)

	1	2	3
Factor 1. Tie Strength and Relationship	1.000		
Factor 2. Health Knowledge and Experience	.347*	1.000	
Factor 3. Similarity and Preference Awareness	.454*	.441*	1.000
Mean	3.44	4.02	3.64
(S.D.)	(0.81)	(0.76)	(0.85)
* p < 0.01			

Relationships between WOM Dimension and Dependent Variables

In order to identify the relationships between the three dimensions in factor analysis and independent variables that comprise referring to encouraging to go a physician, satisfaction after positive WOM, and discouraging after negative WOM, a multiple regression analysis was utilized. The results of the regression models indicated that the regression models were statistically significant. As shown in Table 4, the results of the regression models indicated that the regression models were statistically significant ($F = 31.930$; $p < 0.01$ and $F = 9.736$; $p < 0.01$), and 5% of the overall encouraging and 1% of the overall discouraging to go a physician were explained by the three dimensions of health based WOM. The regression coefficients indicated that the dimensions of 'similarity and preference Awareness' ($\beta = 0.193$; $p < 0.01$) and tie strength and relationship ($\beta = 0.111$; $p < 0.01$) exerted the strongest influences on the overall encouraging behavior. In terms of the second regression model, the regression coefficients referred that the first dimension, termed tie strength and relationship ($\beta = 0.090$; $p < 0.01$)

and the third dimension, termed similarity and preference awareness ($\beta = 0.080$; $p < 0.01$) exerted the strongest influences on the overall discouraging behavior.

Table 4: Regression results on encouraging to go a physician and discouraging after negative WOM

Factors	Dependent variables					
	Encouraging to go a physician			Discouraging to go a physician		
	Std. β	t	p	Std. β	t	p
Tie Strength and Relationship	0.111	4.457	0.000*	0.090	3.558	0.000*
Health Knowledge and Experience	0.098	3.966	0.000*	0.066	2.607	0.009*
Similarity and Preference Awareness	0.193	7.789	0.000*	0.080	3.148	0.002*
Constant		264.699	0.000*		170.246	0.000*
	R ² =0.059 Adj. R ² =0.057 F= 31.930*			R ² =0.019 Adj. R ² =0.017 F= 9.736*		
* p < 0.01						

The third regression model considered satisfaction after advice phenomenon as the outcome variable, and the three dimensions of health based WOM as predictor variables. The regression model was found to be statistically significant ($F = 6.903$; $p < 0.01$) with 6% of overall satisfaction after WOM explained by the three dimensions of WOM. The results of regression analysis indicated that the dimensions of tie strength and relationship ($\beta = 0.174$; $p < 0.01$), similarity and preference awareness ($\beta = 0.128$; $p < 0.01$), and health knowledge and experience ($\beta = 0.069$; $p < 0.05$) indicated statistically significant relationships with the overall satisfaction as outcome of physician services (Table 5).

Table 5: Regression results on satisfaction after WOM

Factors	Dependent variables		
	Satisfaction after WOM		
	Std. β	t	p
Tie Strength and Relationship	0,174	7,013	0.000*
Health Knowledge and Experience	0,069	2,781	0.000*
Similarity and Preference Awareness	0,128	5,136	0.005*
Constant		158.754	0.000*
	R ² =0.071 Adj. R ² =0.061 F= 6.903*		
* p < 0.01			

CONCLUSION & IMPLICATIONS

The customers of today need new and reliable information sources due to lack of trust that they have for traditional commercials. As in many industries, sharing the information based on experience has significant importance for health services. WOM is considered as an important promotional tool because it is found trustable. In this study, it has been tried to display the characteristics of the people who are the subject to WOM. In addition to that, the relationship among WOM factors and, encouraging, discouraging ve satisfaction was another important aim of the study.

This study developed a 17-item survey instrument to evaluate dimension of WOM related to health or physicians' services. The results showed that dimension about health based WOM could be conceptualized and measured as a three-dimensional construct comprising 'tie strength and relationship', 'health knowledge and experience', and 'similarity and preference awareness'. These dimensions could be evaluated that advices or

experimental recommendations have an important effect on perceived physician services quality. The scale exhibited ideal internal consistency and met rigorous conceptual and empirical criteria for validity. The results of this study revealed that tie strength and relationship is the most important dimension of health related WOM followed by health knowledge and experience, and similarity and preference awareness. In compose of confidence, the level of tie with persons advising a product or services could have a significant effect because of the product experiences or involvement.

The results of multiple regression analysis indicated that the aspect of similarity and preference awareness seemed to exert the strongest influence on encouraging going a physician in comparison to other dimensions. The results also revealed that tie strength and relationship exerted the strongest influence overall discouraging behaviour. The third model of multiple regression revealed that all three dimensions related WOM were significantly correlated with overall satisfaction as outcome of service quality.

These results may be considered as a path for marketers of health services. Health services that the experience is real important are figured based on this kind of worm of mouth communication. What is thought for doctors and hospitals could me more important than any other industry. Main reason for this is that perceived risk in health services may result worse and make up for that negative result may be real difficult. So, it is not difficult to say that what people think can be influential on the others. Negative thoughts could increase the tendency for not benefiting related doctor or hospital. For this reason, patients will look some characteristics on the people who recommend a doctor or hospital to them. For example, having close relationships, knowledge level of the person and experience of the person could be important in evaluation of the information gathered by WOM.

Limitations could be considered in two ways: the scope of the study and research sample. First limitation is about general recommendation related to the doctors. WOM may result differently under specialization. For example, perceptions of a paediatrician and a gynaecologist would be different. Similarly, perceptions will different according to the importance of the sickness. Irretrievableness of health services can be thought as a one time service that patients will demand. Recommendations according to the diseases will be also different. For example, recommendations for a doctor who is going to operate the heart and recommendation for an examination will be evaluated differently by the patience. It has been pointed out that sampling was the other limitation. Future research on health related WOM could be extended to include wider demographic base, both geographically and international-wise, to further explore the extent to which the findings are generalisable. The respondents in the study were limited to those who live in a single Turkish city. Furthermore, the focus on Turkish people places the research in a particular cultural context. Consequently, the results may not adequately represent the total population in Turkey.

İstanbul University,

ABSTRACT

With this study, it is intended to determine the levels of life satisfaction, work satisfaction, conflict between daily life and work life and factors that cause stress at work of the physicians working in the primary health care in Üsküdar district.

96 physicians participated in this research who are the members of the Üsküdar Health Group Presidency. Research datas were collected with the physician satisfaction survey. The Obtained datas from the survey were analyzed by statistical packages and tables and graphs were made by the computer by using MS Excel. Frequency, percentage and arithmetic means are used to describe the evaluation of the data. The relationship between variables has been identified with One-Way Anova analysis, the independent T-test, Pearson correlation analysis and Regression analysis

After the research, it was determined that physicians were satisfied with their life and work at the middle level. Moreover, it was determined that doctors were sometimes conflicted between daily life and working life and they sometimes saw adequacy of work and the relationship between people and often the difficulty of the treatment of patients as the stress factor. It was determined that Physician's work satisfaction and life satisfaction depended on each other by 35%, while the level of daily life and working life conflict increased, level of work and life satisfaction reduced, as the work life and daily life conflict level increases, work and life satisfaction reduce, by seeing the adequacy for the work and relationship between the people as a stress factor, reduces job satisfaction.

INTRODUCTION

Preventive health services, also known as primary health services, are the services for saving and developing the community health. In today's modern medical understanding, prevention and early diagnosis of diseases is more important than treatment. This is only possible with primary health services. Cheaper than the cost of treatment services that provide preventive health services can not be sufficient; society's health deteriorated and disease rates are increasing. Labor costs and treatment of disease losses in the country's economy are causing a heavy load. This vicious cycle can be broken as a priority of preventive health services needs to be strengthened.

Effective and efficient delivery of health services in the contribution of health personnel is very important. However, in our country, the number of medical personnel is insufficient. Especially in primary health care practitioners and the number of employees, our country is very small compared to other countries. General practitioners for specialist doctors in developed countries, 2/1, while in our country, this ratio is close to 1 (Özdemir, 2003). The practitioners are few in preventive health care. Their job dissatisfaction develops because of lack of public investment and they also tend to be specialised.

Job satisfaction which is one of the necessities for Employees success, happiness and productivity is an emotional reaction after the evaluation of the business and work area. There are many factors that affect job satisfaction positively and negatively. These can be identified as the factors related with individuals and with groups. Employees' job satisfaction will affect the individual factors, age, professional experience, education level, marital status, gender and personality traits as, work-related factors, physical working conditions, wages, promotion, conditions, work environment, communication and safety as grouped. These positive or negative

direction depending on the affected employee's job satisfaction level of productivity affects life satisfaction. Therefore, the factors that cause workers' high level of job satisfaction and job dissatisfaction should be identified and removed. This research is also done to identify the level of job satisfaction, life satisfaction, business and daily life conflict level and the factors that cause stress in business area of the doctors in our country who work in primary care services and who have effects on primary health care tasks.

JOB SATISFACTION

Concept that expresses personal, subjective and emotional satisfaction, is not observed directly by another person, only felt by the individual identifiable and can be expressed within the delight, or inner peace (Eroğlu,1984). Staff throughout his working life, employment and business environment are gaining many experiences. Overall job satisfaction is a result of this attitude and in good condition from the employee's physical and mental perspective, various definitions of job satisfaction have been made by many people. Job satisfaction linked by many Bullock'e isle are not desirable and the whole experience and an attitude as a result balancing is taken into consideration (Şimşek,1995). Vroom sees the concept of job satisfaction as a measure of employees' perceptions, feelings and behavior within different dimensions. (Şimşek,1995). Job satisfaction is defined in various ways above and it is briefly loving work, work commitment, adapt yourself on work. Shortly we can say people who work are satisfied by their work.

There are three important dimensions of job satisfaction (Luthans,1989)

- a) Job satisfaction, the emotional response is a business case. Thus can not be seen, just is expressed.
- b) Job satisfaction is usually the extent to which earning expectations are or how much are the exceptions exceeded
- c) Job satisfaction, represents a variety of attitudes interrelated. For example, the work itself, payment, promotion opportunities, methods, style, colleagues, etc...

Factors Affecting Job Satisfaction

Job satisfaction is not a static phenomenon or stable concept. Therefore, with individual or other factors, job satisfaction or dissatisfaction can appear.(Lam, 1995) . Thus, factors that could be considered depending on individual and job or work environment can be classified as factors.

a) Individual Factors Affecting the Job Satisfaction

Affects of a person's satisfaction level and size of individual major elements can be summarized as follows:

- Age and Service Time:
- Gender
- Education
- Marital Status

b) Affecting Job Satisfaction and Work-Related Factors of Business Environment

The general view of the business itself, the social and economic interests and the work atmosphere and the conditions of the business area are the main effective factors of the job satisfaction of the employee. . These factors are not individual, are social, not judgmental can be analyzed, measured, can be compared to other business. (Ozgen et al., 2002) and the general characteristics of these factors are as follows:

1. Work itself
2. Fees and Awards System
3. Progress, or the promotion of Meat Facilities
4. Human Relations in Business
5. Working Conditions
6. Safety

The Benefits of Job Satisfaction

Workers who are well motivated have a great job satisfaction and will have higher morale in the workplace. As a result, they will be very helpful to the business. A high employee morale, makes these positive effects on employees and working area(Şenatalar, 1978).

- A highly moralled person does his job with full of energy and happiness.
- They will be highly willing to work.
- The employees obey the orders work rules and regulations willingly.
- The employees will want cooperation according to the workplace goals.
- The employees feel committed to the workplace and executives.
- High morale has positive effects on labor transfer, and absence. Therefore absenteeism reduces. Accordingly the cost of folding is also reduced.

The problems arising from the dissatisfaction

With low job satisfaction, but have to work with a variety of reasons, the employees begin to put in negative behavior in the organisation.. He often complains, he will always have negative comments about the organization within and outside the organization, and he also tries to disrupt morale of the employees. As a result they slow down work, and will be absent from work at last they leave work.

The physicians' Job Satisfaction in Primary Health care Services in Turkey

We have mentioned before that job satisfaction is the satisfaction in work area. If we look at the job satisfaction of the physicians who work in the primary health care units in Turkey, we must first check the work conditions, salary, job security etc.. When we examine their working situations and compare them with other jobs, we see that they work long hours, they are on duty for a long time. We can also see that their job has a lot of risks, it is tiring and they work for a long time.

They examine a large number of patient in primary care units this makes working conditions more severe. According to the OECD 2008 report one thousand people have 1.6 physicians, but in OECD countries as a thousand people will have 3.1 physicians (İRDES, 2009). Although doctors in Turkey is low, the ratio of seeing the doctor is 4.6 per person. In 2006, in the OECD countries, the average is 6.5 per person and it is around 70% . In 2007 the consult rate per person in Turkey is increased to 5.4 and is reached to OECD average of 80% of the previous year (Health Ministry,2009). Physicians per application rate is higher, at one point in Turkey. Therefore it should be solved by increasing the physicians' low destiny. However, in this case, this situation increases the physicians workload, and this causes them to be exhausted. Previous researches showed that GPs level of job satisfaction in their working conditions are of intermediate levels. However, these surveys are before the year 2002. The attending number to Primary health services increased rapidly after 2004 and the average is above the OECD average in 2005. In Aslan and his friends' research in (2007) it was seen that the GPs couldn't have their expectations from their profession and they experienced professional uncertainty and conflicts in their job and they couldn't have feedbacks from their professional effort .Also they could be easily affected by the irregular organisational structure.(ASlanan et al., 1997). Ergin showed that the Specialist Physicians, Physicians general practitioners, dentists, pharmacists, nurses, health technicians and midwives for the Maslach Burnout Inventory norms Turkey has interests in the operation, general practitioners and nurses' emotional exhaustion and insensitive scores of other professional groups are higher (Ergin, 1993).

MATERIALS AND METHODS

The aim of this study is to analyse the physicians' in Istanbul's Uskudar Health Group Presidency working life satisfaction, job satisfaction, the level of the conflict of work and daily life, and to find the level of the factors that cause stresses at work and it is cross-sectional descriptive type of investigation.

The research is done for the physicians who work in the primary health care units and all the health groups in Lucknow in Ontario. The entire universe has been included in the survey, sampling was done. The creator of the universe has attended 102 96 research physician. Research during the absence of physician 3 physicians and 3 in the Trustees Reports that could not be included in the research.

Questionnaire techniques were used as a data collection method. Questionnaire was created by different researchers. The questionnaire consists of six chapters and in the first part there are questions about the physician sociodemographic and professional characteristics, the second part is about the doctors' life satisfaction, in the third section, there are questions about the job satisfaction, in the fourth chapter there are questions about daily life satisfaction, in the fifth chapter there are questions about the positions of business life conflict situations and in the sixth chapter there are questions about the stress source level that they see work-related stress sources. There are questions about the level of resources. The survey data were collected between January-March 2008. The reliability analysis was done and the result of the answers are found as Alpha response was 0.75.

Survey data obtained through computer analysis using the statistical package program was converted into Excel tables and graphs. Descriptive data for evaluating the frequency, percentage and arithmetic mean is used. To determine the relationship between variables purposes; One-Way ANOVA analysis, Independent sample t-test, Pearson made Korelayon Analysis and Regression Analysis.

FINDINGS

21% of the physicians surveyed "26-31" age group, 21% of the "45 and over" age group. 58% of women, while 44% were male. When we look in terms of marital status, the vast majority of physicians (76%) were married and 7% were divorced or living separately from his wife (Table 1).

Table 1: Research on Socio-Demographic Characteristics of Attending Physician

Socio-Demographic Characteristics		Number(n)	Percentage(%)
Year	26-31 Years	20	20,83
	32-37 Years	23	23,96
	38-43 Years	33	34,38
	44-49 Years	14	14,58
	50 + Years	6	6,25
	TOTAL	96	100,00
Gender	Famele	54	56,25
	Male	42	43,75
	TOTAL	96	100,00
Marital Status	Married	73	76,04
	Single	16	16,67
	Separate Alive / Divorced	7	7,29
	Widowed	0	0,00
	TOTAL	96	100,00
Owner Status Children Have	Have Child	64	67,37
	No Child	31	32,63
	TOTAL	95	100,00

If we look at their having children 67% have children, %33 have no children. In terms of professional experience, 24% of physicians have 0-6 years experience, while 24% between 7-13 and 39% between 14-20 years of experience. 2% of the physicians have expertise. 80% of the Physicians work 45-60 hours per week, while %6 work more than 60 hours and 14% work less than 45.

	(%)	5,21	8,33	55,21	22,92	8,3		
GENERAL AVERAGE							2,85	0,49

Related to job satisfaction, Table 4 shows the findings when we examine the life satisfaction we see that majority of physicians (38%) stated that they are not happy about their salary. The majority of physicians have indicated that they are not happy about the support of promotion and raise possibilities in the institutions. Two expressions mean the satisfaction is the lowest average between 1.99 and 1.98, and it is the lowest degree in answers. The highest average is about their satisfaction with the communication with other physicians and colleagues.

The comparison of the physicians's sociodemographic and Professional features and the conditions of their satisfaction in first Health Cares in Uskudar district

After One-Way ANOVA analysis only with these statements: "How would you evaluate your work life" are "your ability to diagnose and treat your patients when needed" it was seen that there was a great difference between ages. When the ages increase the satisfaction rate increases. Between the 44-49 age groups have the highest satisfaction rate after 50 age group, as expected, average rate decreased. When we look at the Satisfaction with the status of the physicians and the gender we see that women have higher satisfaction rate. (t: 2.19 p: 0.031).

In our survey, when we look at one-way anova analysis we see that a 28-33 year –experienced physicians have higher work life satisfaction than other groups and Business Life and daily life conflicts are lower than the others. As a result of analysis, no difference was seen in the answers given by the physicians about professional experience years and reasons of the stress factors.

After T-test results, only four significant difference was found as shown in table 9 about the answers given to the questions by the GP practitioners and specialist physicians. Specialist Physicians stated that they are happy with their social relationships and lives, while too; practitioner Physicians have expressed that their satisfaction is at the middle level. However, in order to measure their life satisfaction, questions were asked and the answers is not bad with 2.00 as it is 2.25, for GPs and was seen that GPs are happier, but from statistical view it is not so significantly different ($p > 0.05$).

While doing their job, Specialist Physicians' satisfaction about having man power when needed is 1.50 which can be regarded as bad. The GP s working in the same atmosphere is 2.77 which can be regarded as middle.

Here we can conclude that Specialist Physicians wishes and GP s wishes are different. According to the marital status of the physicians when we look at the answers we can see two different dependant variables.. "How would you rate your family life," is expressed the highest average of 3.74 as highly satisfied by the married physicians while living separately from his wife or divorced are moderatel satisfied as 2.86. ($p = 0.010$) Physicians who are married have more regular life, as they are married than the unmarried or divorced or the ones who left their family as we expected Evaluations the results support our literature. In addition, in our

research it was seen that married ones and the ones living separately from his wife and the divorced physicians experience a dense conflict between daily life and business life ($p = 0.006$). It is very normal for the married physicians to live a conflict between work and daily life, as they have more Responsibilities than the single physicians.

The Physicians who Have children variables were compared with T-test, the physicians who have a child are happier with their financial situation in general with their lives than the physicians who haven't any children. After One-Way ANOVA analysis, working for 60-90 hours per week makes the Physicians are satisfied with their education with the contribution to practical life and they are happier than the ones who work 45-60 hours ($p = 0.005$).

Employees' who work less than 45 hours per week and who work 60-90 hours per week are satisfied with their incomes than the ones who work 45-60 hours per week ($p = 0.036$).

After Pearson correlation analysis when Physicians' working 'weekly' and the position of satisfying the patients' demands and needs factors were analysed, it was seen that as the working hours increases seeing the patients' demands and needs as stress factor decreases ($r = -0.240$, $p = 0.022$). In addition, as physicians' weekly work hours increase, seeing the treatment difficulties of patients as stress factor decreases. $r = -0.263$, $p = 0.012$.

Table 4: The Position Of The Relations Between The 'Life Satisfaction Average "Job Satisfaction Average" Work Life And Everyday Life Conflict Average "Employment Eligibility And Contacts Between Relationship Stress Factor As A Guest Vision" And "Patients' Treatment Challenges Of Stress Factors As Visually Average" Of The Practitioners Who Joined Our Research.

Pearson Correlation Matrix		L.S. Mean	J. S. Mean	E.L.C. – B.L.	S.F.	S.F.- T. P.
L.S. average	r	1,000	0,590	-0,289	-0,178	-0,077
	p	0	0,000	0,007	0,089	0,481
J. S. average	r	0,590	1,000	-0,229	-0,283	-0,114
	p	0,000	0	0,047	0,010	0,315

	p	0,007	0,047	0	0,007	0,013
S.F.	r	-0,178	-0,283	0,284	1,000	0,231
	p	0,089	0,010	0,007	0	0,028
S.F.- T. P.	r	-0,077	-0,114	0,268	0,231	1,000
	p	0,481	0,315	0,013	0,028	0

L.S. Mean: The average of the life satisfaction of the physicians who joined in research

J. S. Mean: The average of job satisfaction of the physicians' who joined our survey.

E.L.C. – B.L.: aAverage of the conflict between Everyday Life and t Business Life of the physicians who joined our survey

S.F. The average of seeing the efficiency to job and Relations Between people as Stress factor by the practitioners who joined our survey

S.F.- T. P.: The average of seeing the' treatment of the patients as Stress

A positive strong relation was found between the life satisfaction and job satisfaction of the practitioners who joined our survey. ($r = 0.590$, $p = 0.000$). Moreover, regression analysis of job satisfaction and its effect on life satisfaction was found at a rate of 34.8 % ($R^2 = 0.348$, $p = 0.0001$).

There was a negative relationship between Life satisfaction and "with the business and daily life conflict" ($r = -0.289$, $p = 0.007$). We can say that Business and daily life in the conflict here is higher and average life satisfaction is low. Same situation is valid for "job satisfaction". There was a meaningful negative relationship was significant for the average of "Job satisfaction" and with average "conflict between work and everyday life" ($r = -0.229$, $p = 0.047$).

In addition, a meaningful positive relationship was found between the average of "conflict of business and daily life" and the average between the factors that cause stress in working life of physicians. As the

conflict between the job and daily life increases eligibility to work and interpersonal relationships as visual stress factors "average and" difficulty in the treatment of patients as visual stress factors "average is also increasing.

A negative relation was found between The average of seeing 'eligibility to work and interpersonal relationship' as stress factors and the average of "job satisfaction" ($r=-0,283$ $p=0,01$) As the average of seeing the efficiency to work and interpersonal relation as a stress factor increases, job satisfaction decreases and the doctors who see the efficiency to work and interpersonal relationship as stress factors tend to see treatment difficulties as stress factors. Because when a correlation analysis is done between these two variants a positive relation was found between them. ($r = 0231$ $p = 0.028$).

DISCUSSION AND CONCLUSION

When you evaluate the County Health Group, working in Üsküdar Presidency 96 physicians were participated in research. 98% of surveyed physicians are general practitioners and only 2% are of specialist physicians. Physicians' professional experience in an average is 13 years (standard deviation 7) and also 1-year and also there are 31 years of experienced Physicians available. The ages of the physicians surveyed are distributed between 26-58 and the average age is 38' (standard deviation 7) . When we look at gender in terms of doctors 44% are males and 58% are women. 74 %are married while 7% were divorced or living separately from his wife. 67% of physicians have children which is suitable for this situation. . When we look at the results of working conditions %80 work 45-60 hours per week ,%6 work more than 6 hours and 14%work less than 45 hours per week

After the questionnaire applied to the doctors, it was seen that physicians' life satisfaction average is found as 2.69. We can accept physicians' life satisfaction as moderate. Physicians are highly satisfied with their family lives associated with life satisfaction while expressions of social relations they are moderately satisfied. But they are not happy with their incomes and job life.

The average of job satisfaction which affects physicians' life satisfaction is 2.85. When we look at the overall average of physicians' satisfaction about their jobs which they have done, we see that they were moderately satisfied. However, they aren't also satisfied with their wages. Life satisfaction has the same results. Most of the doctors stated that they are not satisfied with the financial condition. One of the important factors affecting job satisfaction again is that they are not satisfied with the promotion possibilities to Physicians. They think that they aren't supported enough to be successful and to improve themselves.

The conflict average between Daily life and work life is 2.84. We see that the doctors sometimes have conflicts between daily and work lives. In addition, physicians imply that they miss the social activities because of intensive works. When we look at the stress factors the doctors have at work, we see that they can not to follow the developments in the medical profession" and this causes stress. The developments in medicine and technology requires physicians to develop themselves continuously. To be efficient to their jobs doctors should continuously update and improve their knowledge.

When we analyse Research results according to the physicians' sociodemographic and professional characteristics, we see a "J" shaped curve relation between the doctors work status and age 26-31 age group has high average of work job evaluation whereas the average of the next age group decreased but started to rise again after a certain age. Lee and Wilbur 1707 support this result by doing researches on public employees. When we look at the Physicians' Professional Experience, we see that 28-33 years of professional experienced physicians have high satisfaction with their life and work. Of course the conflict between work life and daily life is less according to the other groups.

When we compare the GPs and specialist physicians answers the specialist physicians aren't satisfied with their wages as the GPs. Life satisfaction average of specialist physicians is (4,5) and it is higher than that of GPs. The average of general practitioners is (3,05) In addition, the specialist doctors are more satisfied with their lives in general and social relations. Besides age, gender, years of professional experience and marital status also affect the conflict position stress factors. The physicians who are married have high family life satisfaction, while those who divorced or living separately from his wife have lower family life satisfaction. . The Single practitioners' family life satisfaction level is between the two ($p = 0.01$). The married ones have Higher average life satisfaction but the conflict of work and daily life is higher compared with single ones. ($p = 0.006$). We can think that married ones have more responsibilities than the single ones. The ones who have children in general are more satisfied with their lives and their financial situation once again than the ones who have no children.

Research results; life satisfaction and job satisfaction are closely related ($r = 0540$ $p = 0.000$) with the regression analysis of life satisfaction and job satisfaction by 35% and was found to be connected to each other. As Business Life and daily life conflict increase, the average of life satisfaction and job satisfaction is negatively decreased and stress-causing factors have been found to increase. Also as the average of seeing conflict between the Competence of work and interpersonal relationships as the stress factors increase, it decreases the job satisfaction and it increases seeing the treatment of patients as a difficulty as stress factor

RECOMMENDATIONS

In order to see the doctors' satisfaction level who work in Üsküdar County Health Group Presidency and to see the factors that affect them and to increase their job and life satisfaction which isn't very high and in order to abolish the factors which cause their dissatisfaction, this research is done.

One of the factors that affects the dissatisfaction of the doctors highly is the income. It is clear that the performance system which is put forward for the Improvement in fees hasn't satisfied the doctors. Therefore, improvement in the salaries of doctors should be done.

Furthermore the Physicians who joined the research think that their Institutions do not support them enough to improve and to be successful and this causes dissatisfaction in their job. Therefore, for primary care physicians career paths should be identified, those who succeed in business should be fairly rewarded and all the working physicians should be encouraged for this.

The other factor that affects job satisfaction in a negative way which must be abolished is having stress about suitability for the job. In order to stop this is that the doctors should always follow the publications and they should be encouraged to join the congress, seminars and panels and by inservice trainings they should update their knowledge and improve it.

TOURISM AND HOSPITALITY MANAGEMENT

THE IMPACTS OF GLOBALIZATION ON SERVICE QUALITY AND INNOVATION OF FIRMS IN TOURISM SECTOR IN ANTALYA

Oya ERDİL
Gebze Institute of Technology, TURKEY

Adnan KALKAN
Mehmet Akif Ersoy University, TURKEY

ABSTRACT

Globalization is a complex phenomenon, penetrating into all spheres of social life. Supporters see it as a high-speed elevator to universal peace and prosperity, while sceptics charge it with impoverishing the world's poor, enriching the rich and devastating the environment. As a rule, such statements are often based more on personal attitudes than on objective evidence. The empirical evidence would allow to form a much more objective attitude towards the notion of globalization and its impact on various aspects of social life.

With globalization, the free circulation of technology, knowledge, capital and people increases. Because of this situation, firms can get technology easily and cheaply. Therefore, service quality and innovativeness increases in firms which use this technology. According to this situation, we expect that globalization will effect service quality and innovativeness. If so, to what extent and how? This study explores the relationships between globalization, service quality and innovativeness in the hotel industry in Antalya.

One of the impacts of globalization has been the growth in tourism because tourism is supported by free market and open borders. Different culture and lifestyles of foreign tourists can differentiate the type of products and services in tourism sector.

Antalya, which is located on the Mediterranean coast of Turkey, is a well known city worldwide as the "tourism capital" of Turkey. Globalization doesn't bypass Antalya either but the impacts of globalization are quite questionable. This leads to the scientific problem of what the impacts of globalization on service quality and innovation of firms in tourism sector in Antalya are.

Thus, the main aim of this paper is to analyse the impacts of globalization on service quality and innovation and the relationships between these variables on tourism sector in Antalya.

In this study, the relationships between innovation and service quality and globalization have been investigated and measured. With regard to this issue, various hypotheses have been developed and the accuracy of these hypotheses was investigated. The correlation type relationships between variables have been investigated.

The findings obtained from this research do not support the Hypothesis 1 (H1) and Hypothesis 2 (H2) claiming that globalization has a positive effect on innovation and service quality of hotels in tourism sector. Nevertheless, these findings support the Hypothesis 3 (H3) claiming that innovation has a positive effect on service quality of hotels in tourism sector.

As a result, the findings state that there is no correlation between globalization and, innovation and service quality. These results may be due to the relatively small amount of hotel samples and relatively low total variance explained. Therefore, further similar research of a larger sample is necessary to confirm the hypotheses of this study.

Key Words: Globalization, Innovation, Service Quality.

INTRODUCTION

Because of the technological and socioeconomic developments over the last 20 years, the world's needs and preferences have become more homogenized and such commonality of preferences is leading to the standardization of products and services. In addition, firms must capture global-scale economies to remain competitive. At the same time, technological innovations have also brought changes in process and allowed firms to develop products and services on a global basis. Firms started attempting to achieve globalization by rationalizing their operations.

In recent years, tourism and its associated economic repercussions have taken place within a wider context of globalization of the world economy. Macroeconomic policymakers have been concerned to decrease barriers which impede international flows of goods, services and financial capital and to ensure flexibility of exchange rates, interest rates and wages, with the aim of inducing markets to operate more efficiently (Sugiyarto, et al., 2003: 683). With the increasing trend towards globalization, the growth of tourism sector may help Turkey to maintain its competitive advantages.

With globalization, the circulation of people between the countries increased. Many people travel to other countries and stay there. For this reason, the amount and variety of demands of customers increased in almost all countries. In addition to this, interaction happens between cultures. Firms reply to these demands by increasing their technology level (Reddy, 1997:1821).

Despite the current world economic situation, it is widely accepted that travel and tourism will continue to grow in a globalized economy (Jolly & Dimanche, 2009: 579). With globalization, firms can get technology easily and cheaply due to free circulation of technology (Gomory & Baumol, 2004: 426-428). These advancements arise the question whether globalization affects service quality and innovativeness in the hotel industry? If so, to what extent and how? This study explores the links between globalization, service quality and innovativeness in the hotel industry in Antalya.

LITERATURE REVIEW

Globalization

Globalization, as one of today's most controversial issues, can be defined as the increasing integration of economies, societies and civilizations. It includes, and goes beyond, the more simple internationalization defined as relations among and within nations. Globalization is a restructuring process that works across units and affects all aspects of human life: from capital flows, through political collaboration, to the flow of ideas (Hjalager, 2006: 437).

Globalization is conceptualized as a process that erodes national boundaries, integrates national economies, cultures, technologies and governance and produces complex relations of mutual interdependence. The real driving force behind globalization is the technological development in transportation and, information processing and communication (Schulze & Ursprung, 1999: 302).

Contemporary globalization is defined as an intensification of cross-national cultural, economic, political, social and technological interactions that lead to the establishment of transnational structures and the global integration of cultural, economic, environmental, political and social processes on global, supranational, national, regional and local levels (Martens & Zywiets, 2006, 332).

The Measurement of Globalization

The most common way of measuring the degree of internationalization is to calculate the ratio of foreign sales to total sales (Fisch, J. H. and Oesterle, M. J., 2003, pp. 4). The other is the share of foreign assets in total assets.

Chen et al. (1997) use the ratio of foreign pre-tax income to total pre-tax income. Other possible measures are the number of countries with foreign operations and the shares of foreign employees, profits, value added, or shareholders (Fisch, J. H. and Oesterle, M. J., 2003, pp. 4).

Sullivan (1994) chooses five out of nine possible variables to measure internationalization. These are the foreign sales as a percentage of total sales, the overseas subsidiaries as a percentage of total subsidiaries, the foreign

assets as a percentage of total assets, the psychic (cultural) dispersion of international operations, and top managers' international experience (Fisch, J. H. and Oesterle, M. J., 2003, pp. 5).

Another measure, the UNCTAD (1995) transnationality index, which weights the percentages of foreign assets, sales, and employees, suffers from corresponding deficiencies (Fisch, J. H. and Oesterle, M. J., 2003, pp. 5).

We have determined five possible variables to measure globalization. These five measures are customers coming from foreign countries, benefits from new cultural values of foreign customers, total volume of sales to foreign customers, the amount of foreign exchange sales, and the rate of foreign sales to total sales.

The Effects of Globalization

Globalization suggests the intensification, or the growing magnitude, of interconnectedness and flows of trade, investment, finance, migration, culture, etc. The growing extensity and intensity of global interconnectedness can be linked to the acceleration of global interactions and processes, as the evolution of the world-wide transport and communication systems increases the dissemination of ideas, goods, information, capital, and people (Macerinskas & Pipinyte, 2003: 72).

Globalization may affect the enhancement of innovation capabilities in the firms. Other effects on the innovation capabilities of the firms include the diffusion of knowledge related to patents and other intellectual property rights. With the transnational corporations technology investments in the firms are increasing. The most important reason for locating international corporate technology activities in tourism firms has trained their personnel. Dispersed technology activities of firms require excellent communication and other infrastructural facilities. The countries seeking to attract technology investments should establish such infrastructural facilities on a priority basis (Sundbo, et al., 2007: 88).

Globalization has led to a strong growth in trade and consequently provided new opportunities for service firms in the tourism sector. At the same time, globalization has also resulted in a strengthening of global competition and has had a tremendous impact on the way companies nowadays operate. The changing structure of global markets and consequently demands of consumers have forced hotels to rethink their business processes to satisfy tourists' needs better (Yang, et al., 2009: 6).

The Relationship Between Globalization and Tourism

One of the impacts of globalization has been the growth in tourism and mobility of capital. The term "globalization" may be defined in terms of the mobility of goods, factors and/or consumers. The mobility of goods has always been the hallmark of trade theory. However, in recent years there has been increasing mobility of factors, in particular capital and consumers. While the former represents factor mobility, the latter is defined as tourism. One type of the mobilities of people is a short-term tourism/business travel. Consumers travel from one country to another as tourists to enjoy and consume the private and public goods that the other country offers. Tourism has been growing at an extraordinarily high rate (Chao, et al., 2004: 141) because tourism is underpinned by free market and open borders.

Tourism and globalization can be connected in many different ways. In general terms, both have to do with the movement of people, the movement of ideas and the movement of capital across borderlines (Reiser, 2003: 310). Different culture and lifestyles of foreign tourists can differentiate the mode of products and services in tourism sector.

Table-1. Tourism and Globalization: Examples of Connections (Reiser, 2003: 311).

Tourism	Globalisation
Movement of people (e.g. tourists, workers in tourism industry)	Movement of people (e.g. immigrants and their cultures)
Movement of ideas (e.g. new cultural values with tourists; ways of doing business in tourism industry)	Movement of ideas (e.g. new technologies across the globe)
Movement of capital (e.g. tourism industry investment, foreign exchange earnings through tourism)	Movement of capital (e.g. instant movement of capital across borderlines)
Needs new technology to expand (e.g. wide-bodied jets)	Spread of new technology around the globe
Started at the latest in ancient Greece (limited to particular groups of society)	Started with the first movement of humans (e.g. from Africa to Indonesia in 17,000 years using some of their original tools, maybe domesticated animals etc.)
Enormous growth in the last 100 years	Time-space-compression, in particular in the last 30 years
Towards travelling as a right for everyone, Development of a world tourism culture?	World tourism culture?
Tourism needs local culture, or at least the image of it (e.g. differentiation between destinations)	Towards a world culture

Tourism

Today tourism is often recognised as the world's largest industry, or as one of the fastest growing sectors of the global economy. Tourism is closely connected to leaving a place of residence for a different place; it involves the movement of people and their ideas (eg. their culture) across (social) borderlines (Reiser, 2003: 306-309).

Chadwick found that tourism or travel can be described as three concepts: the movement of people; a sector of the economy or industry; or a broad system of the interacting relationship of people and their needs to travel outside their communities, and the services that attempt to respond to these needs by supplying products (Reiser, 2003: 310).

Overall, it can be said that a definition of tourism evolves around one or more of the following elements: Tourism as the movement of people; tourism as a sector of the economy; tourism as a broad system of the interacting relationship of people and their need to travel, therefore involving a time dimension, a space dimension (people moving) and the exclusion/inclusion of people. These elements provide the basis for the connection of tourism and globalisation, while, for example, technological innovations in transport, communication and information spreading around the world present the link between globalisation and tourism (Reiser, 2003: 310).

Turkey has several unique opportunities for different types of tourism compiled under the category of alternative tourism, which include, in addition to coastal tourism, health and thermal tourism, winter sports, mountain climbing and layout tourism, adventure trips, plateau tourism and ecotourism, conference and expo tourism, cruise ship and yacht tourism, golf tourism and etc. The number of foreign visitors and tourism receipts between 2006 and 2009 are given in Table-2 (Tourism Strategy of Turkey-2023, 2007: 1) (<http://www.kultur.gov.tr/>).

Table-2. Distribution of Tourism Receipts of Foreign Visitor and Turkish Citizens Residing in Abroad by Years (<http://www.kultur.gov.tr/>) (Republic of Turkey: Ministry of Culture and Tourism Statistics).

Years	TOTAL			FOREIGNER			% by Number
	Tourism Receipt (\$1,000)	Number of Visitors	Average Expenditure (\$)	Tourism Receipt (\$1,000)	Number of Foreigner	Average Expenditure (\$)	
2006	16,850,947	23,148,669	728	12,556,829	19,275,948	651	83.3
2007	18,487,008	27,214,988	679	13,989,952	23,017,081	608	84.6
2008	21,950,807	30,979,979	709	16,801,618	26,431,124	636	85.3
2009	21,249,337	32,006,149	664	15,853,077	7,347,977	580	85.5

Tourism in Antalya

Antalya, which is located on the gulf of Antalya on the Mediterranean coast of Turkey, is a well known city as the “tourism capital” of Turkey and has been selected as the best town of the Mediterranean region in 2009. The population of the city is 603,190 (2000 census) but reaches up to 2 million in summers at the height of the tourist season.

In Antalya which is among the top 5 cities in terms of foreign population in Turkey, 6 thousand 343 - foreigners inhabit according to the last census (2007 census) (<http://www.olay07.com/index.php?lng /22.01.2008>).

Table-3. The Number of Visitors Coming to Antalya and the Rates According to Nations Between the Years of 2006 and 2009 (<http://www.antalyakulturizm.gov.tr/>) - Ministry of Culture and Tourism Statistics.

Nations	2006 (Jan-Dec)		2007 (Jan-Dec)		2008 (Jan-Dec)		2009 (Jan-Dec)	
	Number of Visitors	Rate of Nations	Number of Visitors	Rate of Nations	Number of Visitors	Rate of Nations	Number of Visitors	Rate of Nations
Germany	2,087,430	34.73	2,208,969	30.30	2,309,762	26.97	2,298,231	27.82
Russian Fed.	1,293,336	21.52	1,817,974	24.93	2,183,302	25.49	2,112,673	25.58
Holland	374,163	6.22	388,250	5.32	443,316	5.18	425,966	5.16
Ukrain	244,824	4.07	325,283	4.46	452,978	5.29	344,233	4.17
UK	182,758	3.04	218,032	2.99	279,093	3.26	319,913	3.87
Others	1,828,672	30.42	2,332,848	31.99	2,896,062	33.81	2,759,383	33.40

Innovation

A number of studies have found that innovation is the most important tool that enterprises use to maintain a competitive advantage (Chen and Jaw, 2009: 247). The convergence of consumer preferences worldwide and the international diffusion of technology have influenced both the pace and the locus of innovation (Reddy, 1997:1821).

Due to fierce competition in the marketplace, globalization and an explosion of technology in recent years, innovation and differentiation are considered as a necessity for every company. At the same time, to achieve market success and sustain a competitive advantage, businesses need to exploit new opportunities, develop new products and/or services and markets (Tajeddini, 2010: 221).

The increased facility of communication, as a key component of globalization, has, in turn, helped to speed technology transfer from one country to another. Information about innovations is disseminated throughout the world almost instantaneously in fields in which technology-exchange agreements between firms are widespread (Gomory & Baumol, 2004: 428).

Due to the globalization process which has occurred over the past few decades, innovation in the service industry seems inevitable. Recent history has shown that the hospitality industry in general and the hotel industry specifically are service industries that are very vulnerable to changes in the economy and different incidents, such as global and national financial crises and natural disasters. It's therefore important that this type of service industry is dynamic enough to be able to adapt to changes in their environment and competition. More specifically, under such conditions, hoteliers have to be innovative and flexible to develop sustainable competitive advantages. The adoption of innovativeness can help a hotel to adopt new ideas, processes and ways of acting by certain social communities, such as suppliers, involved organizations and subunits, groups and persons (Tajeddini, 2010: 229).

Innovation is defined as ‘implementing new ideas that create value’. This generic description refers to the various types of innovation such as product development, the deployment of new process technologies, and management practices. This means the adoption of new products and/or processes to increase competitiveness and overall profitability, based on customer needs and requirements (Leskovar, 2007: 535).

Innovation is viewed as an evolutionary process within an organization to adopt any change pertaining to a device, system, process, policy, or service that is new to the organization. Innovation capability basically refers

to the firm's ability to continuously transform knowledge and ideas into new products, processes and systems for the benefit of the firm. Innovation may occur in every aspect of an organization's operations. Technological and administrative or managerial innovations especially have received a considerable amount of attention because together they cover a wide range of changes within the organization. New technologies, new products and new services are typically regarded as technological innovation. In contrast, new procedures, new policies and organizational firms belong to administrative innovation (Yang, et al., 2009: 6).

Due to the constant change and increasing competitive pressures on today's hotel industry, hoteliers strive to maximize business results through growth and increasing profit margins. Hence, they face more demanding customers, new regulations, globalization, and the destabilizing effects of technological advancement. All of these critical factors change the hotel landscape significantly and are introducing new challenges and generating new requirements for hoteliers. Therefore, they have to be innovative, exploit marketplace opportunities and, similar to other service organizations, develop long-term relationships with their customers. In view of the nature of the hotel industry, a more customer-oriented approach might be especially required of them for improved performance (Tajeddini, 2010: 221-222).

Innovation capability is regarded as a process involving the interaction of many different resources. Hence, successful innovation relies on firms' resources, such as people, equipment, knowledge and money (Yang, et al., 2009: 7).

Burns and Stalker (1971) viewed the management of innovation as a product of the social processes taking place within organizations. The act of innovation is often considered in terms of the generation and commercialization of new ideas of economic or competitive value. According to Boer (2002), continuous innovation is the ongoing interaction between operations, incremental improvements, learning, and radical innovation aimed at effectively combining operational effectiveness and strategic flexibility, exploitation and exploration. Recent developments in society, markets, technology, and industry suggest that leading organizations need to find configurations of processes, procedures, people, technologies and organizational arrangements that allow them to be continuously innovative (Chen and Jaw, 2009: 249).

The Measurement of Innovation

The most innovative hotels are those that use professional management instruments. Innovative hotels are furthermore more positive towards using Information Technology. Thus, the more professionally organized hotels appear to be more innovative. Furthermore, the production system explains the innovative behaviour of the firms. The innovative tourism firms are characterised by their production system being mostly modularised (standard elements that are combined individually to the individual customer) and by using several types of organisations of the innovation activities of which ad hoc project groups is the most commonly used type (Sundbo, et al., 2007: 98-99).

The innovation system in tourism should emphasise the last part of the technology - economic network, namely the commercial development - market relation. As elsewhere in the service sector, the innovation system would be most efficient if it is strategy based and market/customer-oriented - without forgetting the technological possibilities (Sundbo, et al., 2007: 104).

Organizational innovation capability can be measured by two categories, i.e. innovation intensity and innovation advantage. Innovation intensity measures the extent of the company's innovation output in the form of innovative products, process, organizational and marketing innovations. Innovation advantage measures the extent of the advantages achieved by the company's innovations. The measure includes financial and market advantages. Internal organizational capabilities can be measured by three categories, i.e. innovation-oriented culture, entrepreneurship and market orientation. Organizational culture is very supportive of creativity and innovation (Leskovaar, 2007: 539).

We have determined five possible variables to measure innovation. These five measures are number of innovations introduced to market, availability of formal procedures supporting the creativity and innovation, encouragement of staff to be creative and innovative, diverse uses of information and communication, availability of technologies mostly with web-based services offering, and implementing new ideas, services or processes.

The Effects of Innovation

Technologies are expected to benefit the firms in three ways: (i) by adapting products and processes to the changing conditions, it improves the efficiency of the firms's operations and the customers' access to products that are better suited to their needs, perhaps at a lower price; (ii) by assisting the firms in introducing a new product/service, technologies may help improve the performance of the firms; and (iii) technologies derives benefit as well as contributes to the progression of the capabilities of innovation. (Schulze & Ursprung, 1999: 301).

The most important reason for locating innovation activities in tourism firms is to train their staff. Dispersed innovation activities of firms require excellent communication and other infrastructural facilities. The firms seeking to attract innovation investments should establish such infrastructural facilities on a priority basis.

Information Technology (IT) investments are the technology driving force in tourism activities. IT is used in the back-office for handling routine operational problems and to facilitate multi-stakeholders interactions as well as in yield management. IT is used as well, for example, in the front office for customer relationship management.

Tourism activities are open to technology investment. Because;

- Tourism activities are information-intensive industries; they are particularly receptive to IT investments.
- Tourism offer is a set of products and services that need to be properly bundled; technology can be useful to realize integration between a large set of different suppliers (Jolly & Dimanche, 2009: 579).

Customers can access guest reservation systems and make bookings from a central location by using information systems. Hotels are 'location bound' and many services such as housekeeping, food and beverage preparation and serving, laundry and reception duties must be performed in, or close to, the hotel itself. However, there are opportunities for cost savings and quality improvements through concentration of 'back-office' activities such as account management, finance, training, and other support activities which do not directly involve guest contact. With advances in information technology, the ability to centralize such functions has increased (Whitla, et al., 2007: 783).

Networks are an important factor for innovation. They support innovations as they facilitate the transfer of information, learning and the coordination of production and product development activities. In tourism, networks may be both non-local and highly localised within tourist destinations and may combine the benefits of local and global networks. At the destination, such networks may be comprised of local relations among firms in the same branch of tourism, e.g. hotels; of relations among complementary firms, e.g. hotels and other tourism firms; and of relations with providers of inputs. Non-local networks, on the other hand, consist of chain relations; of relations among firms on destinations and their distributors, e.g. tour operators; and of relations with providers of inputs. Such different relations may provide different benefits depending on their structures and the actors involved (Sundbo et al., 2007: 92-93).

Some innovations are purely behavioural and do not include technology, and could be called organisational innovations, however, this would not be the correct notion as some of them are changes of organisational structures or culture, but some are changes in individuals' social behaviour. Other innovations are real technological ones such as introducing a web-net based ticket purchasing or reservation system for all kinds of tourism firms. The innovation is a changed behaviour, but the new behaviour could not be carried out without new technology. An example is the change in the behaviour of a hotel receptionist who starts treating the customers individually (remembering their wishes concerning rooms, their careers, etc.). This innovation will increase customer satisfaction and thus the willingness to pay a higher price, and return at a later date. This is a case of behavioural change on behalf of the receptionist. However, since receptionists change and cannot remember the personal data for thousands of customers, the new behaviour is based on a common PC-system where the personal key in the information about the customer as soon as they get it. Innovation in tourism can thus neither be reduced to the introduction of Information Technology or other technology, nor can technology be excluded (Sundbo et al., 2007: 90).

Innovations and new ideas may be dependent on the willingness of the staff to make positive changes and innovations in the organization (Leskovar, 2007: 538).

The Effects of Innovation on Service Quality

Tourism firms' competitiveness depends on their innovativeness in achieving lower costs and higher quality outputs that meet the demand requirements of potential customers, and which introduce new products (e.g.,

improved services and products, individualisation, environmental issues and ICT interaction) (Sundbo et al., 2007: 88).

When controlling for various organizational cultures (i.e., market, ad hococracy, clan, and hierarchy), Deshpande et al. (1993) concluded that customer orientation and innovativeness are key determinants for business performance. Moreover, hotels have to be innovative in achieving lower costs and higher quality outputs (Tajeddini, 2010: 223).

Innovation capability was found to relate positively to firms' customer service performance in terms of operational service quality and value adding performance (Yang, et al., 2009: 7).

Investment in technology for tourism activities can lead to several benefits. These benefits are to expand business (e.g., increasing sales, broadening market reach especially foreign markets; improving service quality; providing one-to-one interaction); to improve productivity and efficiency (e.g., reducing transaction costs, reducing communication costs, reducing distribution costs) (Jolly & Dimanche, 2009: 579).

The introduction of new technologies (especially information and communication) has significantly reduced the costs and increased the service quality and productivity by decreasing the mistakes (Sharmistha, 2001: 51).

Service Quality

The importance of quality as a business objective is recognised by chains such as the Four Seasons and Rocco Forte hotel groups which are addressing service quality as a key success factor that can bring significant strategic advantage (Briggs, et al., 2007: 1007).

There is a lack of consensus about the construct of service quality. The most common approach is that of the disconfirmation paradigm which asserts that quality can be defined as the gap between customers' expectations and perceptions (Briggs, et al., 2007: 1008). Owing to the intangible, heterogeneous and inseparable nature of services, service quality has been defined as "the consumer's judgment about a product's overall excellence or superiority" or "the consumer's overall impression of the relative inferiority/superiority of the organization and its services". Many models have been developed to measure customer perceptions of service quality (Martinez, 2010: 30).

From the perspective of customer perceptions, this concept is the result of comparing customer expectations and perceptions. For Gronroos, "the perceived quality of a given service will be the result of an evaluation process, where the consumer compares his expectations with his perception of the service received; in other words, he places the perceived service and the expected service opposite one another". Since customers evaluate the quality of a service, numerous contributions in the literature have attempted to establish which criteria or factors they consider when evaluating service quality, or its dimensions. A pioneering study by Gronroos (1984) proposes three dimensions: technical quality, functional quality, and image (Saez, et al., 2007: 48).

There is consensus that the quality of the service encounter is critical to business success or failure and that service quality is rarely concerned with a single aspect of service but with the whole service package. Indeed service quality in a tourism context has been viewed mostly as the quality of the opportunities available at a destination and is considered to be related to a tourist's quality of experience (Briggs, et al., 2007: 1009).

The hotel sector faces manufacturing problems in providing high quality products and service delivery problems in providing high quality services. The delivery of hotel services involves high contact encounters with significant interaction among customers, staff and facilities. Variability is inherent (and in some cases desirable) in service delivery. The challenge for management is to balance the need for routine and standardisation with the need to treat customers as individuals. Excellent companies know that positive employee attitudes promotes stronger customer loyalty, thus companies must attract the best employees with a long-term career focus (Briggs, et al., 2007: 1008-1009).

The Measurement of Service Quality

Garvin identifies eight determinants; performance, features, reliability, conformance, durability, serviceability, aesthetics and perceived quality. Parasuraman et al. identified ten which were subsequently collapsed into five; tangibles, reliability, responsiveness, assurance and empathy. There are several factors to evaluate the quality of tourism services. These factors such as waiting time for a service, processing time and availability of tourist

amenities for comfort and convenience are measures of the service level components. Service quality is an overall evaluation of the destination and satisfaction is concerned with the overall evaluation of the experience at the destination (Briggs, et al., 2007: 1009).

Tourist satisfaction is crucial in the sense that it affects expectations and intentions for the next destination purchasing decision. Thus, tourist destination considers customer satisfaction as one of the most important sources of their competitive advantage. Some authors suggest that service quality is a vital antecedent of customer satisfaction and, concretely, some relevant aspects of quality perception as promptness of service and on-time programming. Several activities related to tourism service like, for instance, transport infrastructure have to be provided in an efficient way to guarantee a high level of tourism service quality. For transport services, reliability becomes the core of service quality (Cejas, 2001: 874).

The tourism industry uses service quality measurement models frequently, particularly the SERVQUAL scale and variations on it. Most studies of accommodation services have focused on hotels, without particular reference to rural environments. Various authors have applied the SERVQUAL instrument to hotels with little modification. Their results confirm the latter's five dimensions. The most important is reliability, followed by assurance, responsiveness, tangibles, and empathy (Saez, et al., 2007: 49).

Tsaur, Chiu and Huang establish eight dimensions - responsiveness, tangibles, meal service, location, reliability, empathy, reputation, and business service - to measure service quality in international hotels, ranking responsiveness and tangibles most significant and meal service least. Ekinci and Riley propose 35 items divided into 7 dimensions: decoration, cleanliness, staff behavior and attitude, output quality, accessibility, timeliness, and reliability. After applying a Q analysis and the Guttman procedure, only decoration, staff behavior, and output quality are valid. Erto and Vanacore present a probabilistic approach to evaluating hotel service quality. Thus, no consensus exists on evaluation and measurement of service quality dimensions in the hospitality industry (Saez, 2007: 49).

The literature overview provides information on dimensions used in previous studies and in research on other types of accommodation, such as hotels. The dimensions initially considered reflects several aspects: tangible elements (physical facilities, decoration, cleanliness of facilities and personnel), reliability (including accuracy of prices and advertising), professionalism (competence), credibility (accommodation image), responsiveness (includes timeliness), courtesy, security (including physical safety), accessibility (including location), communication, understanding, and complementary offer (complementary services integrated into the rural environment) (Saez, et al., 2007: 51).

For the guest perception, the most relevant attributes are identified. Guest perception is decomposed into premises, services, and additional services. Premises consist of attributes that describe the hotel's location and buildings (landscape and environment). Environment describes the hotel's surroundings (architecture, order and cleanliness, access to the hotel, and availability of parking spaces), while the inside of the hotel building is embedded in the attribute hotel (equipment, homeyness, cleanliness, and spaciousness). The services are divided into food service (taste, look, variegation, and quality of service), drinks (diversity of drinks offered, serving quality, and their tradition), and attitude of personel (personnel to customer, personnel to personnel, and cleanliness of the personnel). The attribute additional services describe the availability of additional services provided on the hotel (such as sports, animation, and souvenir sales). The attribute repeat visits represent important information: whether the guest is willing to visit the hotel again (Rozman et al., 2009: 632).

The first service quality model was proposed by Grönroos. This author adapts the disconfirmation paradigm from customer satisfaction literature in order to propose that the quality of the service is dependent on expected service and perceived service. Expected service quality is formed by variables such as word of mouth, corporate image, advertising, pricing or personal factors, whereas perceived quality is the result of consumer's view of a bundle of service dimensions, some of which are technical and some of which are functional in nature. Technical quality refers to the out come of the service performance or what the customer receives in the service encounter. Functional quality relates to the subjective perception of how the service is delivered and defines customers' perceptions of the interactions that take place during service delivery. Grönroos also claims that under certain conditions corporate image can act as an other service quality dimension, although, inreality, it is a variable that moderates the relationships between quality dimensions (technical and functional) and perceived quality (Martinez, 2010: 30).

Most recently, Brady and Cronin suggested a hierarchical and multidimensional model. These authors combined the traditional approach of service quality (i.e., the Tri-component model of service quality) with the multilevel

conceptualization of service quality. They described a third-order factor model, in which service quality is formed by three primary dimensions, such as interaction quality, physical environment quality and outcome quality. Each of these dimensions is formed by three corresponding subdimensions such as attitude, behavior and experience (interaction quality); ambient conditions, design and social factors (physical environment quality); waiting time, tangibles and valence (outcome quality) (Martinez, 2010: 33).

We have determined five possible variables to measure service quality. These five measures are application of service quality management system, providing cleanliness, safe accommodation for customers, staffs' treatment to customers, providing quality cooking, and safety measures.

The Effects of Service Quality

The effectiveness of a service business is linked to service quality and, in the hotel sector, service quality not only has a positive and direct effect on competitiveness, but also an indirect positive effect via other variables such as occupancy level and average direct costs. Service quality is critical to the profitability of the sector and to the growth of tourism (Briggs, et al., 2007: 1008).

Natural surroundings and infrastructures that provide activities to bring the tourist into contact with nature are important elements in choosing a destination, but there are others. Return visits and generation of income also depend on the how tourists value quality during their stay. Receiving excellent service reinforces the loyalty of current customers and increases the prospect of attracting new ones as well as generating more income. Loyalty to a destination can be strongly related to the quality of services offered, where they enable the tourist to enjoy participating in the host surroundings or the tasks, customs, and lifestyle of local inhabitants (Saez, 2007: 46).

METHODS

The Scope and Model of the Research

The contribution of this research should be discussed with respect to the progress made in methodological and empirical knowledge about the impact of globalization on service quality and innovation of firms in tourism sector in Antalya.

In this study, globalization as an independent variable, innovation and service quality as dependent variables are chosen. Here, the relationships between dependent and independent variables (positive or negative) have been investigated and measured. With regard to this issue, various hypotheses have been developed and the accuracy of these hypotheses was investigated. The correlation type relationships between variables have been investigated.

Globalization supplies a growth in trade and consequently provides new opportunities for hotels in the tourism sector. The changing structure of markets and demands of consumers with globalization have forced hotels to rethink their processes to improve service quality. In light of all, it can be proposed that;

Hypothesis 1: Globalization has a positive effect on innovation of hotels in tourism sector.

Hypothesis 2: Globalization has a positive effect on service quality of hotels in tourism sector.

Hypothesis 3: Innovation has a positive effect on service quality of hotels in tourism sector.

We have studied correlation type relationships as was shown in Table-4.

Table-4. Dependent and Independent Variables

Dependent Variables	Y	Independent Variable	X
Innovation	Y ₁	Globalization	X ₁
Service Quality	Y ₂		

A symbolic model has been used as research model as shown in Figure-1.

Figure-1. Impacts of Globalization on Service Quality and Innovation in Tourism Sector

Data and Sample

This paper aims to present impacts of globalization. The data is analyzed empirically whether globalization impacts the hotels by developing their innovation and service quality or not.

Analysis has been carried out using data which were obtained from the hotels on tourism sector in Antalya by using a questionnaire form in 2010.

A questionnaire survey was carried out in Antalya, Turkey. The questionnaires were applied to 53 firms. The number of tourism licenced establishments with 5 stars is 169 (population) in Antalya in 2008 (<http://www.kultur.gov.tr>). The rate of randomly selected sampling is 31.4 % (53/169). Among them, however, only 1 questionnaire couldn't be used for the analysis because of incomplete reply from a respondent. Among the 53 responses, 21 were from Antalya and the rest 31 were from Belek. Calculations were based upon 52 firms on tourism sector. In the study, respondents were asked to rate on five-point Likert scales ("certainly disagree"/"certainly agree").

Antalya is a big, safe and beautiful city with clean air, sea and water. This city has an unspoiled and natural environment with a very attractive location. It is no wonder that Antalya has been one of the first cities to develop tourism as a major industry. For many travelers, this is important when choosing an overseas destination for their holidays.

The hotel industry in Antalya has a reputation for excellence and providing high quality, reliable services. It is true that hotels in Antalya are generally clean, tidy and organized. In almost all hotels in this city, the owners and managers attempt to maintain the reputation through consistent high standards in operating methods, service delivery and development.

Analyses and Findings

Data collected from questionnaires were entered into the computer and analyzed with SPSS 15.0, a kind of statistics program. In the investigation of the relationship between variables; whether there was a relationship or not, and the direction and degree of relationship were taken into account.

Factor analysis, reliability analysis, correlation analysis and regression analysis for hypothesis tests were conducted respectively. Hypotheses were tested in accordance with the results emerged from regression analysis. Analysis and the results are explained below.

In this study, hotels operating in tourism sector in Antalya were chosen as the research population. Hotels with 5 stars in Antalya were taken as the sample of the research (31.4 percent of population). Questionnaires were subjected to respondents by interviewing face to face. Of the respondents, 67.3 percent were top level managers (vice president, managers), 17.3 percent were mid level managers (assistant of manager), and 15.4 percent were low level managers (chiefs). According to descriptive statistics analysis, some information is given in frequency tables, Table-5.

Table-5. Frequency Tables

Job Title	f		%		Tot. Num. of Beds	f		%		Number of Staff	f		%		Star Rate of Firms	f		%		Age of Firms (years)	f		%	
Top Man.	35	67.3	<300	0	0	60-120	4	7.7	4 stars	3	5.8	0-5	15	28.8										
Mid Man.	9	17.3	300≤X<600	9	17.3	121-180	8	15.4	5 stars	49	94.2	5-10	15	28.8										
Low Man.	8	15.4	600≤X<900	15	28.9	181-240	10	19.2				10-15	7	13.5										
			900≤X<1200	14	26.9	>240	30	57.7				15-20	11	21.2										
			≥1200	14	26.9							> 20	4	7.7										

a) Factor Analysis

In factor analysis, the dependent and independent variables were considered separately and variables were analyzed in this way. Factor loadings for the innovation are given in Table-6. Total variance explained is 54.1 %.

Table-6. Factor Loadings for Innovation

Dependent Variable	Questions	Component
Innovation (Y ₁)	B.1	.604
	B.4	.630
	B.5	.506
Rotated Component Matrix. Solution (Extraction) Method: Principal Component Analysis		

The results of factor analysis for service quality are given in Table-7. Total variance explained is 44.7 %.

Table-7. Factor Loadings for Service Quality

Dependent Variable	Questions	Component
Service Quality (Y ₂)	C.1	.833
	C.3	.703
	C.4	.666
	C.5	.849
Rotated Component Matrix Solution (Extraction) Method: Principal Component Analysis		

Factor loadings for globalization are given in Table-8. Total variance explained is 59.8 %.

Table-8. Factor Loadings for Globalization

Dependent Variable	Questions	Component
Globalization (X ₁)	D.3	.864
	D.4	.860
	D.5	.870
Rotated Component Matrix Solution (Extraction) Method: Principal Component Analysis		

b) Reliability

The alpha reliability coefficients for variables are given in Table-9. In all questions about globalization, innovation and service quality, the reliability (alpha coefficient) is 81.1 %.

Table-9. The Result of Reliability Analysis

Variables	Alpha Coefficient (α)
Globalization (X_1)	.799
Innovation (Y_1)	.787
Service Quality (Y_2)	.676

Alpha coefficients obtained were accepted because it was higher than 0.50 defined by Bagozzi & Yi (1988) in literature. As a result, reliability values for variables were higher than the value defined and accepted by international literature.

c) Correlation Analysis

The values for Pearson correlation coefficients are shown in Table-10. In the correlation table, one to one relationships between independent variable and dependent variables are given.

Table-10. Correlation Values

Variables		Y_1	Y_2	X_1
Y_1	Innovation	1,000		
Y_2	Service Quality	.469**	1.000	
X_1	Globalization	.255	.006	1.000
Pearson Correlation and Significance				
**. Correlation is significant at the 0.01 level (2-tailed)				

d) Regression Analysis and Hypotheses Tests

Hypotheses proposed in the model were tested by using regression analysis. Regression equations have been suggested for testing the hypotheses. These equations defined as a mathematical model are given below:

$$X_1 = \beta_0 + \beta_1 * Y_1.$$

$$X_1 = \beta_0 + \beta_2 * Y_2.$$

$$Y_2 = \beta_0 + \beta_3 * Y_1.$$

Here dependent variable Y_1 defines innovation. Similarly, another dependent variable Y_2 defines service quality, and independent variable X_1 defines globalization. Here Y_i is i^{th} variable; β value is standardized beta regression coefficient. After conducting regression analysis, according to β coefficients and significance level (ρ) of variables hypotheses would be accepted or rejected.

In the analysis, “Innovation” was taken as the dependent variable as shown in Table-11. Regression analysis was conducted by choosing globalization as an independent variable. In this regression model, $R^2=0.065$, $\rho=0.068$ and $F=3.470$ values were obtained. The results indicate that there exists no significant relationship between “Globalization” and “Innovation”.

Table-11. Globalization Affecting Innovation

Independent Variable	Beta (β)	Anlamlılık (ρ)
Globalization (X_1)	.255	.068
$R^2 = .065$		
$F= 3.470$		
$\rho= .068$		
**. Correlation is significant at the 0.01 level (2-tailed)		
*. Correlation is significant at the 0.05 level (2-tailed)		
Dependent Variable “Innovation”		

In the second regression model, “Service Quality” was taken as the dependent variable as shown in Table-12. Regression analysis was conducted by choosing globalization as an independent variable. In this regression analysis, $R^2=0.000$, $\rho=0.968$ and $F=0.002$ values were obtained. These values don’t explain any significant relationship between “Globalization” and “Service Quality”.

Table-12. Globalization Affecting Service Quality

Independent Variable	Beta (β)	Anlamlılık (ρ)
Globalization (X_1)	.006	.968
$R^2 = .000$		
F= 0.002		
$\rho = .968$		
**. Correlation is significant at the 0.01 level (2-tailed)		
*. Correlation is significant at the 0.05 level (2-tailed)		
Dependent Variable "Service Quality"		

In the analysis, "Service Quality" was taken as the dependent variable as shown in Table-13. Regression analysis was conducted by choosing innovation as an independent variable. In this regression analysis, $R^2=0.220$, $\rho=0.000$ and $F=14.111$ values were obtained which indicate that there exists a significant relationship between "Innovation" and "Service Quality".

Table-13. Innovation Affecting Service Quality

Independent Variable	Beta (β)	Anlamlılık (ρ)
Innovation (Y_1)	.469**	.000
$R^2 = .220$		
F= 14.111		
$\rho = .000$		
**. Correlation is significant at the 0.01 level (2-tailed)		
*. Correlation is significant at the 0.05 level (2-tailed)		
Dependent Variable "Service Quality"		

The results of regression analyses belonging to globalization, innovation and service quality are shown schematically in a collective manner in Figure-2 below. The relationships accepted are shown by arrows with thick lines.

Figure-2. Impacts of Innovation on Service Quality in Tourism Sector

As a result of findings, equation considered as a mathematical model is given numerically below:

$$Y_2 = 0.296 + .469^{**} Y_1$$

RESULTS

Our results show the implications of globalization and the relationships between service quality and innovation. These outcomes have some implications for future research as well as for business, socio-cultural and political decisions.

The results regarding the hypotheses are shown in Table-14. Totally 3 hypotheses are ranked in the Table. With regard to the results; Beta coefficients (β), Significance (ρ) and ACCEPTED/REJECTED (A/R) status are also given in the Table. According to these results; only 1 hypothesis was accepted at significance level of 0.01 level.

Table-14. The Results Belonging to Hypotheses

No	Hypothesis	(β)	(ρ)	A/R
H_1	<i>Globalization has a positive effect on innovation of hotels in tourism sector</i>	.255	.068	R
H_2	<i>Globalization has a positive effect on service quality of hotels in tourism sector</i>	.006	.968	R
H_3	<i>Innovation has a positive effect on service quality of hotels in tourism sector</i>	.469**	.000	A

These findings do not support the Hypothesis 1 (H_1) and Hypothesis 2 (H_2) that globalization has a positive effect on innovation and service quality of hotels in tourism sector. Nevertheless, these findings support the Hypothesis 3 (H_3) that innovation has a positive effect on service quality of hotels in tourism sector.

As a result, the findings state that there is no effect between globalization and, innovation and service quality. These results may be due to the relatively small amount of hotel samples. Moreover, total variance explained (<70) is low. Therefore, further similar research of a larger sample is necessary to confirm the hypotheses of this study before making a robust evaluation across the Turkish hotels.

At the last part of the questionnaire the impact of globalization on innovation and service quality, and the impact of innovation on service quality were directly asked to respondents as an open ended question.

Table-15. The Results of Reliability Analysis

Variables	Alpha Coefficient (α)
The Effect of Globalization on Innovation	.904
The Effect of Globalization on Service Quality	.893
The Effect of Innovation on Service Quality	.919

When the answers given by respondents were analyzed by T test, it was found out that respondents had an attitude at a significant level. Accordingly, common attitudes of respondents are on the direction that there is an impact of globalization on innovation and service quality. Moreover, they reported that innovation also impacts the service quality.

Table-16. T Test and Mean

Variables	Sig. (2-tailed)	Mean	t
The Effect of Globalization on Innovation	0.000	4.12	42.45
The Effect of Globalization on Service Quality	0.000	4.12	41.38
The Effect of Innovation on Service Quality	0.000	4.37	48.28

The respondents' opinion that innovation affects the service quality is stronger (4.37) than the other statements. That opinion also supports the result that innovation affects the service quality, which is consistent with the findings of correlation analysis.

CONCLUSION

The contribution of this research should be discussed with respect to the progress made in methodological and empirical knowledge about the impact of globalization on innovation and service quality of firms on tourism sector in Antalya.

The results obtained from regression analysis indicate that there exists a significant relationship between innovation and service quality. The values, however, indicate that there exists no significant relationship between globalization and innovation. Moreover, the values don't explain any significant relationship between globalization and service quality. These two findings have been surprising and inconsistent with the previous literature. The reason behind that might be the small size of the sample that could be realized in the research due to the inevitable restrictions. In addition to this, interest and participation of respondents were found to be low in this research. Unfortunately, some hotels have emphasized that they could not take the time to apply the survey.

Some general conclusions can be drawn and suggestions can be offered for country tourism. These suggestions can be arranged as below:

- Determine a vision and targets by analyzing and evaluating the existing tourism situation. Then, reconsider and plan the tourism products and services offered.
- Promote the country by exporting culture, art and films with TV and cinema.
- Strengthen the international cooperation and trace global trends and demands closely.
- Extend the season throughout the year by diversifying products and services.
- Create high quality in all processes and products/services by transferring and using technology.
- Enhance the staff quality with university education on tourism.
- Studies on product deployment across the enterprise, enhancing staff qualities, search for cooperation and innovation should all be encouraged in tourism industry.
- A tourism database should be set up and implemented for the purpose of providing information to firms for R&D. By obtaining and evaluating these informations, firms will be able to achieve innovations. For sustainable R&D, research and statistical studies shall be monitored and assessed on an ongoing basis in firms. Media and Internet should be used for spreading of information.

ABSTRACT

Today, workforce diversity is not only a legal requirement for organizations, but it is also a must to survive in a highly competitive business environment. The prime motive for this study is to investigate the relationship between workforce diversity and perception of discrimination. The basic hypothesis of the study is that as the workforce diversity increases, the perception of discrimination decreases. In order to test the hypothesis, a survey is carried out international hotel chains in Istanbul. There are 19 international hotel chains in Turkey. In this study research is designed to understand human capital heterogeneity pattern of international chains of hotel industry and how this contribute organizational culture strategically that help to manage organizational performance much more efficiently with cross sectional data. Globalization of markets, changing demographics in the labor market, new business strategies requiring team work and the shift from a manufacturing to a service economy are the prime reasons for human capital heterogeneity (HCH). HCH improves the organizational capabilities in terms of flexibility, creativity, problem solving and competitive advantage. Especially in the service sector, in order to gain competitive advantage, organizations need a diverse workforce for both understanding the diverse needs of customers and answering to these needs in a prompt and proper way.

Keywords: human capital, organizational performance, hotel chain

INTRODUCTION

Although there are various classifications of discrimination types in the literature, two of the most widely stated ones are disparate treatment and disparate impact. Disparate treatment occurs when individuals in similar situations are intentionally treated differently based on such factors as race, religious belief, sex, age, national origin, disability status. Disparate impact occurs as a result of employment processes or decisions that result in discrimination, although there is no such discriminatory intention.

Discriminatory practices towards workforce result basically from prejudice against individuals or certain groups (women, black people, the disabled etc.) There are negative consequences of discriminatory practices for the organizations such as high turnover rates, decreased employee efficiency and motivation, increased absenteeism rates, increased failure rates in selecting the best people for the job, diminished competitive advantage and as a result of these, decreased overall efficiency and effectiveness of the organization.

Although there are legal regulations concerning workforce discrimination, discriminatory practices continue to exist. On the other hand, changing world of today and globalization result in more organizations valuing workforce diversity. Diversity means that organizations are becoming more heterogeneous in terms of sex, race, age, national origin, thought, viewpoint etc.

HUMAN CAPITAL HETEROGENEITY

Heterogeneity stands for organizational or societal variety in which human beings differ from one another demographically (Ferris, Buckley & Fedor, 2002:122). The variety of workforce concept consists of several dimensions which can be named as gender, race, nationality, religion and disability (Byars & Rue, 2000:7). Heterogeneity in human capital stands for human features that diverge individuals from one another. (Mejia, Balkin & Cardy, 2001:124).

The dimensions of variety can be categorized under two frameworks. The primary dimension consists of basic features which every individual has in common and features that can not be changed (Reece & Brandt, 2003:156); they are born and/or specify the features that start in early socialization process of individuals which have an important impact on life-long period of every individual. The primary dimensions are age, ethical background, gender, physical and mental abilities, race and sexual preferences (Loden & Rosener, 1991:18-19, Reece & Brandt, 2003:156). The secondary dimensions consist of features that individuals can change consciously and on purpose, can gain or can quit, such as education level, residential location, marital status, work experience, income level, religious beliefs, political beliefs, health habits, communication means (Mejia, Balkin & Cardy, 2001:124, Reece & Brandt, 2003:156).

THE REASONS OF HUMAN CAPITAL HETEROGENEITY

In the new era, globalization and its' recently formed structural consequences have led Human Capital Heterogeneity (HCH) to become an important issue. Especially, HCH in the organizational systems should be designed in order to support the expansion to different markets, and to establish a synergic organizational culture.

There are numberless developments that led "Change is good" mentality rather than "Change is bad" mentality to take over in organizational change process. These developments can be summarized as;

a. Change in Workforce Demographic Structure

The change in workforce demographic structure has changed the size and the composition of new employees pool (DeNisi & Griffin, 2001:477).

b. Globalization of Market

Global variety means everything and everyone should be analyzed in concept of resemblance and diversification features (Byars & Rue; 2000:8).

c. Shift from Production Economics to Service Economics

d. Organizational Understanding of Variety and/or Diversification Features

Another important factor for contributing workforce diversification is organizational understanding of workforce quality improvement by employing and promoting the most qualified (DeNisi & Griffin, 2001:477).

e. New Business Strategies that Stimulate Teamwork Necessity

Organizations should be in the position to overcome the broad set targets and goals in order to be more durable, serve better and be successful. Thus, organizations should accomplish strategies that one specific department can not fulfill (Cascio, 2003:124).

RESEARCH METHODOLOGY

In our era, organizations should speak the cross-cultural language to succeed in the global competitive environment. New diversified communication tools that respond to various demands and needs should be developed and supply of similar product policies should be departed (Loden & Rosener, 1991:10).

One of the basic factors that organizations need to be successful, is to divert workforce and segment customer variety. Organizations that differ in terms of culture, language, clothing, customs and traditions that fulfill the necessity of being parallel to customers, respond their needs and requirements in a fast and convenient way.

In this study, service sector in which HCH term counts most, has been preferred. The conduct of study is planned to be in hotels area because of customer variety it offers and 24/7 service mentality, employment of diversified workforce, possession of various departments. The questionnaire has been developed under this framework and four and five stars hotels in Ankara regions that offer high numbers in terms of employees and low turnover rates, have been chosen as sample. 10 hotels out of 40 hotels have been chosen as sample.

In the questionnaire, demographical variety measurement data is being asked. Dependent on the literature review and primary and/or secondary dimensions, questions of the questionnaire are developed. The context contains gender, age, marital status, education level, work period in the job, position in the job, income level, religion, race, ethnical background and the physical or mental abilities. The return rate in 10 hotels is 210 respondents out of 550 employees.

FINDINGS RELATED TO HUMAN CAPITAL HETEROGENEITY

Two different measurement methods are applied in terms of workforce diversification measurement; Heterogeneity Index of Blau and Coefficient of Variation. Blau gathers parameters in two groups; nominal parameters and graduated parameters. As can be drawn from Figure 1, Blau states that the first parameter indicates heterogeneity and second parameter indicates inequality (Blau, 1977:8-9). Nominal parameters are the parameters that sub-groups the population. Graduated parameters are the parameters that diversify the individuals according to their status ranking (Blau, 1977:7).

Therefore, when measuring demographic diversification, gender, marital status, religion, race, nationality, ethnical background and physical and mental abilities, Blau's Heterogeneity Index is used (Knight, Pearce, Smith, Olian, Sims, Smith & Flood, 1999:452; Carpenter, 2002:279; Simons, Pelled, Smith, 1999: 666; Carpenter & Fredrickson, 2001: 538). Coefficient of Variation is used in the measurement of other factors. Data measured with Blau Index.

Measurement using Blau Index depend on the formula indicated below:

(Blau, 1977: 9).

$$1 - \frac{\sum x_i^2}{(\sum x_i)^2}$$

Data measured with Coefficient of Variation (Standard Deviation and Mean):

Data gathered from hotels are transferred to SPSS program and after having run the program, SD and Mean values of parameters such as age, education level, position in job, income level parameters are measured together with Blau Index.

HUMAN CAPITAL HETEROGENEITY MEASUREMENT CRITERIA

According to Blau's Heterogeneity Index, if the whole population is gathered under one group then there is no heterogeneity and the value is equal to zero (0). If all groups are in equal size, heterogeneity approaches to the value one (1) (Blau, 1977:9), which means that heterogeneity is at maximum. Thus;

As Human Capital Heterogeneity approaches to zero, population homogeneity should be pronounced. Workforce diversity is at its' maximum as the population groups show an equal distribution. As to Blau Index, the maximum heterogeneity level depends on the number of groups the population is distributed. When the Index is shown as : $1 - \sum p_i^2$ (where " p_i " shows the number of individuals in each group and the percentage of population (Blau, 1977:78), the maximum diversity level for each parameter can be calculated.

In the first half of the study which measures the demographic structural diversity, the parameters such as gender, nationality and physical and mental abilities that are measured with Blau Index, the population is categorized in two groups and the maximum diversification level is 0,50. Parameters such as religion and ethnical background categorize the population into four categories and the maximum diversification level is 0,75. Marrital status parameter categorizes the population into three groups and the maximum diversification level is 0,667.

At this stage of the study, Performance Index that concerns finance, sales performance and management systems efficiency of companies has been developed. Under this framework, Performance Indexes of each hotel have been developed by using three factors. The overlapping of Human Capital Heterogeneity and organizational performance is provided in Figure 1.

Figure 1: Overlapping of Human Capital Heterogeneity and Organizational Performance of Hotels

As can be drawn from Figure 1, HCH of companies creates a synergic effect and allows the company to show a more dynamic and a more innovative approach. Thus, companies should give great attention to plan their human capital stocks and organize them strategically. The companies can maximize their resources in this way and gain competitive advantage.

RESULTS

The study shows that hotels are neither aware of Human Capital Heterogeneity benefits nor know how to manage the process. They have a broader approach by not employing a diversified workforce in means of nationality diversification. The perception verifies for Turkish nationalities as well as foreign nationalities. The different treatment to Turkish nationalities is perceived as discrimination by foreign nationalities and also different treatment to foreign nationalities is perceived as discrimination by Turkish nationalities. The reason for discrimination perception is cultural differences.

In hotels sector, the customer diversification is a fact due to different customer profiles. The increase in HCH is a urge to serve cross-cultural customers in better ways as a result of global world economics which lead to foreign subsidiary openings and/or establish strategic alliances. The managers of hotels that serve different nationalities should give importance to this issue and find strategies to avoid such perceptions.

In the correlation analysis, by %95 meaning, the relation between education level and income level is measured and the result was 0,887 positive correlated. The income level increases as the education level increases and visa versa, the education level increases as the income level increases. As the income level increases individuals have more opportunities for a better education and as the education level increases their approach differs. The variation and diversity in approaches lead individuals to think about various behaviors.

The results compared to other studied conducted in the field, lead to similar results in terms of position in the job, but different in terms of education level. The main result for this difference is the implementation of study conducted in various cultures and in different sectors.

When the job advertisements in Turkey are analyzed, it reveals the fact that individuals who belong to middle-old aged groups are disadvantaged due to fact that job advertisements require age restrictions, innovative thinking and openness to change criteria. During evaluation of job applications, younger applicants are preferred and education opportunities are provided to younger employees.

The result of the study reveals that Human Capital Heterogeneity is low. Dependent on high ranking of Power Distance Index of Hofstede for Turkey and the tendency to avoid conflicts, employers tend not to react against discrimination or accept the inequalities in work environment. As a result of Power Distance Index, employees expect their managers to have an authoritarian management style and be stronger than themselves.

Workforce diversity, besides its' positive features, also possesses negative consequences. The most important consequence is conflict in the organizations, and as a result of grouping of similar employees, the division of communication networks and not being able to profit from different approaches in the organization.

Individuals are complicated systems and each dimension of diversification adds new complicated factor to the system process. Many individuals prefer homogeneity to heterogeneity, known to unknown and being with similar individuals to themselves. The reason for such a tendency is that individuals feel more comfortable and conflicts are minimized (Loden & Rosener, 1991:23).

It is natural that Human Capital Heterogeneity level is low when the effect of Uncertainty Avoidance Index, avoidance of conflicts, and friendship relations on Turkish culture are analyzed. Whereas, the study is conducted in hotels, thus in service sector. In service sector, customer diversity is high and with respect to this fact, the problem diversity which various personalities' differing needs and requirements result is also high. The problems in service sector, because of existence of human factor, are not always routine. Teamwork, different approaches, innovation and quick response to problems are required. This can only be reached through diversified workforce.

As a result of low Human Capital Heterogeneity in the study, it is seen that in Ankara four and five star hotels still lack such factors, avoid conflicts and are not well informed about conflict resolution techniques. Besides, because of homogenous workforce, services provided will also be limited in terms of variety and this will result in limited customer variety. This result will minimize organization's success and competitive advantage in the globalization process.

For future research, the effect of low ranking Human Capital Heterogeneity on process and the most effective management style to overcome the problems occurred due to this low ranking can be analyzed.

ABSTRACT

The purpose of the present study is to investigate and compare the potential and the satisfaction levels of Russian and German tourists visiting Alanya in creating a sustainable competitive advantage in Alanya destination. It is a common point that Russian and Germans are two nationalities most frequently visited Alanya, town of Antalya in Turkey. Moreover, every year many Russians and Germans decide to live in Alanya. So we wonder that how global crisis effected Turkish tourism industry, especially Alanya, and Russian and German preferences. The findings from the present study help decision takers to create new marketing strategies for Russian and German tourists.

Keywords: Destination Competitiveness, Tourism, Alanya, Tourist Profile, Tourist Satisfaction.

INTRODUCTION

In the global tourism industry, increased competition for tourists has spurred many countries, cities and organizations to specialize in developments that will give them an edge over their competitors. One way to achieve this is to embark on a marketing image that depicts a destination as unique and distinctive (Pawitra and Tan, 2003). Tourist satisfaction is assumed as one of the crucial elements for a superior advantage or a distinctive image, as it influences the choice of destination and the decision to return (Yoon and Uysal, 2005). From both the theoretical and the empirical perspectives, customer satisfaction is the key to companies' competitiveness and can be considered the essence of success in today's highly competitive world of business (Bitner and Hubbert, 1994). Therefore, enhancing customer satisfaction should be one of all destinations' primary functions and a prerequisite for the development of a strategy leading to a destination's enhanced attractiveness and its competitive positioning (Dmitrovic et al, 2009; Pearce, 1997).

In the literature, satisfaction is simply defined as the global evaluation that the consumer makes after a purchase (Campo and Yagüe, 2009). Churchill and Surprenant (1982) define satisfaction as an outcome of purchase and use resulting from the buyer's comparison of the rewards and costs of purchase in relation to the anticipated consequences. Maybe, "an evaluation of an emotion" is the shortest definition by Hunt (1977). Although different ones may be added to these definitions, consensus is sufficient regarding the key role of satisfaction for all industries from patient satisfactions in health industry to customer satisfaction in electronic retailing (e-tailing) industry and decision-makers as it leads to intention to (re)purchase, to willingness to pay more, and willingness to recommend goods/services to others (Yi and La, 2003; Yu and Dean, 2001; Barutçu, 2010; Garbarino and Johnson, 1999; Soderlund, 1998; Fornell et al., 1996; Anderson et al., 1994; Fornell, 1992; Johnson and Fornell, 1991). Otherwise, dissatisfaction may occur and lead to negative behavior, such as customer complaining behavior which ultimately affects retention rates (Campo and Yagüe, 2009).

Customer satisfaction also is a vital issue to provide managerial guidance for tourism industry (Dmitrovic et al., 2009). Because satisfaction is not only an essential element for maintaining long-term relationships with tourists but also affects intentions to return, reputation (Ryan et al., 1999) and trust (Selnes, 1998). Enhanced tourist

satisfaction may lead to increased revenues and profits for service providers. Thus, recognizing and understanding the cognitive and behavioral consequences of satisfaction has important implications for destination management (Dmitrovic et al., 2009). In other words, tourist satisfaction has an important role in planning marketable tourism products and services for destinations and its assessment must be a basic parameter used to evaluate the performance of destination products and services (Yoon and Uysal, 2005). For almost all destinations, tourist satisfaction is considered as one of the most important sources of competitive advantage (Fuchs and Weiermair, 2004; Buhalis, 2000). Therefore, tourist satisfaction monitoring may also help managers; to identify strategic objectives at the destination level, to prepare tactical and operational plans, and to increase the competitiveness of a given destination (Dmitrovic et al., 2009; Lee et al., 2008; LeHew and Wesley, 2007; Turner and Reisinger, 2001; Heung and Cheng, 2000; Soderlund, 1998; Lee et al., 2008; Hui et al., 2007; Pawitra and Tan, 2003; Huang and Xiao, 2000; Heung, 2000; Pizam et al., 1978). Furthermore, improvements in tourist satisfaction have come about better management for tourists, regarding better reservations, better signage, new customer care courses, and the installation of other information provision (Augustyn and Knowles, 2000).

Due to its key role of tourist satisfaction in sustainable competitive advantage of destinations, it is not so difficult to see numerous researches aimed to measure tourist satisfaction and its antecedents in the tourism literature (Serroto et al., 2009; Lee et al., 2008; Hui et al., 2007; Pawira and Tan, 2003; Kozak 2001a; Kozak, 2001b; Reisinger and Turner, 200; Huang and Xiao, 2000; Baker and Crompton, 2000; Heung, 2000; Soderlund, 1998; Tribe and Snaith, 1998; Pizam and Jeong, 1996; Hallowell, 1996). For example, Serrato and his friends (2009) stated about 12 potential variables that may influence the global satisfaction of tourists; hospitality and friendliness of people, quality of lodging facilities, environmental and cultural preservation, quality of the gastronomy, availability of fun and leisure activities, tourist information, public security, urban cleanness, noise in tourism areas, signs for tourism sites and services, infrastructure developed for tourism, and fair prices. Their regression analysis results for 1986 surveys indicated that the most important variable influencing global satisfaction of tourist was the hospitality and friendliness of people followed by fair prices. Gastronomy, the quality of lodging, and fun and leisure activities also showed some influence on global satisfaction, but a lower level. On the other hand, Cracolici and Nijkamp (2008) talks about two types of factors due to the results of their study for tourists evaluation of the quality of tourist facilities and attributes in a destination.

According to Cracoli and Nijkamp, variables including reception and sympathy of residents, artistic and cultural cities, landscape, environment and nature are “basic factors” as they characterize the comparative advantage of a tourist destination. But, the variables including information and tourist services, cultural events (concerts, festivals, art exhibitions, etc.), quality and variety of products in the shops, hotels and other accommodation, level of prices and living costs, and tourist safety are “complementary factors”, because these factors stimulate tourists to have a higher tourist well-being. In Aktas and his friends’ study (2009) carried out in 2007 for satisfaction of tourist visiting Alanya, variables influencing tourists’ overall satisfaction with their holiday were grouped under three titles: destination facilities, accommodation services, and incoming travel agency services. Their research findings indicated that the model accounted for 22% of the variance in German tourists’ satisfaction whereas dimension of accommodation services was the strongest predictor, followed by incoming travel agency services, and destination facilities. For Russian tourists, the model accounted for 35 % of the variance in overall satisfaction, and accommodation services was also the strongest predictor, but followed by destination facilities and incoming travel agency services.

METHODS

In this study, data were collected through a questionnaire designed by the authors (Pawitra and Tan, 2003; Kozak, 2001; Echtner and Ritchie, 1991; Fuchs and Weiermair, 2003). Demographic survey part of the questionnaire is composed of 7 variables. And 15 variables exist on the second part of the questionnaire to measure the degree of tourist satisfaction and the factors, namely hotel, shopping, sales person, services and quality of goods, transportation, security, sea-sand-sun, night life-entertainment, etc. The instrument consisted of these 15 items answered on a five-point Likert with anchors strongly disagree (= 1) and strongly agree (=5). SPSS pc + version 15.0 was used for statistical analysis. Differences in the responses between the groups were tested by the T-Test Analysis.

FINDINGS

Alanya is a resort in Antalya, and it's situated in the 135 km east coast of Antalya Gulf on the Anatolian Peninsula. Following the arrivals of Germans in the late 1950s, Alanya met with tourism (Aktas et al., 2007). Today, Alanya has become one of the most important tourism destinations of Turkey with its 6.5 % share in total, approximately 150.000 beds in 668 hotels and annual tourism receipts exceeding \$1 billion (Table 1).

Year	Tourist Numbers			Alanya's Share (%) in		Alanya's			
	Turkey	Antalya	Alanya	Turkey	Antalya	Bed Capacity	Numbers of Accommodation Firms	Average expenditure per tourist (dollar)	total tourism receipts (dollar)
2002	12.921.981	4.747.328	1.029.350	7,96	21,68	122.663	768	697	717.456.950

Source: Directorate of Antalya Culture and Tourism, 2009; Economics Report of Alanya Chamber of Commerce and Industry, 2008.

Table 1 and Table 2 show that there is a steady increase in tourist number of Alanya, Antalya and Turkey, except 2006 and 2009. Due to global crisis, Antalya met with a decrease of 3,55 % in tourist numbers in 2009. On the other hand, Table 2 shows that Germans and Russians are the largest two groups visited Antalya and Alanya. Contrary to Germans, there is a steady increase in the number of Russians visiting Antalya and Alanya for last five years. But, there is a decrease for both groups in 2009, 0,50% for Germans and 3,23% for Russians.

Source: Statistics of Directorate of Antalya Culture and Tourism, 2010.

Table 3 presents characteristics of the sample. First, German tourists are approximately two thirds of the sample (65.8%), and 34.2 percent are Russian tourists. Second, 58.9 percent of the Germans are female, and 41.1 percent are male. For the Russians, males are the largest group (62%), and followed by females (38%). Third, 58.9 percent of the Germans, and 57 percent of the Russians are married. Fourth, about 34 percent of German respondents report completing high school and approximately 33 percent report completing university. About 29 percent of the Germans have a master degree. On the other hand, about 76 percent of Russians respondents report completing university and approximately 18 percent report completing high school. About 4 percent of the Russians have a master degree. Fifth, the respondents who are in 42-53 year-olds make up the largest percentage of German respondents (31.4 percent), followed by those who in 18-29 year-olds (25.3 percent), those who in 30-41 year-olds (22.2 percent), those who in 54-65 year-olds (16.4 percent), and those who in above 66 year olds (4.7 percent). Russian respondents are primarily young, with 40.6 percent falling in the range of 18-29, followed

by those who in 30-41 year-olds (33.4 percent), those who in 42-53 year-olds (18.8 percent), those who in 54-65 year-olds (6.6 percent), and those who in above 66 year olds (0.6 percent). About 74 percent of Russian respondents are under 41 year-olds. Sixth, the respondents who are employee in private-sector make up the largest percentage of German respondents (55.0 percent), followed by retired (11.0 percent), student (9.1 percent), public employee (6.7 percent), the self-employed (5.6 percent), and others (12.5 percent, including unemployed and householder). Russian respondents are composed of public employee (14.4 percent), private-sector employee (26.3 percent), the self-employed (15.3 percent), retired (6.4 percent), student (9.8 percent), and others (27.8 percent, including unemployed and householder).

Table 3: Demographics Findings

Gender	German	Russian	Marital Status	German	Russian
Female	377 (58.9%)	126 (38.0%)	Married	371 (58.9%)	188 (57.0%)
Male	263 (41.1%)	206 (62.0%)	Single	259 (41.1%)	142 (43.0%)
Education	German	Russian	Monthly Personal Income	German	Russian
Elementary	23 (4.0%)	9 (2.7%)	750 Euro and less	65 (14.3%)	147 (46.2%)
High School	199 (34.3%)	59 (17.9%)	751-1500 Euro	157 (34.5%)	115 (36.2%)

Other (unemployed, householder, etc)	78 (12.5%)	91 (27.8%)	Other (relatives, parents, dating couples)	17 (2.7%)	40 (12.2%)
Visit times	German	Russian	Duration of Holiday	German	Russian
First visit	244 (38.1%)	216 (65.9%)	1-3 days	16 (2.5%)	2 (0.6%)
Second visit	139 (21.7%)	53 (16.2%)	4-7 days	189 (29.4%)	72 (21.6%)
Third visit	76 (11.9%)	28 (8.5%)	8 days and over	437 (68.1%)	259 (77.8%)
Fourth time and more	181 (28.3%)	31 (9.5%)			

Seventh, for the Germans, 38.1 percent of respondents are first-time visitors, followed by who in second visit (21.7 percent), who in third visit (11.9 percent), and who in fourth and more (28.3). But, most Russian respondents are first-time visitors, occupying 65.9 percent of respondents, followed by who in second visit (16.2 percent), who in third visit (8.5 percent), and who in fourth and more (9.5). Eighth, about 34.5 percent of German respondents report having a salary between 750-1500 Euros and approximately 14.3 percent report earning less than 750 Euros in a month, followed by who in 1501-2500 Euros range (30.5 percent), and who earn more than 2250 Euros (20.7 percent). Most Russian respondents report earning less than 750 Euros in a month (46.2 percent) and 36.2 percent of Russian respondents are in 751-1500 Euros range, followed by who in 1501-2250 Euros range (11.6 percent) and who earn more than 2250 Euros (6.0 percent). Ninth, most German respondents report choosing “all-inclusive” from accommodation alternatives (82.3 percent). The next popular alternative is “half board” (13.9 percent) and then “full board” (2.5 percent) for German respondents. “bed and breakfast” alternative is preferred by only 0.6 percent of German respondents. Similarly, “all inclusive” is preferred by most Russian respondents (95.5 percent), followed by “full board” (3.0 percent), “bed and breakfast” (0.6 percent), “half board” (0.3 percent), and others (0.6 percent). Tenth, most German respondents come with their families (37.5 percent). German respondents coming with wife/husband are next (27.6 percent), followed by those coming with classmates or friends (24.3 percent), those coming with children (6.3 percent), those coming alone (1.7 percent), and others (2.7 percent, including the dating couples, relatives, parents). Most Russian respondents come with their friends or classmates (27.4 percent). Russian respondents coming with wife/husband are next (24.1), followed by those coming with their families (15.9 percent), those coming with children (12.2 percent), those coming alone (8.2 percent), and others (12.2 percent, including the dating couples, relatives, parents).

Table 4: Comparison of German and Russian Tourist Information Sources for Alanya: Chi-Square Test Results

Getting Information About Alanya	German	Russian	Pearson Chi-Square	Sig.
Internet	323 (50,0%)	113 (33,6%)	23,991	,000*
TV-Radio	12 (1,9%)	5 (1,5%)	,177	,446
Journal-Magazine	32 (5,0%)	8 (2,4%)	3,744	,035*
Travel Agency	346 (53,6%)	206 (61,3%)	5,392	,012*
Friend's Advice	152 (23,5%)	113 (33,6%)	11,447	,001*
Others	48 (7,4%)	19 (5,7%)	1,096	,181

According to the Chi-square test results seen from Table 4, there are significant differences between the information sources used by German and Russian tourists for their decisions to visit Alanya. Chi-square test results indicate that German tourists use internet and journal-magazines more frequently than Russian tourists for vacation decisions: internet, with a percentage of 50.0 for German tourists and 33.6 for Russian tourists; and journals-magazines, with a percentage of 5.0 for German tourists and 2.4 for Russian tourists. Test results indicate that Russian tourists use travel agency and friend's advice more frequently than German tourists for vacation decisions: travel agency, with a percentage of 61.3 for Russian tourists and 53.6 for German tourists; friend's advice, with a percentage of 33.6 for Russian tourists and 23.5 for German tourists. No significant difference in tv-radio preferences of Russian and German tourists for vacation decisions is found.

Table 5. Comparison of German and Russian Tourist Expenditure Items in Alanya: T-Test Results

Expenditures	Nationality	n	Mean	t	p
Food & Beverage	German	646	2,786	6,549	,000*
	Russian	336	2,267		
Excursions	German	646	3,140	-5,473	,000*
	Russian	336	3,604		
City transportation	German	646	2,593	-,791	,429
	Russian	336	2,655		
Entertainment	German	646	2,134	-9,399	,000*
	Russian	336	2,863		
Textile goods	German	646	3,335	2,902	,004*
	Russian	336	3,091		
Jewellery	German	646	2,305	3,455	,001*
	Russian	336	2,039		
Souvenir	German	646	2,862	-6,389	,000*
	Russian	336	3,380		
Others	German	646	2,870	-,832	,406
	Russian	336	2,909		

As seen from Table 5, t-test results indicate that there are significant differences in the expenditure preferences of German and Russian tourists. According to the test results, Russian tourists spend more than German tourists for three items. These are: excursions, with a mean of 3.60 for Russian tourists and 3.14 for German tourists; entertainment, with a mean of 2.86 for Russian tourists and 2.13 for German tourists; souvenir, with a mean of 3.38 for Russian tourists and 2.86 for German tourists. On the other hand, test results indicate that German tourists spend more than Russian tourists for other three items: food and beverage, with a mean of 2.78 for German tourists and 2.26 for Russian tourists; textile goods, with a mean of 3.33 for German tourists and 3.09 for Russian tourists; jewellery, with a mean of 2.30 for German tourists and 2.03 for Russian tourists. There is no significant difference between the expenditures of the two groups for city transportation.

Table 6. Comparison of German and Russian Tourist Expenditures in Alanya: Chi-Square Test Results

Amount of expenditure in Alanya	German	Russian
None	22 (%3,6)	5 (%1,6)
1-250 Euro	246 (%40,5)	95 (%29,9)
251-500 Euro	181 (%29,8)	86 (%27,0)
501-750 Euro	72 (%11,8)	57 (%17,9)
751-1000 Euro	56 (%9,2)	33 (%10,4)
1001 Euro and more	31 (%5,1)	42 (%13,2)
Pearson Chi-Square	33,317	
Sig.	,000	

Chi-Square test results do show a significant difference in the amount of money that German and Russian tourist spend in Alanya (Table 6). According to the test results, Russian tourists spend more than German tourists as a percentage in three expenditure ranges. These are: 501-750 Euros, with a percentage of 17.9 for the Russians and 11.8 for the Germans; 751-1000 Euros, with a percentage of 10.4 for the Russians and 9.2 for the Germans; 1001 Euros and more, with a percentage of 13.2 for the Russians and 5.1 for the Germans. Test results indicate that German tourists spend more than Russian tourists as a percentage in first two expenditure ranges: 1-250 Euros, with a percentage of 40.5 for the Germans and 29.9 for the Russian,; 251-500 Euros, with a percentage of 29.8 for the Germans and 27.0 for the Russians. The percentage of the tourists who do not spend any Euros in Alanya is 1.6 for the Russians and 3.6 for the Germans.

Table 7. Comparison of German and Russian Tourist Evaluations with Reasons for Visiting Alanya: T-Test Results (1=strongly disagree, 5=strongly agree)

Variable	Nationality	n	Mean	t	p
Sea-sand-sun	German	646	4,535	2,605	,009*
	Russian	336	4,359		
Cultural and heritage attraction	German	646	3,222	1,531	,126
	Russian	336	3,108		
Reasonable price range	German	646	4,038	7,078	,000*
	Russian	336	3,571		
Lively nightlife	German	646	2,404	-2,762	,006*
	Russian	336	2,617		
Safety of destination	German	646	4,094	5,746	,000*
	Russian	336	3,706		
Other	German	646	3,847	1,301	,194
	Russian	336	3,802		

T-test results, seen from Table 7, indicate that there are significant differences between the evaluations of Russian and German tourists with determinative variables in their Alanya preferences. Three out of six variables are evaluated as significantly more effective in Alanya preferences by German tourists than by Russian tourists. These variables are: sea-sand-sun, with a mean of 4.53 by German tourists and 4.35 by Russian tourists; reasonable price range, with a mean of 4.03 by German tourists, compared to 3.57 by Russian tourists; safety of destination, with a mean of 4.09 for German tourists, and 3.70 for Russian tourists. Additionally, t-test results indicate that Russian tourists find only one variable to be more effective in Alanya preferences than German tourists. This is lively nightlife, which is given a mean of 2.61 by Russian tourists, as opposed to 2.40 by German tourists. No significant difference between the evaluations of the two groups with the effective role of Alanya's cultural and heritage attraction is found.

Table 8. Comparison of German and Russian Tourist Satisfaction with Alanya Destination: T-Test Results (1=dissatisfied, 5=satisfied)

Variable	Nationality	n	Mean	t	p
Cheapness of city	German	646	3,4175	4,968	,000*
	Russian	336	3,0747		
Safety of city	German	646	3,7454	-,667	,505
	Russian	336	3,7890		
Sufficient recreation facilities	German	646	3,7706	-3,626	,000*
	Russian	336	4,0014		
Cleanliness of city	German	646	3,5465	-4,594	,000*
	Russian	336	3,8556		
Modernity of city	German	646	3,6139	-2,327	,020*
	Russian	336	3,7630		
Sufficient shopping opportunities	German	646	4,1721	,054	,957
	Russian	336	4,1688		
People's hospitality	German	646	4,1784	1,929	,054
	Russian	336	4,0452		
Transportation facilities	German	646	4,2237	1,556	,120
	Russian	336	4,1271		

T-test results, seen from Table 8, suggest that Russian tourists are more satisfied than German tourists with three variables of Alanya facilities: sufficient recreation facilities, with a mean of 4.0 by Russian tourists and 3.77 by German tourists; cleanliness of city, with a mean of 3.85 by Russian tourists and 3.54 by German tourists; modernity of city, with a mean of 3.76 by Russian tourists and 3.61 by German tourists. T-test results, placed in table 8, indicate that German tourists are more satisfied than Russian tourists with the cheapness of the city, with a mean of 3.41 by German tourists and 3.07 by Russian tourists. On the other hand, no significant difference between the satisfactions of the two groups with other four variables; safety of city, sufficient shopping opportunities, people's hospitality, and transportation facilities of Alanya destination is found.

Table 9. Comparison of German and Russian Tourist Satisfaction with Accommodation Services: T-Test Results (1=dissatisfied, 5=satisfied)

Variable	Nationality	n	Mean	t	p
Cleanliness of Hotel	German	646	4,1250	-4,734	,000*
	Russian	336	4,4070		
Hospitality of the Staff	German	646	4,3667	-,949	,343
	Russian	336	4,4265		
Service quality	German	646	4,2390	1,945	,052
	Russian	336	4,1092		
Comfortableness of Hotel	German	646	3,9476	-5,082	,000*
	Russian	336	4,2661		
Quality of Food and Beverage	German	646	4,1373	2,046	,041*
	Russian	336	3,9938		
Animation-sports facilities	German	646	3,3857	-7,087	,000*
	Russian	336	3,9468		

T-test results indicate that Russian tourists are more satisfied than German tourists with three variables of accommodation services (Table 9): cleanliness of hotel, with a mean 4.12 by German tourists, as opposed to 4.40 by Russian tourists; comfortableness of hotel, with a mean of 3.94 by German tourists and 4.26 by Russian tourists; animation-sports facilities, with a mean of 3.38 by German tourists and 3.94 by Russian tourists. As seen from Table 9, German tourists are more satisfied than Russian tourists with the quality of food and beverage, with a mean of 4.13 by German tourists and 3.99 by Russian tourists. On the other hand, no significant difference in service quality and staff hospitality satisfactions of the two groups is found. Moreover, T-test results do not indicate a significant difference between the evaluations of Russian and German tourists with other variables.

Table 10. Comparison of German and Russian Tourist Satisfaction with Holiday: T-Test Results (1=dissatisfied, 5=satisfied)

Variable	Nationality	n	Mean	T	p
Overall holiday satisfaction	German	646	4,4165	-2,245	,025*
	Russian	336	4,5461		
Intent to recommend Alanya for holiday	German	646	4,4038	-,177	,860
	Russian	336	4,4145		
Intent to come again	German	646	4,2377	-,294	,769
	Russian	336	4,2584		
Intent to live in Alanya	German	646	2,4709	-1,467	,143
	Russian	336	2,6028		

T-test results indicate that Russian tourists are more satisfied than German tourists with holiday satisfaction, with a mean of 4.54 by the Russians, compared to 4.41 by the Germans (Table 10). T-test results do not indicate a significant difference between the evaluations of Russian and German tourists with other variables: intent to recommend Alanya for holiday, with a mean of 4.40 for the Germans and 4.41 for the Russians; and intent to come again, with a mean of 4.23 for the Germans and 4.25 for the Russians; and intent to live in Alanya, with a mean of 2.47 for the Germans and 2.60 for the Russians. Test results indicate that both German and Russian tourists are more satisfied with their holiday in Alanya, and they want to recommend this town to their friends/relatives, and to visit Alanya again. But, according to the test results, German and Russian tourists are not so eager to live in Alanya.

CONCLUSION

Germans and Russians are the largest two groups visited Alanya. There is a steady increase in the number of Russians visiting Alanya for last five years. But, there is a small decrease in number of both groups in 2009 due to Global crisis.

On the other hand, research results indicate that some differences exist between the preferences, perceptions and evaluations of German and Russian tourists about Alanya. For example, German tourists use internet and journal-magazines more frequently than Russian tourists for vacation decisions. But, Russian tourists frequently use travel agency and friend's advice for their vacation decisions for Alanya. On the other hand, research results indicate that Russian tourists spend more for excursions, entertainment, and souvenir, whereas German tourists spend more for food and beverage, textile goods and jewellery. Sea-sand-sun, reasonable price range and safety of destination are first three critical elements for Germans to prefer Alanya. Lively nightlife of Alanya is a determinative element for Russians. These are similar to the findings of Aktas and his friends' research (2009) applied in Alanya in 2007.

Also research results indicate that Russian tourists are more satisfied than German tourists with Alanya's recreation facilities, cleanliness and modernity. But, German tourists are more satisfied than Russian tourists with the cheapness of the city. Furthermore, Russian tourists are more satisfied than German tourists with cleanliness, comfortableness, and animation-sports facilities of hotels. But, German tourists were more satisfied than Russian tourists with the quality of food and beverage. According to the research results, Russian tourists were more satisfied than German tourists with overall holiday satisfaction. As a result, these two groups are half of the tourist potential of Alanya and similar researches should be implemented periodically to determine their satisfaction to create a sustainable competitive advantage in tourism industry.

DESTINATION COMPETITIVENESS OF TURKEY AT GLOBAL TOURISM PLATFORM

Muhsin Halis
Didar Sari
Sakarya University, Turkey

ABSTRACT

Competitiveness is a significant factor for organizations at sustaining their presence nowadays. As one of the most rapid developing sectors in the world; tourism is living competitiveness deeply at -micro level- on the firms operating in the sector, and at -macro level-, on destinations as well. Coping with the destination competitiveness, various competitiveness models has been developed. The aim of this study is to analyse Turkey's destination competitiveness considering those models and Travel & Tourism Competitiveness Index (TTCI). There're various strengths of Turkey at international tourism platform. On the other hand, for sustainable destination competitiveness, the weaknesses and threats related with Turkey's tourism industry should be overcome.

Keywords: *Tourism, Competitiveness, Destination Competitiveness.*

INTRODUCTION

"In the present global and rapidly changing market the capacity to compete lies at the heart of national and industry efforts aimed to attract national and international visitors (UNWTO, 2010)." Hence, by the last two decades, various studies at tourism literature formed about competition strategies that provide holding in the sector by branding. However, The Diamond Model which developed by Michael Porter and the following enhanced models like Crouch and Ritchie's Conceptual Competitiveness Model, and Dwyer and Kim's Integrated Model are the most accepted basic models for destination competitive strategies.

The aim of this study is to identify the ability of Turkey's competitiveness at tourism sector in which competition experiencing intensively. From this point of view, in the literature part, first; the terms of competitiveness and destination competitiveness defined and the importance of them in tourism sector investigated. Afterwards, by explaining the main destination competition models, a general look to the mechanism has taken. In the second part of our study, Turkey's competitiveness in global tourism analyzed via the results of Travel & Tourism Competitiveness Report 2009, in the light of destination competition models. By the results, it's aiming to benchmark Turkey against other countries and thus, help government at identifying the sustainable tourism planning and politics for Turkey.

DEFINING DESTINATION COMPETITIVENESS

The Term of Competitiveness

Competitiveness, is a complex notion that has not been defined clearly yet. The reason in this might be the whole range of factors account for it. Having a relative and multi-dimensional structure, various definitions consists at the literature for competitiveness. (Spence and Hazard, 1988)

In general concept, competitiveness will be held by micro and macro forms. In micro version it's evaluating at firm level. "In order to be competitive any organizations must provide products and services for which customers or clients are willing a fair return or price (Dwyer and Kim, 2003a:372)". In the long run, it'll be measured by the ability of stay in business, protecting the investments, to earn a return on them and to ensure jobs for the future.

When we look from the macro perspective, competitiveness will be held at sectoral or national platform. OECD, defines competitiveness at trade, as a "measure of a country's advantage or disadvantage in selling its products in international markets (2005)" while WTO defining in economics perspective, "as the degree to which a country can, under free and fair market conditions, produce goods and services which meet the test of international markets, while simultaneously maintaining and expanding the real incomes of its people over the long term (2000)."

Neither micro nor macro forms, a firm may not be regarded as competitive unless it's able to sustain advantages it possesses over the long-term (Ritchie and Crouch, 2003:33).

Destination Competitiveness

“Competitiveness is a general concept that encompasses price differentials coupled with exchange rate movements, productivity levels of various components of the tourist industry and qualitative factors affecting the attractiveness or otherwise of a destination” (Dwyer et al., 2000:9).

“What makes a tourism destination truly competitive is its ability to increase tourism expenditure, to increasingly attract visitors while providing them with satisfying, memorable experiences, and to do so in a profitable way, while enhancing the well-being of destination residents and preserving the natural capital of the destination for future generations” (Ritchie and Crouch, 2003:2).

Bahar and Kozak state that, destination competitiveness will come through by development strategies which cover marketing activities including image, quality, brand, service etc., destination management and sustainable tourism (2005:114). It's certain that competitiveness and it's advantages would be a temporary success without a sustainable concept.

Dwyer and Kim, make relations of “comparative advantages of a tourism destination with inherited or endowed resources such as climate, scenery, flora, fauna, etc., while competitive advantage would relate to such created items as the tourism infrastructure (hotels, attractions, transport network), festivals and events, the quality of management, skills of workers, government policy and so on. In the context of tourism, both comparative advantage and competitive advantage are important and a model of destination competitiveness must recognize this (2003a:372).”

COMPETITIVE DESTINATION MODELS IN TOURISM SECTOR

“In the tourism context, the multiplicity of industries involved in creating and sustaining destinations requires the development of a competitiveness model that examines the extent of cooperation needed for the future of competitiveness. Consequently, competitiveness is defined here as the destination's ability to create and integrate value-added products that sustain its resources while maintaining market position relative to competitors” (Hassan, 2000:239).

Porter's Diamond Model

The diversity of the components of tourism sector, causes differs at competitive strategies according to the general competition strategies but it will be very useful to analyze Porter's Diamond Model which is the first model on developing competitiveness strategies. The structure of the model is very suitable for destination competitiveness, too.

Porter, who claimed the increment of the competing force of organizations, will take the ability of international competing force; connected the national competitive advantage to the success and harmony of 4 main factors. (Porter, 1990) These factors which can be listed as 'Factor Conditions', 'Demand Conditions', 'Related and Supporting Industries', 'Firm strategy, structure and rivalry' will create the competitive force that aimed in Diamond Model, beside the support of the role of 'Chance' and 'Government'.

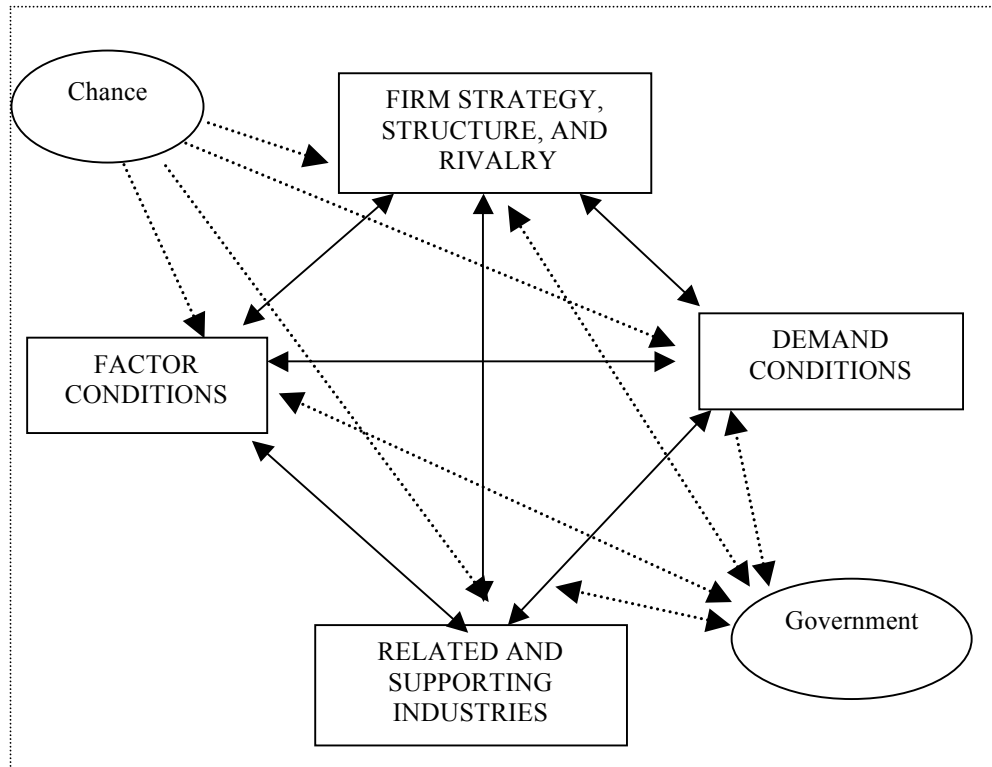

The Complete System of Porter's Diamond Model

In the study of 'The Competitive Advantage of Nations', Porter defined the Factor Conditions as “The nation's positions in factors of production, such as skilled labor or infrastructure, necessary to compete in a given industry.” Beside these, for tourism sector, the attractiveness of physical and historical tourism sources, scientific and technological infrastructure conditions, capital investment attraction level etc. can be added as 'factor conditions'.

Demand conditions defined as “The nature of home demand for the industry's product or service.”

Related and supporting industries are defined as “The presence or absence in the nation of supplier industries and related industries that are internationally competitive.” Beside the core organs of tourism sector which are hospitality managements, travel agencies & tour operators, food & beverage managements, it has a vital importance working coordinately with the contributing businesses like recreation firms, gift shops, manufacturing sector etc.

Figure I: Porter's Diamond Model

Porter, M. (1990:127)

Porter defined the 'Firm strategy, structure, and rivalry' as "The conditions in the nation governing how companies are created, organized, and managed, and the nature of domestic rivalry" (Porter, 1990:71). The ability to create policies and strategies for competing is differs considerably according to the structure of the management and market.

Supporting these elements, there are governments and chance factors at the model, which will be illustrated with the incentives, economy and legal politics, bureaucracies, etc. in one side, and natural and economic crisis, devaluation, wars etc. in the other side.

Dwyer and Kim's Integrated Model of Destination Competitiveness

Dwyer and Kim's integrated model bring together the national and firm competitiveness with the main elements of destination competitiveness (2003b:58). Correlating the comparative and competitive advantage factors, the integrated competitiveness model is a comprehensive study for that.

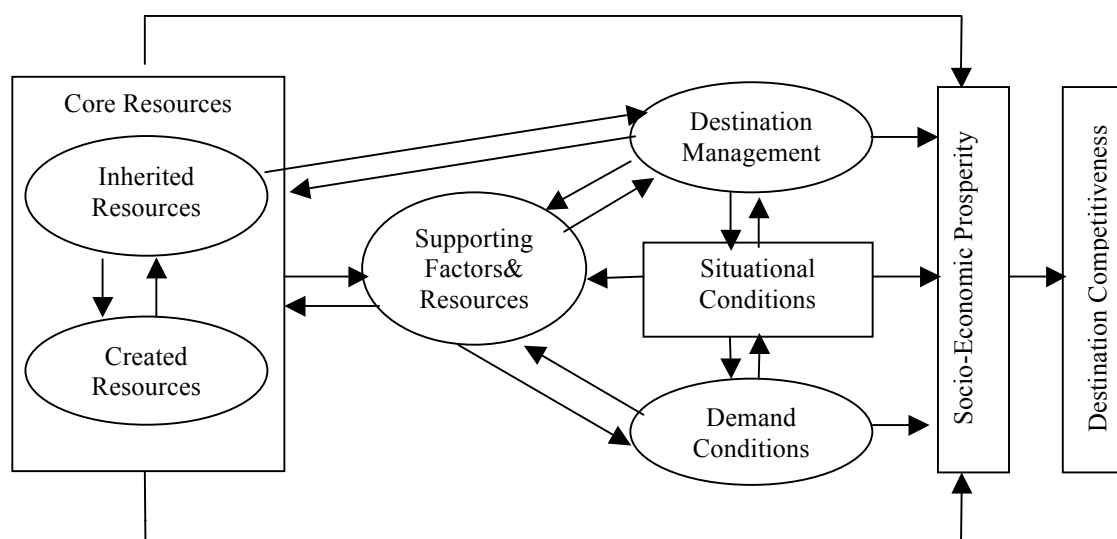

Authors underlining the importance of core resources for tourism sector by dividing them two groups as 'Inherited Resources' and 'Created Resources' in the study. Here, inherited resources defined as natural (lakes, beaches, mountains, etc.) or cultural/heritage (cuisine, handicrafts, language etc.) while created resources are including attributes such as tourism infrastructure, the range of available activities etc.

Supporting factors and resources have a vital importance in destination competitiveness. They're sampled in the model general infrastructure, quality of service, accessibility of destination etc. The bi-directional flow from supporting factors & resources to core resources indicates that core resources are insufficient to provide destination competitiveness alone.

In the model, destination management factor which "enhance the appeal of the core resources and attractors, strengthen the quality and effectiveness of the supporting factors and resources, and adapt best to constraints or opportunities imposed or presented by the qualifying and amplifying determinants (Ritchie&Crouch,2003:73)", will be undertaken by private or public sector.

Development of national tourism strategies, national manpower programs etc. are the main plans implementing by public sector, while the private sector is performing by tourism associations, industry training programs etc.

Figure II: Integrated Model of Destination Competitiveness

Dwyer, L. and Kim, C. (2003b:58)

Demand conditions comprise awareness, perception and preferences which are the three main elements of tourism demand and situational conditions are forces in wider external environment effecting destination competitiveness by economical, technological, environmental etc. ways. Therefore, the influence of situational conditions to demand conditions and destination management is apparent by bilateral arrows.

By socio-economic prosperity, destination competitiveness shown as an outcome with various factors influencing it.

Crouch and Ritchie’s Conceptual Competitiveness Model

Crouch and Ritchie, who’ve developed most comprehensive model on destination competitiveness, studying at this field since 1992, by illustrating Smith’s and Ricardo’s comparative advantage theories, Porter’s competitive advantage and specific destination competitiveness factors (Crouch, 2007).

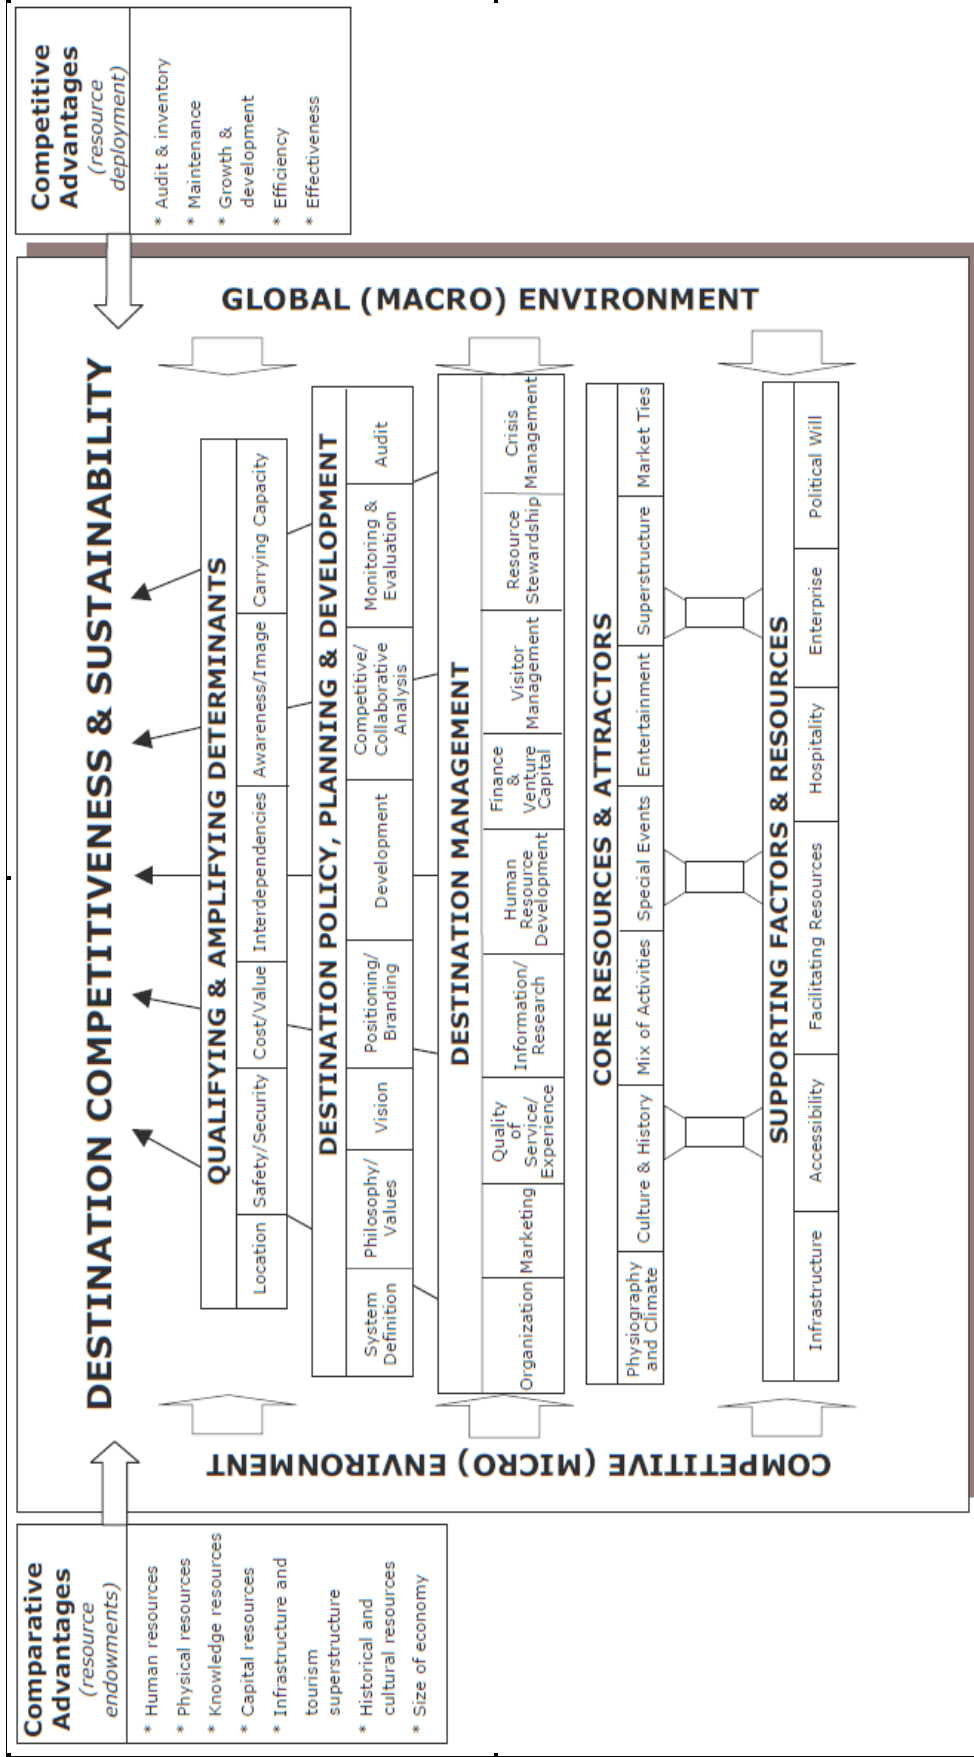

According to their model, competitiveness based on, destination’s resource endowments what’re comparative advantages and, the capacity to deploy resource that are comparative advantages; under the impacts of global macro-environmental forces like global economy, terrorism etc. and competitive micro-environmental circumstances effecting the destination’s tourism system’s mechanism.

As it can be understood in the figure below, the model which’s clustered into 5 groups. ‘Core Resources and Attractors’ defined at the model as the primary elements of destination appeal. The sub-components of this group have the most important role at tourist’s preference of a destination.

Forming tourism industry in a destination requires ‘Supporting Factors & Resources’. In the long term, making a successful plan to ensure a proper balance between tourism growth and development of infrastructure and other facilitating resources has a vital importance.

Tourism has a multi-directional sector with its effects to other industries. Providing a sustainable development and competitiveness, it’s an absolute necessity making a well organized ‘Destination Policy, Planning & Development’, related to social, economical, cultural etc. goals.

Below, by **Figure III, Conceptual Competitiveness Model** is shown.

Crouch, G. (2007:3)

Representing the most direct mechanism to destination management & sustainability, the 4th group (Destination Management) has the factors that are implementing destination policy and planning framework have done before. These factors are aiming to strengthen the quality and effectiveness of the destination with organizational structure, marketing, crisis management etc.

In the 5th group, Qualifying & Amplifying Determinants', there're various factors effecting to the destination's competitiveness independently from other groups. The sub-components of this group might be positive or negative effects on tourist's preferences of destination choices.

By these groups, destination competitiveness depended on 36 main factors.

"Of the 36 destination competitiveness attributes examined, the ten most important were found to be (Crouch, 2007: v)"

- Physiographic and Climate
- Market Ties
- Culture and History
- Tourism Superstructure
- Safety and Security
- Cost/Value
- Accessibility
- Awareness/Image
- Location
- Infrastructure

ANALYSE OF TURKEY'S COMPETITIVENESS IN GLOBAL TOURISM

As a sector which has a high elasticity of demand, effective competitiveness in tourism is a vital factor for sustaining it. Beside this, due to its location, Turkey is located in very competitive tourism geography. In order to increase its tourism revenues, the inadequacies and advantages of Turkey's tourism industry should be well defined.

Travel & Tourism Competitiveness Index developed by World Economic Forum, and Ritchie & Crouch's Conceptual Competitiveness Model which's one of the most comprehensive, Turkey's destination competitiveness in global platform is handled.

Data of Turkey's Domestic Tourism and It's Location at the Global Platform

Tourism industry has a vital importance for Turkey's national economy. In 2009, tourism revenue declared as \$ 21.249,3 million, while the first quarter of 2010, it was \$ 2,414 million. Because of the global economic crisis tourism revenues rate of change occurred -3,2 % at 2009/2008, and -2,2 % for the first quarter of 2010/2009. However, incoming tourists at 2009 was 27.077,114. It's rate of change occurred as 2,81 % at 2009/2008 period while in the first quarter of 2010/2009 3,2 % for departing visitors (Ministry of Culture and Tourism, 2010 and Turkish Statistical Institute).

At international tourist arrivals of 2008, Turkey ranked at 8th, and 9th for the receipts. The most significant point is that Turkey's rank at international tourist arrivals change% occurred 12% for 2008/2007 while the leading countries changing rates occurring at minus levels (UNWTO, 2010).

Travel and Tourism Competitiveness Index

World Economic Forum's Industry partnership program for Aviation, Travel and Tourism sector has been developed The Travel & Tourism Competitiveness Index (TTCI), which's aiming to measure the factors and policies that make it attractive to develop the T&T sector in different countries. TTCI is based on 3 broad categories of variables that facilitate or drive T&T competitiveness (WEF, 2009).

1. *T&T regulatory framework subindex*; which captures those elements that are policy related and generally under the purview of the government
2. *T&T business environment and infrastructure subindex*, which captures elements of the business environment
3. *T&T human, cultural and natural resources subindex*, captures the softer human, cultural and natural elements of each country's resource endowments.

Each of these factors composed in turn by a number of pillars effecting T&T competitiveness showing below:

1. Policy rules and regulation
2. Environmental sustainability
3. Safety and security

4. Health and hygiene
5. Prioritization of Travel & Tourism
6. Air transport infrastructure
7. Ground transport infrastructure
8. Tourism infrastructure
9. ICT infrastructure
10. Price competitiveness in the T&T industry
11. Human resources
12. Affinity for Travel & Tourism
13. Natural resources
14. Cultural resources

According to TTCI competitiveness factors, Turkey's competitiveness at global arena in 2009, can be shown below via the graphics. 14 factors stated above, are taking place in the horizontal axis of the graphics.

Composed via WEF, "The Travel & Tourism Competitiveness Report 2009, *Turkey"

TTCI, ranked **133** destinations with scores ranging from **1-7**.

The first three countries in this ranking have been the same at 2008 and 2009. Switzerland, Austria and Germany are the leading countries in destination competitiveness at TTCI.

According to 2009 index, Turkey is ranked 31st in Europe and 56th destination in the global arena. The strengths of the Turkey can be considered as its rich cultural heritage with 11 of World Heritage Cultural Sites, several international fairs, exhibitions and strong creative industries.

On the other hand, safety and security problems including terrorism, road safety and concerns about crime and violence, are Turkey's most important weakness in the competitiveness (92nd). Health and hygiene is also a comparative weakness (62nd). The inadequacies at ground transport infrastructure especially in railways and ports are weakens of Turkey in competition.

One of the most important threats for sustainable tourism competitiveness in Turkey is the protection of natural resources. Its ranked 104th in environmental sustainability.

Thus, Turkey's scale at T&T Regulatory framework is 4,6/7; while T&T Business Environment and Infrastructure's is 3,7/7 and T&T Human, cultural and natural resources group is 4,3/7 (WEF, 2009).

CONCLUSION

The results of this paper shows that Turkey has strengths beside weaknesses, competing at international tourism arena. It's rich cultural resources are one of the most important advantages while security & safety problems, hygiene & health, infrastructure inadequacies are the leading lack in destination competitiveness. The threats at protection of natural environment has a vital importance for Turkey, where natur-based alternative tourism developing rapidly.

According to Ritchie & Crouch's Competitiveness Model, Turkey's safety and security problems will be held in 'Qualifying & Amplifying Determinants' level, what've direct effects negatively to the destination competitiveness. Ground transport infrastructure inadequacies are at infrastructure group of 'Supporting Factors & Resources', which requires a good planning to ensure the balance between tourism growth and development in the long term. These are the comparative disadvantages of Turkey at global platform with its rich cultural heritages constituting a significant advantage on the other hand.

Through competitiveness index and models, taking precautions immediately at micro and macro levels is so significant for a sustainable development of Turkey's one of the leading industry.

INSTITUTIONAL STRATEGIC CONSCIOUSNESS AND ITS REFLECTIONS: A RESEARCH ON QUALIFIED HOTELS IN ISTANBUL

Muhsin HALIS
Mehmet SARIISIK
Oğuz TURKAY

Sakarya University, Turkey

ABSTRACT

Strategic consciousness is a cognitive skill that enable firm to develop a clear vision and a system of thought based on inquiry, research, transforming of values, increasing of mental capabilities etc. The success of strategic planning is also related to this phenomenon. In this study, strategic consciousnesses of hotels' managers have been measured related to three factors were consist of reframing, reflecting and system thinking. Consciousness construct was found to be formed by two factors in hotels; reframing & reflecting, and system thinking. These two factors have influences the contents of strategic action plan, stakeholder analysis and participation, existence of action plan, and performance measurement. Two factors of consciousness have been influenced especially in the variation of stakeholder analysis & participation. Stakeholder analysis and participation factor also determined the level of customer satisfaction significantly.

Keywords: strategic consciousness, reframing, reflecting, system thinking, hotel industry, Istanbul.

INTRODUCTION

In last two decades, many reasons such as competitive pressures, technological developments, environmental changes etc. have affected organizations about making healthy decisions for their future. By the way they are also faced such difficulties to make comprehensive decisions. For many years, researchers have attempted to define "strategy" and tried to model variables, activities and relations were called "strategic". As it is known, strategy is a comprehensive and integrated plan that is made for providing competitive advantages and it is designated to reach desired long terms goals and is conducted by the executive management. Chandler (1962) took in hand the concept of strategy in his early work, "Strategy and Structure" as the process of determining the organization's long-term goals and objectives as well as the process of adopting a course of action and allocating sufficient resources. Andrews (1980) defined its as the pattern of decisions in a company that determined and revealed its objectives, purposes or goals, produces the principal policies and planed for achieving those goals, and defined the range of businesses the company is to pursue. To determine how strategies do form in organization, Mintzberg and Waters (1985) identified different strategies planned or unplanned. Researchers argued that strategy was more a pattern of action resulting from whatever intended or unintended strategies were realized, thus concept of strategy means more than a plan of action. The action must be supported by awareness (Pencarelli et al., 2008), thinking (Bonn, 2005), orientation (Morgan and Strong, 2003), and consciousness (Naktiyok et al., 2009) in order to respond the change. Strategic management applications and related interventions is required cognitive support anyway named awareness, orientation, or consciousness. Although the conceptualization had been done diversely, these notions discuss the cognitive roots of strategic planning. Consciousness was thought as more extensive and provided a more holistic view option to analyze these roots.

In this study the concept of strategic consciousness have been investigated and defined. Previous studies suggested that strategic consciousness influenced strategic planning process (see Naktiyok et al., 2009). But there is little empirical studies conducted on the determinants of strategic management in hospitality industry, especially depend on consciousness. Thus, the purpose of the study is to assess the effects of strategic consciousness in hospitality industry, and to investigate its influences on strategic planning. The effects of strategic planning on customer satisfaction level are also aimed to discuss in order to create a model conscious-implementation-output flow for hotels.

STRATEGIC CONSCIOUSNESS AND ITS REFLECTIONS

Among its many descriptions, consciousness can be defined as “sense of awareness of self and of the environment” basically (Webster’s Online Dictionary, 2010). Concept is depicted as the “ability to know” something without the use of rational thought processes or direct cognition. Another description is the capacity to know without words, to perceive the truth without justification or cognitive interpretation, reasoning or explanation. It operates knowing that past, present and future is simultaneous. Consciousness can synthesize ideas and choices instantly. It enhances analytic consideration and put forward insights as to timing, specific strategy and innovation. Consciousness is the key to perceiving and receiving unlimited possibilities and to provide new opportunities. Therefore, it indicates the ability without rational thought in a specific time, but it consists of rationality for ever. To be aware of the past, present and future are provided to know deeply and extensively.

Consciousness can be evaluated as one mental function that accompanies all mental events (Webster’s Online Dictionary, 2010). Thus, strategic consciousness means the mental capability of a firm that collects and re-activates all mental functions.

Strategic is about knowing what it would take to create a vision into reality and making this work for you. In the context of strategic consciousness, being strategic is more about inquiry, to argue from analogies, reframing of experiences and knowledge gained, continuous monitoring, being adaptable, responsive to the unexpected and ever ready to receive opportunity. It is a state of being, not just a planning document. Being strategic is less about planning ahead and more about continuous monitoring of the environment, rapid response and fast adaptation. Being strategic then means being clear about the organization's vision and mission, being aware of the organization's resources, and incorporating both into being consciously responsive to a dynamic environment. Being strategic is vital for success in business today.

The ability to think and has conscious strategically is critical to manage complexity and to cope with fast change in the environment. Strategic behavior involves skillful planning and management; it implies forethought, an understanding of the interdependence of actions within a social system, and a purposeful coordination of resources. Leaders who engage in strategic consciousness consider the interplay between actions and responses in light of a set of purposes, purposes that may be explicitly stated or implicit in a principal's understanding of a school and its needs (Hallinger and McCary, 1990).

Strategic consciousness allows people to let go of old identities and the need to control, instead of making choices to be the contribution to the advancement. Strategic consciousness has let employees to take in a wide range of information and perceive things in a broader context. To lead a successful organization, business strategy needs to be together with a consciousness of how different factors in the wider environment and the organization fit together. Pure consciousness alone, however, does not lead to business success. Thus, to be more successful consciousness must be supported effective strategic planning processes, and mutual interaction between them must be developed. Therefore, to explain of business success (customer satisfaction level was discussed in this study) it must be focused on consciousness as cognitive progress and its effects on strategic planning level. The main estimation is “strategic consciousness enhances the level of strategic planning” and “strategic planning effectiveness determines the level of customer satisfaction”. According to Naktiyok et al. (2009) strategic consciousness is a structure which consists reframing, reflecting and system thinking. By this view, these three variables have been tested as predictors of strategic consciousness.

Reframing

Reframing is a cognitive skill which to be enable to see and evaluate events and facts from different perspectives (Naktiyok et al. 2005). This is that to be aware of possible deficiency of him/her own way. Pisapia et al. (2005) defined the term as ability to switch attention across multiple perspectives, frames, mental models and paradigms in order to generate new insights and options for actions. Researchers emphasized four abilities used in reframing:

1. To suspend judgment while appropriate information is gathered.
2. To be able to identify and understand mental models, paradigms and frameworks those are being used to frame a problem, situation or issue.
3. To be able to use different mental models, paradigms and frameworks to understand one situation
4. To review and reform one’s own and others’ mental models.

Reflecting

Reflecting is a capability to apply knowledge for new situation and facts. Naktiyok et al. (2005) argued that this concept means to develop some intuitive standards for next cases, within the supports of experiences. According to Pisapia et al. (2005), reflection is the ability to weave logical and rational thinking through the use of perceptions, experience and information to make judgments as to what has happened and then creates intuitive principles that guide future actions. The five abilities are used in reflection identified as follows (Pisapia et al. 2005):

1. To recognize why certain choices work and others do not.
2. To use double loop learning governing principles.
3. To use perceptions, experience and knowledge to understand situation and how to think about them.
4. To blend perceptions, experiences, and knowledge and analysis while taking action.
5. To use your current perceptions, experience, and knowledge and that of others from past experience to create an understanding of the present and the future.

System Thinking

The idea of system thinking is to see whole and develop a holistic view in order to solve of problems. The features of system that provide a basis for behaviors, relations, interactions and whole social networks have to be considered. Pisapia et al. (2005) identified the term and discuss the main abilities used in system thinking: Systems thinking is the ability to see systems holistically by understanding the properties, forces, patterns and interrelationships that shape the behaviors of the systems which provide options for actions. There are four abilities are used in systems thinking:

1. To think holistically.
2. To recognize patterns and interrelationships.
3. To recognize and act upon intrinsic systems properties and specific systems archetypes.
4. To recognize and act upon the system imperatives of goal attainment, pattern maintenance, integration and adaptation.

Strategic Planning

The strategic planning has defined as the process included in evaluating an organization and its relationships with its environment, deciding what has been useful for the company and how it may realize its objectives, and it has defined the company's strategy and making decision on allocating its resources to remain its own strategy with the capital and manpower. There are some definitions about this term that are held by many researchers in their past investigations. Poister and Streib (1999, p 311-312) defined the strategic planning as "the overall purpose of strategic management was to develop a continuing commitment to the mission and vision of the organization, nurture a culture that identifies and supports the mission and vision, and maintained a clear focus on the organization's strategic agenda throughout all of its decision processes and activities". According to Olsen and Eadie (1982, p. 4), strategic planning was a disciplined effort to produce fundamental decisions and actions that shape and guide what an organization was, what it did, and why it did it. In short, it is a set of concepts, procedures, and tools designed to help leaders, managers, and planners think, act, and learn strategically (Bryson, 2004, p. 15).

In recent years, strategic management and also strategic planning have been most popular investigations subjects for many researchers. In some studies, they have been taken as an important tools and objectives for businesses while explaining its effects on company's goals in others. By the way, strategic planning may enhance organizational viability and its competitive forces. Ayouna and Moreob (2008) pointed out that top managers of individual business units are directly responsible for the overall process of strategic management of their businesses; the linkages between their personal characteristics and the approach toward strategy development have been yet to be understood. Strategic planning was defined by Martin (1998) as forecasting the future success of an organization by matching and aligning all, while Begun and Heatwole (1999) expressed it could provide a framework for coordinated efforts to ensure that key stakeholders understand and were working in support of common organizational objectives.

The existing literature provides few investigations about strategic planning in the tourism and hotel industry (Karhunen, 2008; Burgess et al., 1995; Litteljohn and Roper, 1991; Slattery, 1996; Crawford-Welch, 1991; Alexander and Lockwood, 1996). Additionally recent researches, in international business and management have identified a number of institutionally derived forces that affect business strategies in a post-socialist environment through transaction costs or relational networks (Karhunen, 2008).

RESEARCH METHOD AND MATERIAL

Research Approach and Process

The purpose of the study is to assess the effects of strategic consciousness in hospitality industry, and to investigate its influences on strategic planning. A cross-sectional method was employed as known survey method. Data were collected through a developed survey according to the past researches. The Questionnaire has consisted of four parts:

- [1] The factors of strategic consciousness in hotels.
- [2] The factors of strategic planning in hotels.
- [3] Customer satisfaction level as non-financial performance indicator (relatively).
- [4] Demographics of participants (hotel managers).

Research Instrument and Data Collection

Data for study was collected with structured questionnaire from 4 and 5 star hotels in Istanbul and analyzed via package statistical program. Firstly, descriptive statistics about participants (hotel managers) showed. Later, advanced statistical analysis such as factor analysis was performed to reduce a great number of variables related strategic awareness and reflected strategic operations as outputs of strategic awareness. The obtained data were classified by using "principal component analysis". Furthermore Regression Analysis had been done.

A 20 item scale questionnaire instrument was developed, based on the Naktiyok et. al. (2009) and Pisapia et al. (2005) to investigate the levels of strategic thinking, and a 30 item scale for strategic planning activities adopted from Naktiyok et al. (2009). As a dependent variable the level of customer satisfaction in relations with industrial levels was measured with an item. Naktiyok et al. (2009) measured strategic thinking within the frame of three variables (reframing, reflecting and system thinking) as referred to Pisapia et al. (2005); and strategic planning with five variables (intuitional thinking, strategy base and action plan, environment analysis, knowledge management and strategic control) from some strategic planning tool kits and self-assessment questionnaires. The items for strategic thinking were getting from Naktiyok et al. (2009) by the control and redesign from Pisapia et al. (2005) and items for strategic planning from Naktiyok et al. (2009) without any redesign process. Applicants indicated agreements on five-point scale, ranging from 1-strongly disagree to 5-strongly agree. The item for customer satisfaction level indicated "level of satisfaction" opposite of industrial averages.

The Population and Sampling

The research population of the sample was consisted of managers were employed in qualified (4 and 5 star hotels) hotels in Istanbul. Data were collected from 71 hotels. According to Statistics of Accommodation Establishments published by Ministry of Culture and Tourism, 55 five-star and 103 four-star hotels located in Istanbul by the year 2008 (Republic of Turkey Ministry of Culture and Tourism, 2009).

RESEARCH FINDINGS

In the data analysis phase of the study, obtained data from hotels were analyzed by using descriptive and inferential statistical methods. Before the analysis for the study at hand, collected questionnaire forms were study, and sieved questionnaire that carelessly done. Then, the remaining polls were evaluated.

Descriptive Statistics about Participants

A hundred and fifty questionnaires had been sent to hotels out, and 71 hotels had responded. Eighteen percent of participants were female, 78 percent of them were male. Twenty-one percent worked as top manager while sixty-six percent as mid-level manager. Six percent of them had mid-school education, thirty-five percent had two-year degree, forty-eight percent had high school education, and ten percent had master and doctoral degree. According to their age categories, about one percent was under 25, thirty percent were 26-30 years old, twenty-four percent were 31-35 years old, and seventeen percent of them were above the forty. All participants had management experience between; thirty percent 1-4 years, twenty-eight percent 5-8 years, fourteen percent 9-12 years, and sixteen percent more than 13 years. By the context of total job experiences, seventeen percent of them

had 1-4 years, twenty percent had 5-8 years, sixteen percent had 9-12 years, and forty-five percent had more than thirteen years (Table 1).

Table 1: Demographics of Survey Voters

<i>Gender</i>	N	%	<i>Position</i>	N	%
Female	13	18,3	Top Manager.	15	21,2
Male	55	77,5	Mid-level Manager	48	67,6
Missing	3	4,2	Missing	8	11,2
<i>Education</i>			<i>Job Experience as Manager</i>		
Mid-level	4	5,6	1-4 years	26	36,6
Under graduated	25	35,2	5-8 years	20	28,2
Graduation	34	47,9	9-12 years	10	14,1
Master & Doctorate	7	9,9	13 + years	11	15,5
Missing	1	1,4	Missing	4	5,6
<i>Age</i>			<i>Job Experience in Total</i>		
- 25	1	1,4	1-4 years	12	16,9
26-30	21	29,6	5-8 years	14	19,7
31-35	17	23,9	9-12 years	11	15,5
36-40	16	22,5	13 + years	32	45,1
40 +	11	16,9	Missing	2	2,8
Missing	4	5,6			

Findings about Strategic Consciousness

It is very crucial to gather information via a valid scale and test its structural validity by factor analysis. For this purpose, the strategic thinking items and strategic planning items tested with factor analysis separately. Principal component analysis, with varimax rotation, was used to assess how the 20 items were grouped for the replies on strategic consciousness. Three of items were either cross loaded or had low scores (<,40) in the analysis, they were excluded to clearly identify the structure. The result of Keiser-Meyer-Olkin (KMO) test for sampling adequacy was 0,896 which supported the coherence of data for factor analysis. The factor analysis indicated 2 factors with eigenvalues greater than one, and these two factors explain %64,991 of total variances.

Table 2: Dimensions of Strategic Consciousness

Factors	Factor Loadings	Eigenvalues	Variances Explained%	Cronbach Alpha
Reframing and Reflecting		6,04	35,55	,937
Consideration of using information gathered by experience, in the solution of the problems.	,827			
The causes of error and success were searched.	,827			
“Why” was asked frequently in order to understand problems.	,806			
It was requested from employees that they to be aware of relations between diverse information.	,784			
We have a consciousness to use different perspectives against complex problems.	,761			
Consideration of the effects of “institutional consciousness” while searching roots of problems.	,745			
It was expected that each employee must develop a unique / different solution against errors.	,718			
To provide conditions for employees can develop their problem solving capability.	,655			
Consideration the limitation of perspectives created within the firm (ST35)	,617			
Evaluation of decision processes and results to relocate experience into knowledge.	,574			
System Thinking		5,00	29,44	,900

Consider how change occurs through the influence of environmental factors.	,835		
Look for the overarching, common goal when two parties are competing.	,785		
Locate a problem within the structure of things—including hierarchies, goals, specialized roles, and formal relationships—that influence the specific problem.	,762		
Evaluate a situation using many different viewpoints.	,743		
Try to evaluate relationships between variables in the process of understanding complex information.	,730		
Employees are aware of how affected the firm activities what they have done.	,715		
Consideration of institutional values and beliefs while re-evaluate of decisions and results of business.	,587		

NOTE: Principal Components Factor Analysis with Varimax Rotation., Kaiser-Meyer-Olkin Test Value: ,896, Bartlett's Test of Sphericity: $p > .000$; X^2 : 901,238, df: 136; Total Variance Explained: % 64,991; Voting Categories: 1:Strongly Agree - 5: Strongly Not Agree.

Table 2 shows the item loadings of each factor along with their respective eigenvalue, percent of variance explained and Cronbach alpha's of factors. Reframing & reflecting factor consisted of 10 items and explained 35.550 percent of the total variance. System thinking factor comprised 7 items and explained 29,441 percent of total variation in the data. Reframing, system thinking and reflecting were three factors expressed as dimensions of strategic thinking by Pisapia et al. (2005) and also Naktiyok et al. (2009). In the sample of hotels, it was diversified as a structure with two factors; reframing & reflecting, and system thinking. This result indicated that the scale of strategic thinking was adequate for hotel population, but with a structural differentiation. For hotel, we have to consider the concept of strategic consciousness within two factors/dimensions.

Reflections of Strategic Consciousness

To assess the structure of strategic planning, factor analysis was implemented. Principal component analysis, with varimax rotation, was used to assess how the 30 items were grouped for the ratings on strategic planning. Fourteen of total items were either cross loaded or had low scores ($< .40$) in the analysis, they were excluded. The result of Keiser-Meyer-Olkin (KMO) test for sampling adequacy was 0,866 which supported the congruence of data for factor analysis. The factor analysis indicated 4 factors with eigenvalues greater than one, and the ratio of variance explained by these four factors is 72,351% (Table 3).

Table 3: Dimensions of Strategic Consciousness Reflections

Factors	Factor Loadings	Eigenvalues	Variances Explained%	Cronbach Alpha
The Content of Strategic Action Plan		3,37	21,06	,874
Action plan clarifies aims and activities obviously	,824			
Employee knows how and from where they can gain information that they need.	,744			
Resources are identified for action plan	,732			
Qualitative and quantitative estimation techniques are utilized for strategic planning	,663			
We have a vision and mission statement	,650			
Stakeholder Analysis and Participation		2,97	18,56	,872
The communication channels were identified for every stakeholder groups.	,874			
The needs and demands of stakeholders was defined	,776			
All of related employees were involved in planning process.	,671			
In planning process, feedback was gained.	,564			
It had been determined the time periods for each action in action plan.	,559			
Existence of Action Plans		2,67	16,69	,807
We have a plan for medium-term (1-3 years)	,820			
We have a long-term plan (for after 3 years)	,794			
We have a short term plan (for the period until 1 year)	,755			
Performance Measurement		2,56	16,02	,812
It is defined and well known how the results of controls will analysis and report.	,850			

Performance outcomes were scanning and analyzing regularly.	,845			
The targets of our firm are identified and could be measured as quantitative.	,660			

NOTE: Principal Components Factor Analysis with Varimax Rotation, Kaiser-Meyer-Olkin Test Value: ,866; Bartlett's Test of Sphericity: $p > .000$; X^2 : 692,454, df: 120; Total Variance Explained: % 72,351; Voting Categories: 1:Strongly Agree - 5: Strongly Not Agree.

The content of strategic action plan, stakeholder analysis and participation, existence of action plan, and performance measurement factors are identified. The content of strategic action plan factor consisted of five items and explained 21,06% of the total variance. Stakeholder analysis and participation factor comprised five items and explained 18,56 percent of total variation in the data. Existence of action plan factor consisted of three items which explain 16,69 % of total variances. Performance measurement factor also consisted of three items explained 16,02% of variances. This is the situation how sampling hotels are performed strategic planning, and which determinations are effected planning process.

Internal consistency reliabilities for factors were generally high, indicating respondents answered these items consistently.

To investigate the effects of strategic consciousness factors on strategic planning factors (Table 4) and strategic planning factors on the level of customer satisfaction (Table 5), regression analysis was conducted. To determine these relationships, the related factors entered into the equation together, and factors which have a significant effect are highlighted.

Table 4: Regression Analysis Results for the Effects of “Strategic Thinking” Factors on “Strategic Planning” Factors

Dependent Variable	Predictors	Beta	t value	p value	R ²	F Change	Sig.
Content of Str. Action Plan	Reframing & Reflecting	,176	1,681	0,097	,617	54,789	,000
	System thinking	,653	6,254	0,000			
Stakeholder Analysis And Participation	Reframing & Reflecting	,532	5,082	0,000	,616	54,464	,000
	System thinking	,315	3,014	0,004			
Existence of Action Plan	Reframing & Reflecting	-,087	-,721	,474	,491	32,846	,000
	System thinking	,759	6,301	,000			
Performance Measurement	Reframing & Reflecting	,857	8,693	,000	,659	65,626	,000
	System thinking	-,068	-,686	,495			

System thinking has a significant effect in explaining variance on content of strategic action plan ($p < 0,01$). R-square shows this is a strong effect and to explain the variation of dependent variable, variation of system thinking has strong effect. Each two independents have determined effect significantly on the explanation of variations on stakeholder analysis and participation ($p < 0,01$). R-square is absolutely high. As a dependent variable, existence of action plan is determined by system thinking significantly ($p < 0,01$) with the R-square value of ,49. The variation on performance measure factor also explained by variation on reframing & reflecting factor significantly ($p < 0,01$) with a high R-square rate of ,65.

These results show how these two concepts / structure are tied to each other and significance of identified relations within the dimensions of them. In this framework, it may assert a proof for the relationship of these dimensions. And to advocate the effect-cause relation between these dimensions is meaningful.

Table 5: Regression Analysis Results for the Effects of “Strategic Planning” Factors on the Level of Customer Satisfaction

Dependent Variable	Predictors	Beta	t value	p value	R ²	F Change	Sig.
Level of customer Satisfaction	Content of Str. Action Plan	-,045	-,297	,767	,270	7,095	,000
	Stakeholder Analysis And Participation	,587	3,869	,000			
	Existence of Action Plan	,071	,543	,589			
	Performance Measurement	-,061	-,472	,639			

Three of strategic planning factors (the content of strategic action plan, existence of action plan, and performance measurement) did not have any significant influence on the level of customer satisfaction ($p > 0,05$). Only stakeholder analysis and participation factor significantly explained the variation in dependent variable at the level 27 percent (R²).

The similar significant relations had been founded by Naktiyok et al. (2009). Although there are differences on factors which determine the construct of strategic planning, the match between two studies by the strong effect from strategic consciousness to strategic planning is noteworthy. Results indicated that in hotels there is a strong dependency between planning and consciousness. And planning acts a key role to capture the satisfaction of customer. Findings are shown below as Figure 1.

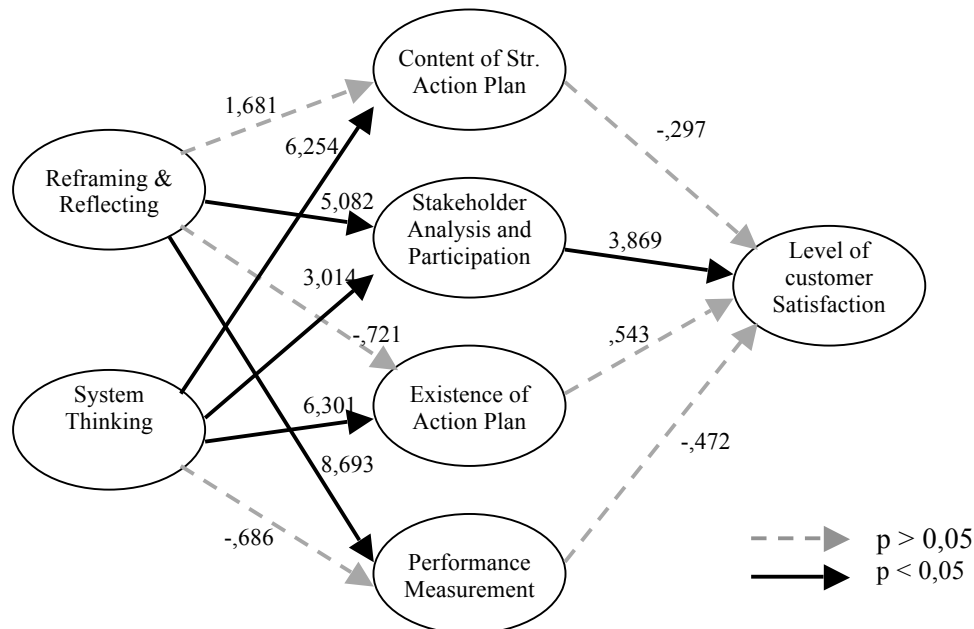

Figure 1: The Model of Study with t Values

CONCLUSION

This study investigated the effects of strategic consciousness on strategic planning, and the effects of strategic planning on customer satisfaction. Initial results indicated that reframing & reflecting factor and system thinking factor explained significant variances in both content of strategic action plan, stakeholder analysis and participation, existence of action plan, and performance measurement. To explain the variations in content of strategic action plan and existence of action plan, only system thinking created an effect while the performance measurement factor determined by only reframing & reflecting. This is the more noteworthy result of both factors of thinking have strong power to explain the variation in stakeholder analysis and participation. In the other hand, the level of customer satisfaction is explained only by stakeholder analysis and participation significantly.

We can express that for the qualified hotels, reframing & reflecting, and system thinking factors determine strategic planning activities, especially stakeholder analysis and participation, and this variable has crucial contribution to customer satisfaction level of firm.

THE IMPORTANCE OF CUSTOMER FOCUSED MARKETING STRATEGY BY RELATIONSHIP MARKETING APPROACH AND A BOUTIQUE HOTEL APPLICATION FROM TURKEY

Güzide Öncü Eroğlu Pektaş
Halic University, Turkey
Mustafa Karadeniz
Naval Science and Engineering Institute, Turkey

ABSTRACT

Years ago, owner of the Ford Motor Company had emphasized the product focused approach by stating as ‘‘Any customer can have a car painted in any colour he wants so long as it is black’’. This strategy was valid since offer was not enough but demand was high. But because of the improving globalizing, world expects on customer focused approach. Shrinking world market share, low offer high demand and financial crisis occurring in some countries have focused the companies to invent new marketing strategies to sell their products before their rivals. So relationship marketing related customer focused marketing strategy has been emerged. Companies are making their strategic marketing plans on keeping long term customers and trying to have loyal customers when upgrading their marketing strategies. Companies are distributing loyalty cards, bonuses or variable reduction tactics to their target customers and expressing their messages by television, internet or mobiles. Companies which do not implement planning and contemporary marketing tactics will stay one step behind their rivals and vanish in time. Customers are deciding their purchasing activities as sorting out thoughtfully in quality, cost and service advantage after buying of the product nowadays. In this research we aimed to observe by survey method on the importance of relationship marketing and customer focused marketing strategy and whether relationship marketing is occurred in tourism sector. A local boutique hotel from Turkey will be selected and a survey will be applied to customer of this boutique hotel.

Keywords: *relationship marketing, tourism marketing, marketing strategy*

INTRODUCTION

Relationship marketing is a competitive marketing strategy which has been implemented lately in the marketing literature. It is a strategic approach aimed enhancing, protecting and improving customer satisfaction and customer loyalty specially in the production and service sectors. Years ago owner of the Ford Motor Company had emphasized the focused on product approach by stating ‘‘Any customer can have a car painted in any colour he wants so long as it is black’’. But focused on product approach has been turned into customer focused approach by the effect of constantly improving and globalizing world. Companies have to invent new marketing strategies to keep their products one step forward from rivals’ ones due to shrinking markets and more offer than demand. From this point of view importance of customer focused marketing strategy depending on relationship marketing is increased. Companies ahead to have loyal customers and planning their marketing strategies on keeping long term customers. Companies are realizing relationship marketing strategies by achieving in keeping customers on life time customer in dense competitive environment. We are planning to measure the level of customer loyalty and customer focused marketing strategy in a company which is a service sector. The reason for selecting servicing sector is the fact that customer loyalty and satisfaction is more important in servicing sector.

LITERATURE REVIEW

The late management guru, Peter Drucker, stated, ‘‘Innovation and marketing are the only two valuable activities of a firm. The rest are costs.’’ Yet, marketing has become increasing pressure as managers find it hard to show a backward reaction on marketing spending. Asking for millions of dollars for advertising or for improving

customer service is easy, but it is much harder to indicate how this investment affects corporate profits or shareholder merit. This has mostly led corporates to resort to state of art short-term strategies like promotions, cost-reducing or financial reengineering whose effects are easier to measure. (Gupta & Lehman 2006, p.88)

Relationship marketing is a philosophy to affect willingly the customers behaviours and implementations depending on what the customers idea about the company is and what the personnel of the firm should know about the customer. (Odabaşı, 2000, p. 19)

A relationship's value as it is felt by the customer has been given a lot of consideration in recent studies. (e.g., Anderson & Narus 1998; Eggert, & Ulaga 2002). Like the customer-perceived value, the supplier-perceived value of a relationship amplifies the supplier's understanding of the trade-off between the benefits and the disadvantages in a relationship. The appraisal of customer relationships takes into account all positive and negative contributions of the customer to the supplier's aims. (Helm 2004, p.79.)

Relationship marketing as a term has been used mostly to cover various activities, with distinction made between its philosophical, strategic and operational dimensions (Bery 1995; Gronroos 1994) given by a general definition of the domain of relationship marketing when he showed it as being about mutually beneficial exchanges and realizing of promises by both parties in a number of interactions over all periods of their relationship. To explain the domain of relationship marketing, a number of recurrent subjects have helped, especially trust, commitment, a long term orientation and co-operation (Morgan and Hunt 1994; Bagozzi 1995; Gronroos 1994; Christopher, Payne and Ballantyn 1991). It has been obvious that relationship marketing at the level of business to business exchange requires very different principles and techniques with relationship marketing between a company and numerous low value personal customers. (Palmer 2002, p.81)

The primary goal of relationship marketing is to build better relationships with customers and a strategy to solve problems such as taking global competitive advantage, challenging rapidly changing technologies and reducing 'time - to - market' of new products. (Wel & Bojei 2009, p.25)

Servicing and selling existing customers is viewed to be just as important to long-term marketing success as acquiring new customers. Relationship marketing is attracting, maintaining and -in multi service organizations- enhancing customer relationships. It is necessary to serve qualified to retain the relationship. Good selling is needed to enhance it. The marketing mind -set is that the attraction of new customers is only the initial step in the marketing process. Empowering the relationship, making similar customers loyal, servicing customers as clients- this is marketing too. (Berry 2002, p.61)

Between 1980s and early 1990s, marketing research began to emphasize the importance of producing relationships for effective marketing. Emory University that brought the issue of relationship management into the mainstream was the base for the center of relationship marketing. (Sharma 2007, p.35)

Relationship marketing has gained significant attention since the 1990s as consumers have become more demanding with firms and rivalry has intensified. Marketers have become interested in the potential of relationship marketing activities to deliver enhanced value to the customer over and above the firm's product or service offering. Because of the difficulty of direct imitation by competitors, maintaining strong customer relationships offers an important rival advantage. (Sherrell & Bejou 2007, p.4)

Relationship marketing is mainly about the sustaining mutually beneficial exchange relationships and benefits and threats of engaging in. Relationship marketing states that, usually, it is more critical for a company to contact with existing customers, and to make customers more loyal, than it is to try to gain new customers. The concept of relationship marketing shows that exchange relations are not 'one-off' but are continuing over the lifetime of the relationship. (Evanschitzky & Wangenheim 2006, p. 80-81)

In enhancing business performance, Competitive Marketing Strategy has relationship marketing as one of the key factors. Relationship marketing can be explained as the identification, foundation, maintenance, enhancement, modification and termination of relationships with customers to found value for customers and profit for company by a series of relational exchanges that have both a history and a future. (Kanagal 2009, p. 97)

Understanding how to start and maintain buyer-seller relationships is becoming increasingly paramount for marketers, because of increased competition and price pressures. (Peltier, Schibrowsky, & Davis 1998). Especially, to success an effective relationship in a consumer context is thought to be even more hard than it is in a business context, given the generally more multi dimensional character of consumers as opposed to business customers.

In most studies, the literature distinguishes between three levels of relationship marketing (Berry 1995). A first level depends on pricing incentives to secure customer loyalty. It is often called as 'level one relationship marketing.' A second level of relationship marketing focuses at the social aspects of a relationship for example regularly talking with consumers or calling their name during an encounter. These social tactics are usually bundled into what is called "Level two relationship marketing", "Level three relationship marketing" is related with finding structural solutions to customer problems, as argued by Berry (1995). At a level three, the solution to customer's problem is designed into the service-delivery system rather than depending upon the relationship marketing goes beyond what is commonly described as a loyalty program. Loyalty programs are usually based

upon level one and/or level two relationship marketing, and were explained by Sharp and Sharp (1998) as ‘‘... efforts on behalf of the company rewarding customers for their loyal behaviour.’’ Today, it is extremely popular to use of loyalty programs as a technique for companies to enhance customer loyalty, as it is thought that both consumers and companies can take benefits from it. (Wulf & Schröder & Canniere and Oppen 2003, p. 70-71)

Different people understand different things about Customer Relationship Management(CRM). For some, it is the term to describe a set of IT applications that automate customer-facing process in marketing, selling and service. For others, it is about an organizational wish to be more customer based. (Irina& Buttle 2006, p.23)

Customer relationship management is the general company strategy which concentrates to the starting and retention of the long living and powerfull relations with customers. Loyalty programs are creating for the effective development of these relations. (Gudonaviciene & Rutelione 2009, p.397)

Customer lifetime value and customer profitability are fast becoming accepted as new bases to customer classification. Firms are building on traditional bases segmentation like geographic, demographic, socioeconomic, attitudinal, and behavioral to incorporate customer past and projected purchase data into customer classification models, customer portfolio models and resource allocation decision making. These models provide sales and account managers another lens through which to understand and prioritize their customers, and to evaluate the efficiency and effectiveness of their marketing and sales programs and resource allocations.(Lemon & Mark 2006,p. 57)

Increasing interest in Mass Customization has focused on the role of relationships. Proponents of mass customization point to the growing importance of implementing an experimental view of consumer behaviour, showing that all companies need to understand the complicated subjectivity involved in consumption, and should look for developing unique formulations of products which satisfy each individual’s requirements. For most products, there has been the tendency to change from mass marketing of a homogenous product to anonymous buyers towards customization of product to meet the needs of known individuals whose needs have become apparent through some form of dialogue based relationship.(Palmer & Bejou 2005, p.5)

Loyalty is an hard to grasp concept. Behavioural data is typically used to measure the loyalty of customer in marketing literature, because its collection is easier and cheaper to obtain. Behavioral data can have frequency of purchase, size of purchase. The argument against behavioural data is that is it difficult to differentiate between adulterate loyalty and true loyalty. Adulterate loyalty involves a situation where the customer will face to alternatives at the first available oppurtunity. True loyalty is the state where customers may never think other options and will stay with an organization in spite of changes in factors like price.Behavioural measures fail to distinguish between true and Adulterate loyalty and do not identify the factors that underlie the behaviour. (Wetsch 2005, p.32-33)

Customers too enjoy certain benefits from relationship marketing, especialy, risk reduction and social benefits. Gwinner,Gremler,and Bitner(1998) claimed that consumer relational benefits could be classified into three distinct benefit types: confidence, social, and special treatment. Cannon and Homburg (2001) have found cost and value to be other important benefits that customers look for. Customers also appear to prefer certain styles of marketing from suppliers (Chaston 2000). When customers enter into a relationship with a company, they are often willing to forego other options and to limit their ways. Some of the motivations to do so come from greater efficiency in decision making, reduction in information processing, successing of greater cognitive consistency in decisions, and reduction of forseen risks associated with future decisions (Sheth and Parvatiyar 1995). Relationship marketing allows service providers to be more responsive to customer requirements, thereby offering more value to their customers.

Relationship marketing appears to be an expensive alternative to firms practicing mass marketing due to relatively high initial investments, though it has numerous benefits. This results in, firms that are used to traditional mass marketing are likely to adopt relationship marketing only if they believe that relationship marketing will benefit them.

In the context of relationship marketing relationship strategy is marketing strategy. According to Morgan (2000), relationship marketing can be a part of the firm’s overall means of achieving its targets and objectives. It can be a big part of the firm’s strategy, and can give the firms a guiding strategy for decisions.

New developments in information technology, data warehousing and data mining have made it possible for firms to maintain a one-to-one relationship with their customers (Peppers, Rogers, and Dorf 1999). Through account management personnel, call centers, interactive voice response systems, on line dial up applications, and web sites firms can often manage every single contact with the customer to build lasting relationships. These interactions can be used to gather information and insights about customer needs and their buying behavior to design and develop services that helped create value for customers as well as for the company. Business need to do a lot more than just adopt these solutions to implement customer relationship management (CRM) practices, although customized as well as off the shelf technological solutions are available in the marketplace (Mirani,Moore, and Weber 2001), (Pisharodi & Angur & and Shainesh 2003, p. 5-6)

It is widely related for enterprises to direct risky relationships for two reasons. First of these, the importance of the consumption event is presumed and has been shown to be connected to a lower aim to express

dissatisfaction. So, dissatisfied customers in consumer goods mass markets are more probable to quietly reduce their buying frequency or their quantity compared to other suggestions. Second, research on consumer behaviour has proved that behavioral intentions are frequently not a sufficient forecaster of actual behaviour. Peculiarly, for consumer goods a decline in sales is frequently not even conscious to customers. (Moeller & Fassnacht and Klose 2008, p.199)

METHODS

In this research, the importance of relationship marketing and customer focused marketing strategy and whether relationship marketing is occurred in tourism sector are observed by survey method. We selected a local boutique hotel from Turkey and applied a survey to customers of this boutique hotel. We evaluated the value of tourism companys' customer focused relationship marketing strategies. The application of boutique hotel survey was applied to a boutique hotel in Taksim region in Istanbul. In this research independent variables are service quality, location, price and promotion activities and dependent variable is level of loyalty of the customers. With SPSS analysis method, trust analysis, frequency analysis, factor analysis and regression analysis are used.

RESEARCH DESIGN

Application part of the study was conducted in a boutique hotel in Istanbul. The boutique hotel in Taksim area hosts many local and foreign guests. The hotel has a capacity of 65 rooms, a large meeting room and a beautiful terrace on the top floor. Not only foreign tourists but also domestic tourists prefer this hotel for meeting and conferences.. Boutique hotel, why we prefer our research of the relational marketing philosophy of the concept of customer focus and loyalty is more common in small and medium-sized tourism enterprises is the idea. Our survey boutique hotel guests, such as face-to-face, with an average over a period of two weeks was completed. Related to circulation of guests and hotel room capacity, a total of 60 hotel guests were questioned. Research model is listed below. At Palmatier and the 2006 work inspired by the adapted model, expertise and competence of the workers, business image, service quality, relationship marketing tactics and operations of the physical features of the independent variables as dependent variables commitment to the effect will be investigated.

RESEARCH MODEL

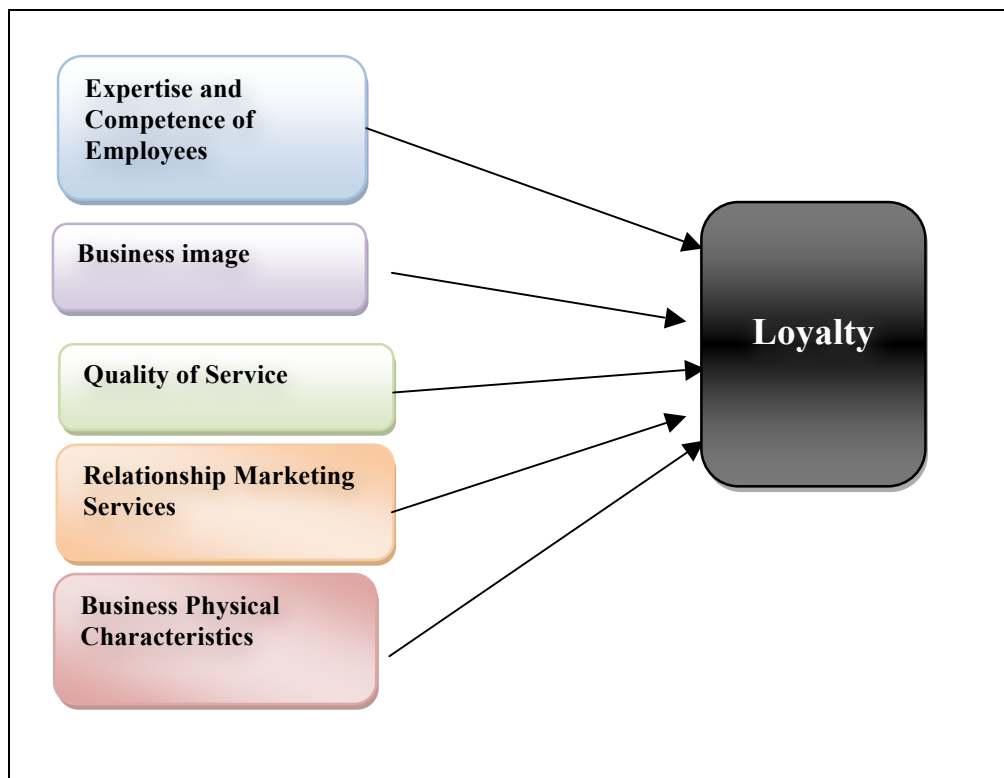

Figure 1. Research Model

Source: The study was developed and inspired by Palmatier et al (2006)

The frequency analysis was conducted to demographic characteristics of the 60 people surveyed. 46% were female participants, 53% were male, aged 26-30 years with the largest weight in the range of 35% when creating the second period with 21% of the 31-35 age range is made up of guests. 40% of participants were university graduates in education levels, while 31% of graduates have master degrees. Marital status; %46 married, % 41 single, % 10 is the widow. Income levels; participants has a percentage of 26% at 2501-3000 YTL , of 21% 2001 to 2500 YTL range. With the end of the demographic characteristics of the profession as employees of the private sector constituted the largest percentage. Incentives are the second professional guests. Participating in the survey were asked for the reason of coming to hotel and we learned that the participants who came for work is 22% , visit 18% and conventions and meetings 14%. When we asked to the participants whether they were loyal to the hotel or not, the 48% of the participants' answers were "yes".

FACTOR ANALYSIS

Reliability analysis of the survey questions were examined before the factor analysis. Cronbach Alpha coefficient of reliability of survey questions was the value 0.818 which suggested a reliable result. We had a total of 26 variables in the questionnaire and we removed four questions which had low reliability and coefficient values smaller than 0.500 degree. We considered the question of the loyalty variable is 6. Accordingly to the factor analysis 16 questions variable have been put. As a result, factors variables have been grouped under four. The KMO value was very good up to a level at 0.796 level. This shows proper to factor analysis. 1. The questions, "These hotel workers are experts in their fields, the hotel staff is acumen, the hotel employees are knowledgeable and talented while dealing with the hotel customers' problems, the questions employees expertise and competence." are subgrouped under the name of employers' competence and expertise at factor group. 2. The questions; " This hotel as a company is an innovative and forward-looking, this hotel customers feel themselves safe, this hotel is a regular guest of the rewards and benefits makes this hotel, repeat customers offer better service, this hotel is a good image" are subgrouped under the name of service quality and image at factor group.3. The questions; "This hotel is always clean and sanitary, quality equipment and materials are used in this hotel, this hotel is quiet, comfortable." Are sugrouped under the hotel's physical characteristics at factor group.4 The Questions;" This hotel's employees are trusted, who work at this hotel and honest, experienced staff " are subgrouped under the name of confidence and attitude of the employees at factor group.

Table 1. Factory result analysis

Name of Factor	Expressions of Questions	Factor Weights	Explanatory Factor For (%)	Reliability
1. Employees' Expertise and Competency	This hotel staff are experts in their fields Hotel staff is versed in this business.	0,840	17,146	0,825
	This hotel gives attention the customers' problems immediately.	0,838		
	In this hotel staff is knowledgeable and talented.	0,707		
		0,563		
2. Service Quality and Image	This hotel is an innovative and forward-looking company .	0,788	16,433	0,753
	This hotel's customers will feel themselves to be safe	0,674		
	This hotel offers convenience and rewards to repeat customers.	0,662		
	This hotel offers a better service to repeat customers.	0,593		
	This hotel has a good image.	0,590		
3. Physical Characteristics of Hotels	This hotel is always clean and hygienic.	0,881	15,791	0,777
	This hotel uses good quality equipment and materials.	0,734		
	This hotel is quiet.	0,687		
	This hotel is comfortable.	0,572		
4. Confidence and Attitudes to employees	In this hotel employees are trusted..	0,789	14,158	0,715
	In this hotel employees are honest and sincere..	0,764		
	In this hotel employees are experienced.	0,657		

Table 2. Regression Model Summary

Model	R	R Square	Designated R Square Value (Adj. R 2)	Estimated Standart Deviaiton	Durbin-Watson
1	0,676 (a)	0,458	0,418	0,418	1,763

The fourth factor in the regression analysis, factor analysis results we bring to the boutique hotel, a level of commitment as well as increased 45%. In this case, boutique hotel for hotel customers are loyal customers can make comments. As shown in Table 3, the most significant factor contributing to faithfully provide all the factors. That our research shows the significance and validity. Boutique hotel, 45% loyalty are all factors supporting the group. From these results, the hotel's service quality and customer-focused marketing approach can tell you just kind of customer loyalty.

Table 3. Regression Analysis Coefficients

	p value (sig.)	VIF
Expertise and competence of employees	0,000	1
Service Quality and Image	0,010	1
Physical Characteristics of hotel	0,001	1
With Confidence and Attitudes of employees	0,000	1

CONCLUSION

Relationship marketing is a widely used strategy by companies to establish good relations with customers and make these relations continue. It is important to form confidence between companies and customers to constitute a long term communication with customers. In this context, it is necessary to understand customers' demands and develop an marketing strategy on the basis of these demands. For this reason, a bilateral communication with customers and constant data flow is very important. With the help of bilateral communication with customers, companies will gain loyal customers.

In the X boutique hotel application based on relationship marketing with customer focus philosophy, our results are also close to Palmatier and others (2006) article which we were inspired by the research model. Model of expertise and competence of the staff, service quality and image of the hotel's physical properties and the application of the results of 4 independent variables are consistent. 4. The trust factor and the attitude of our employees in the survey given scarves high factor weights were created by a different group of factors. Results of this research before all prepared, and the fit between the model results shows consistency. The boutique hotel has a close level of loyalty 50% and this is another positive result. This shows commitment of the customers to the hotel. When we comment the attractive results at demographic characteristics, we should say that the majority of the participants of this survey is male. guests. While the majority of private sector employees, professional groups, income levels in the range of 2200-3000 YTL. It is seen that occupational and income status of the guests are in good condition. And the last demographic characteristic is about education level which shows that majority of the participants are graduated from college or master degrees. Participants in the survey are loyal to hotel when we look their answers including 48% percentage. This emphasizes that we can see the loyalty of participants without analyzing the survey.

This study shows relationship marketing approach in terms of customers' loyalty. A conceptual point of view of the literature was showed and then 60 hotel guests were made to the survey at a medium-sized boutique hotel in Istanbul. We think that this survey assigns a new point of view to the literature and also to the tourism sector by the view of relationship marketing.

MARKETING STRATEGIES

THE EFFECTS OF CONSUMER ETHNOCENTRISM AND CONSUMER ANIMOSITY ON THE RE-PURCHASE INTENT: THE MODERATING ROLE OF CONSUMER LOYALTY

M. Şükrü Akdoğan
Şevki Özgener

Ayşen Coşkun

Nevşehir University

ABSTRACT

With the growth of international trade and travel, consumers are increasingly confronted with foreign products and services. But some negative attitudes towards foreign products can arise from several factors such as previous or ongoing political, military, economic, or diplomatic events. Thus, both consumer ethnocentrism and consumer animosity have become important constructs in marketing. The purpose of this study is to investigate whether consumer ethnocentrism and consumer animosity affect repurchase intent towards U.S. products and whether this impact is moderated by customer loyalty. The findings of the research indicate that consumer ethnocentrism increases consumer animosity for the sampling. The present study also denotes that both consumer ethnocentrism and animosity have a negative impact on repurchase intent toward U.S. products in Turkey. According to the results of regression analyses, customer loyalty may not be an important moderating factor between consumers' animosity and repurchase intent toward U.S. products. However, customer loyalty moderated the relationship between consumer ethnocentrism and repurchase intent toward U.S. products. Further implications for Turkish consumers in supermarkets in the province of Nevşehir are discussed. The value of future research is also acknowledged.

Keywords: *Consumer ethnocentrism, Consumer animosity, Customer loyalty and Repurchase Intent*

INTRODUCTION

Ethnocentrism and animosity as concepts associated with marketing management and organizational behavior are fairly new.

Both ethnocentrism and animosity are variables associated with the origin of a product. Ethnocentric consumers believe that buying foreign products hurts the domestic economy and national employment. Animosity refers to remnants of antipathy, or hostility towards a country (Jimenez and San Martin, 2010: 34-45).

Consumer ethnocentrism and consumer animosity are considered to have an influence on customers' perception of the goods and services offered. In fact, consumer animosity and consumer ethnocentrism have a negative effect on customers' repurchase intent to foreign products. But it is commonly known that there is a positive relationship between customer loyalty and repurchase intent. In this context, the goal of this study is to investigate the moderating role of customer loyalty on the relationships between consumer animosity - consumer ethnocentrism, and repurchase intent toward U.S. products.

Consumer Ethnocentrism

Ethnocentrism has a negative influence on the evaluation and purchasing intentions of consumers, although that may vary within cultures and between different country-of-origin products (Jiménez Torres and San Martín Gutiérrez, 2007: 6-7).

Shimp and Sharma (1987) apply ethnocentrism to the study of marketing and consumer behavior. They defined consumer ethnocentrism as a belief held by consumers on the appropriateness and indeed morality of purchasing foreign-made products. Consumer ethnocentrism implies the normative belief that purchasing domestic products is more beneficial than purchasing foreign goods.

Previous studies found that scores on the CETSCALE are related inversely to willingness to purchase imports, perceptions of the quality of imported goods, cultural openness, education, and income (Shimp and Sharma, 1987; Netemeyer et al., 1991). Particularly, consumers who hold strong ethnocentric beliefs are more likely to evaluate foreign products negatively than are those who do not hold such beliefs. Those who believe that it is wrong to buy foreign goods also tend to perceive those goods as lower in quality than domestic goods; ethnocentric consumers prefer domestic goods not only because of economic or moral beliefs, but also because they believe that their own country produces the best products (Klein et al., 1998: 92).

In the minds of ethnocentric consumers, the purchase of foreign-made products is wrong because it hurts the domestic economy, causes loss of jobs, and is unpatriotic. Therefore, it is anticipated that ethnocentric consumers tend to be biased towards domestic products (Evanschitzky et al. 2008: 9). Ethnocentric consumers will tend to reject people, symbols and values that are culturally dissimilar, while intra-cultural objects will become recipients of pride and attachment (Herche, 1994: 6).

Consumer ethnocentrism is positively related but distinct from consumer animosity. Klein and Ettensen (1999) suggest that consumer ethnocentrism contributes to a consumer's propensity to avoid buying foreign products in general, while animosity is directed towards a specific country (Rose et al., 2009: 331). However, there are limited numbers of studies on consumer ethnocentrism and repurchase intent to foreign goods and services in Turkey.

Consumer Animosity

With the growth of international trade, an increasingly diverse array of products of different national origins is now available in many countries throughout the world. This has resulted in greater interest in examining consumer attitudes towards products of different national origins. Because consumer ethnocentrism and consumer animosity substantially affect the multinational firms' investment decisions and foreign capital flows. Most research has been conducted in large industrialized countries such as the US, France, Germany, and China that have large internal markets and a wide range of domestic alternatives or brands in most product categories (Klein et al., 1998; Witkowski, 2000; Nijssen and Douglas, 2004; Bahae and Pisani, 2009). There are a few studies related with consumer ethnocentrism and consumer animosity in Turkey.

Consumer animosity is defined as the remnants of antipathy related to previous or ongoing political, military, economic, or diplomatic events – will have a direct, negative effect on consumers' purchase behavior in the international markets (Ettenson and Klein, 2005; Riefler and Diamantopoulos, 2007).

Consumer animosity refers to strong negative emotions toward purchasing products from a disliked nation or group. The majority of consumer animosity studies have examined the attitudes of the members of one nation towards the products of another nation (Rose et al., 2009: 330). Examples are numerous and range from reports of Jewish consumers avoiding the purchase of German-made products to the boycott of French products by Australian and New Zealand consumers because of the recent nuclear tests made by France in the South Pacific (Klein et al., 1998: 90). If consumers think a foreign nation damages their own country, they will be likely to show animosity towards that specific country. The emotional nature of animosity shows how international tensions can have repercussions on relationships between persons of different nationalities. That is, consumer animosity towards a country and their consequences are associated with political behaviour; consumers indirectly protest about international events. Both ethnocentrism and animosity would probably have some influence on consumer behaviour which is preceded by cognitive and affective aspects (Jiménez Torres and San Martín Gutiérrez, 2007: 4).

Witkowski (2000) studied U.S. consumers' animosity toward Chinese products and showed the negative impact of animosity on consumers' purchasing decision. Similarly, Ettenson and Klein (2005) analyzed the impact of Australian consumers' animosity on attitudes towards French goods: The results of study showed that Australian consumers' animosity toward France was negatively related to their willingness to purchase French products. On the other hand, Bahae and Pisani (2009) investigated the relationship between Iranian consumers' animosity and U.S. products. The results suggested that the antecedent demographic variables of education, age and foreign travel experience are inversely related to consumer animosity whereas women and students tend to hold greater consumer animosity feelings than men and non-students. Additionally they found a strong and significant inverse relationship between Iranian consumer animosity and intention to buy U.S.-made products. However, in Turkey, the studies about consumer animosity and repurchase intent to the goods and services of foreign countries are rather few in number.

Customer Loyalty

At the heart of many firm strategies is the desire to develop and to maintain close relationships with customers. Accordingly, the creation of customer loyalty is a strategic objective for most company in global competitive markets. As customer loyalty may act as a barrier to customer switching behavior, it has an impact on the development of a sustainable competitive edge.

Oliver (1997) defines it as "a deeply held commitment to re-buy or re-patronize a preferred product/service consistency in the future, thereby causing repetitive same-brand or same brand-set purchasing, despite situational influences and marketing efforts having the potential to cause switching behavior." Customer loyalty is a function of perceived product superiority, personal fortitude, social bonding, trust, emotional attachment, and their synergistic effects (Ogba and Tan, 2009: 135; Pitta et al., 2006: 422). Moreover, Hwang and Wen (2009) suggest that customer loyalty depends on positive word-of-mouth, a resistance to switching, identification with the service, and a preference for a particular service provider among competition. The benefits of customer loyalty to a provider of either services or products include lower customer price sensitivity, reduced expenditure on attracting new customers; and improved organizational profitability (Rowley, 2005: 574).

Loyal customers are customers who hold favorable attitudes toward the company, commit to repurchase the product/service, and recommend the product to others (Bowen and Chen, 2001: 214). Loyal customers are less likely to switch to a competitor due to a given price inducement, and these customers make more purchases compared to less loyal customers (Wong and Sohal, 2003: 497).

There is a positive relationship between customer loyalty and repurchase intent to foreign goods and services. In this study, it will be analyzed whether customer loyalty as a moderate variable will reduce or not the impact of customer ethnocentrism and customer animosity on the repurchase intent to U.S goods and services.

Repurchase Intent

In this study, repurchase intention is accepted as dependent variable. Repurchase intention (RI) is defined the individual's judgment about buying again a designated service from the same company, taking into account his or her current situation and likely circumstances (Hellier et al., 2003: 1764). RI is one of the most appropriate dependent variable in any system of relationships designed to develop management insight and improved strategic planning and service delivery. Customers' repurchase intent depends on the value obtained in their previous transactions such as: appropriate performance criteria (benefits), competition, cost considerations, customer satisfaction (Olaru et al., 2008: 555), mood and past experiences, affect and perceived value, convenience and customer familiarity (Hume, 2008: 354).

As we (it is) explained above, this study is needed because the researches relevant to the relationship between consumer' animosity, consumer ethnocentrism and repurchase intent are limited. In this context, this study examines the effects of consumer ethnocentric tendencies and consumer animosity on repurchase intent. The following hypothesis will be tested in this respect:

H1: Consumer ethnocentrism will be negatively related to repurchase intent.

H2: Consumer animosity will be negatively related to repurchase intent.

H3: Consumer ethnocentrism will be positively related to consumer animosity.

H4: Customer loyalty will moderate the relationship between consumer ethnocentrism and repurchase intent.

H5: Customer loyalty will moderate the relationship between consumers' animosity and repurchase intent.

-Figure 1 about here-

Methodology

The sampling consists of Turkish consumers in supermarkets in the province of Nevşehir in Turkey. Interviewers were used to distribute questionnaires to 500 subjects. Of consumers who responded, 208 provided useable questionnaires on all study variables for a response rate of 41.6 per cent. This rate is an acceptable response rate for this kind of study (Özgener and İraz, 2006).

Repurchase intent was designated as the dependent variable in this study while consumer animosity, consumer ethnocentrism were considered as the independent variables. We used a 17-item scale called CETSCALE (Consumer Ethnocentric Tendencies SCALE) to assess consumers' ethnocentric tendencies developed by Shimp and Sharma (1987). The CETSCALE is comprised of 17 Likert-type items anchored by 1 = strongly disagree and 7 = strongly agree. The 14-items CETSCALE instrument had reliability (Cronbach's alpha) of 0.93. Usually, a value of 0.70 in the Cronbach's alpha is considered adequate in order to ensure reliability of the internal consistency of a questionnaire (Nunnally, 1978).

Similarly, we used three-item war animosity and four-item economic animosity adapted from Klein et al. (1998) for measuring animosity. Also, we used a single-item to measure general animosity developed by Klein et al. (1998). This scale is reliable (0.94). On the other hand, customer loyalty was measured via a nine-item scale. The questionnaire was adapted from Taylor et al. (2004) and modified to fit the Turkish supermarket industry. Participants responded on a 5-point Likert-type scale dictating to the extent which they agree with each statement as it reflected their present work environment (1 = strongly disagree, 5 = strongly agree). The instrument had reliability (Cronbach's alpha) of 0.86.

For measuring repurchase intent, a four-item 5-point Likert scale (1 = strongly disagree, 5 = strongly agree) was adapted from Zeithaml et al. (1996), Cronin et al. (2000), Wang et al. (2004) and Pavlou (2003). The scale showed adequate reliability. The Cronbach's alpha coefficient was 0.94.

THE RESULTS

The demographic profiles of Turkish consumers are presented in Table 1. The sample consisted of 122 (53.5 percent) females and 106 (46.5 percent) males. 52.6% of those responding had less than 25 ages. 36.0 percent of the respondents were married and 64.0 percent were single.

In terms of education levels, 2.5% of the respondents had graduated from primary school, 45.2 % from secondary school, 30.0% from high school, 25.4% held Bachelor of Science degrees, and 12.7% had Master's degrees. Moreover, nearly half of the consumers had a foreign language (58.3%) and only 18.0 of the respondents had to travel abroad. As students represent a very large majority (41.7%) of the sample, we divided the occupation category into student and non-student.

When household income levels are taken into consideration, it is seen that the respondents to the survey are taken place widely in level of lower class (30.7 percent), lower middle class (38.2 percent), upper middle class (25.4 percent) and upper class (5.7 percent) of the sample. The 63.6% of the respondents had a monthly income between TL 577 and TL 2500.

-Table 1 about here-

This study proposed a model for empirically analyzing the relations between consumer ethnocentrism, consumer animosity and repurchase intent towards U.S. products. Table 2 reports means, standard deviations, correlations among variables, and cronbach's alpha coefficients. As predicted, consumer ethnocentrism was positively related to consumer animosity ($r=0.359$, $p<0.01$), supporting H3. However, both consumer ethnocentrism ($r=-0,214$; $p<0.01$) and consumer animosity ($r=-0,259$; $p<0.01$) were found to be negatively related to customer loyalty. Similarly, consumer ethnocentrism ($r=-0,378$; $p<0.01$) and consumer animosity ($r=-0,371$; $p<0.01$) were negatively related to repurchase intent. Thus, H1 and H2 were supported. Moreover,

customer loyalty was found to be positively related to repurchase intent at the 0.01 level. This result suggests that repurchase intent is largely a function of consumer loyalty.

-Table 2 about here-

Moderated hierarchical regression was used to test the hypotheses related to the constructs. Initially, the block of control variables were introduced into the model, followed by the appropriate independent and moderating variables. The variance inflation factors (VIFs) associated with each regression coefficient (ranging from 1,079 to 2,921) was all smaller than the suggested threshold of ten indicating that multicollinearity is not a problem (Morrow-Howell, 1994). In addition, correlations between variables ranged from 0.566 to -0.378 and were significant at a minimum level of 0.01. Given that none of the bivariate correlations was greater than 0.80, we can assume that multicollinearity is not a problem in data (Grewal et al., 2004).

In Model 1, control variables were entered in the analysis. The results in Table 3 suggest that the overall model was significant ($R^2=0.111$; $F_{(5,221)} = 5,499$; $p<0.01$). That means that 11.1% of the variance in repurchase intent was explained by the control variables. The results showed that only education had a significant effect on repurchase intent.

In Model 2, consumer ethnocentrism, consumer animosity and customer loyalty were entered in the analysis. Model 2 was statistically significant for repurchase intent ($R^2=0.439$; $F_{(8,218)} = 21,285$; $p<0.01$). As it can be observed, the regression coefficients representing the main effects of consumer ethnocentrism and consumer animosity on repurchase intent are negative and significant. The result showed that consumer ethnocentrism ($\beta= -0.155$; $p <0.01$) and consumer animosity ($\beta= -0.157$; $p <0.01$) were significant predictors of repurchase intent. But customer loyalty had a positive and significant effect on repurchase intent ($\beta= 0.503$; $p<0.05$). In model 2, consumer ethnocentrism, consumer animosity and customer loyalty explained additional 32.8 percent of the variance in repurchase intent.

-Table 3 about here-

Model 3 includes the interaction effects on repurchase intent. The results showed that Model 3 was significant ($R^2=0.491$; $F_{(10,216)}=20,877$; $p<0.01$). Model 3 showed that the interaction of consumer ethnocentrism and customer loyalty was positive and significant on repurchase intent ($\beta= 0.849$; $p< 0.01$). Thus, H4 was supported. That is to say, customer loyalty moderated only the relationship between consumer ethnocentrism and repurchase intent. However, the interaction of consumers animosity and customer loyalty had a positive but not statistically significant effect on repurchase intent ($\beta= 0,125$; $p>0.01$). Thus, H5 was not supported. Customer loyalty did not moderate the relationship between consumer' animosity and repurchase intent. The interaction term explained additional 5.3 percent of the variance in repurchase intent.

CONCLUSION

World economies are very much dependent on each other. When one economy suffers, it is unavoidable that other countries' economies will be affected by the crisis, which in turn affects international trade and multinational companies' behaviours. Moreover, when there is an economic and political crisis, it is possible that consumers give more priority to the purchase of local products. Therefore, international trade activities are becoming a central part of the world economy, and it is recognized that there is a greater necessity to predict consumers' attitudes toward both domestic and foreign products. Thus the relationships between consumer' attitudes (consumer animosity and consumer ethnocentrism) and repurchase intent are in need of investigation. Particularly, consumer animosity and ethnocentrism are strong in developing countries such as Turkey. However, little research has investigated the relationships between ethnocentrism and consumers' animosity toward foreign products in developing countries.

Consumer animosity and consumer ethnocentrism have gained considerable attention in strategic marketing literature as components of foreign product purchase behaviour. Through the results of this study, we contribute to a better understanding of how multinational companies may effectively overcome the complex problems or dilemma to consumer animosity and consumer ethnocentrism. Thanks to the findings of the

study, managers of multinational companies could do well to manage marketing efforts or at least not take severe steps that may be difficult to reverse.

This research investigated the impact of consumer animosity and consumer ethnocentrism on repurchase intent. Previous studies suggested that consumer ethnocentrism was positively related to consumer animosity (Rose et al., 2009). In parallel with the previous studies, we identified a significant and positive relation between consumer ethnocentrism and consumer animosity. However, both consumer ethnocentrism and consumer animosity were found to be negatively related to customer loyalty for the sampling. At the same time, consumer ethnocentrism and consumer animosity were found to be negatively related to repurchase intent toward U.S. products, which is consistent with the findings of Witkowski (2000), Ettenson and Klein (2005), and Bahae and Pisani (2009). The anticipated negative effect of attitude towards U.S. products was confirmed. Furthermore, customer loyalty was found to be positively related to repurchase intent.

According to the results of regression analyses, customer loyalty may not be an important moderating factor between consumers' animosity and repurchase intent toward U.S. products. However, the findings of this study show that customer loyalty has a moderator effect on the interaction of consumer ethnocentrism and repurchase intent toward U.S. products. Therefore, it plays a crucial role in providing repurchase intent

The overall results show that animosity and consumer ethnocentrism significantly affect the willingness to purchase U.S. products. That is, the findings of this study suggest that when deciding on purchasing a product, some Turkish consumers are less likely to consider products and services of U.S. companies. The present study also denotes that both consumer ethnocentrism and animosity have a negative impact on repurchase intent toward U.S. products in Turkey. This suggests that U.S. companies and multinational companies in Turkey should pay more attention to Turkish nationalistic tendencies.

The findings of this study need to be interpreted with the following limitations in mind. First limitation is that the results cannot be construed to be representative of all consumers in supermarkets around the world due to the highly limited nature of the sample. Second, because these findings may be subject to cultural and economics factors, there is also a need to replicate the study in cultural and economic contexts that differ from the present one. Third, the majority of the respondents could be reported drastic negative views due to U.S. supporter attitude of Armenia related to Turkish-Armenian political problems.

Future research should test the effect of perceived quality on the relationships between consumer animosity and repurchase intent. In addition, in the aspect of sampling respondents, this study selected only Turkish consumers in supermarkets in the province of Nevşehir-Turkey. Follow-up studies can extend this scope to other consumer groups. Finally, it would be interesting to test the proposed model in several product categories.

DETECTING CUSTOMER DEFECTIONS: AN APPLICATION OF CONTINUOUS DURATION MODELS

Sofia Portela
ISCTE Business School, Portugal

Rui Menezes
ISCTE Business School, Portugal

ABSTRACT

The considerable increase of business competition in the Portuguese fixed telecommunications industry for the last decades has given rise to a phenomenon of customer defection, which has serious consequences for the business financial performance and, therefore, for the economy. As such, researchers have recognised the importance of an in-depth study of customer defection in different industries and geographic locations. This study aims to understand and predict customer lifetime in a contractual setting in order to improve the practice of customer portfolio management. A duration model is developed to understand and predict the residential customer defection in the fixed telecommunications industry in Portugal. The models are developed by using large-scale data from an internal database of a Portuguese company which presents bundled offers of ADSL, fixed line telephone, pay-TV and home-video. The model is estimated with a large number of covariates, which includes customer's basic information, demographics, churn flag, customer historical information about usage, billing, subscription, credit, and other. The results of this study are very useful to the computation of the customer lifetime value

INTRODUCTION

Customer defection, *i.e.*, the customer's decision to terminate the relationship with a provider, is a major concern for fixed telecommunications firms in Portugal.¹ In fact, the considerable increase of business competition in the Portuguese fixed telecommunications industry over the last decades has given rise to a phenomenon of customer switching behaviour, and, thus, high customer churn rates, which has serious consequences for the financial performance of the firms and, therefore, for the economy. Several researchers have mentioned that customer churn is the main reason of profitability losses in the telecommunications industry, due to losses on current and potential revenues, marketing costs, and brand image (*e.g.*, Ahn *et al.*, 2006; Qian *et al.*, 2006; Zhang *et al.*, 2006).

As a consequence of this steady market growth, firms have been focused on customer acquisition and neglected customer retention. Nevertheless, the fixed telecommunications market is becoming saturated in Portugal and, as a consequence, the pool of "available customers" is limited and firms need to change their strategy from customer acquisition to customer retention (Hadden *et al.*, 2005; Hung *et al.*, 2006).

Customer retention became a buzzword in the 1990s, mainly due to the work of Reichheld and Sasser (1990), who firstly provided evidence about the advantages of customer retention. Even though their results are not consensual (see, for example, Carroll, 1991/92; Dowling and Uncles, 1997; East *et al.*, 2006; Gupta *et al.*, 2006; Reinartz and Kumar, 2000) they definitively caused a change in the marketing theory. Following this new paradigm, many firms have focused on retaining all customers. Nevertheless, many researchers argue that the retention strategy must be strongly linked with the customer lifetime value (*i.e.*, the expected net present value of the future cash flows of the customer - CLV), and, consequently, enterprises should not try to retain all of their current customers, because they are probably investing in unprofitable customers (Gupta and Lehmann, 2003; Jain and Singh, 2002; Malthouse and Blattberg, 2004; Thomas *et al.*, 2004), and, in this way, they are destroying value (Gupta and Lehmann, 2005; Jain and Singh, 2002) because (i) the retention of unprofitable customer is damaging to the firm, and (ii) the money wasted on the retention of unprofitable is not used on the retention of profitable ones, who are harder to get (Thomas *et al.*, 2004).

¹ By fixed telecommunications industry we mean firms that provide fixed-line telephone, internet, and pay-TV.

The customer churn issue is present both in studies about CLV as a component of CLV and on specific studies of churn, but in different perspectives. In studies about CLV, customer churn is mainly analysed in a theoretical way, whereas on the later case, the statistical models with empirical data are predominant. Furthermore, most studies which focus on CLV make strong assumptions about customer retention (*i.e.*, the opposite of customer churn), such as customer retention is constant over time (*e.g.*, Berger and Nasr, 1998; Blattberg and Deighton, 1996; Gupta and Lehmann, 2003; Gupta *et al.*, 2004;) and across customers (Hogan *et al.*, 2002). Nevertheless, the limitations of these assumptions are not recognised by all researchers.

Customer churn has been studied using different techniques, in different industries (*e.g.*, banking, insurance, telecommunications), and in different contexts (contractual *vs.* noncontractual settings, continuous *vs.* discrete time). Buckinx and Van den Poel (2005), Hadden *et al.* (2005), Reinartz and Kumar (2003), Song *et al.* (2004), and Van den Poel and Larivière (2004) present literature reviews of customer churn studies. The Appendix 1 presents a review of the literature about customer churn prediction in the TI in contractual settings and continuous time, which is the scope of this study. Ahn *et al.* (2006) point out that the reasons of customer churn and the customer behaviour towards churn need to be more studied.

Despite the large amount of research done on customer churn in mobile telecommunications, there are few studies applied to the fixed telecommunications industry and none applied to firms that provide bundled offers of fixed telecommunications services. Moreover, this issue has never been studied in Portugal. So, this study aims to develop a model of the residential customer churn in the fixed telecommunications industry in Portugal. Specifically, this study intends to estimate the probability of a given active customer cancels his/her relationship with the firm in the next period. Some of the specific areas where this model can help customer management are: *(i) a priori* knowledge about the probability (risk) of a given customer to cancel the relationship with the firm in the next period and, in this way, firms can take preventive measures to avoid the defection of potentially profitable customers, *(ii)* customer selection to retention programs; *(iii)* marketing resource allocation across customers; and *(iv)* computation of customer lifetime value.

METHODS

A continuous survival analysis will be used to understand the residential customer churn in the FT industry (contractual settings) in Portugal. Let T be a continuous non-negative random variable, which represents the survival time in days. Two key concepts in survival analysis are the survival and the hazard function. The survival function is the probability of an individual to survive beyond time t and the hazard function is the instantaneous potential per unit time for the event occurrence (customer churn), given that the individual has survived up to time t . Survival models can accommodate both the proportional hazards (PH) and the accelerated failure time (AFT) forms. PH models assume that the hazard rates of any two individuals are proportional over time and that the hazard ratio is constant over time, and as such, the effect of any covariate in the hazard function is constant over time. AFT models assume that there is a constant non-negative acceleration factor that stretches out or shrinks survival times. AFT models are linear models of $\ln(T)$.

Data were obtained from a Portuguese fixed telecommunications firm which presents bundled offers of ADSL, fixed line telephone, pay-TV and home-video. The database includes a random sample of 830 residential customers who completed a questionnaire about customer satisfaction. The available data contains a large number of covariates, which include customer's basic information, demographics, churn flag, customer historical information about usage, billing, subscription, credit, and other.

In this study, a customer is active if he/ she has currently at least one contract with the firm. In other words, for this analysis, a customer defects only when he/she stops buying all of the company services.

RESULTS

Model estimation

A Cox PH model was estimated in order to test the PH assumption based on Schoenfeld residuals. We found statistical evidence that the PH assumption does not hold ($p = 0.004$); so, AFT models will be used instead. As all AFT models are parametric models, the data distribution has to be postulated in advance. In order to decide which parametric model is more appropriate for our data, we adopted two statistical strategies as suggested by Cleves *et al.* (2004). As regards to the nested models, we estimated a generalized gamma model and we tested its free parameters. It can be concluded that there is statistical evidence that the model can be a

log-normal ($p = 0.141$) or a Weibull ($p = 0.670$) but not an exponential ($p < 0.01$). Then, with the purpose of examining all the models (nested and non-nested), we compared them based on the AIC. It seems that the model that best fit the data is the log-logistic, because it has the lowest AIC.

A log-logistic model with gamma-distributed frailty (unshared) was estimated in order to test the unobserved individual heterogeneity. There is statistical evidence that this effect is presented ($H_0: \theta = 0; p = 0.077$), and thus, it has to be included in the model, since it improves the results. The covariates are presented in table 1 and our final model is presented in table 2.

In AFT models, the estimated coefficients are interpreted taking the survival time as reference (Box-Steffensmeier and Jones, 2004). Thus, continuous covariates with positive coefficients have a positive effect on survival time (and, consequently, a negative effect on the hazard function) and those with negative coefficients negatively affects the survival time (Box-Steffensmeier and Jones, 2004; Cleves *et al.*, 2004).

Our results show that overall revenues positively affect the survival time, which is consistent with the results of Jamal and Bucklin (2006). Zhang *et al.* (2006) also found that the overall revenues from the last 6 months affects the survival time of customers. The results of the present study also appear to indicate that survival time increases as the monthly average of off-peak calls increase. Contrary to expectations, it seems that the value of current debts of the customer has a positive effect on survival time. This can be due to the fact that, until recently, the firm's policy was not stopping the service to customers with debts. Ahn *et al.* (2006) did not find any relationship between the value of current debts and survival time.

TABLE 1 – DEFINITION OF THE SIGNIFICANT COVARIATES

Covariates	Description
Gender	Gender of the customer (0 – female; 1 – male)
Total dunning	Total number of overdue bills since ever
Overall revenues	Total revenues from the customer since ever (in euros)
Debts	Value of current debt (in euros)
Value of off-peak calls	Monthly average of off-peak calls between December 2007 and November 2008 (in euros)
Telephone revenues	Monthly average of the revenues from the fixed-telephone service between December 2007 and November 2008 (in euros)
Internet revenues	Monthly average of the revenues from the internet service between December 2007 and November 2008 (in euros)

AIC	120.496

*** significant at the 1% level; ** significant at the 5% level

On the other hand, it seems that the total number of overdue bills (since ever), the monthly average of customer spending both on fixed-telephone and internet negatively affect the survival time. Even though

some authors have found similar evidence about the monthly revenues (e.g., Ahn *et al.*, 2006; Bolton, 1998; and Madden *et al.*, 1999), other found the opposite (e.g., Kim and Yoon, 2004). This indicates that customers are very sensitive to pricing.

The results of the present study also indicate that the survival time for males is larger than the one for females, which is consistent with Ahn *et al.* (2006) and Seo *et al.* (2007), but contradicts Kim and Yoon (2004) and Madden *et al.* (1999). Furthermore, it seems that the effect of overall revenues on survival time for females is larger than for males.

Contrary to our prior expectations, customer satisfaction is not a significant covariate, which suggests that customer satisfaction in this context is not a reason for customer churn. A possible explanation of this finding is that even though the customer is not satisfied, he/she may do not switch due to inertia or habit. This contradicts the majority of literature about satisfaction (e.g., Bolton, 1998; Eshghi *et al.*, 2007). Kim and Yoon (2004) found that whereas some types of satisfaction positively affects survival time, other do not have any influence. Van den Poel and Larivière (2004) present some studies that did not find any effect of satisfaction on survival time.

Moreover, results also appear to indicate that both the telephone and internet usage do not influence customer churn, which contrasts with the findings of Ahn *et al.* (2006), who found a positive relationship between usage and survival time. We also provide evidence that the payment method and the number of invoices in debt do not influence the customer churn. Nevertheless, Zhang *et al.* (2006) show that the payment method affects the customer churn.

Lastly, the results suggest that the customer retention rate is neither constant over time (the exponential model is the only one which hazard function is constant and this model does not definitely adequately fits the data) nor across customers (because the PH assumption is not satisfied), which contradicts a common assumption made by several researchers on the CLV computation, as mentioned above. Schweidel *et al.* (2008) also provide evidence that the hazard rates vary across customers. The hazard and survival functions of this model are presented in Exhibits 1 and 2, respectively.

EXHIBIT 1 – HAZARD CURVE

EXHIBIT 2 – SURVIVAL CURVE

As can be seen from the analysis of the population hazard curve, there is duration dependence. In fact, the probability that a given mean customer cancels his relationship with the service provider increases as the

customer lifetime increases (for relationships with less than approximately 3.5 years), and then decreases. Different studies have also obtained duration dependence (e.g., Kim and Yoon, 2004; Schweidel *et al.*, 2008; Seo *et al.*, 2007; Zhang *et al.*, 2006).

Goodness-of-fit

The goodness of fit of the model is tested by plotting the Nelson-Aalen cumulative hazard estimator for Cox-Snell residuals, which is presented in **Error! Reference source not found.3**. From the analysis of this graph, it can be concluded that the model adequately fits the data.

EXHIBIT 3 – CUMULATIVE HAZARD OF COX-SNELL RESIDUALS

CONCLUSIONS

This study sheds new light on the crucial issue of customer churn in the FT industry in Portugal. Considering that it is crucial to prevent the churn of profitable customers in order to ensure the financial performance of these firms, the results of this study are very valuable mainly when complemented with an analysis of the CLV for each individual.

These results have a number of managerial implications. Firstly, firms cannot make decisions about customer management based on the average churn rates. Secondly, it appears that firms should concentrate less on customer satisfaction because it does not seem to be an important reason of customer churn, and instead focus on pricing strategy.

ACKNOWLEDGMENTS

We wish to thank the firm that provided their internal customer database, without which this study would be not possible, and who strongly believe on the importance of the expected results to the improvement of its customer portfolio management. We also thank the Fundação para a Ciência e Tecnologia for its financial support (Project reference: PTDC/GES/73418/2006).

APPENDIX - SUMMARY OF THE LITERATURE REVIEW ON CUSTOMER CHURN IN THE TI IN CONTRACTUAL SETTINGS AND CONTINUOUS TIME

Scope of the study		Industry	Region	Technique
Ahn <i>et al.</i> (2006)	<ul style="list-style-type: none"> - Development of a comprehensive churn model of private users - Analysis of the mediating effects of a customer's partial defection on the relationship between the churn determinants and total defection 	Mobile Telecommunications	South Korea	Logistic regression

MOBILE MARKETING OPPORTUNITIES VIA 3G MOBILE COMMUNICATION TECHNOLOGY

Volkan Polat, Fatih Geçti, Mesut Çiçek
Yalova University, Turkey

ABSTRACT

Mobile devices have been diffusing rapidly into our life. This diffusion allows companies to reach customers without location or time barriers. In recent years, mobile services have been demanded intensively. 3G (Third Generation), which is the transmission of data to mobile handsets at high speeds, is one of the latest mobile services. 3G services offer many marketing opportunities for businesses. The objective of this paper is to discuss the mobile marketing opportunities provided by 3G mobile communication technology. This paper reviews existing literature related to mobile marketing and examines the application examples of 3G. The findings provide insights for practitioners working on this field.

Key Words: *mobile marketing opportunities, 3G, mobile communication technology*

INTRODUCTION

The scope of marketing and fields of marketing applications have changed and developed by years. Increased competition has forced the institutions to use various ways and channels for gaining strategic advantages. With the new opportunities created by technological innovations, new ways have been opening in reaching the customers. In parallel with the existence of portable communication equipments and increased number of clients, whether profit seeking or not, mobile marketing activities have been existing in the marketing strategies of the institutions. These mobile marketing activities have been gaining their power from mobile communication technologies. For the last couple of years, one of the hottest topics in communication has been mobile communication technology. 3G, which refers to the third generation of telephony and follows the earlier generations (1G, 2G, 2,5G), is a kind of mobile communication technology. At this point, the main purpose of this paper is to discuss the marketing opportunities and advantages of 3G mobile communication technology in different dimensions and to shed light on the analyzers working on this area. To achieve this aim, we used secondary data resources related to mobile communication technology.

The paper is organized as follows; we firstly describe the research methodology. Secondly, we provide a literature review on mobile marketing. Thirdly, we mention about mobile communication technology and its evolution. Finally, we discuss mobile marketing opportunities created by 3G technology and the advantages offered by it.

RESEARCH METHODOLOGY

In this study, it is aimed to obtain deep and detailed information and data concerning marketing opportunities provided by 3G technology and to make the issue more senseful on various dimensions. In this respect, the applications of 3G mobile communication technology within the field of mobile marketing and its marketing opportunities have been discussed. The research has been studied on the base of secondary sources on mobile communication technology and mobile marketing applications. These secondary sources consist of data from articles, journals, books and internet pages related to the issue.

The research strategy adopted can be classified into three stages:

- The necessity of a broad literature review concerning mobile marketing to discuss the opportunities brought by mobile marketing has been noticed.
- The significance of mobile communication technologies is comprehended. In this context, mobile communication technologies, their characteristics and evolution stages of them have briefly been denoted.
- Questions such as “What kind of mobile marketing opportunities are created via 3G technology when considering current applications? What kind of advantages can 3G technology offer to subscribers?” have been tried to be answered.

A LITERATURE REVIEW ON MOBILE MARKETING

Before conducting the conceptual research about mobile marketing opportunities, we need to clarify what mobile marketing is. Many authors and institutions have offered a variety of definitions of mobile marketing up to date. Although plenty of definitions of mobile marketing exist, we used the commonly accepted definition provided by the Mobile Marketing Association (MMA) which is the premier global organization that strives the growth of mobile marketing and its associated technologies.

Mobile Marketing Association defines mobile marketing as a set of practices that enables organizations to communicate and engage with their audience in an interactive and relevant manner through any mobile device or network (Mobile Marketing Association, 2010). Articles and researches related to mobile marketing are scattered across various publications especially business and information technology journals. There are many studies examining the topic of mobile marketing in terms of different perspectives. In reference to the literature, we have realized that the researches in connection with mobile marketing have shed light on some streams such as customer relationship management (CRM), short message service (SMS) marketing, advertising, permission based marketing, consumer perceptions, consumer acceptance etc.

Several researches have addressed the issue on SMS and mobile messaging services related to mobile marketing. Dickinger et al. (2004) discussed SMS which belong to the first and one of the most successful forms of mobile data transmission. This paper helped us to gain insight of SMS marketing and its applications. Bamba and Barnes (2007) examined the phenomenon of consumers’ willingness to give permission to SMS advertisement. We came to know from the paper that consumers’ perception of SMS ads were rather negative. Okazaki and Taylor (2008) examined the factors associated with the intention of multinational corporations operating in Europe to implement SMS advertising. According to their research, managers from the EU, the US and Japan will be more likely to adopt SMS advertising if they perceive it has the ability to help build the brand. Mafe *et al.* (2010) analyzed the key drivers of consumer acceptance of SMS to participate on television programmes in different countries. The paper helped us to know that while perceived value, attitude and affinity towards television programmes determined SMS acceptance to participate in television programmes in Spain, subjective norm, perceived value and attitude were the key drivers of SMS acceptance in Colombia.

Some papers have concentrated on mobile customer relationship management (m-CRM). Ranjan and Bhatnagar (2009) firstly presented a conceptualization of m-CRM in respect of data mining, then developed the empirically grounded framework of m-CRM from data mining perspective. Customer care information center, data store and access systems and mobile services and technology were identified as three critical issue from this paper. Valsecchi *et al.* (2007) estimated the size of the Italian market for mobile customer relationship management services and then evaluated some benefits which can be obtained via the use of m-CRM applications by companies. The improvement of customer satisfaction, an increase in the efficiency of internal process and an increase in revenue were found as the main benefits through the paper. Lee and Jun (2007) empirically validated the mobile commerce consumer’s repurchase intention model. The paper helped us to understand that the proposed model could serve as an initial blueprint for understanding of contextual marketing offer on consumer retention in m-CRM perspective. Sinisalo *et al.* (2007) assessed the underlying issues and challenges facing companies when moving towards m-CRM. According to their research, the proposed framework identified exogenous, endogenous and m-CRM specific issues that the company take into account when moving towards m-CRM.

Some scholars have focused on permission based marketing in the context of mobile marketing. Akbiyik *et al.* (2008) examined the applications of permission based marketing in the area of mobile marketing. The paper helped us to understand how consumers perceived the applications of mobile marketing. Jayawardhena *et al.* (2009) conceptualized how trust, experience and perceived control affect the customers' willingness to provide companies with personal information and permission to use it in mobile marketing. Institutional trust was found as the main factor affecting the consumers' decision to participate in mobile marketing through the paper. Karjaluo *et al.* (2008) tested the impact of the different sources of trust and control on the customer's willingness to provide permission and personal information for mobile marketing purposes in a previous study by Kautonen *et al.* in 2007. According to their research, the company's presence in the media in the form of advertisement was the most important factor.

Several researchers have concentrated on the field of mobile advertising related to mobile marketing. Okazaki (2008) addressed the role of trust in mobile advertising acceptance. The paper helped us to understand that trust in mobile advertising and in the brand both directly and positively affect attitude toward the ad, which in turn determine attitude toward the brand. Tahtinen (2005) found a term that covers the essential elements of mobile commercial communication. The paper helped us to clarify the meaning of mobile marketing and mobile advertising. Lappaniemi *et al.* (2004) talked about the success factors of mobile advertising value chain. They developed 5C model (content, cross-media marketing, campaign management, customer database, carrier cooperation) describing the critical success factor of mobile advertising value chain. Tanveer *et al.* (2007) presented an enabling advertising technology which uses wireless medium for transmitting content. They also illustrated a framework of such system with all components. Haghirian *et al.* (2005) firstly discussed the relevance of mobile advertising value of mobile marketing, then investigated how perceived advertising value of mobile marketing can be increased. The paper showed us that the message content was of greatest relevance for the perceived advertising value, while a high frequency of message exposure had a negative impact on it. Merisavo *et al.* (2007) examined the drivers of consumer acceptance of SMS based mobile advertising. They found that utility and context were the strongest positive drivers of consumer acceptance of mobile advertising.

Some specific fields of research have focused on consumer perception of mobile marketing. Roach (2009) examined consumer perceptions of mobile phone marketing. According to her statistical analysis, a consumer's perception of two of three innovation tested were significantly associated with their acceptance of marketing messages sent via their mobile phones. Gurau and Ranchhod (2009) provided a comparison of mobile consumer's perceptions regarding privacy issues in three different national and cultural context. The paper showed us that the country of origin and the personal profile of users were influences their perceptions concerning privacy threats in the mobile commerce environment.

Some studies have mentioned about mobile marketing campaigns and their success. Scharl *et al.* (2005) investigated one of the most successful forms of mobile marketing communication, SMS, via qualitative and quantitative analyses. The paper helped us in understanding the diffusion of SMS technology. Leppaniemi and Karjaluo (2005) examined mobile marketing strategy development and proposed a framework for addressing key issues in mobile marketing campaign planning and implications. The paper guided us to understand how mobile marketing should be integrated into the firm's overall marketing communication strategy. Pousttchi and Wiedeman (2006) examined several case studies in order to identify relevant characteristics of mobile marketing campaigns. Information, entertainment, raffle and coupon were the four mobile marketing standard types derived through the paper.

Consumer acceptance and consumer responsiveness are also among the key issues in mobile marketing applications. Bauer *et al.* (2005) investigated the factors inducing consumers to accept mobile phone as a means of communicating promotional content. The importance of embodying mobile marketing messages and campaigns according to consumer entertainment and information requirement were known from the paper. Heinonen and Strandvik (2003) explored consumer's responsiveness to mobile marketing communication varied consumers. Promotion is one of the most important instruments for a company's marketing activities. Some papers emphasized on marketing communications which are about the promotion of the company. Karjaluo *et al.* (2004) investigated the role of mobile marketing in companies' promotion mix. According to their research, mobile medium was a growing two way marketing medium.

The study of above literature helped us in gaining information related to mobile marketing and its applications.

MOBILE TELECOMMUNICATION TECHNOLOGY AND ITS EVOLUTION

First mobile telephony used in 1920's. Mobile telephony began to be used on an experimental basis by several police departments in the USA in 1920's. Technology had reached some success with maritime vessels. But equipments and the radio technology were not able to work on land communication. With the development of frequency modulation (FM) in the 1930's, which helped in battlefield communications during the World War II. The first radio telephone service was used to connect mobile users in cars to the public fixed network in the USA at the end of the 1940's. Improved Mobile Telephone Service (IMTS) brought many improvements like direct dialing and higher bandwidth, which was launched by Bell Systems in the 1960's. The first analog cellular systems were based on IMTS. Systems coverage areas were split into smaller areas, each of which is served by a low power transmitter and receiver (Smith and Collins, 2002; International Telecommunication Union, 2010). The phases that mobile communication technology has gone through are briefly explained below.

1G

Analog system for mobile communications as we know it today really started in the 1970's, with the implementation of a trial system in Chicago in 1978, but actually appeared in the 1980's (Smith and Collins, 2002). The first generation (1G) used analog transmission techniques or traffic (Korhonen, 2003). There were several system standards. The most known technologies are;

- Advanced Mobile Phone Service (AMPS)
- Nordic Mobile Telephony (NMT)
- Total Access Communications System (TACS)

There were also a number of other propriety systems, rarely used outside the home country. Generally, AMPS, NMT and TACS are still in use but, especially in countries have more advanced telecommunications technology, will soon be closed, or already have been, as they waste valuable frequency spectrum that could be used in a more effective way for newer digital networks (Korhonen, 2003; Smith and Collins, 2002; International Telecommunication Union, 2010).

2G – 2.5G

Analogue radio networks were replaced with digital networks in 1990's. Main difference between first and second generation is the digital/analog split (Korhonen, 2003). The 2G systems have higher capacity, greater security against fraud and more advanced services (Smith and Collins, 2002). There are four main standards for 2G systems;

- Digital AMPS (D-AMPS)
- Global System for Mobile (GSM)
- Codedivision Multiple Access (CDMA)
- Personal Digital Cellular (PDC)

2.5G systems include upgrades but differences between 2G and 2.5G are not clear (Korhonen, 2003). So, it is difficult to say 2.5G has a radical change. 2.5G includes following technologies;

- High-speed Circuit-switched Data (HSCD)
- General Packet Radio Services (GPRS)
- Enhanced Data Rates for Global Evolution (EDGE)

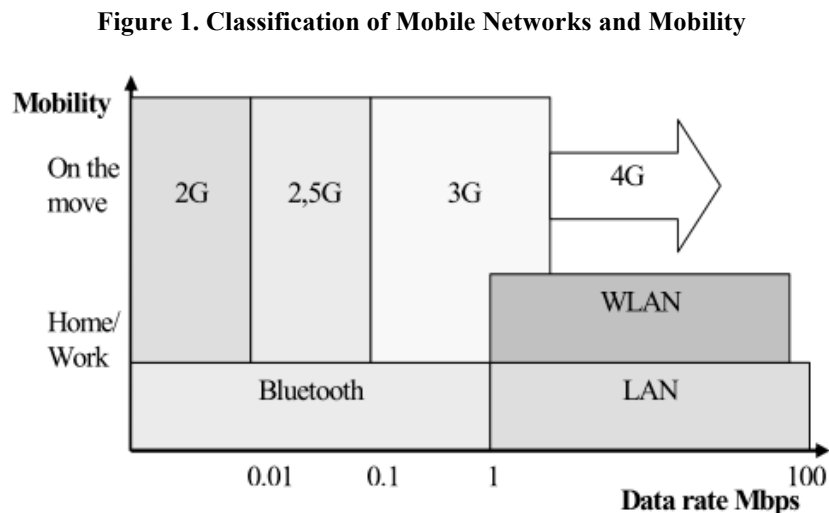

3G

Definition of 3G is not so simple, because 2G has been deployed throughout the world and has great capability and performance for data services (International Telecommunication Union, 2010). The basic 3G standards were developed by the private sector but International Telecommunication Technology Union (ITU) has adopted International Mobile Telecommunications 2000 (IMT-2000) to formally standardize the already developed 3G wireless flavors (Garber, 2002). The IMT-2000 has led to recommendations such as user bandwidth (144 kbs for mobile service and up to 2 Mbps for fixed service), multimedia services and flexible networks that can support small or large number of subscribers (Smith and Collins, 2002). ITU selected five technologies for terrestrial service in 1999. These are;

- Wideband CDMA (WCDMA)
- CDMA 2000 (an evolution of IS-95 CDMA)
- TS-SDCMA (time division-synchronous CDMA)
- UWC-136 (an evolution of IS-136)
- DECDT

3G has increased bandwidth, reinforced speed and efficient of data transmission (Kuo and Yen, 2009). Because of that subscribers can use devices to reach more multimedia contents and streaming services (Hartung *et al.*, 2007). The shift from 2G to 3G gives users fresh ways to communicate but also several types of new services such as digital television, e-mail instant messaging, browsing the internet, video conferencing (Karjaluto, 2006). 3G technologies are the latest cellular networks that have data rates 384kbit/s and more (Cho, *et al.* 2007). As a matter of fact that the world is now busy moving into 3G networks. 3G users are about 500 million (GSA, 2010).

The Figure 1 shows us the classification of mobile networks and mobility.

(Karjaluto, 2006:93)

MOBILE MARKETING OPPORTUNITIES VIA 3G

Functions of marketing and marketers' point of view on marketing have changed in time. Increase in the market dynamics, rapid changes on the customers' preferences and expectations are among the main factors that cause change of marketing's focal point. The evolution of the marketing concept also shows itself in the field of marketing applications. From the point of view, it can be said that developments in the mobile telecommunication technology affect the mobile marketing implications. Table 1 shows us the evolution of marketing concept in mobile communication sector.

Table 1. The Evolution of Marketing Concept From 2G to 3G

From 2G	To 3G
Technology focus	Customer focus
Acquiring new customers	Reducing churn
Selling handset	Selling services
Treating all equally	Targeted marketing
Minutes of use	Lifetime value
Do it yourself	Do it with partners
Revenue	Profit

(Ahenon et al. 2004)

As it is seen in the Table 1, with the 3G technology, there is a transition to different marketing concept that takes the customers to the focal point, provides life-time value to the customers and gives opportunities to the customers to involve the services.

It is not possible to distinguish the 3G services and its marketing opportunities from the previous generations and the offerings provided by standard internet connection. Most of services and applications were partly tried or used previously, but there are some missing parts and these parts became an impulsive force in order to improve new technology. This impulsive force caused the creation of new opportunities that are provided by 3G technology. In this section, some mobile marketing opportunities, which are provided by 3G technology, towards some of the basic marketing concepts such as segmentation, product&service, promotion, place and pricing have been discussed. Besides advantages brought by 3G technology are enriched with application examples.

Segmentation

Segmentation is the starting point of marketing activities. The objective of segmentation is learning enough about customers to be able to target the offering, and extract the best possible price from any distinct group of customers (Ahenon, 2002). Considering the advanced mobile services arena of 3G and the vast numbers of customers, segmentation is a key tool to deliver targeted marketing activities. The poorly designed segmentation limits the chances for the company to succeed, while powerful segmentation will deliver competitive benefits through the organization (Charalampos and Vasiliki, 2004). If the mobile operator and its content partners do not use strong segmentation tools, they are destined to fail in the competitive marketplace, in delivering desirable services, in tariffing for revenues and in delivering profits (Ahenon, 2002).

There are different segmentation types in mobile marketing. Ahenon (2002) suggested Five-Dimensional Segmentation Model. All dimensions in the model can be used independently. Figure 2 shows us the five-dimensional segmentation for mobile operators.

Figure 2. Five-Dimensional Segmentation Model

Ownership: 'Company phone', 'Own phone', 'Second phone', 'Parents' phone'
Geographic: 'Jetsetter', 'Driver', 'Mover', 'Commuter', 'Homer'
Pattern: 'Sponsor', 'Initiator', 'Receiver', 'Avoider', 'Call-Backer'
Timing: 'All timer', 'Day caller', 'Evening caller', 'Expat returner'
Contacts: 'Few contacts', 'Many contacts', 'Random contacts'

(Ahenon, 2002:231)

As it is seen in the Figure 2, it is possible to say that this model examines just the needs of customers for voice services and messaging. However, video transferring opportunity which is one of the most important features provided by 3G technology is not taken into consideration in this model.

Rapid changes in the customer needs and expectations cause a decline in the effectiveness of mass marketing. Therefore, companies have tried to find more sensitive and flexible marketing tools. Formerly, general segmentation activities were used for mass customer groups. In order to manage that they used expensive, long term surveys, focus groups and other analyses. Although PC's and notebooks are considered as customized tools, these products can also be used by other people. Mobile devices are the most personalized tools for people and rarely can be used by others. 3G technology provides companies micro segmentation opportunities which they seek in order to reach their customers accurately.

Operators and their partners have already known their customers' demography such as gender, age, occupation. Every service and application that is used by the customer gives detailed information to the operators automatically. For example, a subscriber who hires a football match over 3G, can give information about which football team he supports. In addition, by analyzing which news channels he is watching via his 3G mobile phone, supplies information about what kinds of news he is mostly interested in. Thus, mobile marketing strategies can be formed according to these micro segments. The observability of every customers' individual TV programme preference provides very valuable and important marketing opportunities to the advertising agencies and companies who want to reach niche segments with minimum budget. However, this advantage can not be offered by other media tools. It is also possible for companies to track their customers who carry 3G devices permanently. Customers can be tracked by other communication devices, but the feature making 3G special is that 3G is totally personalized.

Product&Services

One of the most important goals of the marketing managers is creating value to customers. In today's business market, almost all the companies have similar services and products. So, in order to differentiate themselves, companies must provide potential services (Berman and Evans, 2009).

Video customer service is a kind of potential service which the customers do not expect and even are not aware of this service. This service is just possible via 3G technology and provides customers to make a video call to the company's customer services. Customers can see the responsible person and better express their problems. Also, the customer services get several advantages of providing video customer services.

These advantages are (Turkcell, 2010);

- Creating more effective and faster solutions by showing demos to customers who have technical problems
- Increasing the product awareness by showing product ads to the customers who are waiting on the line
- Decreasing the service duration by providing voice menu instead of voice menu.

Barcode reader application is another product&service solution provided by the usage of 3G technology. For example, i-nigma's barcode reader application enables mobile users to access a predefined URL on the mobile web, or to trigger web services by scanning Data Matrix and QR barcodes displayed on various forms of media such as printed media, billboards, digital screens etc. Once scanned, barcodes direct phones to information and promotional offers hosted on the mobile web eliminating the need to enter long mobile web addresses or response details (I-nigma, 2010).

There are many marketing opportunities and benefits created by this application for media and marketing companies. These are (I-nigma, 2010):

- i-nigma's barcode-creation, campaign management and advanced monitoring and reporting tools improve advertising campaign performance, from planning through to execution and monitoring the success of a mobile campaign. This drives more relevant campaigns, providing deeper audience engagement and better return on investment and return on marketing objectives.

- It is possible for advertisers and brand owners to start running ads immediately while advanced targeting options and real-time success metrics on barcode usage provide valuable insight on campaign progress. These tools and valuable reports allow marketers to fine-tune campaigns at any time during their lifecycles in order to maximize performance.
- The i-nigma solution can be hosted either by 3GVision or by mobile service providers, who can generate significant revenues by offering unique advertising campaigns to publishers and advertising agencies. The solution is available in the form of preloaded clients, downloaded clients or both, branded or customized client applications, branded or customized server.
- Powerful mobile advertising campaign management capabilities to drive more relevant campaigns, deeper audience engagement and better ROI and Return on Marketing Objectives.
- Real-time reporting and detailed insights on mobile barcode campaign performance metrics, providing better understanding of customers response to multiple campaigns.

3G technology provides some applications which are cheaper than the other standard technologies for the companies. For example, VoIP is an application that assures phone call on internet. Formerly, it could be used only in mobile devices with wi-fi features and wi-fi inclusion fields. Thereto, it will be possible to make VoIP calls via 3G without any necessity for wi-fi point. Thereby, whether national or international, phone calls will be cheaper all around the world. This may create an opportunity for the companies that provide cheaper VoIP services to the users. This opportunity may also expand the companies' market size.

Promotion

Promotion is one of the key elements of marketing. There are many tools which constitute the promotion mix. The promotion mix provides the means to by which brands and organizations are presented to their audiences with the goal of stimulating a dialogue leading to a successful purchase. Each promotional tool is used in different ways to develop relationship with customers (Karjaluoto *et al.*, 2004:112). Some mobile promotion tools of which 3G technology has been used and the opportunities and advantages brought by them have been discussed below.

Mobile portals – First usage of mobile services has generally been via portals. On fixed internet lines, the firms can present detailed information concerning their products and services via portals. Although mobile portals do not contain as detailed information as fixed internet lines, it has been a place of any time-available and confidence renewable to its brand. Besides, it is not recommended to be much rich and detailed content for mobile portals. Because, an increase of quantity of downloaded files and therefore time is not perceived with pleasure for the user. After 3G, portals have a distinguished characteristic of consisting of more multimedia and interactive contents.

Mobile portal of Mercedes-Benz could be an example for that. There are four sections in the portal; New Vehicles, Brand World, Entertainment, as well as Service and Contact, have been joined by additional entertainment platforms such as Mercedes-Benz TV and the music download service Mercedes-Benz Mixed Tape. Users can watch features on the five different web channels lifestyle, vehicles, motor and sports, history and legends and innovation. Once every eight weeks, new compilations for downloading mp3 files to cell phones are available on Mixed Tape (Mercedes Benz, 2010).

Location based advertising – LBA contains the system of providing data to people concerning any places such as restaurants, theatres and etc. Close to them and vocal warning especially within the usage of GPS (Global Positioning System) and GPS-type devices. Albeit some debates on the ethical dimension, the gaining in respect of advertisement would be high.

For instance, when people travel to new places, they may not know where to rest, where to eat etc. In this situation, they are able to search the closest shops, restaurants, hotels via their 3G mobile phones and they can see the exact location of these businesses. In order to turn this opportunity into a successful marketing strategy, companies should apply to the operators or their partners for being found when the potential customers make a search. This can help businesses increase their sales and affect their image positively.

Viral marketing - Users can spread the information related to the products and services they benefit to the other users via 3G technology. Since 3G technology increase the usage proportion of the social media sites, this increase the brand awareness or brand image of the companies who mostly focus on social media promotions.

Video Ads- Companies can send their video ads to their customers via 3G technologies. On TV ads, reach rate is not so high (Mobil İletisim, 2010). Consumers do not always watch the same channels and same programmes, therefore high percentage of TV ads can not reach to the customers and that cause waste of money. But video ads directly go to the owner of the phone whose demography have already known. Thus, this feature provided by video ads creates a segmented promotion opportunity for companies.

Pricing

One of the problems in pricing is the question of how the payment will be finalized. The payment methods created via 3G technologies and the advantages provided by these methods have been presented below with examples.

There are opportunities of using the cell phones as a means of payment through 3G. The firms that supply such service provide convenience to their users, thus giving them the opportunity to create extra value. Turkcell's new mobile payment system which is planned to be online soon, can be an example. Turkcell's mobile payment system, enables its users make online payment in the fastest way via their 3G mobile phones without credit card or money transfer. This system is an alternative payment system (Turkcell, 2010).

Square is a mobile payment technology. This technology provides an opportunity to receive the payments via 3G mobile phones whereby a card sweeper which is connected to the phone's earphone jack. In addition, companies can have information about the past purchases of the customers who use Square technology and customers make the purchases in safe by using picture verifying technology (Squareup, 2010).

Place

3G connects many devices to the world not only via mobile phones and PDA (Personal Digital Assistant) but also via internal and external 3G modems. Laptops with connection via wi-fi or fixed internet lines, game consoles will also be able to have internet connection via 3G.

For example, with project "Sido24", which was awarded in the contest of Turkcell named with 3G service, it will be possible for users to listen music in anywhere and get advertisement with personal advertisement platform without any necessity of downloading mp3 to the phones (Mobilasyon, 2010).

It could be mentioned about paid TV channels as another product sample. As a matter of fact, because these channels are 'paid', people who does not stay at home does not tend to prefer these channels. But, because 3G technology provides the opportunities to reach these channels at anywhere and any time, it is anticipated that these channels are to be much preferred here after. This brings opportunity to reach more customers for the firms operating these channel services. For instance, a channel on football matches named Lig TV, of a digital broadcasting system called Digiturk, brings the opportunity for owners of mobile phones compatible with Turkcell Mobile TV to watch the matches and sport news on their mobile phones. In this way, by 3G technology, the firm could have a chance to enlarge its customer portfolio.

3G technology also enable companies to mobilize their marketing, sales and distribution process. Hence, the companies can manage almost all their operations via their 3G mobile phones. This technology provides that sales representative can send live videos to the head office about the location of the products on the shelves, retail audits, competition tracking etc. Hence managers can adjust their strategies by using this update information.

CONCLUSION

Technological products and innovations, as well as being market objects, create new horizons for marketing strategies. 3G technology is one of them. 3G is a product and it also affects the existence of new services and products directly and indirectly. We have tried to provide a general perspective for the fields of usage of 3G technology as marketing opportunity by giving examples from Turkey and the world in such an era of shift of

communication technology to 4G. Because both usage of 3G technology is so new in our country and the technologies that we exemplified are new phenomenon, we have tried to make a general framework for the future quantitative researches that may be done especially in our country.

Rapid changes in demands and expectations of the consumers have been forcing the firms to develop new personalized products and services and to plan marketing strategies in accordance with that. In this context, on the mobile marketing view, it has been noticed that the importance of classical segmentation is being declined and a shift to micro segmentation is being witnessed.

With respect of all these and reality of a shift to micro segmentation, the importance of mobile marketing and technology that empowers 3G has been worth paying attention. In this respect, we have discussed the opportunities and advantages brought by 3G technology with sample applications directed towards marketing mix in this study.

In the study, we have tried to interpret the advantages and opportunities of 3G technologies directed towards some basic marketing concepts such as segmentation, product & service, pricing, promotion and distribution. But as it is known, the marketing concepts are various; not just of basics. Limiting with the marketing opportunities and advantages within the context of basic concepts has been a big constraint for us during the study. Although there are many opportunities that can be provided through 3G, we were able to place some of them in this paper. This is another limitation of this study.

This study offers some directions for future studies. The discussed opportunities in this paper should be supported quantitatively in further researches. In this regard, measurement of effectiveness of mobile marketing opportunities which has been presented in this study could be explained. Besides, future studies determining the awareness of consumers and firms about the opportunities created by 3G could also be made.

CONSEQUENCES OF SERVICE-WORKERS' CUSTOMER ORIENTATION AND PERCEIVED ORGANIZATIONAL SUPPORT: PROPOSING AND TESTING A MODEL IN CAFE CHAINS

Uğur Yozgat
Marmara University, Turkey

F. Oben Ürü
Haliç University, Turkey

ABSTRACT

The main object of this paper is to examine the effects of customer orientation and perceived organizational support on service workers' responses to their jobs. Thus the research was performed in Turkey's 4 biggest café chains. Data were collected from 314 wait staffs and analyzed using structural equation modeling. As the results of analyses, customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's Needs and for Personal Relationship" have direct effects on job fit and organizational fit. Also results show that job fit full mediated the relationship between customer orientation dimensions and job satisfaction dimensions. On the other hand, perceived organizational support have direct effects on customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's Needs and for Personal Relationship; Service-Oriented Organizational Citizenship Behavior's Dimensions "Service Delivery", "Loyalty)", and "Participation"; job satisfaction's dimensions; LMX perceptions and affective organizational commitment. Finally, it was seen that person-organization fit have direct effect on Service-Oriented Organizational Citizenship Behavior's Dimensions "Service Delivery", "Loyalty", and "Participation"; job satisfaction's dimensions; LMX perceptions and affective organizational commitment. This study's theoretical contribution is examination of effects of service-workers' customer orientation and perceived organizational support on their responses to their jobs in a comprehensive model; proposing new variables in the model and filling this gap in the research. Furthermore, this study's practical contribution is there is lack of research that consists of all stated variables in our model conducted in restaurant- café industry especially in café chains. And finally, the methodological contribution of this study is investigation of consequences of service-workers' customer orientation and perceived organizational support in Turkey, a developing country; it shows the external validity of these theories which were tested in Western developed countries.

Keywords: *Customer Orientation, Perceived Organizational Support, Job Fit, Organizational Fit, LMX*

INTRODUCTION

In today's competitive marketplace, firms in every industry are seeking new ways and solutions for satisfying customers. Customer satisfaction is an important determinant of customer loyalty and in turn firm's profitability and longevity. Therefore, having satisfied customers and their loyalty have become key success factors for sustainable competitive advantage. And, for satisfying customers firms must gain a broader understanding of the essentials that are required if they are to thrive and survive in a rapidly evolving and increasingly competitive global market. While the importance of satisfying customers is generally accepted, some debate exists regarding the factors leading to satisfaction. The means used to build customer satisfaction in different industries generally include a variety of characteristics. Especially, in services industry these characteristics may include food quality, the value of the dining experience, convenience, speed of service, and various other aspects which are influenced by the food service establishment's customer contact employees. From this point of view, personal interaction component of services is often a primary determinant of the customer's overall satisfaction. Furthermore Farrell & Oczkowski note that (2009:149) customers often base their impressions of the organization on the quality of service received from customer

contact employees. For instance, Pettijohn et al. (2004) state that in restaurant-café industry, customer contact employees, “the wait staff”, have an important role in determining customer satisfaction and restaurant-café profitability. Since customer satisfaction represents a legitimate goal for the service firms, it may be assumed that service-workers (e.g. in restaurant-café industry, a firm’s wait staff) those are more “customer-oriented” would be more likely to engage in activities designed to build customer satisfaction. In a service setting, customer orientation is critically important because customers have fewer tangible cues to use in evaluating the quality of the service items (Kelly, 1992). Thus, one method that can facilitate lasting differentiation may be found in service-workers (e.g. in the restaurant’s/café’s wait staff). For the organizations competing in service industries, where the service delivered by the employee is a crucial aspect of the customer experience, knowing what variables affect performance outcomes can help in the development of a competitive advantage (Farrell & Oczkowski, 2009:150). Nonetheless, the degree to which service-workers are customer-oriented may provide a distinguishable and lasting competitive advantage in services industry (Pettijohn et al., 2004:47). If we view service-workers’ customer orientation as a resource in the competitive marketplace, the question then becomes which factors may support or inhibit the customer orientation of service workers, and service-workers’ customer orientation can affect which factors. Until recently, research on service-workers’ customer orientation focused on identifying personal characteristics and work environment that related to customer orientation behavior. Although many variables influence service-workers’ customer orientation, there is reason to suspect that their beliefs about the extent to which the organization values their contribution and cares about their well-being represent a particularly powerful influence. Research shows that perceived organizational support leads employees to be more customer-oriented (Bell & Menguc, 2002; Farrell & Oczkowski, 2009). On the other hand, research shows that employees’ customer orientation positively influences several job outcomes such as job fit, organizational fit, job satisfaction and job commitment (Bettencourt, 2001; Bell & Menguc, 2002; Donovan et al. 2004; Farrell & Oczkowski, 2009). Thus, service-workers’ customer orientation can be fostered and inhibited by several factors. This research builds upon the work of Bell and Menguc (2002), Donovan et al. (2004), Farrell & Oczkowski (2009) and also answers the call from them for further research directing firms in the light of customer orientation. Furthermore, from the literature review, it is seen that most of the research has been conducted in Western countries, primarily in the United States. And we have not met a research about the consequences of service-workers’ customer orientation and perceived organizational support in Turkey. Thereby, the objective of this study is to investigate the job-related consequences of service-workers’ customer orientation and perceived organizational support through a theoretical model, focusing on the biggest café chains in Turkey. For purposes of this study, first, prior theories and research focusing on customer orientation and perceived organizational support are reviewed. Second, research hypotheses are developed and research model is presented. Third, discussion of the methods and findings are explained in the light of the research conducted in café chains. Finally, discussion about the research results is stated expressly.

THEORETICAL BACKGROUND AND HYPOTHESES

Customer Orientation

The market success of service organizations crucially depends on the interaction between customer contact employees and their customers. In the market orientation literature, recent studies have focused on the customer contact employees who are responsible for translating a market-oriented strategy into quality service (Farrell & Oczkowski, 2009:150). These basic insights generated a large body of research on the role of customer orientation (CO) of service employees or disposition to meet customer needs for achieving customer satisfaction (Wieseke, Ullrich, Christ & Van Dick, 2007:266). In this context, customer orientation has been important because service employees who exhibit a high degree of customer orientation engage in behaviors that increase the satisfaction of their customers. In addition, customer-oriented behaviors lead to the development of long-term relationships between the organization and its customers that are beneficial to both parties (Kelley, 1992: 27). Moreover, research show that organizations that focus on their customers’ needs are well positioned to achieve long-term success. On this account, meeting customers needs and exceeding their expectations are key factors as they are antecedents of customer satisfaction and loyalty which they in turn help organizations gaining and sustaining a competitive advantage. Therefore, for the organizations especially in the service industry, having these key success factors highly depends on hiring customer-oriented employees as being customer-oriented is satisfying customer needs at the level of the employee-customer interaction.

From the literature review, it is seen that many scholars define customer orientation as a behavior of employee’s tendency to meet customer needs. (Brown, Mowen, Donovan & Licata, 2002; Donovan et

al.,2004). Since behavior is based on a function of person and environment; Donovan et. al. (2004) stated that customer oriented behavior will result from the combination of person (e.g. personality, goals, functional motives) and environment (e.g. nature of the job, short-term situational effects). Consistent with this definition of customer orientation, recently research show that customer orientation is influenced by personal and organizational context, and in turn influences employee's job related outcomes (i.e work performance) (Brown, Mowen, Donnovan & Licata, 2002; Donovan et al.,2004; Pettijohn, Pettijohn & Taylor, 2004; Karatepe, Yavas, and Babakus, 2007). Customer orientation should be viewed as a trait, though customer-oriented behaviour results from the fit between personal characteristics (such as personality and goals) and the environment (McBain, 2004:29). In this respect, Donovan and colleagues (2004) developed a four-dimensional conceptualization of customer orientation (i.e., need to pamper the customer, need to read the customer's needs, need for personal relationship, and need to deliver the service required). According to their definition; employees' *need to pamper the customer* represents the degree to which service employees desire to make customers believe they are special, that is, individually important to the service provider. The service provider's *need to read the customer* reflects the employee's desire to pick up on customers' verbal and nonverbal communication. The service employee's *need for personal relationship* captures the employee's desire to know or connect with the customer on a personal level. Finally, customer-oriented employees' *need to deliver* reflects their desire to perform the service successfully (p.132). In this study, these dimensions are taken as the bases of customer orientation.

Customer Orientation, Job Satisfaction and Job Fit

In the literature, research focused on customer orientation (CO) has been shown to exert positive effects on performance outcomes (e.g. Brown et al. 2002). Theorists have noted the importance of worker satisfaction in retaining service workers, as well as the importance of worker retention to the success of the services organization (Schneider & Bowen 1993). In this context, job satisfaction refers to the employee's overall affective evaluation of the intrinsic and extrinsic facets of the job (Bettencourt, L., Gwinner, K. P. and Meuter, L., 2001:30). From the literature review, it is seen that researchers have investigated the possible relationship between job satisfaction and CO in the service context. And results showed that service workers who have higher degrees of CO are more satisfied with their jobs than employees who have less CO. (Pettijohn, Pettijohn, and Taylor 2002; Saxe and Weitz 1982; Donovan et. al., 2004). In contrast to these findings, Farrell & Oczkowski (2009) found in their study that CO had no direct effect on employee's job satisfaction. In the present study we addressed these different findings in the literature and wanted to ascertain whether job satisfaction is affected directly or indirectly by CO or not. Hence the influence of CO on job satisfaction is hypothesized:

H_{1a}: The influence of service worker customer orientation on job satisfaction will be positive.

Theorists defined person– job fit as the fit between the worker and the tasks associated with a particular job. And they stated that person– job fit pertains to the degree of match between the personality, skills, and ability of the worker and the requirements of specific jobs or job tasks and people select themselves into jobs that best match their abilities and interests (Donavan et. al., 2004:129). In this respect, research related with person– job fit focused on the role of person– job fit in the relationship between CO and job satisfaction. For instance, previous research found that customer oriented service worker was a more natural fit in a service job and, as a result, experienced greater job satisfaction. (Donavan et. al.,2004; Farrell & Oczkowski 2009). According to these findings this study proposes that service workers customer orientation affect their job satisfaction through their job fit. Therefore,

H_{1b}: The influence of service worker customer orientation on job satisfaction will be mediated by job fit.

Customer Orientation and Person-Organization Fit

Person–organization (P-O) fit is defined as the congruence between the norms and the values of organizations and the values of persons (Chatman, 1989:339). In other words, P-O fit refers to the compatibility between a person and a organization, emphasizing the extent to which a person and the organization share similar characteristics and/or meet each others needs (Kristof, 1996; Sekiguchi, 2004:179). Researchers stated that people select jobs that are compatible with their interests, values and abilities (Wilk, Desmarais & Sackett, 1995). In addition, researchers have found that people are more likely to choose organizations with values that match their own values (Cable & Judge, 1996; Judge & Bretz, 1992; Judge & Cable, 1997; Farrell & Oczkowski, 2009). And they are selected by organizations with whom their values match (Cable & Judge, 1997; Kristoff-Brown, 2000). According to these findings, this study proposes

that highly customer oriented employees will have a closer fit with their values and organizational values. Hence the following hypothesis is advanced:

H₂: The higher level of service worker customer orientation, the higher level of person-organization fit.

Customer Orientation and Organizational Commitment

Organizational commitment can be defined as the relative strength of an individual's identification with and involvement in a particular organization (Steers, 1977:46; Mowday, Steers, Porter, 1979:226). This definition reflects especially the affective component of organizational commitment also established by Allen & Meyer (1990:1). Recently, researchers have found positive relationships between customer orientation levels and organizational commitment (Babakus, Cravens, Johnston & Moncrief, 1996; Babin & Boles, 1996; Pettijohn, Pettijohn & Taylor, 2004; Donovan & Hocutt, 2001; Donovan et al. 2004; Farrell & Oczkowski, 2009). These findings indicate that employees, who are highly customer oriented, have greater levels of organizational commitment. Based upon the above arguments, we expect that customer-oriented employee is more likely to be more committed to the organization. Therefore;

H₃: The influence of service worker customer orientation on organizational commitment will be positive.

Customer Orientation and Service-Oriented Organizational Citizenship Behaviors

In recent years, researchers have recognized the importance of distinguishing between in role (e.g. sales volume, commissions) and extra-role (e.g. organizational citizenship behaviors, pro-social behaviors) aspects of performance. The types of extra-role performance that have received the most attention in management and marketing literature are organizational citizenship behaviors (Vilela et al., 2008:1008). Organizational citizenship behavior (OCB) can be described as a discretionary or 'extra-role' behavior that goes beyond the stated requirements of a job description (McBain, 2004:25). That is to say, OCB is a type of discretionary behavior beneficial to an organization but falling outside of an employee's formal role requirements (Organ, 1988, MacKenzie, Podsakoff & Ahearne, 1998). In service settings OCBs are considered extra-role providing a relevant framework for conceptualizing the link between service worker behavior and a level of service quality that exceeds customer expectations (Bell & Menguc, 2002). However, few studies focus on impact of the OCB of service workers who have special requirements related to dealing with customers and representing the organization to outsiders (Wang, 2009). Recently, scholars focused on determining the basis of service-oriented organizational citizenship behaviors in service settings and exposed that service-oriented organizational citizenship behavior (SOCB) is similar to generic OCB except that it focuses on dealing with customers and representing the organization to outsiders (Bettencourt, Gwinner & Meuter, 2001; Wang, 2009). In this context, SOCB that contact employees may exhibit include *loyalty* OCB, which reflects allegiance to the organization by promoting its interests and image to customers; *participation* OCB, which improves the quality of service delivery; and *service delivery* OCB, which involves exhibiting conscientious behavior involving service delivery to customers (Wang, 2009:651).

From the literature review, it is seen that the relationship between customer orientation and different types of OCB is explained by socialization theory suggesting that employees who perform one type of helping behavior (customer-oriented behavior), are more likely to perform other types of helping behaviors (e.g. organizational citizenship), due to the personal values acquired through the socialization process (Farrell & Oczkowski, 2009:152). Thereby researchers found that service worker customer orientation has positive effect on different types of OCB (Bell & Menguc, 2002; Donovan et al., 2004; Farrell & Oczkowski, 2009). Hence the positive effect of service worker customer orientation on service-oriented organizational citizenship behavior is hypothesized:

H₄: The influence of service worker customer orientation on service-oriented organizational citizenship behavior will be positive.

Perceived Organizational Support

In the literature, organizational support theory applies perceived organizational support (POS) as a central construct to understand the employee-organization relationship. POS refers to employee global beliefs that the firm cares about them personally –their well being- and values their contributions to the organization (Eisenberger, Huntington & Sowa, 1986; Eisenberger, Fasola & Davis-LaMastro, 1990). The caring, approval, and respect connoted by POS, in turn, fulfill socio-emotional needs, causing employees to incorporate organizational membership and role status into their social identity (Wang, 2009:650). According

to Rhoades and Eisenberger (2002), there are three primary ways in which employees perceive favorable treatment from their organizations: (1) Through supervisor support; (2) through rewards and favorable job conditions; and (3) through fair policies and practices. In this context, POS strengthens employees' beliefs that the organization recognizes and rewards increased performance or expected behaviors (Rhoades & Eisenberger, 2002). Thence, it is expected that POS can affect positively several job outcomes which in turn affect overall organization performance.

Perceived Organizational Support and Customer Orientation

In conceptualizing the relationship between POS and service worker customer orientation, we build upon the arguments by Farrell & Oczkowski (2009) who state that in a service setting, primary focus is on meeting the needs of the customer and the culture of the organization is concerned with supporting customer-oriented activities. In turn, argue Farrell & Oczkowski (2009), if employees believe that their organization values their contribution to service quality, they are more likely to engage in customer-oriented behavior. Hence, the following hypothesis is advanced:

H₅: The higher level of perceived organizational support, the higher level of service worker customer orientation.

Perceived Organizational Support and Service-Oriented Organizational Citizenship Behaviors

In the literature, tenets of social exchange theory indicate that employees perceiving the firm is committed to them will feel obligated to reciprocate the firm's supportive orientation with voluntary contributions that benefit the firm (Bettencourt, Gwinner & Meuter, 2001:30). Bell and Menguc (2002) state that perceived organizational support is related to employee OCBs because it may affect employees' perceptions that they are valued by their organizations. They also added that if an organization supports its employees will lead to reciprocal contributions from employees in the form of extra-role behaviors (p.134-135). In addition, Wang (2009) stated that service orientation is a paramount concern in service settings, and valued service behavior would be to perform the job to serve customers delightedly. As to Wang (2009), it is likely that high-quality employment relationship will prompt service workers to expand their SOCB beyond what is formally expected by their organizations. Prior studies have found that POS leads to various types of OCBs (Eisenberger, Fasola & Davis-LaMastro, 1990; Moorman, Blakely & Niehoff, 1998, Bell & Menguc, 2002; Bettencourt, Gwinner & Meuter, 2001; Farrell & Oczkowski, 2009; Wang, 2009). Considering prior research on other forms of OCBs and service workers behaviors, we expect that POS to be positively related to service worker SOCB (loyalty, service delivery, and participation). Therefore,

H₆: The higher level of perceived organizational support, the higher level of service-oriented organizational citizenship behavior.

Perceived Organizational Support, Job Satisfaction, Organizational Commitment and Leader-Member Exchange Perceptions

From the literature review, it is seen that POS leads several job outcomes such as job satisfaction, organizational commitment and leader-member exchange (LMX) perceptions. As stated before, organizational commitment especially its affective commitment dimension relates to how an employee feels towards his or her organization. In the literature, POS is stated as a major causal factor in increasing the affective organizational commitment by fulfilling such socio-emotional needs as affiliation and emotional support (Khurram, 2009). Research focusing on POS show that when POS is high, a social exchange develops where the employee may feel compelled to reciprocate the high level of perceived affective commitment he or she receives from the organization (Wayne, Shore & Liden, 1997; Wang, 2009).

On the other hand, LMX is described as the strength of the exchange relationship between an employee and his/her supervisor (Scandura & Graen, 1984:428). On this basis, supervisors are likely to have high expectations of employees whom the organization strongly supports (Khurram, 2009). Thus employees having high POS would be viewed as valuable exchange partners with whom supervisors would be inclined to develop strong LMX relationships (Khurram, 2009).

In this context, prior studies have found positive relationship between POS and job satisfaction (Rhoades & Eisenberger, 2002; Farrell & Oczkowski, 2009); LMX (Wayne et al., 2002, Khurram, 2009) and organizational commitment (Muse & Stamper, 2007; Farrell & Oczkowski, 2009, Khurram, 2009). Hence the following hypotheses are advanced:

H₇: The higher level of perceived organizational support, the higher level of job satisfaction.

H₈: The higher level of perceived organizational support, the higher level of LMX perception.

H₉: The higher level of perceived organizational support, the higher level of organizational commitment.

Person-Organization Fit, Service-Oriented Organizational Citizenship Behaviors, Job Satisfaction, Leader-Member Exchange Perceptions and Organizational Commitment

In the literature, the term person-organization (P-O) fit is described as the connection between individual and organizational goals; individual preferences or needs and organizational systems or structures; and individual personality and organizational climate (Kristoff, 1996; Vilela et al., 2008). Research on P-O fit is generally related with several job outcomes. In this context, O'Reilly and Chatman (1986), Donovan et al. (2004) and Farrell and Oczkowski (2009) have found positive relationship between P-O fit and different types of OCBs. Specially, they found that congruence between individual and organizational values predicted a higher likelihood of OCB (i.e. helping others).

P-O fit theory suggests that shared values between individuals and organizations lead to job satisfaction for the employee (Chatman, 1991). Prior research supports the positive effect of P-O fit on job satisfaction (Kristoff, 1996; Vilela et al., 2008; Farrell and Oczkowski, 2009). According to these findings, perceived value congruence is an antecedent of job satisfaction.

As regards the relationship between P-O fit and organizational commitment, it was revealed that individuals who recognize a strong link between their personal values and those of their organization, have higher levels of organizational commitment (Vilela et al., 2008: 1008). Indeed, recent studies show that P-O fit is a determinant of organizational commitment (Chatman, 1991; O'Reilly, Chatman & Caldwell, 1991; Kristof-Brown et al., 2005; Vilela et al., 2008; Farrell and Oczkowski, 2009)

From the literature review, it is seen that very few studies have proposed a theoretical model or conducted empirical investigations of relationship between P-O fit and LMX as experienced by employees in an organization (e.g. Erdogan & Bauer, 2004; Kristof-Brown et al., 2005). Specially, in this study we expect that P-O fit will positively affect LMX perception.

Based upon the above arguments, the following hypotheses are advanced:

H_{10a}: The influence of person-organization fit on service-oriented organizational citizenship behavior will be positive.

H_{10b}: The influence of person-organization fit on job satisfaction will be positive.

H_{10c}: The influence of person-organization fit on LMX perception will be positive.

H_{10d}: The influence of person-organization fit on organizational commitment will be positive.

The hypothesized model showing details of variables and the relationships is depicted in Figure 1.

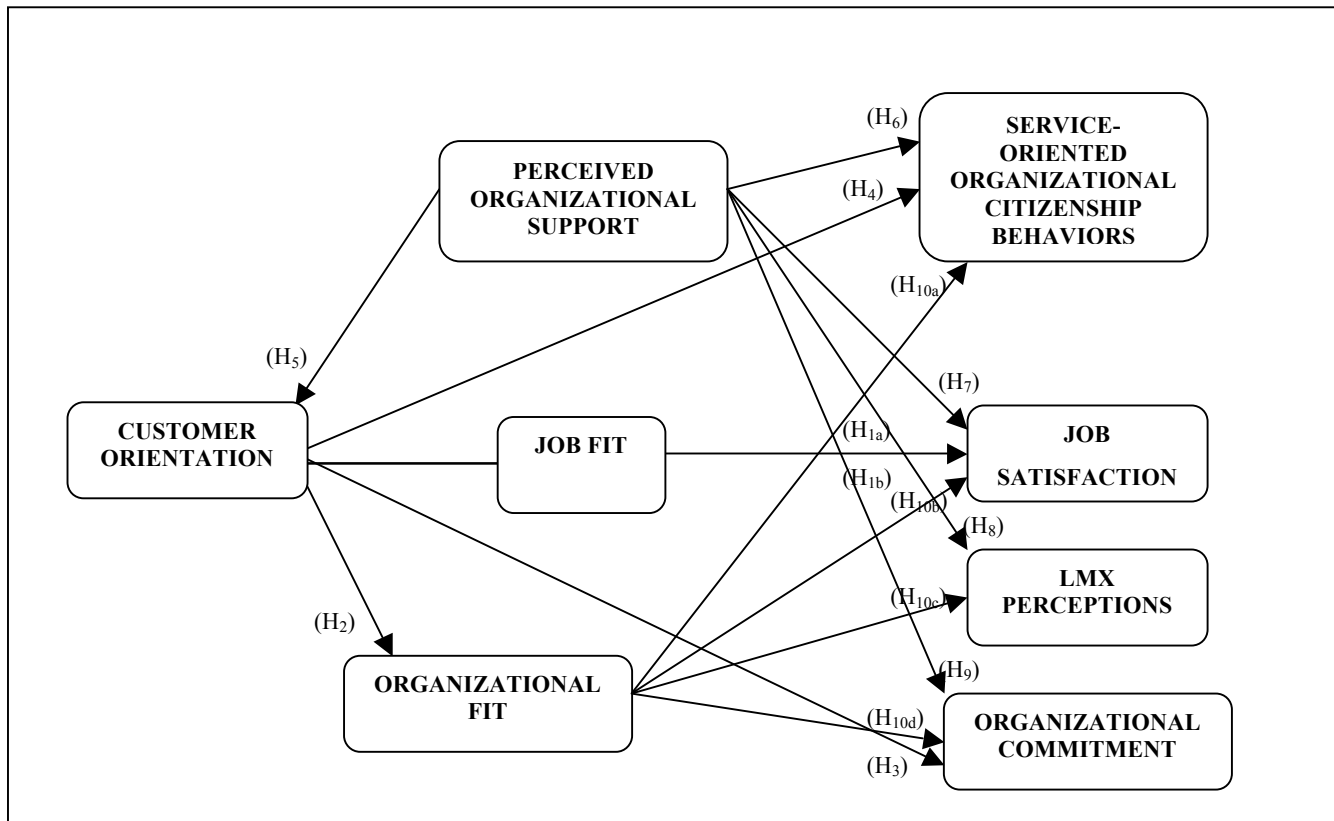

Figure 1: Hypothesized Model

METHODOLOGY

The Main Objective and Scope of the Research

The main objective of this research is to examine the effects of customer orientation and perceived organizational support on service workers' responses to their jobs. This research comprises 4 biggest café chains in Turkey. In this context, cafés' wait staff's opinions and perceptions are taken as base. The café chains -Café and Restaurant Industry- was appropriate for testing our hypotheses for various reasons. First, the delivery of service is a fundamental aspect of the customer experience. Second, this industry itself invests considerable resources in recruiting and training staff. Furthermore, we chose Turkey's 4 biggest café chains these have a reputation for good customer service.

Data Collection Method, Procedures and Type of Research

This study was performed by explanatory and causal research models. According to these, the effects of wait staff's customer orientation and perceived organizational support on several job outcomes - job fit, organizational fit, service-oriented organizational citizenship behaviors, intrinsic job satisfaction, LMX perceptions and affective organizational commitment- were explained and identified. *The population of this study* was composed of 44 café chains in [Turkey](#) listed in Economist Magazine 2009. *Research sample* consisted of 4 biggest café chains and their 276 divisions in Turkey. Data were collected through **structured questionnaires**. In this research 4 biggest café chains and their 276 divisions in Turkey are reached via e-mail and telephone. The questionnaires are given all of the specified café chains' divisions through face-to-face interviews or via postal 10 each. But some of the participants excused for not answering the questionnaires by reason of their workload or length of the questions in the questionnaire. Hence, 276 of 62 café chains' divisions returned; thereby **62 café chains' divisions of 314 wait staffs'** answers included in this research.

Details of dispersion of the questionnaires to the café chains are exhibited in Table 1.

Table 1. Dispersion of the Questionnaires to the Café Chains

CAFÉ CHAINS	Population (Total Number of Divisions)	Sample Size (Number of the Divisions Answered the Questionnaire*)	Sampling Ratio (%)	Number of the Wait Staffs Answered the Questionnaire**
Starbucks Coffee	139	27	19,42	142
Gloria Jean's Coffees	59	12	20,33	50
Kahve Dünyası	49	15	30,61	70
Café Crown	29	8	27,58	52
TOTAL	276	62	22,46	314

*Minimum 3, maximum 10 questionnaires returned from each café chains' division answering questionnaire.

**Number of the wait staffs answered the questionnaire consists of wait staffs answering questions in the questionnaire completely and consistently (questionnaires with missing and inconsistent statements were excluded).

Measures

The questionnaire prepared for wait staff, consists of 78 questions in 9 parts (one part for 8 demographic questions). Thereby in this research 8 different scales were used. In the first part of the questionnaire, for measuring *customer orientation* Donavan et al.'s (2004) 13-item scale having 4 dimensions (*need to pamper dimension, need to read customer's needs dimension, need to deliver dimension and need for personal relationship dimension*) was used. In the second part, *perceived organizational support* was measured by 11-item scale adapted from Eisenberger et al. (1986). In the third part, for measuring *job fit* Donavan et al.'s (2004) 3-item scale was used. In the fourth part, *organizational fit* was measured by Cable and Judge's (1996) 3-item scale. In the fifth part, for measuring *service-oriented organizational citizenship behaviors* Bettencourt et al.'s (2001) 16-item scale having 3 dimensions (*loyalty, service delivery and participation*) was used. In the sixth part, for measuring job satisfaction Weiss et al.'s (1967) scale known as the Minnesota Satisfaction Questionnaire's short form capturing 12 *intrinsic job satisfaction* items was used. In this study, Minnesota Satisfaction Questionnaire translated into Turkish by Oran (1989) was used. In the seventh part, *LMX perceptions* were measured by 7-item scale adapted from Scandura and Graen (1984). In this study, LMX scale translated into Turkish by Özutku, Ağca and Cevrioğlu (2008) was used. In the eighth part, for measuring organizational commitment Mowday et al.'s (1979) 5-item scale capturing *affective organizational commitment* was used. And finally in the last part, demographic questions for measuring descriptives and other control variables such as educational level, and job tenure are asked. All the variables were measured by participant responses to questions on a five-point Likert-type scale ranging from "strongly disagree" to "strongly agree" for the variables customer orientation, perceived organizational support, job fit, service-oriented organizational citizenship behaviors and affective organizational commitment; ranging from "not at all" to "completely" for the variables organizational fit and LMX perceptions; ranging from "very dissatisfied" to "very satisfied" for the variable job satisfaction.

Analysis

In the direction of purpose of the study, following statistical analysis were performed using SPSS 17.0 Statistical Package and LISREL 8.54. First, for measuring participants' demographic characteristics frequency analyses were done. Second, reliability analyses using principal components method and varimax rotation were performed towards the determination of internal consistencies of the scales. Also in this step, content validity and then construct validity were performed. For testing construct validity, Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were applied to determine whether the adapted forms of scales had valid factor structures. In this study EFA using principal components method and varimax rotation was performed to examine the factor structures of the scales according to the data obtained from the Turkish participants and CFA was applied to confirm the original scales structures in Turkish culture. Third, to determine means, standard deviations and to understand correlations among all factors came out in the factor analysis, descriptive statistics were performed. And last, structural equation modeling (SEM) with latent constructs was used to test hypothesized model. The advantage of SEM is that it offers a simultaneous test of an entire system of variables in a hypothesized model and thus enables assessment of the extent to which the model is consistent with the data and the entire set of relationships (Hair et al., 2006). In this study, Anderson and Gerbing's (1988) comprehensive, two-step analytical strategy to test hypothesized model depicted in Figure 1 was performed. According to this strategy, the measurement model was first

confirmed using CFA and then SEM based on the measurement model to estimate the fit of the hypothesized model to the data was performed. To gauge the model fit, chi-square (X^2) values were reported as the index of absolute fit, which assesses extend to which the covariances estimated in the model match the covariances in the measured variables (Kline, 1998). For models with good fit, chi-square (X^2) normalized by degrees of freedom (X^2/df) should not exceed five. Among the absolute fit measures used to evaluate the model are; X^2 statistics divided by its degrees of freedom, goodness-of-fit index (GFI; Jöreskog & Sörbom, 1993), Adjusted Goodness of Fit Index (AGFI; Hair *et al.*, 2006), Comparative Fit Index (CFI; Bentler, 1990), Normed Fit Index (NFI; Browne & Cudeck, 1992), Relative Fit Index (RFI; Browne & Cudeck, 1992), Root Mean Square Error of Approximation (RMSEA; Steiger, 1990) Standardized Root Mean Square Residual (SRMR, Jöreskog & Sörbom, 1993). Fit Indexes such as GFI, AGFI, CFI, NFI and RFI were evaluated with the traditional cutoff value of .90. In addition, good fit is achieved with RMSEA and SRMR values of .05 or less; acceptable fit, with values between .05 and .10; poor fit, with values larger than .10 (Steiger, 1990; Jöreskog & Sörbom, 1993; Browne & Cudeck, 1992).

FINDINGS

Frequency Analysis

Demographic questions were analyzed according to frequency. The sample of this study was 314 wait staffs working in 4 biggest café chains. Results of frequency analyses showed that 57,3% of employees were male ($f=180$), 42,7% of employees were female ($f=134$); 11,1% of whole was 25 years old ($f=35$); 56,1% of whole was single ($f=176$); 68,7 % of whole graduated from high school or lower ($f=216$); 15,9% of whole has 3 years of work experience ($f=50$); 19,7% of whole has 4 years of job tenure (in the current firm) ($f=62$); 21% of whole has been working with their managers (leaders) for 4 years ($f=66$).

Factor and Reliability Analyses

Content validity of the survey instrument was established through the adoption of validated instruments by other researchers in the literature (Straub, 1989). During the translation process, by local meeting with professionals content validity was established. And Turkish final versions of the scales were used to measure each construct.

Customer Orientation Scale (CO). Internal consistency reliability to test unidimensionality was assessed by Cronbach's alpha. As a result of Cronbach's reliability analysis performed for CO, Cronbach's alpha coefficient for each dimension of the scale was above the acceptable threshold (.70) suggested by Nunnally & Bernstein (1994) and the scale had a strong reliability (Cronbach's $\alpha = .937$). As a result of Exploratory Factor Analysis (EFA) (principle component analysis with varimax rotation) performed for CO, 2 factors which Eigenvalues ≥ 1 obtained consisting of 13 items (KMO=0,900, $X^2_{\text{Bartlett test}}(78)=3206,272$ $p=0,000$). Total variance explained was 67,262%. Scale factors were found unlike the original, so we named these factors in turn as; “*Need to Pamper and Deliver (Cronbach $\alpha = .929$, % of Variance=38,296)*”, “*Need to Read Customer's Needs and for Personal Relationship (Cronbach $\alpha = .868$, % of Variance=28,966)*”. The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=209.47, N=314, $df=62$, $p<.000$, $X^2/df=3.37$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.96, AGFI=0.95, CFI=0.97, NFI=0.97, RFI=0.94, RMSEA=0.014, SRMR=0.036. According to these values, it can be said that the structural model of CO which consists of two factors was well fit to the Turkish culture.

Perceived Organizational Support Scale (POS). As a result of Cronbach's reliability analysis performed for POS, 2 items decreased the reliabilities were eliminated and the scale had a strong reliability as Cronbach's $\alpha = .930$. Therefore EFA repeated. After EFA was performed, 1 factor which Eigenvalue ≥ 1 obtained consisting of 9 items (KMO=0,929, $X^2_{\text{Bartlett test}}(36)=1891,259$ $p=0,000$). Total variance explained was 64,471%. The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=59.74, N=314, $df=22$, $p<.000$, $X^2/df=2.71$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.96, AGFI=0.92, CFI=0.99, NFI=0.98, RFI=0.97, RMSEA=0.074, SRMR=0.026. According to these values, it can be said that the structural model of POS which consists of one factor was well fit to the Turkish culture.

Job Fit Scale (JF). As a result of Cronbach's reliability analysis performed for JF, the scale had a reliability as Cronbach's $\alpha = .891$. As a result of EFA performed for JF, 1 factor which Eigenvalue ≥ 1 obtained consisting of 3 items (KMO=0,739, $X^2_{\text{Bartlett test}}(3)=551,342$ $p=0,000$). Total variance explained was 82,160%. The results of CFA indicated that the model was saturated and the fit was perfect. According to these results, it can be said that the structural model of JF which consists of one factor was perfectly fit to the Turkish culture.

Organizational Fit Scale (OF). As a result of Cronbach's reliability analysis performed for OF, the scale had a strong reliability (Cronbach's $\alpha = .912$). As a result of EFA performed for OF, 1 factor which Eigenvalue ≥ 1 obtained consisting of 3 items (KMO=0,746, $X^2_{\text{Bartlett test}}(3)=660,491$, $p=0,000$). Total variance explained was 85,175%. The results of CFA indicated that the model was saturated and the fit was perfect. According to these results, it can be said that the structural model of OF which consists of one factor was perfectly fit to the Turkish culture.

Service-Oriented Organizational Citizenship Behaviors Scale (SOCB). As a result of Cronbach's reliability analysis performed for SOCB, the scale had a strong reliability (Cronbach's $\alpha = .959$). As a result of EFA performed for SOCB, 3 factors which Eigenvalues ≥ 1 obtained consisting of 16 items (KMO=0,934, $X^2_{\text{Bartlett test}}(120)=4786,597$ $p=0,000$). Total variance explained was 76,995%. Scale factors were found as in the original, so we named these factors like the original in turn; "Service Delivery (Cronbach $\alpha = .928$, % of Variance=28,048)", "Loyalty (Cronbach $\alpha = .934$, % of Variance=24,871)", "Participation (Cronbach $\alpha = .918$, % of Variance=24,076)". The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=281.26, N=314, df=99, $p < .000$, $X^2/\text{df}=2.84$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.98, AGFI=0.94, CFI=0.97, NFI=0.97, RFI=0.96, RMSEA=0.012, SRMR=0.039. According to these values, it can be said that the structural model of SOCB which consists of three factors was well fit to the Turkish culture.

Intrinsic Job Satisfaction Scale (IJS). As a result of Cronbach's reliability analysis performed for IJS, the scale had a strong reliability (Cronbach's $\alpha = .913$). As a result of EFA performed for IJS, 2 factors which Eigenvalues ≥ 1 obtained consisting of 12 items (KMO=0,892, $X^2_{\text{Bartlett test}}(66)=2232,061$ $p=0,000$). Total variance explained was 63,314%. Scale factors were found unlike the original, so we named these factors in turn as; "Intrinsic Job Satisfaction 1 (Cronbach $\alpha = .888$, % of Variance=39,146)", "Intrinsic Job Satisfaction 2 (Cronbach $\alpha = .824$, % of Variance=24,168)". The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=209.67, N=314, df=56, $p < .000$, $X^2/\text{df}=3.74$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.95, AGFI=0.92, CFI=0.95, NFI=0.96, RFI=0.91, RMSEA=0.015, SRMR=0.048. According to these values, it can be said that the structural model of IJS which consists of two factors was well fit to the Turkish culture.

Leader-Member Exchange Scale (LMX). As a result of Cronbach's reliability analysis performed for LMX perceptions, the scale had a strong reliability (Cronbach's $\alpha = .924$). As a result of EFA performed for LMX perceptions, 1 factor which Eigenvalue ≥ 1 obtained consisting of 7 items (KMO=0,900, $X^2_{\text{Bartlett test}}(21)=1578,974$ $p=0,000$). Total variance explained was 69,117%. The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=42.49, N=314, df=12, $p < .000$, $X^2/\text{df}=3.54$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.94, AGFI=0.91, CFI=0.98, NFI=0.97, RFI=0.95, RMSEA=0.013, SRMR=0.037. According to these values, it can be said that the structural model of LMX which consists of one factor was well fit to the Turkish culture.

Affective Organizational Commitment Scale (AOC). As a result of Cronbach's reliability analysis performed for AOC, the scale had a strong reliability (Cronbach's $\alpha = .884$). As a result of EFA performed for AOC, 1 factor which Eigenvalue ≥ 1 obtained consisting of 5 items (KMO=0,859, $X^2_{\text{Bartlett test}}(10)=824,662$ $p=0,000$). Total variance explained was 68,513%. The results of CFA indicated that the model was well fit and Chi-Square value (X^2)=10.60, N=314, df=4, $p < .000$, $X^2/\text{df}=2.65$) which was calculated for the adaptation of the model was found to be significant. The goodness of fit index values of model were GFI=0.99, AGFI=0.95, CFI=0.99, NFI=0.99, RFI=0.98, RMSEA=0.073, SRMR=0.019. According to these values, it can be said that the structural model of LMX which consists of one factor was well fit to the Turkish culture.

According to the **Tukey's Test of Additivity**, "Customer Orientation", "Service-Oriented Organizational Citizenship Behaviors", "Intrinsic Job Satisfaction" variables were taken with their dimensions came out from factor analysis in the following analysis. All of the factor scores in the research were calculated via averaging.

Descriptive Statistics

^a N=314

^b Job Tenure is measured in years, Education is measured in years completed in the schools

* p<0.05 **p<0.01

Table 2 displays means, standard deviations, and correlations among all the variables. As it is seen, all variables except job tenure and educational level have correlations. Therefore job tenure and educational level were not taken as control variables in the analysis.

Hypothesis Testing

Prior to testing the measurement and the structural models, items were averaged into dimensions for customer orientation, service-oriented organizational citizenship behaviors, and intrinsic job satisfaction. And their different dimensions were distinct, thereby these different dimensions were treated as separate variables in our SEM analyses. For all other variables in our model, items were averaged into single indicators.

Measurement Model Analyses

The baseline measurement model consisting of twelve constructs was initially analyzed and refined before the estimation of the structural model. Standard factor loadings (t-values) of the measurement model were brought in line with the modification indices resulting from the first order factors analysis and values of all items were bigger than acceptable t-value (1.96 for p<0.05). The measurement model results indicated a good fit to the data: (X^2)=1936.18, N=314, df=1078, p<.000, X^2 /df=1.79; GFI=0.94, AGFI=0.92, CFI=0.95, NFI=0.94, RFI=0.95, RMSEA=0.042, SRMR=0.044. The goodness of fit index values of model provided evidence that further examination of the structural model was justified.

Structural Model Analyses

The Maximum Likelihood (ML) SEM was employed. Structural modeling results suggested that the hypothesized model fit to the data well: (X^2)=2136.47, N=314, df=1182, p<.000, X^2 /df=1.80; GFI=0.95, AGFI=0.96, CFI=0.96, NFI=0.95, RFI=0.94, RMSEA=0.041, SRMR=0.043. Table 3 summarizes all the model fit indexes. Figure 2 presents the overall structural model with path coefficients. The value of the model is bigger than 1.96.

Table 3. Summary of Model Fit Indexes^a

Model Test	X^2	df	GFI	AGFI	CFI	NFI	RFI	RMSEA	SRMR
1. Independence model	13,687,252	2278							
2. Measurement model	1936.18	1078	.94	.92	.95	.94	.95	.042	.044
3. Hypothesized model	2136.47	1182	.95	.96	.96	.95	.94	.041	.043

^a X^2 values for the measurement model and structural models are significant at $p \leq .001$.

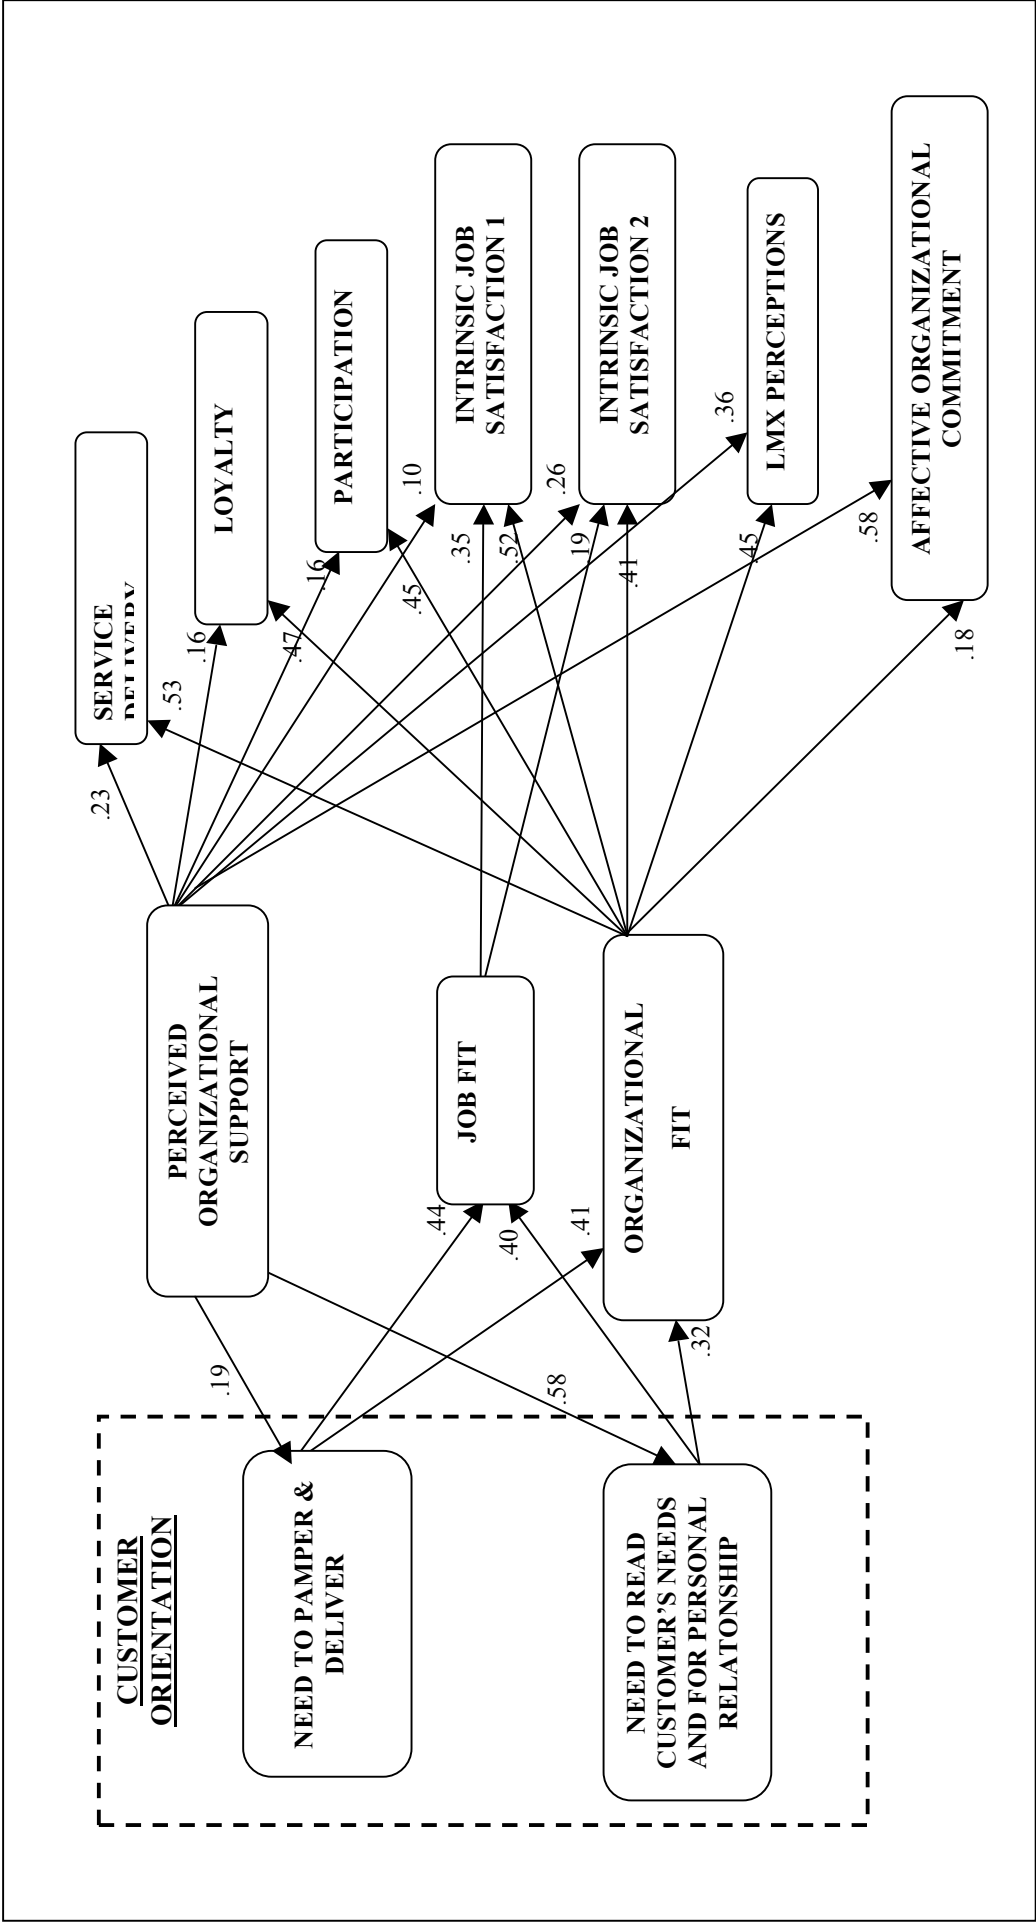

Figure 2: Structural Model Results^a
^a N=314. All paths in structural model analysis are significant at $p < .05$

According to the results of Structural Model, the following observations are made about the hypotheses. Hypothesis 1a states that the influence of service worker customer orientation on job satisfaction will be positive. The findings **not supported H_{1a}** as the direct effects of customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's needs and for Relationship" on job satisfaction's dimensions "Intrinsic Motivation 1", "Intrinsic Motivation 2" are not statistically significant (standardized path coefficient (β) = .037, t-value = 0.56; β = .048, t-value = 0.69; β = .033, t-value = 0.50; β = .059, t-value = 0.74). **Hypothesis 1b**, which states that the influence of service worker customer orientation on job satisfaction will be mediated by job fit, **is supported** as the effects of job fit on job satisfaction's dimensions "Intrinsic Motivation 1", "Intrinsic Motivation 2" are statistically significant (β = .35, t-value = 5.40; β = .19, t-value = 2.77). Hypothesis 2 says that the higher level of service worker customer orientation, the higher level of person-organization fit. The findings **supported H₂** as the effects of customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's needs and for Relationship" on person-organization fit are statistically significant (β = .41, t-value = 4.52; β = .32, t-value = 3.40). **Hypothesis 3**, which states that the influence of service worker customer orientation on organizational commitment will be positive, **is not supported** as the direct effects of customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's needs and for Relationship" on organizational commitment are not statistically significant (β = .031, t-value = 0.49; β = .045, t-value = 0.62). Hypothesis 4 states that the influence of service worker customer orientation on service-oriented organizational citizenship behavior's dimensions will be positive. The findings **not supported H₄** as the direct effects of customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's needs and for Relationship" on service-oriented organizational citizenship behavior's dimensions "Service Delivery", "Loyalty", "Participation" are not statistically significant (β = .067, t-value = 0.98; β = .055, t-value = 0.70; β = .064, t-value = 0.92; β = .054, t-value = 0.69; β = .040, t-value = 0.53; β = .066, t-value = 0.94). **Hypothesis 5**, which states that the higher level of perceived organizational support, the higher level of service worker customer orientation, **is supported** as the direct effects of perceived organizational support on customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's needs and for Relationship" are statistically significant (β = .19, t-value = 2.24; β = .58, t-value = 6.14). Hypothesis 6 states that the higher level of perceived organizational support, the higher level of service-oriented organizational citizenship behavior. The findings **supported H₆** as the direct effects of perceived organizational support on service-oriented organizational citizenship behavior dimension's "Service Delivery", "Loyalty", "Participation" are statistically significant (β = .23, t-value = 3.09; β = .16, t-value = 2.91; β = .16, t-value = 3.03). **Hypothesis 7**, which states that the higher level of perceived organizational support, the higher level of job satisfaction **is supported** as the direct effects of perceived organizational support on job satisfaction's dimensions "Intrinsic Motivation 1", "Intrinsic Motivation 2" are statistically significant (β = .10, t-value = 2.14; β = .26, t-value = 4.08). Hypothesis 8 states that the higher level of perceived organizational support, the higher level of LMX perception. The findings **supported H₈** as the direct effect of perceived organizational support on LMX perception is statistically significant (β = .36, t-value = 5.65). **Hypothesis 9**, which states that the higher level of perceived organizational support, the higher level of organizational commitment, **is supported** as the direct effect of perceived organizational support on organizational commitment is statistically significant (β = .58, t-value = 8.68). Hypothesis 10a states that influence of person-organization fit on service-oriented organizational citizenship behavior will be positive. The findings **supported H_{10a}** as the direct effects of person-organization fit on service-oriented organizational citizenship behavior's dimensions "Service Delivery", "Loyalty", "Participation" are statistically significant (β = .53, t-value = 8.73; β = .47, t-value = 8.25; β = .45, t-value = 7.70). **Hypothesis 10b**, which states that influence of person-organization fit on job satisfaction will be positive, **is supported** as the direct effects of person-organization fit on job satisfaction's dimensions "Intrinsic Motivation 1", "Intrinsic Motivation 2" are statistically significant (β = .52, t-value = 8.16; β = .41, t-value = 6.16). Hypothesis 10c states that influence of person-organization fit on LMX perception will be positive. The findings **supported H_{10c}** as the direct effect of person-organization fit on LMX perception is statistically significant (β = .45, t-value = 6.97). Finally, **Hypothesis 10d**, which states that influence of person-organization fit on organizational commitment will be positive, **is supported** as the direct effect of person-organization fit on organizational commitment is statistically significant (β = .18, t-value = 3.48).

RESULTS AND DISCUSSION

In this study, the effects of customer orientation and perceived organizational support on service workers' responses to their jobs were investigated with a comprehensive model in Turkey's 4 biggest café chains. As the results of analyses, customer orientation's dimensions "Need to Pamper and Deliver" and "Need to Read Customer's Needs and for Personal Relationship" have direct effects on job fit (44%; 40%) and organizational fit (41%; 32%); and these findings are consistent with previous findings of Donovan et al. (2004) and Farrell and Oczkowski (2009). In other words, the higher service workers desire to make customers believe they are special,

pick up on customers' verbal and nonverbal communication, connect with the customer on a personal level and perform the service successfully, they are better fit their job and their organization. On the other hand, contrary to our hypothesis, no evidence was found to support the customer orientation-job satisfaction relationship, indeed results show that job fit full mediated the relationship between customer orientation dimensions and job satisfaction dimensions. And this finding is consistent with Donovan et al.'s (2004) 'Study 3' as well as Farrell and Oczkowski's (2009) study. Our findings suggest that recruiting customer-oriented staff and employing them in a service setting, does not necessarily guarantee such staff will be satisfied with their jobs. In this respect, customer-oriented staff can have job satisfaction as long as they perceive that they are good fit with their job.

Results also show that customer orientation has no direct effects on service-oriented organizational citizenship behaviors and organizational commitment and contradict the findings by Farrell and Oczkowski (2009). These findings reveal that having service-oriented organizational citizenship behavior and commitment to the organization in service settings, firstly depends on having a good fit to the organization as well as perceiving support from organization according to the overall our model results.

On the other hand, results show that perceived organizational support have direct effects on customer orientation's dimensions "Need to Pamper and Deliver (19%)" and "Need to Read Customer's Needs and for Personal Relationship (58%); Service-Oriented Organizational Citizenship Behavior's Dimensions "Service Delivery (23%)", "Loyalty (16%)", and "Participation (16%)"; job satisfaction's dimensions (10%; 26%); and affective organizational commitment (58%). And these findings are consistent with Farrell and Oczkowski's (2009) study. According to this study's another valuable finding, perceived organizational support have direct effect on LMX perceptions (36%). In other words, staffs that perceive organizational support in service settings, have high quality relations with their leaders (managers). In this context, perceived organizational support can be considered as basis of high quality relationships between managers and staffs. Results also show that that person-organization fit have direct effect on Service-Oriented Organizational Citizenship Behavior's Dimensions "Service Delivery (53%)", "Loyalty (47%)", and "Participation (45%)"; job satisfaction's dimensions (52%; 41%); LMX perceptions (45%) and affective organizational commitment (18%). These findings which are consistent with Farrell and Oczkowski's (2009) study show that the importance of selecting employees who are a good a good fit with the organization.

Consequently, our study's overall results show that organizations in service settings can hire customer oriented staff but it would not be enough for their commitment to their organization, job satisfaction and extra-role behaviors (organizational citizenship behaviors). Indeed, staffs should be well fit to their organization and should perceive support from their organizations for these job outcomes. At this point, managers should consider these factors affecting their staffs' customer oriented behaviors if they want to differentiate from other organizations by their customer oriented services and in turn to gain competitive advantage in service industry.

This study's theoretical contribution is examination of effects of service-workers' customer orientation and perceived organizational support on their responses to their jobs in a comprehensive model; proposing new variables in the model and filling this gap in the research. Furthermore, this study's practical contribution is there is lack of research that consists of all stated variables in our model conducted in restaurant- café industry especially in café chains. And finally, the methodological contribution of this study is investigation of consequences of service-workers' customer orientation and perceived organizational support in Turkey, a developing country; it shows the external validity of these theories which were tested in Western developed countries.

The results of this study provide important insights about the factors related to the effects of customer orientation and perceived organizational support on service workers' responses to their jobs. Future studies should focus on exploring this topic in different cultures and across different types of organizations. Furthermore, such studies should seek to employ quantitative as well as qualitative methods to determine the effects of customer orientation and perceived organizational support on several job outcomes.

ABSTRACT

Market orientation is one such metric that has emerged as a significant predictor of performance and is presumed to contribute to long-term success (Deshpande & Farlez, 1999): Market orientation is heavily influenced by the marketing concept (Drucker, 1954; McCarthy, 1960; McKitterick, 1957), and is the cornerstone of the marketing management and marketing strategy paradigms (Hunt, 2002).

Our analysis serves to bridge this gap in the literature by investigating studies of the relationship between management role and organizational behaviour and market orientation in Bosnia and Herzegovina, as the one of transitional countries.

Based on two different dimension of market orientation measuring: (1) research of prerequisites and factors for market orientation implementation and (2) research of consequences or results of its implementation, we decided to include both of them in the B&H economy research, but first of them in this paper. That means we have wanted to investigate: (a) factors influencing successful implementation of market orientation of companies on B&H market; (b) relations between the level of market orientation implementation and business performances; and (c) to stress possible suggestion how to build better business performances through market orientation and its implementation.

On the sample of 104 BH companies we had tested hypothesis that top management emphasis on a market orientation will positively influence market orientation of the company, and all three elements of market orientation, as well as top management risk aversion is negatively correlated with market orientation, again all three elements of market orientation. Second group of factors we had tested were interdepartmental dimensions, conflict and connections. Finally study show influence of reward system orientation and market orientation dimensions.

Paper is structured in 5 main parts. After introduction we present theoretical framework of market orientation, and specifically relations between market orientation and business performance. Next part explains hypothesis tested in the survey, methodology of research, data analysis and conclusion, in the form of manager recommendations and limitation of research.

Keywords: *market orientation, business performance, organizational behaviour,*

INTRODUCTION

Market orientation is one such metric that has emerged as a significant predictor of performance and is presumed to contribute to long-term success (Deshpande & Farlez, 1999): Market orientation is heavily influenced by the marketing concept (Drucker, 1954; McCarthy, 1960; McKitterick, 1957), and is the cornerstone of the marketing management and marketing strategy paradigms (Hunt, 2002).

Over time, scholars have acknowledged that market orientation research has significantly influenced the development of marketing knowledge (Biggadike, 1981; Day, 1999; Kohli & Jaworski, 1990). Moreover,

international studies in marketing most often compare developed, rather than developing countries. Marketing scholars recognize this limitation and called for the extension of research to an international context (Deshpande, Farley, and Webster, 1997; Homburg & Pflesser, 2000; Kohli, Jaworski, & Kumar, 1993). This analysis serves to bridge this gap in the literature by investigating studies of the relationship between market orientation and business performance in transition countries, i.e. Bosnia and Herzegovina, as the one of the transition countries.

*** More than one country

Namely, one of the very important influences of FDI was the strong competition on the market and strengthening level of competitiveness of the companies and countries getting foreign capital. Based on all those theoretical and empirical results of FDI influences, we have tested connection between the level of FDI capital in companies and their business performances.

The notion that market orientation has a positive impact on business performance is well documented in scholarly research (e.g., Baker & Sinkula, 1999; Harris, 2001; Matsuno & Mentzer, 2000). This study seeks to go beyond the assessment of the existence and the direction of this relationship by investigating two important research questions: (1) What is the strength of the relationship between market orientation and business performance? (2) What is the impact of foreign ownership on the level of market orientation of the company? (3) How the level of managerial development could influence on the acceptance and implementation of market orientation?

MARKET ORIENTATION

Over the last decade there has been a growing interest in the construct of market orientation (Webster, 1994; Day, 1992) and its usefulness in increasing companies' economic performance (Narver and Slater, 1990; Ruekert, 1992; Jaworski and Kohli, 1993; Lambin, 1996; Deng and Dart 1994).

Hamburg and Pflesser (2000) distinguish two complementary perspectives on market orientation: behavioural and cultural. First, Narver and Slater (1990) defined market orientation in terms of culture and related it to the fundamental characteristics of the organization (e.g., customer orientation, competitor orientation, and inter-functional coordination), although they operationalized market orientation in terms of employee behaviour. The cultural stream describes market orientation as a culture that commits the organisation to the continuous creation of superior value for customers (Deshpande, Farley and Webster, 1993; Narver and Slater 1990). This culture creates an environment that maximises opportunities for learning about markets, for sharing information among functions in the organisation that allows for common interpretations, and for taking co-ordinated actions (Slater and Narver, 1994). Narver and Slater (1998, p. 235) emphasised the importance of the cultural perspective in comparison to the behavioural approach: "If a market orientation were simply a set of activities completely disassociated from the underlying belief system of an organisation, then whatever an organisation's culture, a

market orientation could easily be implemented by the organisation any time. But such is not what one observes.”

Second, Kohli and Jaworski’s (1990) approach defined market orientation in terms of organizational behaviors (e.g., generation of information, dissemination of information, and responsiveness to information). The behavioural stream of research describes market orientation in terms of specific behaviours related to the organisation-wide generation of market intelligence pertaining to current and future customer needs, dissemination of this intelligence across departments and organisation-wide responsiveness to it (Kohli and Jaworski, 1990). Key features in this view are a focus on markets, an emphasis on a specific form of inter-functional coordination and a focus on activities related to information processing.

Mavondo and Farrell (2000) noted that the cultural and behavioural approaches share the notion that the consumer is central in the manifestation of market orientation and stakeholders shape the needs and expectations of consumers. In addition, Deshpande’ and Farley (1998, p. 226) offered a conceptualization that includes both perspectives and emphasized a behavioural approach that defined market orientation as “the set of cross-functional processes and activities directed at creating superior value for customers through continuous needs assessments.”

MARKET ORIENTATION AND BUSINESS PERFORMANCE

The notion that market orientation affects business performance is a matter of extensive research (e.g., Kohli & Jaworski, 1990; Matsuno & Mentzer, 2000; Narver & Slater, 1990). In line with this reasoning, researchers have pursued an understanding of the link between market orientation and business performance by investigating: (1) a direct relationship (e.g., Pelham 1999; Ruekert 1992); (2) a moderated link (e.g., Greenley 1995b; Pelham 1997), and; (3) a mediated relationship (e.g., Baker and Sinkula 1999b; Han, Kim and Srivastava 1998). Studies investigating a direct relationship reveal 67.8% positive effects of market orientation on measures of business performance, 30.0% non-significant effects, and 2.2% negative effects (Langerak, 2002). Ruekert (1992) and Slater and Narver (1994) find positive effects, Han, Kim and Srivastava (1998) and Greenley (1995b) reports no effects, while Grewal and Tansuhaj (2001) encounter negative effects.

Although some studies suggest a negative or non-significant relationship, most findings indicate a positive relationship between market orientation and business performance (e.g., Deshpande ’ & Farley, 1998; Matsuno & Mentzer, 2000; Slater & Narver, 2000). Furthermore, Doyle and Wong (1998) found market orientation to be the second most important driver, differential advantage being the first, of business performance. No matter all those results, this is an important consideration, because devoting resources to develop a market orientation potentially may be wasteful if the orientation does not lead to higher performance in certain business environments, such as those with low competitive intensity.

While internal organizational as well as external factors (e.g., competitive intensity) can be argued to be antecedents of market orientation (Lusch and Laczniak, 1987), the presented study focuses on internal factors. This perspective embodies a more applied orientation, because managers have more control over internal antecedents compared to external ones.

Based on the discussed literature, three sets of antecedents pertaining to top management, interdepartmental factors and reward systems are hypothesized to be related to market orientation, and market orientation is hypothesized to be related to business performance.

Hypotheses on Market Orientation

Several researchers discuss performance outcomes of organizational culture with a theoretical orientation (Barney 1986; Fiol 1991; O’Reilly 1989). Barney (1986) argues that only a valuable, rare, and imperfectly imitable culture of a firm can be a source of sustained competitive advantage. Kotter and Heskett (1992) find empirical support for the performance impact of organizational culture. Their results indicate that firms with a strong culture that emphasizes customer orientation, employee orientation, stockholder orientation, and leadership have higher long-term performance. With respect to the specific domain of market orientation, several empirical studies reveal positive and significant correlation links between market orientation and different performance measures (e.g., Jaworski and Kohli 1993; Narver and Slater 1990; Slater and Narver 1994). In studying performance outcomes of market-oriented organizational cultures, we draw a distinction between market performance and financial performance. Market performance is defined as the effectiveness of an organization's marketing activities and is measured by items pertaining to achieving customer satisfaction,

providing value to customers, retaining customers, and attaining the desired market share. Financial performance is operationalized as return on sales in our study. Basically, we argue that a market oriented organizational culture has an indirect effect on financial performance through market performance. A market-oriented organization provides a unifying focus of individual efforts in the delivery of value to the customers while also providing a comparative impetus with competitors' activities (Kohli and Jaworski 1990). Therefore, a market-oriented organization is likely to achieve higher customer satisfaction, keep existing customers loyal, attract new customers, and subsequently attain the desired growth and market share. Similar to Narver and Slater (1990), we predict that market-oriented organizational culture will have a positive impact on market performance. More specifically, we state that among the four components of a market oriented organizational culture, only behaviours have a direct performance impact. Values, norms, and artefacts are not assumed to have a direct impact on market performance. In summary, this leads us to the following: The presence of market-oriented behaviours in an organization has a positive impact on market performance.

We also assume that performance in the market is a necessary antecedent of financial performance. The literature on performance implications of customer satisfaction and loyalty (Anderson and Sullivan 1993; Fornell 1992; Rust and Zahorik 1993) provides evidence that these components of market performance are positively related to financial performance. Furthermore, Reichheld (1996) argues that loyal customers can increase a firm's profitability through the absence of acquisition costs, lower operating costs, referrals, and higher price tolerance. In addition, PIMS studies identify product/service quality and market share as the most important factors that influence the percentage of return on sales (Buzzell and Gale 1987, p. 45): Market performance has a positive effect on financial performance.

Based on two different dimension of market orientation measuring: (a) research of prerequisites and factors for market orientation implementation and (b) research of consequences or results of its implementation, we decided to include both of them in the B&H economy research. That means we have wanted: (1) To investigate factors influencing to successful implementation of market orientation of companies on B&H market; (2) To investigate relations between the level of market orientation implementation and business performances; and (3) To stress possible suggestion how to build better business performances through market orientation and its implementation.

Previous studies have found top management had key role in the process of forming organizational values and orientations (Felton 1959, Hambrick and Maosn 1984), but at the same time, they are the biggest barrier for successful implementation of companies' market orientation, especially in transitional countries. Unless an organization gets clear signals from top managers about the importance of being responsive to customer needs, the organization is not likely to be market-oriented (Levitt, 1969; p. 244; Webster, 1988, p. 37). If top management do not want accept idea that marketing orientation would positively influence business performance and help companies to survive there is nobody to encourage employees to track changing markets, share market intelligence with others in the organization, and be responsive to market needs (Jaworski and Kohli, 1993).

On the other side, responsiveness to changing market needs often calls for the introduction of new products and services to match the evolving customer needs and expectations. But new products, services and programs often run a high risk of failure and tend to be more salient than established products. Kohli and Jaworski (1990) argue that if top management demonstrates a willingness to take risks and to accept occasional failures as being natural, subordinates are more likely to focus on generating or disseminating market intelligence or responding to changes in customer needs and vice versa.

H1: The top management emphasis on a market orientation will positively influence market orientation of the company:

- H1a: market intelligence generation;
- H1b: intelligence dissemination; and
- H1c: responsiveness of the organization.

H2: Top management risk aversion is negatively correlated with market orientation:

- H2a: market intelligence generation;
- H2b: intelligence dissemination; and
- H2c: responsiveness of the organization.

The second group of factors we had investigated included interdepartmental relations and their influence market orientation. Interdepartmental conflicts refer to the tension among departments arising from the incompatibility

of actual or desired responses (Raven and Kruglanski, p. 70) and could be inhibitor of a market orientation (Levitt, 1969; Lusch, Udell and Laczniak, 1976). Those conflicts is likely to inhibit communication across departments (Ruekert and Walker, 1987) and as the result lowering market intelligence dissemination and response by the departments to market needs, and finally market orientation. On the other side interdepartmental connection as the formal or informal direct contact between employees across departments facilitate interaction and exchange of information, and actual utilization of the information (Cronbach and Associates, 1981; Deshpande and Zaltman, 1982; Patton, 1978). The more individuals across departments are directly connected the more they are likely to exchange market intelligence and respond to it (Kohli and Jaworski 1990). Since more and more information, specifically in service industries, company collecte based on marketing information system, actually its marketing intelligence subsystem, we hypothesized that interdepartmental relations will influence all three dimension of market orientation. Our hypothesis are opposite previous study, excluded marketing intelligence generation (Jaworski and Kohli, 1993).

H3: Interdepartmental conflict will negatively influence on market orientation:

- H3a: market intelligence generation;
- H3b: intelligence dissemination; and
- H3c: responsiveness of the organization.

H4: Interdepartmental connection will positively influence on market orientation:

- H4a: market intelligence generation;
- H4b: intelligence dissemination; and
- H4c: responsiveness of the organization.

The last factor we had researched relates to the measurement and reward system that is in place within an organization, since measurement/reward systems are instrumental in shaping the behaviours of employees (Anderson and Chambers, 1985; Jaworski, 1988; Lawler and Rhode, 1976; Hopwood, 1974). In the present context, Webster (1988, p. 38) argues that "... the key to developing a market-driven, customer-oriented business lies in how managers are evaluated and rewarded." He stressed tendency between managers evaluated on the bases of short-term profitability and results, to focus on these particular criteria instead of market factors. Those attitudes are strongly correlated with the top management emphasis on the specific goals and measures. Looking for visible results in short-period, they will ask subordinates and employees to do the same thing.

H5: Rewarding and evaluating system for managers reliance on market based factors will positively influence market orientation:

- H5a: market intelligence generation;
- H5b: intelligence dissemination; and
- H5c: responsiveness of the organization.

RESEARCH METHODOLOGY AND STATISTICAL MODELS

We developed a questionnaire on the basis of the literature review (Jaworski and Kohli, 1993), the content analysis, and the field interviews and conducted a pre-test with seven managers and two academics, which resulted in small changes in the wording of items and the instructions to answer the questionnaire. We will study elements and dimensions of market orientation at the corporate level. We mailed the questionnaire to a sample of all managers in companies registered at the dataset of Ministry of foreign affairs from different industries in Bosnia and Herzegovina. We ensured the respondents' competence before the mailing by conducting a telephone identification of key informants on the basis of addresses obtained from a commercial provider. The targeted key informants included general managers, marketing managers, and managers from other functional areas. Firms that will not respond after four weeks will mail a follow-up letter and another questionnaire.

For statistical analysis we will use structural equation modelling (SEM). SEM is a family of statistical models that seek to explain the relationships among multiple variables. In doing so, it examines the structure of interrelationships expressed in a series of equations, similar to a series of multiple regression equations. These equations depict all of the relationships among constructs (the dependent and independent variables) involved in the analysis. Constructs are unobservable or latent factors represented by multiple variables (much like variables representing a factor in factor analysis).

SEM is the only multivariate technique that allows the simultaneous estimation of multiple equations. These equations represent the way construct relate to measured indicator items as well as the way constructs are related to one another. Thus, when SEM techniques are used to test a structural theory, it is the equivalent of performing

factor analysis and regression analysis in one step. SEM has become an extremely popular technique in the social sciences based on these key advantages. SEM is known by many names, and sometimes is even just referred to by the name of specialized software package used (e.g. a LISREL or AMOS model).

DATA ANALYSES AND HYPOTHESES TEST RESULTS

The first five hypotheses (H1 through H5 and sub-hypotheses) related to the antecedents of a market orientation. These were tested by estimating the following regression equations, where Y1 denotes overall market orientation, Y2 through Y4 denote market intelligence generation, market intelligence dissemination, and responsiveness, respectively, and X1 through X5 correspond to (1) top management emphasis on market orientation, (2) top management risk aversion, (3) interdepartmental conflict, (4) interdepartmental connection and (5) reward system orientation.

In the first phase of analysis we had found high level of multicollinearity between two independent variables: top management emphasis on market orientation and top management risk aversion. It influenced results of all other variables, and we excluded top management risk aversion from the pool of variables, since we expected that management show above average level of risk aversion as the consequence of recession and economic problems, strongly influence environment companies operate. Results of analyses are presented at the Exhibit 1.

TABLE 1: ANTECEDENTS OF MARKET ORIENTATION

* p<.05

On the market orientation we had found significantly strong negative influence of interdepartmental conflict (b = -.27, p<.001) and the same level of positive influence of reward system orientation (b = .27, p<.001) and lower level of positive influence of top management emphasis (b = .14, p<.01), but interdepartmental connections not significant for the level of company market orientation. Looking at the standardized coefficients, Beta coefficient showed the greater relative effect of reward system orientation and interdepartmental conflict, but positive and negative, comparing to the two other dimensions. Lack of interdepartmental connections influence on market orientation is unexpected results, since dimension of market orientation; (intelligence generation, dissemination and responsiveness) we expect would be positively influenced by cooperation between employees working at deferent departments.

Looking at the intelligence generation, reward system orientation show very strong positive influence ($b = .44, p < .001$). At the same time we found negative influence of interdepartmental conflict ($b = -.22, p < .05$) and interdepartmental connections ($b = -.25, p < .05$). There were surprising results, since cooperation between departments expected being promoters of market orientation, specifically through intelligence dissemination, but we had found interdepartmental cooperation not significant for intelligence dissemination. The only possible explanation could be the misperception of management about the importance those two dimensions. Looking at their own role in companies and reward and motivation system they follow on, they ignore and neglected roles and influence department in companies have in the strengthening market orientation. It could be consequence of the previous economic system and the portion of public companies included in the sample.

Top management emphasis has positive influence on intelligence dissemination at the level of $p < .01$ ($b = .27$), interdepartmental conflict too ($\beta = -.34, p < .01$), and reward system orientation lower level of influence ($b = .10, p < .05$). As we already said unexpected results we have got for the interdepartmental connection variable. It appears non significant at all.

All independent variables had significant influence at regression, but at different levels. Top management emphasis, interdepartmental conflict and reward system orientation influence stronger ($b = .24; b = -.23; b = .27; p < .01$ respectively) than interdepartmental connection ($b = .12, p < .05$). Obviously respondents do not consider interdepartmental connection as the important elements for market orientation of the companies; it was not significant for market orientation and intelligence dissemination, which is illogical; but at the same time it has negative influence on intelligence generation and positive influence at the level of $p < .05$ for responsiveness. The only possible explanation could be perception of marketing department and marketing activities as the most important dimensions for market orientation, from the respondents' point of view. It is typical for the companies operate in transitional countries starting with the implementation of marketing concept after process of privatization and transformation.

Therefore, it appears important that top managers continually emphasize the need for ongoing tracking and responding to market developments to employees. These findings support the earlier expectation that role of top managers is significant in the building market orientation, as well as intelligence dissemination and responsiveness. Surprisingly, top managers emphasize was not significance for intelligence generation.

Interdepartmental conflict, as expected appears to inhibit, intelligence generation, dissemination and responsiveness (table 1). Results concerned intelligence generation are different comparing previous studies (Jaworski and Kohly 1993, p.63) where they suppose there were no influence of the conflicts to the intelligence generation. We had found negative influence of interdepartmental conflict even to the intelligence generation ($b = -.22, p < .05$). This supports the expectations that individuals in organizations in which tensions prevail across departments are less likely to be willing to share market information or to work and cooperate with other departments to satisfy customer needs and expectations.

At the same time interdepartmental connection indicated negative influence on intelligence generation which was unexpected results. These results call for additional research to examine the linkage between interdepartmental connection and market orientation, as well as intelligence dissemination, and causes of negative influence of interdepartmental connection and intelligence generation.

The most influential independent variable, according results, is reward system orientation. It has very strong positive influence on the market orientation and intelligence generation ($\beta = .27; b = .44, p < .001$), than responsiveness ($\beta = .27, p < .01$) and finally intelligence dissemination ($\beta = .10, p < .05$). Using those results we can conclude managers are most interested to empower employees to focus on customer market and competition if they itself motivated and reward based on market focus performance and organizations that reward employees on the basis of factors such as customer satisfaction, building customer relationship, and so on tend to be more market-oriented.

Comparisons of the standardized regression coefficients suggest that the design of reward system has the strongest impact on market orientation among the set included in the study. Adequate reward systems appear to facilitate two components of market orientation – ($\beta = .44, p < .001$), responsiveness ($\beta = .27, p < .01$) and market orientation itself ($\beta = .38, p < .001$).

CONCLUSION

Managerial Implications

Besides being theoretically insightful, our study has several important managerial implications. First, it provides managers with a detailed understanding of some of the processes that drive behaviour in organizations. Within our model, market-oriented behaviours are only influenced through positive or negative artefacts of market orientation. Much managerial activity to guide behaviour in organizations is based on the establishment of norms. Our research tells managers that the establishment of norms will not produce the desired behavioural outcomes unless the norms are supported by appropriate artefacts. Also, written value statements can be effective only if supported by adequate artefacts. Second, managers need to recognize the importance of consciously managing artefacts within their organizations. Third, our findings regarding performance implications of market-oriented organizational culture are managerially relevant show that a market-oriented culture appears especially important in, among other things, a turbulent market environment and transitional periods. Also, our findings show that a market-oriented culture influences financial performance indirectly through market performance. Thus, customer satisfaction ratings and customer loyalty figures are appropriate outcome measures for companies that are trying to enhance their market orientation. Fourth, our scale can be used by managers for measuring the degree of market orientation of their firms' culture. As this instrument makes a distinction among different layers of culture, it is adequate for identifying possible inconsistencies among the different layers of culture. Finally, our research provides managers guidance on the wording of a company philosophy. We have identified a set of values that fosters the development of corresponding norms and thus influences market-oriented behaviours. Managers should take these values into consideration when formulating a company philosophy or writing a mission statement.

Limitations and Further Research

One limitation of our study is the national character of our sample. Similar to other studies of market orientation, our study needs to be extended to an international context (e.g., Deshpande, Farley, and Webster 1997; Seines, Jaworski, and Kohli 1996). Furthermore, these type of studies need to consider international aspects of measurement equivalence. This is particularly necessary for the measurement of values (Hofstede 1980). Further research should investigate the concept of market-oriented organizational culture using data from multiple informants, as has been done by Kohli, Jaworski, and Kumar (1993) in the behavioural research stream on market orientation. The developed scale for market-oriented organizational culture involves several items. From a managerial perspective, it might be useful to develop more parsimonious measures of market-oriented organizational culture while still making a distinction among different layers. The exploratory nature of our measurement of artefacts for market orientation exhibits lower reliabilities than other measures used in this study. Therefore, further research should be conducted to develop better measures of artefacts. If we consider the strong effects of artefacts on market-oriented behaviors, this direction for further research is even more essential. On a more general level, we believe that additional research on market-oriented organizational culture should link this construct to other organizational constructs in marketing research that are related to the intra organizational role of the marketing function. As an example, Homburg, Workman, and Krohmer (1999) analyzed the marketing function's influence within the firm. Influence or power within organizations is one of the most important drivers of organizational behavior. Further research could, for example, analyze whether a powerful marketing department supports (or prohibits) the development of a market-oriented organizational culture.

THE EFFECT OF ADVERTISEMENT ON IMPROVING BRAND PERCEPTION: AN EVALUATION IN AUTOMOBILE SECTOR

T. Sabri ERDİL, Öner BAŞARIR
Marmara University, Turkey

ABSTRACT

The factors caused by the management of consumer perception are revealed in this paper. Process of brand perception management and consumer perception is studied. Surely these perceptions are directly related to messages from the advertisements. We evaluated these theoretical findings, with a focus group investigation for ads, from automobile sector. We found out that some of the brands are successful at orienting the perceptions towards advertisement messages, and some of them aren't.

Keywords: Advertisement; brands; brand perception; perception

INTRODUCTION

The American Marketing Association defines a brand as 'a name, term, design, symbol, or any other feature that identifies one seller's good or service as distinct from those of other sellers' (Pennington and Ball, 2007). The brand is often mentioned as a firm's most valuable asset (Wallström, Karlsson and Sangari, 2008). That's why, the brand acts as a kind of flag, waving to consumers, creating awareness of the product and differentiating it from other competitors (Ellwood, 2002). In fact, the brand has no objective existence at all: it is simply a collection of perceptions held in the mind of the consumer (Thjomoe, 2008). Branding is particularly important as "people choose the brands in the same way they choose friends" (Vrontis, 2007). Customers estimate which offer will deliver the most perceived value and act on it (Kotler and Keller, 2006).

The purpose of the present study is to investigate the effect of TV advertisements as a promotional works on brand perception process in the matter of creating and improving consumer's brand perception that is required or targeted and in the case of factors that effect brand building. In the end of this study, the effect of advertisement on brand perception as one of the most important communication instrument in marketing was dealt with the case of a specific model.

The article proceeds in the following manner. Primarily, it was briefly reviewed the literature presentation. In the literature section, it was observed that evolution of brand perception and the effect of advertisement on perception determiners and it has developed one hypothesis. Afterwards, this effectiveness was analyzed with the fieldwork in an academic aspect. And then, it was presented that the methods for using researching process and the acquired findings at the end of the study. Finally, all acquired findings were examined with an academic aspect.

MESSAGE DESIGNING IN ADVERTISEMENT

The Planning of Message Content

Successful brands are synonymous with consistent, high quality items and offer consumers relevant added values reinforced through advertising (Chernatony, 1989). Advertising represents an important means by which organizations communicate with their customers, both current and potential. The specific objectives of an advertising campaign may adopt many forms, e.g. to: a) create awareness of a new product or brand, b) inform customers of the features and benefits of the product or brand, c) create the desired perceptions of the product or brand, d) create a preference for the product or brand, e) persuade customers to purchase the product or brand (Bendixen, 1993). Advertising has the power to create a psychological relationship between a brand and its users. The best selling brands in a product category are also typically the leading advertisers: Tide, Crest, and Marlboro, to name just a few (Duncan, 2002).

Advertising creativity, the force that drives message strategy development and execution, is the one aspect of advertising that has defied mathematical treatment. In theory, creating effective advertising would seem a simple business - getting the right message to the right audience at the right time. In practice, however, the business of advertising is not so simple; other advertisers are trying to reach the same audience. To overcome competing voices as well as the audience's general defensive tendencies, the key to effective advertising - getting people's attention and then motivating them to process the sales message - is the development and execution of the right message strategy (Dunn, Barban, Krugman and Reid, 1990).

Advertisements should be interesting in nature, convey the information, take the attention of customers and create action on the part of consumers in addition to basic features of conveying differentiated and unique messages to consumers in a safe and complete way (Aktuğlu, 2004).

Obviously, there is an ongoing fierce competition in the advertising sector which necessitates becoming the most successful one among hundreds of ads that is almost always a hard process. Today, the marketing approach has become focusing on differentiation to overcome this problem insuch we whitness on tv ads with good design to be able to influence the tv viewers within a very short time of a few seconds. That is why message design has become so important in advertisements.

Determining images for ads

Brands can be differentiated based on three brand concepts: functional, symbolic or experiential (Ramaseshan and Tsao, 2007). Advertising intended to convey different brand concepts needs to emphasize different quality or nonquality aspects. With functional brand concepts, advertising should emphasize intrinsic attributes; with symbolic brand concepts, extrinsic attributes; and with experiential brand concepts, nonquality variables (Aaker and Biel, 1993).

The impact of the message depends not only on what is said, but also on how it is said. The creative people must find the best style, tone, words and format for executing the message. Any message can be presented in different execution styles, such as the following: slice of life, lifestyle, fantasy, mood or image, musical, personality sembol, technical expertise, scientific evidence and testimonial evidence or endorsement. Finally, format elements make a difference in an ad's impact as well as in its cost. A small change in ad design can make a big difference in its effect. The illustration is the first thing the reader notices - it must be strong enough to draw attention. Next, the headline must effectively entice the right people to read the copy. Finally, the copy - the main block of text in the ad - must be simple but strong and convincing (Kotler, Wong, Saunders and Armstrong, 2005).

'What customers associate with a brand is the result of what they have felt, learnt, seen and heard about the brand (Koll and Wallpach, 2009).' Images used in an ad are at least as important as the messages it conveys to the coonsumers. Images definetly support the messages. For instance, designers decide when to use dark colors and when to use shiny colors depending on the purpose of the ad. Choosing the right images and using them in place will increase the value and effectiveness of the ad which in turn increase brand perception intended.

DETERMINING PERCEPTION FOR TARGET MARKET

Perceptual Factors

A variety of factors affecting perception has been defined in previous literature. Among them are the previous experience, mental and psychological situation, culture, beliefs, values, environmental factors and so on. For instance, quality is a perceptual factor. Consumers might prefer the brand name with high quality perception. Similarly, price is a perceptual factor too. Human being has many other perceptual criteria that he/she will place his/her decisions.

There has been perceptual maps in marketing in order to determine perceptual factors. In these maps product positioning, customer positioning and product attributes are explained. Perceptual mapping has been used as a tool for determining marketing mix for targeted consumers. (Erdil and Uzun, 2009)

Individual with perception, chooses what he/she is interested in from the environment. At this choice stage, he/she may skip some environmental details whereas he/or she may be attracted by some other details. This situation is a kind of proof that perception process differ from person to person. The fact that exposes this difference is people to have various friends, needs, motives, values and experiences.

Consumer perceptions have great importance on creating differences between brand names with the aid of adverts. Advertisement will be influential on the sale of a specific brand, as long as they have the potential to indicate the brand better and more different in consumer perceptions. (Erdil and Uzun, 2009)

Choosing the Factors

Perceptual organization allows consumers to decide between competing brands on the basis of their similarities within mental categories conceived earlier. Consumers group a large number of competing brands into a few categories, since this reduces the complexity of interpretation (Chernatony and McDonald, 2003). And perceptions about a brand as reflected by the brand associations held in consumer memory (Ballantyne, Warren and Nobbs, 2006). These associations refer to any aspect that link the brand with the consumer's memory. Relationships are then created between consumers' personalities and the perceived personalities of brands (Martinez and Chernatony, 2004).

Consider the experience of shopping for a new car. You'll start with your own blend of perceptions, based on received ideas about the car and what you see on the street. You'll modify those views as you talk to others, including owners of the brand and model you're interested in, and as you read reviews and check the car's ratings in third-party reports (Hogan, Almquist and Glynn, 2005).

Consumer tastes and preferences for a product or brand might be built through one or more of six distinct modes (Alreck and Settle, 1999) :

- (1) Need association - The product or brand is linked to one need through repeated association.
- (2) Mood association - The mood is attached to the product or brand through repeated association.
- (3) Subconscious motivation - Suggestive symbols are used to excite consumers' subconscious motives.
- (4) Behavior modification - Consumers are conditioned to buy the brand by manipulating cues and rewards.
- (5) Cognitive processing - Perceptual and cognitive barriers are penetrated to create favorable attitudes.
- (6) Model emulation - Idealized social lifestyle models are presented for consumers to emulate.

All of the factors described above, in fact are clue for the process of the choice of factors. After determining the target market, the stage of choosing the most suitable factor and placing it into the ad is of prime importance. The well known fact is that, strategies are developed depending not on the product, but on target market. Obviously, there would be a plenty of serious changeables, between the factors that used for a target market including elderly consumers and a target market including juvenile consumers.

METHODOLOGY AND DATA

In this study, beside the academic literary comments, in determinants that form brand perception in the automotive sector, effect of the advertising is tested with the data gained from on a group of consumers.

Four different occupation and income groups representing the population are targeted. Ten individual experiment group representing this income and occupation segment. A discussion and question bunch is made to interview the subjects in depth about the determined hypothesis. In the automotive commercials, messages that emphasize the price and payment terms, in the forming of acquired associations on the subjects is questioned. In the same manner, the effect of attractivity messages on forming acquired association on the subjects is questioned in depth.

FINDINGS

Automotive sector has been chosen for the research. One reason for choosing the automobile industry is that commercials regarding automobile companies seem to have global value. Moreover this sector considers all the market segments, as target and used symbols intensively. Following the decision for sector choice, brand names and commercial they create have been chosen for conducting the research. The resulting four automobile companies have been taken as the sample for the investigation.

Focus group interviews and one to one interviews have been used in data collection process. Opinions of both parties namely the advertisement creator. And the consumer have been evaluated. At the first stage of the process the advertisement agency have been questioned for three mainstream lines of subjects which are,

1. What is the target segment?
2. What is the targeted perception for the brand?
3. On the basis of targeted perceptions, what messages did you emphasize on the tv advertisements?

After the survey completed on advertisement agencies, and then person focus group is formed including professionals and academics. Then this person focus group has been asked to watch the each of four commercials, and make an evaluation with the aid of a moderator. This focus group has been asked such questions as given belows:

1. What do you think the target market segment is for this commercial?
2. What messages does the commercial convey to consumers?
3. How those messages have been conveyed?
4. After you view the commercial, what perception did you develop?
5. Is the perception you have just developed consistent with the perception you had had about the brand or do you think commercial has been designed to create somehow different brand perception?

Lastly, information obtained from both sides, advertisement agencies and focus group, have been compared in order to determine to what extend the commercial met the goals first established. In addition to that how influential were commercials under investigation have contributed to the development brand perception were analyzed.

Brand names of automobile firms were chosen Renault, Fiat, Toyota and BMW. These four brands have been chosen due to their high commercial intensity on TV with the related time period. There have been some interesting symbols regarding the questioned commercials. Renault used the emphasis for an ordinary day that a professional worker who has a family drives the black car to work on a sunny day on a green field with a cafe for Renault Influence brand. Fiat the second brand emphasizes its old history since the beginning by the slogan "driven by the future" with the symbols of old models, characters suited to the periods, accelerated motions with a well-known music "Hit the Road Jack" and most impressive the way never finishing.

In its advertisement, BMW uses different car models with different colors, small model automobiles, a good quality slow music accompanied with a variety of different looking human characters. Lastly, Toyota uses a large number of happily sleeping children in its advertisement. Another symbol used in the successful and impressive music.

As the methodology used in the research, firstly names of the advertisement agencies producing the commercials were determined; Publicis Yorum for Renault Fluence, TBWA for BMW and Fiat commercials and Almeti Farika for Toyota. Interviews were contacted with these agencies creator directors.

Publicis Yorum has indicated that they manner to increase the sales as well as to improve quality and comfort perception of the brand. To achieve these goals they planned to use symbols that are impressive for upper income level consumers. Backward-looking questioning technique is preferred that might be valid in decision making process of consumers. Lastly, they target institutional sales by focusing on institutional customer in their advertisement.

TBWA / Istanbul designed and produced BMW and Fiat advertisements. We conducted an interview with creator director from that agency who put effort in producing the ads. For building the ad, they did not look for a new market segment but because of the price competition they focused on messages related to products and promotional activities. Furthermore they stressed BMW's large number of consumers already at hand and the

largest market share BMW has aiming all brands. Additionally, they stressed BMW's wide range of products with dynamic and safe production. Lastly, on the commerce they give the message that they are a big and happy family.

TBWA assets that for FIAT commerce they focus on the long historical background of the company has a significant impact on the development. But still there is a long way to be completed. They did not use much symbols for target market but put more emphasis on renewal of cars during the whole historical life with high speed motion technique.

Lastly, an in-depth interview was conducted with Alapati Farika the producer of Toyota commerce. The image of a small family car has been reinforced in the design with specific emphasis on safety and economy. They developed the commerce not for only national market but for also foreign markets. Moreover, they stressed customer focused messages in the design and did not consider any specific design for target market. The feelings of love and peace have been conveyed with the children sleeping in the Toyota car.

Later at the next step, the four advertisements have been watched by the focus-group consisting of ten people whose occupations are academics and professionals. Then they answered the questions objectively structured before and given on the previous page. This process is repeated for each of four ads.

Focused group members indicated that they perceived middle and upper middle classes targeted by the Renault Fluence advertisement. They come to this conclusion because of the professional man used and his appearance on the ad. The messages given have been to become extra ordinary, innovative and different in addition to future-looking symbols it carries. Viewers agreed upon that the commerce raised the question "what is the core idea in choosing the product – car?" Nevertheless, one of them found the commerce confusing and not easy to understand the message it carries.

For the perception the commerce develop on the viewers they came to different conclusions. Renault as a brand creates an image of becoming an extremely different product easily found and bought in the marketplace. They also conclude that middle-age people were targeted on the commerce. Moreover, the use of black car on the ad was found to be interesting by the viewers that gives a sense of maturity. The viewers expressed their perception for higher quality than before, after they watched the ad. When comparing after and before the commerce perceptions the viewers' recognition were found to be similar and not so much deviated with exception that one of the subjects claimed, he used his consider the brand representing more middle-class, but after watching the commerce, he perceived the brand as representing upper-class.

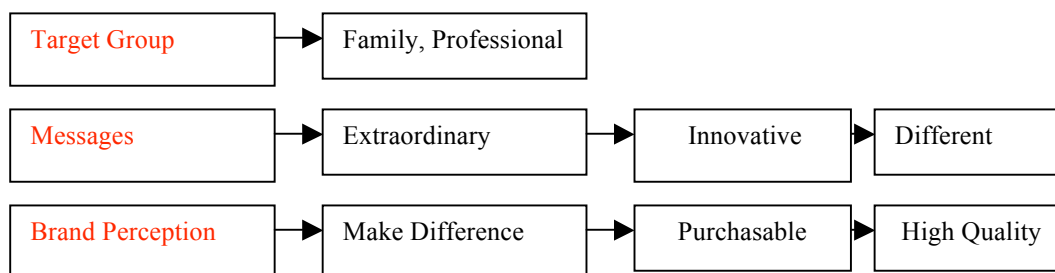

Figure 1 - The effect of Renault Fluence's advertisement on consumer after target group

Toyota commerce have been watched by focus-group members at the next stage. The common conclusion they came was the commerce stress put as "I can drive easily with my children." Thus, the target market was families. The messages given were found to be safety, comfort and peace. Another common conclusion driven for Toyota commerce was that it was funny and easy to remember, in combination with a very good music selected. The most important perception for the commerce was that there has not been any symbols for price recognition, in a manner that "Whatever the price is, I just can buy this car safely". Another common perception raised within the group was that family was expressed without picturing heavily in the commerce. The last message perceived was that the car never breaks down on the road and makes the distances closer. Another commonly shared view has been the before-and-after-commerce perceptions to become parallel, even similar and continuous motives used in a series of Toyota commerces focusing on safety and comfort.

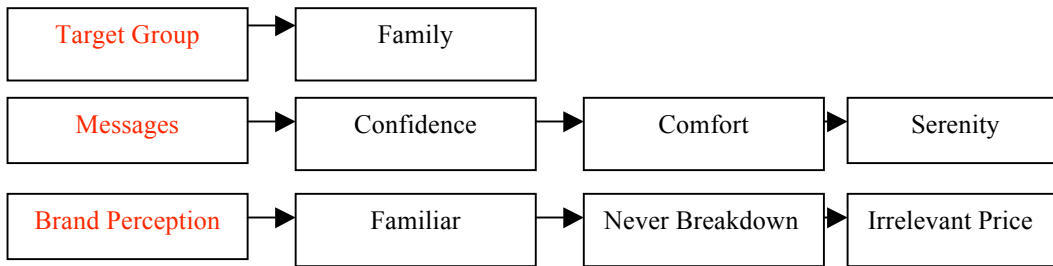

Figure 2 - The effect of Toyota's advertisement on consumer after target group

Focused group members subjected to BMW commerce have concluded easily that the target market is all the population without exception. This brings the conclusion that the BMW Company might have the strategy to increase its market share. The commerce gives a sense of “you are important for us” to the viewers and it stresses comfort; company positions itself as if they produce not only cars but art, so that the brand becomes a kind of passion for the consumers. Moreover, focus group members have the perception that this passionate might arise within young group of consumers. Additionally, differentiated views have been indicated within the group: These are; the brand created a life style and prestige. Now as a brand it is much more warmer than before. Viewers within the group have indicated their desire to buy the BMW car although their salary range doesn't fit the price. In the commerce a variety of shiny colors were chosen to reflect the intention to go beyond the current market segment and obtain new market segments. This breaks down the old image of classical appearance of the brand and changes it into a more dynamic and energetic brand perception. All the viewers shared the conclusion that the commerce has completely broken down the current perceptions for the brand and change it into a new one.

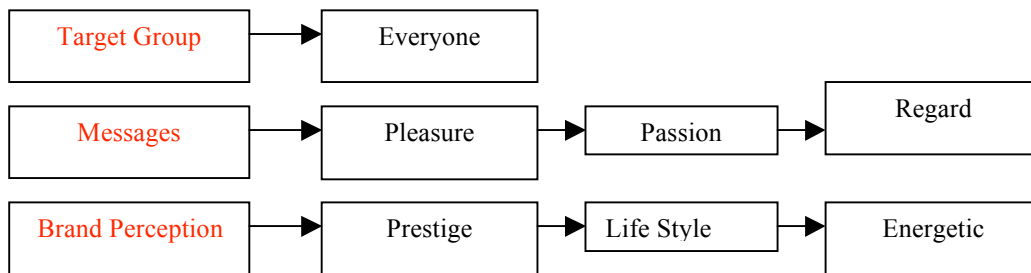

Figure 3 - The effect of BMW's advertisement on consumer after target group

Lastly, Fiat's advertisement was examined in this study. Viewers have concluded that the ad doesn't focus on targeting market, but rather has the message that we compete with ourselves, we are the one who determine the competitiveness, we have always existed, and always will exist. Additionally, innovation and openness to change has been strong emphasized strongly. Advertisement was considered not to be directed to consumers. The brand perception was the one that created respect and trust targeting the middle-class. The viewers also perceived the brand becoming the single one moving on the right direction. Only one of the subjects stated that the ad didn't mean anything to him and didn't improve brand perception in his mind but just it was funny and helpful for brand recognition. Common view for the ad was that all the group members found it impressive but before and after brand perceptions have been found extremely different.

Figure 4 - The effect of FIAT's advertisement on consumer after target group

CONCLUSIONS

Interviews conducted with advertisement agencies and focus group members have been the approach used in this research study.

Advertisement designed for Renault has been successful in the manner that it conveys the messages to consumers targeted in the design having fitness between the perceptions of consumers and the planned content. It has found to be efficient in creating the consumer perception desired.

For BMW advertisement there has been a fit between the target market, content and consumers' brand perception. In achieving its targets, the advertisement has been successful but there has been somehow deviation from what is defined as target market. Obviously, although brand side didn't define any target market, consumers perceived an effort has been put to widen target market.

Fiat advertisement has obtained what is expected as consumers' brand perception. Both sides stressed, there has been no wonder about the targeting market. The definition of targeted market has been parallel to that of consumers' brand association.

Toyota advertisement has been successful because of the strong fit between the messages, target market definition and brand association. There has been a deviation between target market definitions of consumers and ad designers. Advertisement producers stated they didn't define market segment but consumers perceived families chosen as target.

ABSTRACT

*Consumers desire continuous and new fashion trends with the changing consumer demands and needs and artificial scarcity introduced by the concept of fast fashion in the current postmodern marketing approach. Thus, corporations who intend to accommodate to these changing consumer demands and behaviors also involved in this process. The company Zara desires to acquire maximum profit in maturity period of the product with the concept of artificial scarcity and gets an advantage against its rivals and leads in the supply chain through the approach of artificial scarcity. Aim of this study is to explain the concept of artificial scarcity in fast fashion and to measure effect of this model on Zara consumers in Turkey. In addition, marketing efforts, supply chain and artificial scarcity with its relations in the product life curve are also expected to contribute in Turkish literature. Research methodology has two stages. The first stage is the technique of in-depth interview with directors of the company ZARA by the qualitative method. In the second stage, questionnaire study will be conducted by the quantitative research method. Relations between the **perceived concept of artificial scarcity** being the independent variable in the research model and **consumer behaviors** as well as **so-called expensiveness, perceived payable money, perceived value and perceived quality** variables being the dependent variables will be explained and interpreted with analyses in SPSS statistics program.*

Key Words: Fast Fashion, Artificial Scarcity, Consumer Behaviors, Supply Chain, Product Life Curve.

INTRODUCTION

Main philosophy of modern marketing is perform marketing activities in fashion concept as well as meeting consumer demand and needs in the fast changing world correctly and effectively. Such corporations responding the consumers on target market accurately and fast are also in a competition with other competitors on the market. Especially in such products with a short life cycle like ready-to-wear, speed of entering the market is a critical component in terms of competitive advantage. Just at that point, we encounter with a brand-new concept, concept of **fast fashion**. “**Fast fashion**” is providing the customer with the newest, last fashion products in stores by creating freedom and excitement of shopping. They are the products shaped with the approaches of fast production, low price, use-and-dispose or “wear for a few times” and offered on the market. Fast fashion retailers must firstly position well on the market and create brand awareness and loyalty in the consumers in order to obtain an artificial scarcity rent. Fashion retailers must be such companies consistent with fashion with the styles exactly desired by the customer in a shorter time than all other companies and take their places of the shelf faster than competitors. This is only achieved by following fashion, stocking their products in certain numbers, developing new designs and creating product diversity. Some consumers stock products not only to consume in the future but also with the fear of non-availability. Decision making process of the consumer is very limited by the effect of new fashion and scarcity factors and these factors lead the consumer to some type of “reflex purchase”. This shows effect of artificial scarcity of product life curve. There are differences between the classical product life curve and the product life curve influenced by artificial scarcity.

LITERATURE REVIEW

1. CONCEPT OF FAST FASHION

Phenomenon of fashion which is directly related to human and society is in the position of a mirror reflecting many formations like thought, habit, lifestyle etc. realized in societies. Fashion comes from “Modus” in Latin meaning limit. It was used in medieval French as La Mode. The words fashion and modern derived from the Latin words *moda*, *modus* and *modernus* mean “just now, not belonging to yesterday”. However, *fashion* in its present meaning is a word used to define topical dressing styles of people in a general sense like way, style, form, manner, action, behavior, speaking, writing, life style. (Pektas, 2008, 1) According to Frisby and Simmel, fashion is a social form combining attraction of differentiation and change with similarity and harmony. Fashion provides people with the opportunity to be different and also to be an individual and provides social belonging ensuring similarity with the reference groups. (Pektas, 2008, 2)

Main philosophy of modern marketing is perform marketing activities in fashion concept as well as meeting consumer demand and needs in the fast changing world correctly and effectively. Such corporations responding the consumers on target market accurately and fast are also in a competition with other competitors on the market. Especially in such products with a short life cycle like ready-to-wear, speed of entering the market is a critical component in terms of competitive advantage (Hayes and Jones, 2006; Byun and Sternquist, 2008, 134). Just at that point, we encounter with a brand-new concept, concept of *fast fashion*.

Term of fast fashion was firstly defined by Moore and Fernie as response strategies to the last trends in fashion in a commercial sense. (Byun and Sternquist, 2008; 134) In another definition, “*fast fashion*” means providing the customer with the newest, last fashion products in stores by creating freedom and excitement of shopping. They are the products shaped with the approaches of fast production, low price, use-and-dispose or “wear for a few times” and offered on the market. (Ghemawat and Nueno; 2003, 1) Fast fashion retailers treat fashion by resembling it to the thought of spoilage of the foods in food sector and offer almost weekly products on the market to remain updated. Since this idea is derived from the idea of “fast food”, it is called *fast fashion*. (Byun and Sternquist, 2008, 135)

There is no consensus in definition of the concept of fast fashion and previous definitions could not fully define the most significant components of fast fashion strategy. Therefore, we may synthesize fast fashion definitions, responding the latest fashion trends or updating products in short renewal period cycles or rapidly changing inventory. Moreover, latest fashion trends follow-up and short renewal cycles are connected to limited sources. In other words, fast fashion retailers stock less products to consume them in a short time interval in order to keep themselves updated. (Dutta 2002, Moore and Fernie 2004; Byun and Sternquist, 2008, 135) The most significant two components of fast fashion strategy are renewal cycle and limited source.

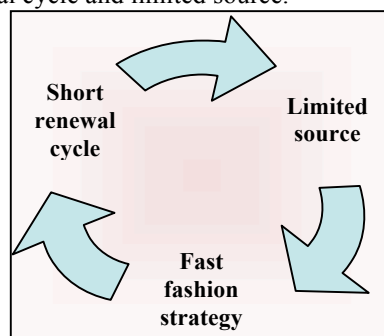

Figure 1. Fast Fashion Strategies

ARTIFICIAL SCARCITY

Prior to proceeding with definition and use of artificial scarcity on the market, concepts of scarcity, scarcity law and scarcity rent are presented below respectively:

Scarcity: It is insufficiency of goods and services to meet human needs. It is a relative concept and economic sources are also considered scarce since they are not sufficient to meet human needs. It requires a good distribution of sources among alternative areas of use due to scarcity. (Parasiz, 1999, p.340; Seyidoglu, 2002, p.352; February 23, 2010, <http://www.metinberber.com>)

Scarcity Law: Basic doctrine of capitalism is established on this concept. It is a doctrine expressing that sources are scarce and human requirements are limitless. According to this doctrine, supply would be insufficient due to scarce sources, so there would be an increase in product prices naturally (Parasiz, 1999, p.340; Seyidoglu, 2002, p.352; February 23, 2010, <http://www.metinberber.com>)

Scarcity Rent: The consideration paid for a scarce source is called scarcity rent. There is a separation between natural scarcity and artificial scarcity. Supply of a source which is naturally scarce is never *flexible*. Owners of such a source may get surplus. Supply of a factor which is classified as artificially scarce, however, is a not fully inelastic. Owner of such a source gets monopoly rent. Source of artificial scarcity includes some limitations arising from law. A patent provided to an inventor, a copyright given to an author, right to participate in some professions and right to carry out some activities create scarcity artificially and provide monopoly rent for their owner. Economic rent is a payment made or attributed for a source beyond the consideration necessary for it to perform its function. Natural limitations and administrative restrictions preventing expansion of supply and monopoly factors cause occurrence of scarcity rent. (www.ekodialog.com 23.02.2010)

Considering in economical terms, explanations above may be sufficient but concept of artificial scarcity has a more different form in terms of marketing. First, a product may not be necessarily a rare asset for being a scarce source. Companies reflect consumers a perception of scarcity which is actually not the case in order to get scarcity rent and maximize their profitability based on scarcity law. Thus, companies may offer the products they produce to consumers without discount or at minimum discount rates and consumers may make payments relatively higher than normal considerations of products.

There are two dominant factors affecting values of fashion. They are *price* and *artificial scarcity*. (Szybillo 1973; Byun and Sternquist, 2008, 137) In general, consumers interpret that higher prices cause artificial scarcity in products or point out that products are relatively non-available. However, Daniels argues that they decrease perceived value in higher priced clothes in middle level mass production. According to Daniels, relatively lower priced products in certain numbers increase their attraction value. In his studies, while available products are in a certain number, value of the products under the effect of artificial scarcity price steps has a more critic significance than value of such products which may be perceived as unique and valuable even if they are at lower prices. (Byun and Sternquist, 2008, 137)

This artificial scarcity is a strategy applied by fast fashion retailers. Certain number of offered products causes a short renewal circle for product range and helps in providing place for new goods. Therefore, availability of products is limited and products are not available in the next time slice. In general, rare raw materials are liked more than those which are easily available. (Lynn 1992; Byun and Sternquist, 2008; 137) Positive value of artificial scarcity is its support from raw material theory of known artificial scarcity effect. (Brock 1968; Szybillo 1973; Byun and Sternquist, 2008, 137) meaning of raw material theory does not include messages, experience or subjects. This theory is parallel with the following three criteria: *being useable, portable from one place to another and having a certain potential*. This theory says in advance that value of raw material would increase due to ongoing perception of non-availability. (Brock 1968; Szybillo 1973; Byun and Sternquist, 2008, p. 137)

Fast fashion retailers must firstly position well on the market and create brand awareness and loyalty in the consumers in order to obtain an artificial scarcity rent. In addition, they must be a fashion retailer strictly following fashion and must have a large design team working hard and a good information network and a good supply chain network. Fashion retailers must be such companies consistent with fashion with the styles exactly desired by the customer in a shorter time than all other companies and take their places of the shelf faster than competitors. Moreover, fashion retailers must keep perceived value and attraction of the products they produce high. This is only achieved by following fashion, stocking their products in certain numbers, developing new designs and creating product diversity. Certain number of products and lots of ranges ensure a shorter product renewal circle and help in minimizing in-store stock levels. Besides, possibility of increase of desired products is less in artificial scarcity due to limited supply, so this causes an increase in consumers' perceptions to the effect that favorite preferences of persons may not be found in the future. Some consumers stock products not only to consume in the future but also with the fear of non-availability. (Frost and Gross 1993; Byun and Sternquist, 2008; 135) Some consumers, however, tend to stock products with the fear of scarcity immediately before they are purchased by other consumers. At the same time, positive value of scarcity of products is its ability to reinforce the idea of product stock automatically. Consumers desiring to get their products timely stock

the products with the intention of minimizing risk perception related to problem of non-availability. (Ten and Chua 2004; Byun and Sternquist, 2008; 137):

Significant approaches of artificial scarcity phenomenon:

- It helps in acceleration of purchasing trend in consumers.
- It affects perceptions of consumers about products positively.
- It enables consumers to pay higher prices for the products they desire to purchase relatively.
- It shortens life course and cycle periods of products.
- It helps in minimizing in-store stock levels.
- It reduces discount rates of fast fashion retailers.
- It helps in delivery of products to more persons since it addresses not only to higher income group but also to middle sized consumers in the consumer audience due to fast retail.
- It allows middle level mass production contrary to lower production level of the fashion products addressing to the higher income group.
- It is also very important for creation of brand loyalty since it creates unique and valuable perception even if it is lower priced relatively.

2. 21ST CENTURY MODERN MARKETING APPROACHES AND ARTIFICIAL SCARCITY STRATEGY

There are many concepts introduced for functionality of marketing activity. In this context, there are various approaches under different names.

Fluctuations, crises in the world economy, e-commerce and virtual communication opportunities provided by internet changed traditional product range, presentation, distribution and transportation methods. Effects of postmodern culture on consumption forms include collective presentation of unrelated products based on location use, utilization of postmodern art in promotion and advertising activities, presentation of marketing communication messages by an eclectic approach. (Babacan and Onat 2009;11)

Therefore, marketing function actively serving in meeting needs of people continues its classical role in economy silently and mostly making soft transitions from one concept to another and embracing a new application almost every day. (Babacan and Onat 2009;13)

As an attractive application in modern marketing approach, concept of fast consumption is applied to the clothing sector and fast shelf cycles are formed fed by lots of ranges. This application also caused changes in consumer behaviors. Strategy of lots of ranges and fast model cycles in the latest fashion products gives rise to artificial scarcity phenomenon in consumers. This artificial scarcity phenomenon runs their purchasing behavior against possibility of fast consumption of products or in their tendency to immediately purchase the product they like very much and causes them to make payment for products when they are at higher prices.

In short, “phenomenon of fast consumption and artificial scarcity” is a postmodern marketing approach which ensured consumers to consume the latest fashion products fast by enabling the companies branded in the global level to feed their products with the concept of scarcity which does not exist actually with the advantage of their brand power, caused consumers to follow brand continuously.

3. PRODUCT LIFE CURVE IN FAST FASHION

Concept of fast fashion is designed as a “policy” for achieving strategic operational goals and targets including increasing profit margin, increasing total sales, creating and/or developing corporate and brand images etc. by designing “differentiation”, “diversification”, “actually a new product” and other “innovative” properties in a certain product in certain intervals and presenting the latest fashion trends to consumers. It is essential to plan operational functions very well to create fast fashion and apply successfully.

For success, it is very important to manage activities of “supply chain” especially including supply, production, inventory management, stock policies, transportation, after-sales activities, pricing and discounts, performance measurements, relational marketing, technology and information management (Birgun et. al., 2007; 35). In normal course, considering fashion as a movement which occurred by the effect of local and global factors and being changed in a cyclic manner, phenomenon of “Fast Fashion” provides high contribution margin and recovery of investment (if made) in a short time for the product since it enables corporations to lead consumers by using various marketing methods acting proactively and it both satisfies feelings of the consumer to be the first and to gain prestige and causes the corporation to supply an innovative product to the market by creating a fashion trend very shorter than normal. For successful change by fast

fashion; the following factors must be considered and must exist. They also play an effective role in creation of concept of fast fashion.

Table 1. The things which must be done for corporations in creation of fast fashion

➤	Brand image must have been created.
➤	The corporation must be well-known by national and international markets in a corporate sense. (Corporate image)
➤	It is necessary to create a quality image to the extent expected by target consumer audience.
➤	It may offer effective after-sales services.
➤	It is essential to establish top level of communication with consumer. (relational marketing)
➤	Logistics/transportation activities
➤	Number of audit of supply sources
➤	Production locations (own plants of corporation and/or contract manufacturing)
➤	Raw material and material stock control and management
➤	Sales policies (Sales in own stores, sales through dealers etc.)
➤	Strategic sales points and coordination between sales points
➤	Effective use of marketing information system
➤	Cost and sales analyses
➤	Performance analyses
➤	Determination of customer satisfaction and future expectations

Life cycle of the products used in creation of fast fashion:

In general; it is observed that all living and lifeless creatures in the world undergo a set of stages from birth to death. They are seen as a process including birth, growth, maturity and death. The process in question is considered as “Product Life Cycle” in marketing literature and consists of the processes of entry on the market (presentation of the product to the consumer for the first time), growth (increase in sales on the market), maturity (continuation of a certain sales level in case of severe competition and saturation point of consumer) and finally decline representing the processes of presentation of innovative products on the market and fast decrease in sales due to resistance of consumer demand against the said products, removal of product from the market or keeping it for further some period on the market by various marketing methods.

Significance of Product Life Cycle for Corporate directors is required by application of different product price, promotion, distribution and after-sales service policies at life cycle stages of the product. Normal life cycle of a product supplied by a corporation on the market under the established marketing strategies is given in the following graphic.

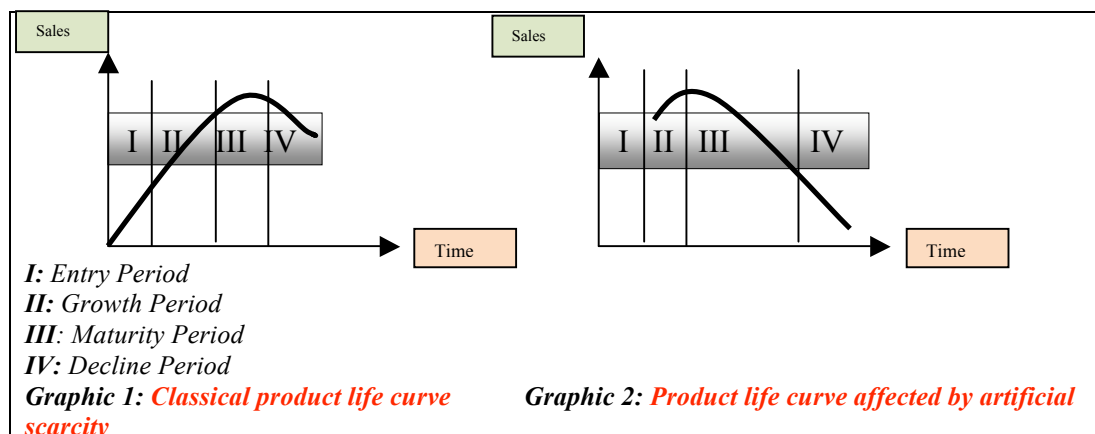

Figure 2. Classical Product Life Curve and Product Life Curve Affected by Artificial Scarcity

In such products being subject of fast fashion, however, the consumer essentially waits innovation periodically due to position of the corporation creating the fashion on the market and gets information about the fashion and follows both national and international fashion trends. Thus, he has sufficient information about the products presented as new fashion. (Conscious Consumer)

This case, in turn, directs purchasing decision process of the consumer; limits it very much and lead him to some type of “reflex purchase” by the effect of new fashion and non-availability (scarcity) factors.

For the reasons summarized above, life cycle of the products under fast fashion has significant differences than normal. To the effect;

1. **Period of entry on the market:** Since consumer is conscious, entry period is exclusively short or there is no entry period. Aim of the consumer is to create privilege in society by purchasing the product supplied in a low number in the established price level.

2. **Period of growth:** Basically, it is short since investment made for the product/products considered by the consumer as innovative and fashion in entry period is retaken in the first period and sales increase above normal due to “scarcity” policy of the corporation. It is possible for competitors to put similar products and imitative products on the market in this period.

3. **Period of maturity:** In this period, there is a decreasing trend since the consumers perceiving the concept of fast fashion mostly made their purchases at the beginning but introduced “new fashion” created new consumers and led them to purchase and it may be longer than the period of growth normally.

4. **Period of decline:** As required by the application of fast fashion; where the new (innovative product placed on the market achieved the sales and profit targets established by the corporation and it is necessary to create a new “fashion”, it is the stage of recalling the product or products from the market or returning them in normal statuses with various differentiation applications.

4. RESEARCH

The aim is to reveal the relation model between perceived artificial scarcity concept being the independent variable in the research methodology and consumer behaviors (desired purchasing behavior) being the dependent variable with statistical analyses.

Considering the frequencies for demographic variables, 159 valid questionnaires, mostly visited Zara Store is cevahir store followed by Capacity, Town Center and Ankamall stores. Given the frequencies of visiting Zara stores, variable of 1 visit per month is the mostly selected option with 58 answers. 30% of the participants are men and 70% of them are women. 65% of the participants are single and 32% of them are married with 3% widow. More than 40% of the participants include young person in between the ages of 21-25. 45% of the participants are graduate, 27% are postgraduate and above and 22% are undergraduates. In addition, most of them are undergraduates by 27%, private sector officers and civil servants by 22%.

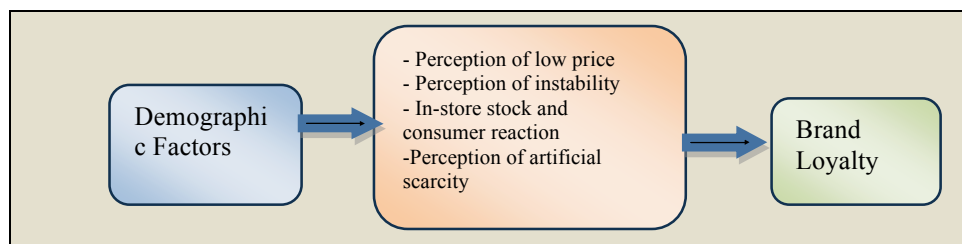

Figure 3. Research Model

All of 23 questions (before excluded questions) in the questionnaire form were made subject to factor analysis by basic components method and Varimax turning method. 4 questions with a factor weight below 0.50 were excluded and 19 variables were undergone factor analysis. All variables were collected under 4 factors following factor analysis. KMO value showing consistency with factor analysis was found high about 0.829. Cronbach Alpha (reliability) values of variables were assessed and Cronbach Alpha (reliability) values of all variables were found as 0.859. This shows almost a perfect result. Respective reliability values of factor analysis groups also provided good results. All data results are shown in the table above in detail. These Factors: **Low Price Perception, Perception of Instability, In-store Stock and Consumer Reaction, Perception of Artificial Scarcity.**

Table 2. Factor Analysis Results

Name of Factor	Question Expressions	Factor Weights	Expressiveness of Factor (%)	Reliability
1. Perception of low price	• Prices are very favorable in Zara stores.	0,905	17,930	0,921
	• Zara branded products are economic.	0,883		
	• Prices are appropriate for my budget for shopping for clothes.	0,853		
	• Zara branded products are not expensive.	0,849		
2. Perception of Instability	• Zara brand introduced new fashion styles in its stores fast.	0,855	17,243	0,846
	• New models are promoted in Zara stores frequently.	0,773		
	• Products in Zara stores are consistent with fashion trend and styles.	0,756		
	• Cycle speed and circulation of products are very high in Zara stores.	0,723		
	• Products in Zara stores move very fast.	0,668		
	• Products in Zara stores do not wait on shelves very long.	0,509		
3. In-store Stock and Consumer Reaction	• I collect the products I am interested in Zara stores fast and keep them for myself.	0,794	16,790	0,760
	• Although I am not sure to purchase the products in Zara stores, I do not want to leave back the products that I already collected.	0,793		
	• I find a way to purchase such things that I desire to immediately buy in Zara stores although they are not included in my shopping list.	0,740		
	• I purchase products in Zara stores immediately and rapidly (I catch them)	0,612		
	• I make excessive payment to buy products during shopping in Zara stores.	0,567		
	• I am driven to buy the product with an expression on it like "Limited in stock!".			
4. Perception of Artificial Scarcity	• Products that I am interested in Zara stores are generally the products which are little in stock.	0,804	10,643	0,670
	• Sizes, colors and styles of the products in Zara store are in a limited number.	0,777		
	• It is difficult to find a product that I am interested in Zara stores when I visit the store for the second time to but that product.	0,542		

Table 3. Regression Analysis:

Model	R	R Square	Adjusted R Square Value (Adj. R ²)	Estimated Standard Deviation
1	0,547 (a)	0,299	0,282	0,544

The table above shows expressiveness of independent variables on dependent variables following regression analysis of research model and participants' levels of loyalty to Zara stores. R square value is below the value of 0.50 (0,299) indicating store loyalty levels of Zara customers are not very strong. However, it may be also interpreted as a value not very low within the Turkish market.

Table 4. Regression Analysis Coefficient

	Beta	St. Error	St. Beta	t value	p value (sig.)	VIF
Fixed value (Constant)	3,615	0,043		83,658	0	
Perception of low price	0,054	0,043	0,084	1,247	0,214	1
Perception of instability	0,248	0,043	0,386	5,720	0,000	1
In-store Stock and Consumer Reaction	0,226	0,043	0,352	5,220	0,000	1
Perception of Artificial Scarcity	0,089	0,043	0,139	2,055	0,042	1

In the table for regression analysis result above, those p values taken by the factor groups below 0.05 were selected and loyalty value was determined by the groups contributing in the group including the 2nd factor (Perception of Instability); 3rd factor (In-store Stock and Consumer Reaction) and 4th factor (Perception of Artificial Scarcity) which are statistically significant. In the model, the factor providing the highest contribution in loyalty value is the 2nd Factor being perception of instability.

Hypothesis tests: T test and Anova analysis were performed between factors groups and demographic characteristics one by one. In t test, there was no difference in hypotheses between gender and factor groups. In Anova analyses, however, a significant relation was found only between educational background and marital status between all factor groups and demographic variables. Results of these hypotheses are given below. There was a significant relation between educational levels and the 4th Factor.

H0: There is not a significant difference between educational background and perception of artificial scarcity of the participants.

H1: There is a significant difference between educational background and perception of artificial scarcity of the participants.

Zero hypotheses is rejected since p value is $0.049 < 0.05$ following the single-way variance analysis (anova) performed for comparison of educational background of the participants and their reactions to artificial scarcity variable, alternative hypothesis is accepted. Tkeu and Scheffe were applied among post hoc tests in order to find the group creating difference. Accordingly, those graduated from high school got the highest score and graduate and post graduates got the lowest score.

H0: There is not a significant difference between the participants in terms of in-store stock and consumer reaction by their marital status.

H1: There is a significant difference between the participants in terms of in-store stock and consumer reaction by their marital status.

Zero hypotheses is rejected since p value is $0.07 < 0.05$ following the single-way variance analysis (anova) performed for comparison of educational background of the participants and their reactions to artificial scarcity variable, alternative hypothesis is accepted. Accordingly, there is a significant difference between the participants in terms of in-store stock and consumer reaction by their marital status. The group creating this difference is the group of single participants with the highest value.

Factor groups were examined one by one with loyalty variable from hypothesis tests. There was no meaningful relation between loyalty average and factor groups.

5. RESULT AND EVALUATION

Fast fashion and concept of artificial scarcity provides a benefit as a different policy to provide the consumer with the latest fashion trends through differentiation, diversification in certain products in

certain intervals and design of innovative products and thus to increase total sales, establish corporate and brand image and reach strategic corporate goals and targets.

In research part of the study questionnaires were applied to 159 consumers by convenience sampling method. Frequency analyses, regression analysis and factor analysis were interpreted in SPSS statistics program. In the research model, effect of demographic characteristics on low price perception, perception of instability, in-store stock and consumer reaction and perception of artificial scarcity was examined and its effect on the dependent variable brand loyalty was examined. Following Factor analysis, questions were collected under 4 factors according to data results of the participants of the research. They include *low price perception, perception of instability, in-store stock and consumer reaction and finally perception of artificial scarcity*. Meaningful relation between factor groups and demographic characteristics was examined by T-test and Anova tests. Following hypothesis tests, a meaningful relation was found only between educational levels and marital status. Factor groups were examined one by one with the loyalty variable from hypothesis tests. No meaningful relation was found between loyalty average and factor groups. This shows that store loyalty levels of Zara customers are not very strong. However, it may be said that it is not so low in the Turkish market. In regression analysis, the factor with the highest contribution in the loyalty value being beta value is the 2nd factor Perception of Instability. Here, the most determinant variable in level of loyalty of consumers to the brand is perception of instability in creation of artificial scarcity.

Concept of artificial scarcity in fast fashion and production of artificial scarcity perception in the consumer following the study titled “Zara Turkey” attracts attention as an effective marketing approach to speed up purchasing trends, shorten course of product life curves and speed up cycle times and also to minimize in-store stock levels and reduce costs and enable companies to sell their products without discount. Companies are able to maximize their profits since they can sell their products without discount or at the minimum discount rates. Based on the variables and research results in the light of this study, corporations may apply the concept of artificial scarcity and get high profits with low stock management. This study is intended to provide positive contributions in academic literature and business world with its contribution in the Turkish literature.

THE IMPACT OF GENDER AND EDUCATION ON PERCEPTIONS OF ORGANIZATIONAL REPUTATION

Ayşe Oğuzlar
Mehmet Eymen Eryılmaz

Uludağ University, Turkey

ABSTRACT

This study researched whether there are differences between sub-stakeholder groups related to importance levels and ranks of reputation-determining factors. This question is of great importance because if variables such as gender and educational status create sub-stakeholder groups influencing the perception of the organizational reputation, then organizations will have to prepare a separate reputation message for each sub-stakeholder group. In addition, such a situation may affect intra-organizational dynamics and change the balance of power among units. Also, some managerial positions may gain importance and legitimacy at the expense of others. The findings were determined using the Analytic Hierarchy Process (AHP) method and some additional statistical analyses revealed that the importance order and level of the reputation-determining factors, differentiate partially in terms of gender and to a great extent in terms of educational status. The findings of this study point out that organizations should strategically shape their reputation messages in terms of gender and educational status and reputation building is indeed a much more complicated task than has been stressed in the majority of related literature to date.

Keywords: *Organizational reputation, sub-stakeholder groups, analytic hierarchy process, freewill, environmental determinism, hotels, Turkey.*

INTRODUCTION

Reputation is a concept which has increasingly drawn the attention of both management-organization studies and other literature (e.g., Abramowitz, (1975) and Caldeira (1983) in political science; Raub and Weesie, (1990) in sociology; Grunig (1997) in education; Bar-Isaac (2003), Horner (2002) and Tadelis (1999) in economics). 99% of CEOs who participated in a survey supported the idea (Resnick, 2004) that the reputation of an organization is more important today when compared to the past. On the other hand, although the difficulties in managing this concept have been focused on extensively in related literature, some possible sources of difficulty such as the existence of sub-stakeholder groups, which have to be taken into account, remain untouched to a large extent.

It is possible to say that there are three main schools of thought in organization theory literature, dealing with environment-organization relations, which is accepted as one of the central debates of organization theory (Astley and Van de Ven, 1983). The first of these, the *environmental determinism* school (Hannan and Freeman, 1977, 1984), constructed on a social Darwinism approach to a great extent, suggests that organizations do not have much opportunity to choose, and the survival of an organization is 'granted' by its technical (task) or economic environment. Since the proponents of this perspective tend to view managers as generally superfluous (Hambrick and Finkelstein, 1990), it can be expected that this school of thought regards the concept of reputation as an almost absolute given from the environment to the organization. Another school of thought, the *voluntaristic* or *strategic choice* school (Child, 1972; Montanari, 1978; Whittington, 1988, 1989), suggests that organizations and their managers have more than sufficient opportunity to shape their own fates. It is possible that this school considers a high and positive reputation mainly as a consequence of 'actions' of 'agents'. The dominant paradigm in current reputation literature seems to be consistent with this perspective to a large extent. Finally, the third school of thought, the *reconciliation* school claims that both environment and organizations shape each other reciprocally and suggests 'a dialectic between free will and determinism' (Bourgeois, 1984). Therefore, the reputation of an organization is influenced by its environment but the organization also may contribute to reconstruction of the environment through its reputation.

The purpose of this study was to understand whether gender and educational status of individuals are possible determining factors in the shaping of reputation perceptions of organizations, in addition to national culture and stakeholder groups. If variables such as gender, educational status, age, marital status, income level, religion, ethnicity, occupation and political view influence the perception of an organization's reputation, then the

organization will have to prepare a separate reputation message for each sub-stakeholder group and deliver this message to the related group in a proper manner. In this context, if the predicted results are obtained, this will support the eclectic idea (e.g., Bourgeois, 1984; Hambrick and Finkelstein, 1990; Pfeffer and Salancik, 1978) consistent with the third school of thought suggesting that in the formation of reputation, the organization does not have absolute freedom of will, but neither is it completely bound by the environment. If the findings are consistent with our predictions, this may engender important and sometimes *asymmetrical* results at different levels of analysis. For example, a drastic change or diversification in beliefs, a '*post-paradigmatic diaspora*' (Lather, 1992 cited from Caputo, 1987), within organizations regarding reputation management concept and professionals emerge and the power relations between departments in organizations may radically change as a result. In addition, although reputation is sometimes depicted as 'the outcome of legitimation processes' (Rao, 1994: 30), some scepticism regarding peremptory manageability of reputation is likely to erode the legitimacy of some managers and units. For instance, the emergence of a belief concerning the unmanageability of organizational reputation to a large extent, may bring on a questioning of the '*moral*' and notably '*pragmatic legitimacy*' (Suchman, 1995) and existence of reputation management departments in organizations. In this situation, these managers may seek to develop some '*remedial tactics*' (Giacalone, 1988 cited from Goffman, 1971) and strategies to re-legitimize their positions in the eyes of the principals and the whole of society. Or, on the contrary, a perception relating to difficulties in the management of reputation may also consolidate the public relations or reputation managers' positions in some organizations. In short, it can be said that these new beliefs about manageability of reputation seem to have the potential to create major changes in organizational dynamics regardless of the directions of these beliefs. A possible plethora of reputational variables can also trigger off significant results for other levels of organizational analysis as well. For example, the emergence of abundant variables which have to be taken into account during the efforts of reputation-building may bring on a '*polypraxism*' (Erlingsdottir and Lindberg, 2005) regarding the reputation practices among organizations in an organizational field. In other words, as put forth by Morris and Lancaster (2006: 209), 'even if the packaging stays the same' to a great extent, the content may change. With this aim, in the second section of this paper, the literature relating to the concept of reputation and some possible complications in its management is reviewed, then the research methodology is described in detail. The findings of the study are given and finally, the conclusion is presented.

ORGANIZATIONAL REPUTATION CONCEPT, FORMATION PROCESS AND SOME POSSIBLE DIFFICULTIES IN ITS MANAGEMENT

There are several studies defining the concept of organizational reputation in various ways. For example, according to one study, reputation is the consequence of a process during which the organization delivers the information about itself in the form of signals to the environment, in order to maximize its social status (Shapiro, 1983). In another study, Fombrun and van Riel (1997: 10) explain the concept of organizational reputation as a 'collective and subjective assessment of the reliability of the organization, based on past performance of the organization'. Also, Morten (1998: 122) defines reputation as 'an element which facilitates economic transactions in an indefinite world'. According to another definition, 'reputation is the perceptions of an individual, group or many groups about the organization after a certain period of time' (Balmer and Greyser, 2002: 76). Finally, Argenti and Druckenmiller (2004: 369) define organizational reputation as 'the collective representation of multiple constituencies' images of a company built up over time and based on a company's identity programs, its performance and how constituencies have perceived its behavior'. In some studies it is possible to find that reputation is used as a synonym for image and identity concepts. However, contrary to the "*analogous school of thought*" (Gotsi and Wilson, 2001), the authors of this study believe that the concept of reputation is different from that of image and identity. The reasons behind this belief will be dealt with later in the study.

There are various reputation models with different steps in literature which endeavor to clarify the process of reputation formation (e.g., Deephouse, 2002). However, it is possible to note that organizational reputation emerges after a two-step process. The first step is that, in a world of imperfect information, signals about the organization reach the minds of individuals or groups, to form a reputation perception. The information about the organization can either be acquired through direct contact of the subjects with the related organization or through other subjects who had a former experience with the organization or through media organs (Gotsi and Wilson, 2001). In the second step of the process, by interpreting the information, the individual or group determines a reputation level in their mind.

Organizational reputation is a concept with inherent difficulties regarding its management. If the organizations are in direct contact with the related subjects at the first step of reputation formation, they have to deliver an accurate message in a proper way, in order to establish a positive and strong reputation. Another problem is that at this step the sources of information about an organization are sometimes other subjects and the media. In this situation, it will be rather grueling for the organization to intervene with signals about itself and transmit them to related subjects. It is possible for some large-scale organizations to control the delivery of information about themselves to a certain extent by co-opting media organs (Sönmez, 1992), but only a few organizations can benefit from this. Lewellyn (2002: 453) supports this, stating ‘Although firms cannot control the initiation of image messages by external sources, for example, the media...’.

At the second stage of the process, the difficulty in the management of reputation stems from the high number of variables to be taken into account. Organizations in the international arena in particular have to manage the concept by considering national cultures and different stakeholder groups in each culture. For example, the study of Poon and Low (2005) suggests that, while assessing hotels, western and Asian tourists attribute different importance degrees to the offered criteria. In another study, Gardberg (2006) notes that, unlike the negative reputation in North America, Philip Morris have a quite positive reputation in Italy. Wang and Wang (2007) also draw attention to the concept of “consumer nationalism” and contend that organizations that want to solidify their reputations in China, should take into account nationalism and comprehend contemporary Chinese consumer behavior. Finally, according to Nişancı (2002), the Republic of Turkey was contrasted with the Ottoman Empire by the founding elite of the republic. In this dichotomy, the Ottoman Empire has been portrayed as traditionalist and patrimonial whereas the young Republic of Turkey is identified as modernist. On the other hand, numerous *sine qua nons* of the modernism discourse such as constitutional state, political parties, democracy and secularism have not been completely transformed into the reality in this setting. Then, this context has enabled governments to adopt a neo-patrimonial political stance. Also, one of the hallmarks of the Turkish economy is the role of the state as a dominant actor (Özen, 2002). In the Turkish context, since neo-patrimonial and statist stances are largely dominant in respectively politics and economics, the robust and close relationships with the state may be one of the most important factors shaping perceptions of various groups concerning the organizational reputation. So, considering the values, beliefs, norms and context of each culture, organizations in contact with different national cultures have to create a message, on which their reputation will be built.

In addition, organizations have to prepare a different message for each stakeholder group in each country. As is known, stakeholders are the groups which have an interaction with the organization, which steer the attitude of the organization and which, at the same time, are influenced by them (Freeman, 1984). Stakeholder group examples may include employees, shareholders, customers, suppliers, distributors, industry partners, competitors, unions, investors, trade unions, regulators, activist groups, non-governmental organizations and general society. While determining organizational reputation, each of these stakeholder groups deals with different information segments related to the organization (Fombrun and Shanley, 1990; Fombrun and van Riel, 1997). For example, the investors constitute an organization reputation in their minds, focusing primarily on financial information such as profitability and rates of return to investments, whereas customers will first seek to obtain information regarding the product and service (Dentchev and Heene, 2004). Also, reputation elements sought by employees may be salary, job title, job security and career opportunities (Goldberg, Cohen and Feigenbaum, 1993). In a similar vein, Cable and Graham (2000: 929) indicated that ‘the type of industry in which a firm operates, the opportunities that a firm provides for employee development, and organizational culture affect job seekers’ reputation perceptions’. Finally, consistent with these claims and findings, Helm (2007)’s reputation research also revealed that 98.7% of the consumers who participated in her study, expressed an opinion about the product quality of a firm. However, only 61.7% of them commented on the issue of “treatment of employees”. So, even if the organization has outstanding performance in issues such as product-service quality, leadership and vision, social responsibility, workplace environment, emotional appeal and financial efforts (Fombrun, Gardberg and Sever, 2000), unless it delivers accurate messages to different groups, it will face the risk of failing to turn this success into a high reputation (Dollinger, Golden and Saxton, 1997).

Within stakeholder groups, sub-groups, or in other words sub-stakeholder groups with common characteristics such as gender, educational status, age, marital status, income level, religion, ethnicity, occupation and political view may emerge and these sub-group identities may profoundly affect individuals’ perceptions and expectations. For example, Min, Min and Chung (2002: 279) found ‘a systematic pattern between the occupation of male tourists and their patronage behaviors’. Also Yancey and his colleagues (2006) revealed that overweight self-perception of individuals is affected by their ethnic variations. In another study, Allensworth-Davies and his friends (2007) indicated that racio-ethnicity of nursing assistants is associated with their perceptions regarding

organizational cultural competency. Finally, Ou (2007) showed that age and income positively moderate the relationship between reputation and respectively travel time and shopping expenditure. These studies testify the importance of emphasized characteristics in perceptions and expectations.

In this study when the customer stakeholder group is divided into gender and education sub-groups, it is asserted that the importance orders and degrees of these elements which shape reputation perceptions of these sub-groups may differ. Only the variables of gender and education were taken into account in this study, since gender (Harper and Schoeman, 2003: 517) and education may be two of 'the most salient and ubiquitous social categories'. Consistent with this idea, Bussey and Bandura (1999) regard 'gender' as a basic element in human differentiation. In the literature, although there are some studies which report indifferences of various issues between genders (e.g., Beutell and Brenner, 1986; Ragins, 1991), there are numerous studies as well which exhibit the impacts of gender and education level on values, perceptions, expectations, attitudes and behaviors of individuals. For instance, Izraeli (1987), in her study which examines the relationship between sex and the evaluation of direct and indirect influence tactics among Israeli managers, found that the interactions between genders of observers and genders of managers affect the perceptions regarding the effectiveness of the managers. Giacalone (1988) reported that acceptance of an account as an indicator of leadership depends on the previous history of misappropriation, genders of the observers and genders of the directors who employed the account. Similarly, the findings of a study which regarded gender as a potential variable affecting the perception and attitudes toward political behavior in organizations, showed that male employees are more tolerant of political behavior than women employees (Drory and Beaty, 1991: 250). In another study, Sweeney and McFarlin (1997: 92) indicated that 'the relationship between procedural justice and various organizational outcome variables were generally stronger for women than men'. Lee and Farh (1999)' findings, contrary to their hypothesis, showed that gender was a moderator variable between the perception of distributive justice and trust in a supervisor. By the same token, McColl-Kennedy, Daus and Sparks (2003) also revealed that there were significant differences between male and female respondents regarding their perceptions of how service recovery should be handled. In addition, Bakar, Akgün and Al Assaf (2008)'s findings showed that patients with a higher level of education had a high-expected service score difference. Finally, Gyekye and Salminen (2009) also revealed a positive association between educational attainment and perceptions of workplace safety. Gender and education also seem to be salient characteristics of the judgment process in the hotel industry. Min, Min and Emam (2002), for instance, indicated that male customers have a greater tendency to stay at a hotel for a business trip than their female counterparts, whereas female customers have a greater tendency to stay at a hotel for a pleasure trip than their male counterparts. The purpose is to indicate a process, in which, in addition to national culture and expectations of stakeholder groups, management efforts concerning organizational reputation should take the characteristics of sub-stakeholder groups into account. In other words, the purpose is to indicate that the construction of organizational reputation is not an effortless task.

METHOD

As previously stated, the purpose of the study was to determine whether there is a difference among sub-stakeholder groups in terms of reputation perceptions. The study was designed for hotels because former reputation studies (e.g., Carmeli and Tishler, 2005; Chu and Fang, 2006; Helm, 2005; Omar and Williams, 2006) generally seem to have focused on manufacturing organizations. Although there have been studies analyzing the reputation of organizations in the service sector (e.g., Baden-Fuller and Ang, 2001; Baden-Fuller, Ravazzolo and Schweizer, 2000; Bennett and Gabriel, 2001; Carmeli and Tishler, 2004), as far as we know, only a few studies have focused on the image (e.g., Kandampully and Suhartanto, 2000; Lewis 1984; Nguyen, 2006) and reputation of hotel enterprises. It was also observed that the studies which directly focused on organizational reputation concept and which were based on hotels were carried out by practitioners (e.g., Manson, 2006) rather than from an academic environment (e.g., Wirtz, Kum and Lee, 2000). Focusing on a new empirical field may facilitate a strengthening of the consciousness that reputation building factors and/or their importance levels and orders may vary depending on the industry, the stakeholder groups in these industries and subgroups under these stakeholder groups. However, in accordance with the proverb that there is no rose without thorns, a new empirical field may also have difficulties in addition to its advantages. For example, there are frequently no strong theoretical bases on which the researchers may easily construct the study. Thus, these projects often require hard work and patience.

In this study, to analyze the difference between the sub-stakeholder groups, customer stakeholder groups were selected because customers are the most strategic group in determining the organization reputation according to various studies (e.g., Kitchen and Laurence, 2003; Wiedmann and Buxell, 2005). In addition, as a stakeholder group outside the organization, the customers are important for distinguishing the concept of organization reputation from the concept of organization identity. According to Whetten and Mackey (2002), organization

identity is based on messages sent by the organization towards internal stakeholders. In this sense, carrying out the study on an out-of-organization group like customers is advantageous in stressing that the study did not focus on organizational identity. Also, as was mentioned earlier, since they seem to be the most prominent social categories (Harper and Schoeman, 2003), educational and in particular gender characteristics of the customer stakeholder group were taken into consideration in this study. Indeed, these categories seem to have a profound effect on the perceptions of individuals. However, since related studies have been mentioned in the theoretical part of this study, we will not deal with them again here.

To this end, the first phase of the study involved asking 76 hotel customers selected completely at random to rank the attributes that distinguish the five-star and resort hotel that they considered to have the highest reputation from other hotels. During the process of random sampling, respondents who participated in the current study from a university in Bursa/Turkey, were selected from the telephone directory of the university. Then, the researchers confirmed that all participants had at least two experiences in different hotels. These customers were first given some brief information about organizational reputation because, as Yang and Grunig (2005) mentioned before, one of the most difficult tasks in reputation research is to clarify the differences between reputation and similar concepts in the participants' minds. There are some studies within literature (Dowling, 1993) in which the concepts of reputation and image are treated as synonymous. However, this study, parallel to the Gotsi and Wilson (2001) perspective, which is called the '*differentiated school of thought*', differentiates between the concepts of organizational reputation and image by applying the premise that a number of experiences combine to create customers' perception of the hotel that they consider to have the highest reputation. For the concept of reputation, as opposed to the more instantaneous concept of image (Balmer, 1998; Gray and Balmer, 1998), is based on information gathering and takes time to establish (Fillis, 2003; Fombrun and Shanley, 1990; Herbig and Milewicz, 1997; Mahon, 2002; Şatır, 2006). Moreover, reputation is the product of a competitive, that is to say comparative, process. Thus consideration was also given to customers' experiences not only at the hotel that they considered to have the highest reputation but also at other hotels. At this point, the interviews were semi-structured and conducted by the researchers. Some of them were one-to-one and the others were group interviews (Fielding, 1993). The researchers also prepared probes and alternative questions for the main questions in the interview form to clarify the understanding of the participants (Boddy, 2005). The time for the one-to-one interviews ranged from 15 to 25 minutes. Some of the participants presented their attribute lists to the researchers at a later date. Finally, the most frequently mentioned criteria were included on a list of points raised by customers with reference to reputation, while those that received little emphasis (fewer than ten mentions) were eliminated from the list. This procedure was necessary because had certain criteria not been eliminated from the combined list containing the criteria elicited from 76 people, the amount of data would have been unwieldy from the point of view of analysis.

In the second part of the study, in interviews conducted with specialists who were included in the study with a convenience sampling procedure and systematically selected customers from the telephone directory of the university, main criteria or related sub-reputation criteria were determined from those in the list. In other words, the hierarchical relationships between the criteria were set. Main and subordinate criteria were determined through dual comparisons of customers and benefiting from participant managers' advices. The interviews were conducted with 15 customers and 4 hotel managers from 3 different hotels, 2 of whom were public relations specialists and 2 of whom were marketing managers. Interviews with hotel managers were conducted in their offices during work hours. The determination of the hierarchical relationships between the criteria with the support of the practitioners, hotel managers, might serve to increase the content validity of the study. In this part of the study, participants' ages ranged from 26 to 57. These interviews lasted for 1-1.5 hours and were carried out as semi-structured interview (Aaker, Kumar and Day, 1998).

In the third phase of the study, 336 people identified as hotel customers and who live in the city of Bursa, were asked to rank the basic and subordinate criteria that had been established in the previous phase. The sampling process was conducted using the convenience sampling of non-random sampling methods. This is because AHP requires face-to-face interviews to be conducted with customers. This procedure, in particular the explanation of the method, takes a considerable amount of time. It is thus quite difficult for researchers to find customers who are willing to participate in the study. However, it is noted in the calculation tables that when the size of population is more than 100,000, the size of the sample should be about 321 at $p < .05$ level (e.g., Bayram, 2004). Thus, it can be said that the sample size was adequate to a great extent. The interviewees' occupations varied: academic, accountant, baker, banker, civil servant, civil engineer, florist, grocer, mechanical engineer and so on. This variation in occupations of interviewees may also increase the external validity of the study. The ages of interviewees ranged between 20 and 78. The other information about the interviewees is given in Exhibit 1.

EXHIBIT 1: Demographic data of participants in the study

Education level: High school and lower education/ University and higher education	57	279
Gender: Male / Female	162	174

The interviews were structured and conducted by the researchers. Since senior management did not let the researchers perform interviews in their hotels for any part of the study, the interviews were largely conducted in the campus of a university and in the food court of a mall. While some of them were one-to-one, some of them were group interviews comprising 6-12 interviewees. To promote internal reliability, both of the researchers were present at many of the interviews. In the interviews conducted with customers, each basic criterion was subjected to a two-way comparison with the other basic criteria, while each subordinate criterion was subjected to a two-way comparison with other subordinate criteria in its group. For example, the criterion of 'internal appearance' was compared by customers with the only other criterion in its own group and level of 'external appearance'. Preferences were rated on a scale of 1-9 recommended by Saaty (1982) as shown in Exhibit 2. The interviews were non-taped and comparisons were typed quickly onto tables prepared before the interviews. The interviews generally lasted between 10 and 15 minutes. All interviews in the three phases were conducted between April 2006 and August 2008. All participants were Turkish and living in the city of Bursa, which attracts thousands of people from different regions of Turkey every year due to its extensive employment opportunities in automotive, textile and furniture industries.

In the current study, the Analytic Hierarchy Process (AHP) method was employed. AHP, which was selected to test the assertions of this study, was developed by Saaty (1980) to cover the provision and planning needs of the scant resources of the army. The purpose of AHP is to display the hierarchical relationship between the criteria that the evaluator uses when selecting the alternatives. AHP is a managerial decision-making tool, which has proven itself, but at the same time, can possibly have negative consequences if used improperly (Cheng, Li and Ho, 2002). In management literature, it is possible to see that many studies (e.g., Cheng, Zhang, Ye and Xia, 2006; Liang, 2003; Reisinger, Cravens and Tell 2003; Timur and Tüzüner, 2006) have used AHP.

For many reasons, AHP was used in this study in preference to other reputation measurement tools. The first, being that, since the main aim of the study was to determine priority relationships among reputation factors rather than to measure reputation level, AHP was more appropriate for the purpose. In addition, one of the benefits of AHP is that unlike other reputation measurement tools, AHP offers the possibility of making dual comparisons of reputation criteria and indicating hierarchical relationships between the criteria. For example, in this study, if interviewees rated reputation factors on a five point Likert scale, they had to attribute an equal score to two different factors which have very close but different importance levels and orders in their opinions. On the other hand, detailed dual comparisons in AHP may avoid this danger. Since this study entails intricate dual comparisons, AHP seems a proper device for the current study. Another advantage of the method is that the data is easily offered to related people (Deshmukh and Millet, 1999). Indeed, the researchers shared some findings with managers in the hospitality industry who were curious about the findings of the study, and observed that the managers easily grasped and interpreted the findings.

In addition, criticisms of other measurement tools were also influential in the selection of AHP as the method for the current study. For example, one of these tools, "Reputation Quotient Method (Fombrun *et al.*, 2000)" is criticized by some academics (e.g., Bromley, 2002) since the same measurement tool was applied to more than one stakeholder group with a different point of interest in the organization. Consistent with this idea, Fombrun and his colleagues attest that reputation-determining factors are common and can be used for all stakeholder groups. However, weights or importance levels of the factors vary depending on the groups (Helm, 2007 cited from Fombrun and Wiedmann, 2001). Fryxell and Wang (1994) also suggest that "Most Admired Companies" survey which is another important measurement tool used in many academic studies (e.g., Carter and Ruefli, 2006; Dollinger *et al.*, 1997; Hamori 2003; Roberts and Dowling, 2002; Staw and Epstein, 2000) and which is conducted by Fortune is financial-based and thus inadequate for measuring general company reputation. Mahon (2002), also claimed that this tool was based on financial success criteria and thus it would be more appropriate to rename this survey as "Most Financially Admired Companies". Due to the criticism brought to existing reputation measurement tools and the fact that these measurement tools fail to fully serve the objectives of the study, the researchers preferred to use the AHP method. On the other hand, it could be claimed that in the current study our measure just focuses on issues of service and seems to suffer from the same inadequacy. However, there is an important difference between our measure and other reputation measurement tools. These tools, discussed above, had been constructed before the interviewees completed them. Therefore, there was no alternative for interviewees belonging to different stakeholder groups and interested in different areas of

information relating to the organization except for evaluating financial performance of the organization as an indicator of reputation. In contrast, in our tool, the factors shaping organizational reputation were determined by the customers and this tool was then presented to the customers (same group) again. They then compared these factors in terms of their importance level and order. The same process may be conducted with different stakeholder groups to obtain knowledge about the other facets of organizational reputation. To sum up, it is an arduous but also relatively more dynamic and contingent reputation measurement tool.

Analysis was also carried out within stakeholder groups. There are many suggestions for the methods to be followed during this kind of calculation. In this study, while calculating the values of the groups, calculation over geometric average, which has been most suggested in literature (Kuruüzüm and Atsan, 2001) was preferred. The data were analyzed by the “Expert Choice (EC) 11” program. EC is a multifunction decision support software, based on AHP (Fernandez, 1996). It is applied in areas such as portfolio analysis, resource allocation, supplier selection, strategic planning, risk assessment, human resources management and organizational performance. There are many software programs on the market for activating AHP, but EC is the most popular one related to AHP. The reason for this is that EC was the first software to specialize in AHP (Davies, 2001). Finally, to assess whether the differences between the groups in terms of importance degree and order of criteria are statistically significant or not, some statistical analyses were performed on the main exhibits; Exhibit 3, 4, 7, 8, 9, 10, 13 and 14.

EXHIBIT 2: The Scale of Preferences in AHP

Intensity of Importance	Definition	Explanation
1	Equal importance	Two activities contribute equally to the objective
3	Weak importance of one over another	Experience and judgment slightly favor one activity over another
5	Essential or strong importance	Experience and judgment strongly favor one activity over another
7	Demonstrated importance	An activity strongly favored and its dominance is demonstrated in practice
9	Absolute importance	The evidence favoring one activity over another is of the highest possible order of affirmation
2,4,6,8	Intermediate values between two adjacent judgments	When compromise is needed
Reciprocals of above non-zero numbers	If activity <i>i</i> has one of the above non-zero numbers assigned to it when compared with activity <i>j</i> , then <i>j</i> has the reciprocal value when with <i>i</i>	Reasonable assumption

Saaty, T. (1982). *Decision making for leaders*. USA: Wadsworth inc., p.78.

RESULTS

In the first part of the study, while the customers indicated the factors determining the reputation of a hotel, they did not focus on factors which had been accepted as dimensions of organizational reputation in previous studies, such as financial performance, vision and leadership, work environment, emotional appeal (Alsop, 2004; Fombrun *et al.*, 2000), organizational culture (Cable and Graham, 2000), innovativeness level, leadership in the market (Saxton, 1998) and business partnerships which are characterized as “fitting” (Grupp and Gaines-Ross, 2002). It was observed that the customers first focused on the quality of the services (and products) provided by the organization (hotel) which has been acquiesced as a dimension of organizational reputation in many studies. This situation may lead the readers to wonder if this study analyzed quality level or organizational reputation. However, according to the authors, the fact that customers first focused on “the quality of the services” dimension of the hotels’ reputation was not a surprise, because it would not be logical for the customers to be primarily interested in financial performance of the hotel or the working environment of hotel personnel. As has been previously emphasized in literature (e.g., Dentchev and Heene, 2004; Fombrun and van Riel, 1997), every stakeholder group is interested in specific parts of the information concerning the reputation of an organization to a large extent and the findings of the study support this idea of authors.

With the findings from the second part of the research, at the end of the interviews, it was decided that hotel location, hotel appearance, hotel recognition, services provided by the hotel and the quality of the rooms were

the main (first) criteria that determine the reputation of the hotel. It was found that internal appearance and external appearance were second degree reputation criteria of hotel appearance main criteria. Also, front office, room service, food and drink, entertainment and other services (under “services provided by the hotel” criteria); and comfort and decoration (under “room feature” main criteria) were other second degree reputation criterion. In addition, It was found that politeness and service speed (under “front office services” second degree criteria), variety of food, taste and quality (under “food and drink services” second degree criterion), sport, transport and hotel security (under “other services” second degree criterion) were third degree reputation criteria. Many studies in customer satisfaction literature have referred to many factors which were regarded as second and third degree criteria for the customers who took part in the study (e.g., food quality issue in Saleh and Ryan, 1992). The relations between the criteria are illustrated in Figure 1.

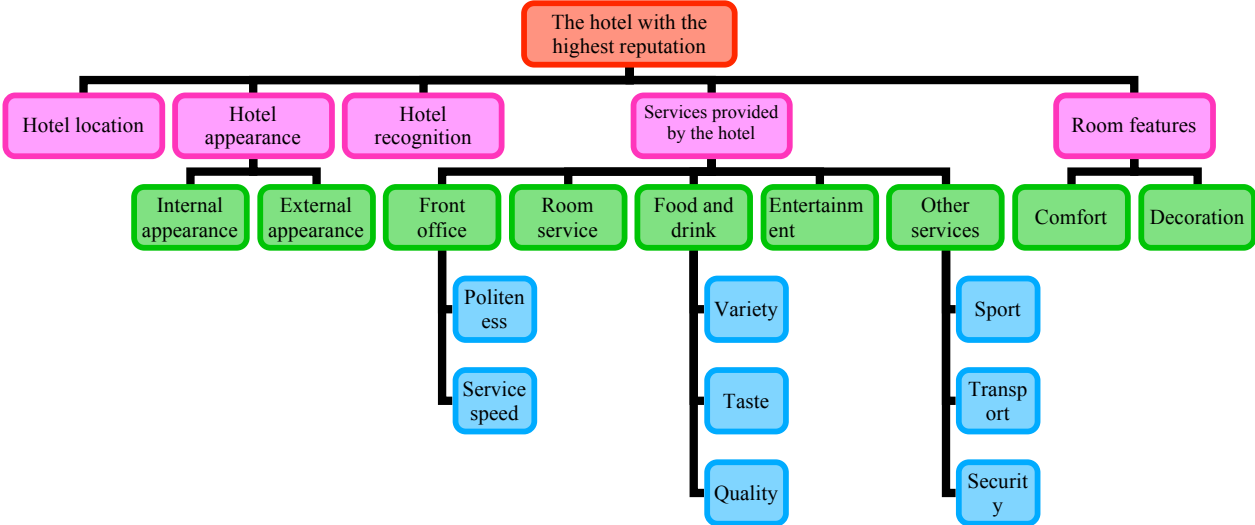

FIGURE 1: The primary, secondary and tertiary criteria influencing customers’ perceptions of hotel reputation.

The findings concerning the data obtained from the interviews conducted with 336 hotel customers who participated in the third part of the study are given in Figure 2, if education and gender factors are not considered. When Figure 2, which was produced after the assessment of 336 hotel customer responses, is examined, it is understood that the customers selected services provided by the hotel criteria (0.395) as the most important factors determining the hotel reputation. The closest to this value, the second most important reputation criterion (0.227) was “room features”. When second degree criteria were analyzed, it was found that “internal appearance” under hotel appearance was given double the importance of “external appearance”. When the sub-criteria under services provided by the hotel main criteria were analyzed, it was found that the services regarding food and drink (0.390) were by far the most important secondary sub-criteria. When third degree criteria were analyzed, it was found that, among food and drink services, “quality” and “taste”, and among other services, “security” were accepted as the most important criteria.

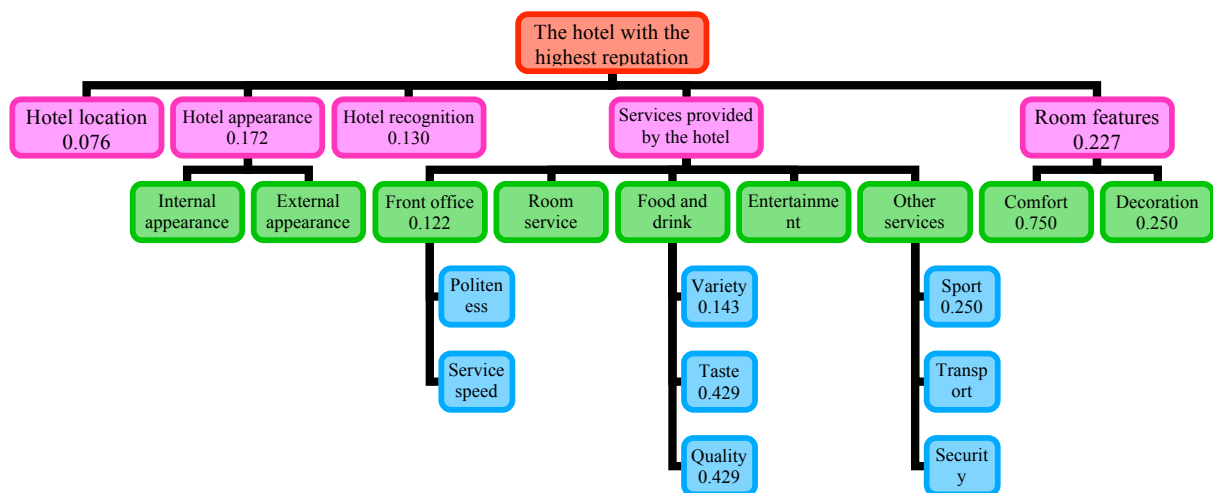

FIGURE 2: The importance rankings of primary, secondary and tertiary criteria influencing customers' perceptions of hotel reputation.

As the purpose of this study is to indicate whether there is a difference between the sub-stakeholder groups in terms of reputation criteria, the 336 people who participated in the study were grouped according to their gender and educational status. The level of importance values according to educational status are given in Exhibit 3. When Exhibit 3 is analyzed, it is found that there is a significant difference between the levels and orders of importance attributed to the main criteria by the customers who had received high school and lower education, or university and post-graduate education. On the other hand, consistency ratio concept has a key role in AHP. If the mathematical values of the responses given by the respondents are above 0.1, responses are considered as inconsistent. It is possible to make the responses more consistent by making the respondents review them. The consistency ratio of the responses of the group of "high school and lower education" given in Table 3 is lower than 0.1, which is the limit, which means an accept level as suggested by Saaty (1980). On the other hand, the value for the other group is higher than 0.1. Thus, the findings for this group in Exhibit 3 should be interpreted cautiously. The values in parentheses in the exhibit indicate the importance order of the criteria for the related group according to the other criteria. As can be seen in the exhibit, both groups attributed the highest importance to the services of the hotel in the determination of reputation. However, importance levels and orders of the other factors for the groups differentiated to a large extent. For example, for the first group, the second most important factor was room features, whereas for the second group it was "location". To confirm this claim, "Spearman Rank Order Correlation Analysis (SCA)" was performed and findings revealed that there is no relationship between the importance orders of the factors attached by groups. It connotes that these groups rank factors differently in terms of their importance. Then, the data was transformed into interval data and an independent sample *t*-test was performed. Findings showed that values the groups attribute to criteria are statistically different from each other except for "appearance". In short, these findings indicate that importance degrees and orders of main hotel reputation criteria vary drastically in terms of the educational level of the customers. The findings are given in Exhibit 3.

EXHIBIT 3: The importance ratings given to the basic criteria by education

		High school and lower education	University and higher education
Location	***	0.075 (5)	0.222 (2)
Appearance		0.103 (3)	0.142 (5)
Recognition	***	0.088 (4)	0.188 (4)
Services	***	0.431 (1)	0.256 (1)
Room features	***	0.304 (2)	0.192 (3)
Consistency ratio		0.03	0.21

When the criteria under the main criteria of services provided by the hotel, are analyzed, it is observed that there are differences in the attitudes of customers with high school and lower education, or with university and post-

graduate education. For example, while services related to food and drink had twice the importance of other services for high school and lower education graduate individuals, the values of these two criteria were relatively more close for those who had received university and higher education. Some additional statistical analyses were performed to test the findings. SCA results indicated that there is a significant and strong positive correlation (0.918) between these two groups' rankings concerning secondary criteria under services provided by the hotel. It means that there is no significant difference between the groups relating to their ordering of the criteria. On the other hand, after transformation of the data, the results of an independent sample *t*-test showed that there were statistically significant differences at $p < 0.01$ level between the values of the two groups attribute to criteria of entertainment and food-drink. The findings are given in Exhibit 4.

EXHIBIT 4: The importance ratings attached to secondary criteria subordinated to 'services provided by the hotel' by education

	<u>High school and lower education</u>	<u>University and higher education</u>
Front office	0.078 (4)	0.126 (3)
Room service	0.134 (3)	0.126 (3)
Entertainment ***	0.078 (4)	0.126 (3)
Food-drink ***	0.488 (1)	0.349 (1)
Other services	0.222 (2)	0.274 (2)
Consistency ratio	0.01	0.00

On the other hand, the analysis of hotel appearance criteria, which is one of the main reputation criteria revealed that high school and lower education graduates gave twice the importance to the internal appearance of the hotel than external appearance. However, for university and higher education graduates, this ratio is 3/1. The findings are presented in Exhibit 5.

EXHIBIT 5: The importance ratings attached to secondary criteria subordinated to 'hotel appearance' by education

	<u>High school and lower education</u>	<u>University and higher education</u>
Internal appearance	0.667 (1)	0.750 (1)
External appearance	0.333 (2)	0.250 (2)
Consistency ratio	0.00	0.00

When the criteria under room features, one of the main reputation criteria, were analyzed, it was found that both university and higher education graduates and high school and lower education graduates gave three times the importance to room comfort than room decoration. As the findings did not show any big differences, they are not given in a separate. It was found that, when other third degree criteria were analyzed, politeness of the personnel and service speed were equally important for university and higher education graduate customers. However, high school and lower education group attributes twice as much importance to speed as politeness. The findings are given in Exhibit 6.

EXHIBIT 6: The importance ratings attached to tertiary criteria subordinated to 'front office attributes' by education

	<u>High school and lower education</u>	<u>University and higher education</u>
Staff politeness	0.333 (2)	0.500 (1)
Staff service speed	0.667 (1)	0.500 (1)
Consistency ratio	0.00	0.00

When the responses of customers were analyzed in terms of third degree criteria (under the criteria of food and drink), it was found that there was a partial difference in the order of importance of these criteria attributed by groups who have different educational levels. In addition, there were differences between the degrees of

importance. The criteria regarding food quality took three times the importance of food variety and taste for the university and higher education graduate group. However, for the high school and lower education graduate group, the quality of food took approximately 1.75 times more importance than the taste of food. To attest the findings, some supplementary statistical analyses were performed. SCA results revealed that there isn't a significant and strong positive correlation between these two groups' rankings concerning tertiary criteria under food and drink. It connotes that there is a difference between the groups relating to their ordering of the criteria. In addition, after transformation of the data, the results of an independent sample *t*-test showed that there were statistically significant differences between the values of the two groups attribute to criteria of food variety. The findings are given in Exhibit 7.

EXHIBIT 7: The importance ratings attached to tertiary criteria subordinated to 'food and drink related services' by education

		<u>High school and lower education</u>	<u>University and higher education</u>
Food variety	***	0.122 (3)	0.143 (2)
Food taste		0.320 (2)	0.143 (2)
Food quality		0.558 (1)	0.429 (1)
Consistency ratio		0.00	0.00

It was determined that, when the reputation perceptions of high school and lower education and university and higher education graduate customer groups were analyzed in terms of third degree criteria (under other services criteria), level of importance concerning factors changed radically among the groups. Here, the most important criterion for both customer groups is security of the hotel. Both groups attach approximately twice as much importance to security services in the hotel as transport facilities. To test the findings, some additional statistical analyses were performed. SCA results suggested that there isn't a significant and strong positive correlation between these two groups' rankings concerning tertiary criteria under other services. It implies that there is a significant difference between the groups relating to their ordering of the criteria. In addition, after transformation of the data, the results of an independent sample *t*-test showed that there were statistically significant differences between the values of the two groups attribute to criteria of "sport activities" at $p < 0.01$ level and "transport facilities" at $p < 0.1$ level. These findings are given in Exhibit 8.

EXHIBIT 8: The importance ratings attached to tertiary criteria subordinated to 'other services' by education

		<u>High school and lower education</u>	<u>University and higher education</u>
Sports activities	***	0.143 (3)	0.250 (2)
Transport facilities	*	0.286 (2)	0.250 (2)
Hotel internal security services		0.571 (1)	0.500 (1)
Consistency ratio		0.00	0.00

The degree of importance attached to the main criteria according to gender are given in Exhibit 9. When Exhibit 9 is analyzed, it can be understood that there were partial differences between males and females in terms of the importance order of the main criteria and the importance level attached to these criteria. For example, males attributed the highest value to "service" criteria, whereas females attached the highest score to the criteria of "room features". In addition, the third and fourth most important factors were different for the two groups. The consistency ratios of the responses are under 0.1, the level Saaty (1980) suggested, as acceptable. The values in parentheses in the exhibit indicate the importance order of criterion among other criteria as mentioned earlier. To confirm these claims, SCA was performed and it revealed that there is no relationship between the importance order of the factors attached by the groups. It means that the ranking of the factors for these two groups were different. Then, an independent sample *t*-test was performed. Findings showed that the only difference in values groups attribute to criteria "recognition" are statistically significant. In short, these findings indicate that in terms of gender, the importance degrees varied partially and the order of the main hotel reputation criteria varied to a large extent. The findings are given in Exhibit 9.

EXHIBIT 9: The importance ratings given to the basic criteria by gender

	<u>Male</u>	<u>Female</u>
Location	0.096 (5)	0.042 (5)
Appearance	0.180 (3)	0.106 (4)
Recognition **	0.147 (4)	0.151 (3)
Services	0.369 (1)	0.260 (2)
Room features	0.209 (2)	0.442 (1)
Consistency ratio	0.02	0.03

When the criteria under the services provided by the hotel were analyzed, it was found that there were no big differences between female and male customers. Food and drink services were the most important criteria for females with the value of these criteria for females being greater than the score males attributed. To verify this claim, first, SCA was performed. The results revealed that there was a positive and strong correlation between the two groups (0.918) concerning the order of the criteria. It meant that there was no big difference between the groups in terms of order of the criteria. In addition, an independent sample *t*-test showed that there were no significant differences between the groups in terms of importance level they attributed to the criteria. These findings couch that there are no significant differences in order and importance level of these criteria in terms of gender. The findings are given in Exhibit 10.

EXHIBIT 10: The importance ratings attached to secondary criteria subordinated to ‘services provided by the hotel’ by gender

	<u>Male</u>	<u>Female</u>
Front office	0.124 (3)	0.093 (4)
Room service	0.124 (3)	0.093 (4)
Entertainment	0.124 (3)	0.119 (3)
Food-drink	0.395 (1)	0.423 (1)
Other services	0.234 (2)	0.272 (2)
Consistency ratio	0.00	0.09

When the criteria under hotel appearance main criteria were analyzed, it was found that males attached twice as much importance to internal appearance of the hotel as external appearance. In contrast, females attached more importance to the external appearance than internal appearance of the hotel. The findings are given in Exhibit 11.

EXHIBIT 11: The importance ratings attached to secondary criteria subordinated to ‘hotel appearance’ by gender

	<u>Male</u>	<u>Female</u>
Internal appearance	0.667 (1)	0.333 (2)
External appearance	0.333 (2)	0.667 (1)
Consistency ratio	0.00	0.00

Analysis of responses of males and females indicated that both genders attached twice as much importance to comfort of the room as decoration of the room. Since there is no difference between the values, these findings are not given in the exhibit. When other third degree criteria were analyzed, it was found that politeness of personnel and speed of service under the characteristics of front office personnel were equally important for male customers. Females attached four times more importance to service speed than politeness. This seemed to be another interesting finding. The findings are given in Exhibit 12.

EXHIBIT 12: The importance ratings attached to tertiary criteria subordinated to ‘front office attributes’ by gender

	<u>Male</u>	<u>Female</u>
Staff politeness	0.500 (1)	0.200 (2)
Staff service speed	0.500 (1)	0.800 (1)
Consistency ratio	0.00	0.00

Analysis of responses of males and females in terms of third degree criteria (under services related to food and drink) indicated that there was no significant difference in the importance level attributed to these criteria between the genders. Males attributed equal scores to food quality and taste. On the other hand, females allocated the highest score to food quality. However, since the consistency ratio is greater than 0.1, this finding should be interpreted with caution. SCA was performed to confirm this claim and it suggested that there is no relationship between the importance order of the factors attached by the groups. It connotes that the ranking of the factors for these two groups were rather different. In addition, an independent sample *t*-test showed that there were no significant differences between the groups in terms of importance level they attributed to the criteria. It means that there is no statistically significant difference between genders attached to food and drink related services. The findings are given in Exhibit 13.

EXHIBIT 13: The importance ratings attached to tertiary criteria subordinated to ‘food and drink related services’ by gender

	<u>Male</u>	<u>Female</u>
Food variety	0.143 (2)	0.169 (3)
Food taste	0.429 (1)	0.387 (2)
Food quality	0.429 (1)	0.443 (1)
Consistency ratio	0.00	0.69

When the hotel reputation perceptions of males and females were analyzed in terms of third degree criteria (under other services), it was found that both importance order and level attached to criteria seemed to change. Sport activities are the most important criterion also in this criteria group. However, the place of second and third criteria was different for genders. For females, transport services are at third level. Males attributed the lowest importance to security. First, SCA was performed to attest this claim and it indicated that there is no relationship between the importance order of the factors attached by the groups. It denotes that the ranking of the factors for these two groups were different. Also, an independent sample *t*-test revealed that there were no significant differences between the groups in terms of importance level they attributed to the criteria. The findings are given in exhibit 14.

EXHIBIT 14: The importance ratings attached to tertiary criteria subordinated to ‘other services’ by gender

	<u>Male</u>	<u>Female</u>
Sports activities	0.400 (1)	0.610 (1)
Transport facilities	0.400 (1)	0.166 (3)
Hotel internal security services	0.200 (2)	0.225 (2)
Consistency ratio	0.00	0.09

DISCUSSION

As previously mentioned, the motivation for this study was to investigate whether gender and educational status variables, ‘the most salient and ubiquitous social categories’ (Harper and Schoeman, 2003), influenced

reputation perceptions. The emergence of a difference in terms of sub-stakeholder groups under a customer stakeholder group may make reputation a more difficult to manage concept. While delivering reputation messages to customers as it so wishes, the organization will also have to take into account the characteristics of sub-groups. This kind of a conclusion will make reputation formation and/or any strengthening activity more time-consuming and expensive for organizations. Also, as mentioned earlier, this situation may affect the balance of power between units and between principals and agents in organizations. Consistent with this idea, there are some studies in the literature which adduce that micro, meso and macro developments may bring about some changes in power relations of organizational units and their executives. For example, according to Fligstein and Freeland (1995), after World War II, the financial executives have strengthened their positions in United States corporate organization context with the assistance of some macro developments, especially through diversification strategies which have become more important. In a similar vein, as put forth by Özen (2002), professional managers, initiators of the diffusion of TQM in Turkey, elaborately have re-constructed the content of TQM and their roles as “quality heroes” and utilized TQM to solidify their positions against principals.

In the first part of the study, the customers specified 22 reputation determining factors for hotels as hotel location, appearance, recognition, services and quality of rooms. This finding was consistent with the researchers’ expectations to a large extent. The findings of the second part of the research revealed that hotel location, hotel appearance, hotel recognition, services provided by the hotel and the quality of the rooms were the main (first) criteria that determine the reputation of the hotel. These findings are consistent with some studies in literature. The emergence of services provided by the hotel and as one of the main reputation criteria is in line with the findings of Heung (2000), who found that service quality was one of the factors determining customer satisfaction. Hotel location as one of the main criteria determining reputation in the minds of customers, was consistent with the findings of Lewis (1985) who pointed out that customers regard hotel location as one of the most important factors when choosing a hotel. Similarly, the finding that hotel appearance was very important for the customers was in line with the findings of Saleh and Ryan (1992), who suggested that the aesthetics of the hotel in an architectural sense positively influenced customer satisfaction. Second-degree criteria for the interviewees were, internal appearance, external appearance, front office, room service, food and drink, entertainment, other services, room comfort and decoration and third-degree were politeness and speed of service of personnel, variety, taste and quality of food and drink and other services of the hotel such as sport, transportation and security. According to Choi and Rue (2001: 279), ‘reviews of literature for the hospitality industry suggest that hotel attributes such as cleanliness, location, room rate, security, service quality, and the reputation of the hotel or chain are regarded as important by travelers’. Our first findings, thus, appear to be consistent with the literature.

The findings concerning the third part of the research show that “services” is the most important main level reputation factor for interviewees regardless of their gender and education level. The fact that services provided by the hotel came out among the first degree factors determining reputation is similar with the findings of Wilkins, Merrilees and Herrington (2006) indicating that service quality is a dimension of a hotel’s quality. Also, room features -comfort and decoration- took the second highest value (0.227) among five main criteria. This finding is, to a large extent, consistent with Barsky and Nash (2002)’s study, which suggested that customers’ feeling of comfort is the most important emotion which fosters their loyalty to a hotel. Consistent with the findings of a study (Wei, Ruys and Muller, 1999) based on customers over the age of 60, suggesting that hotel location ranked five in the respective importance level, hotel location had the weakest importance level (0.076) among the five main factors in this study. On the other hand, there are also some studies in the related literature where customers attach high values to hotel location (e.g., Rivers, Toh and Alaoui, 1991; Tsang and Qu, 2000). Under “service” main criteria, the most important secondary criteria was “food and drink”. These findings are consistent with the findings of the study of Akbaba (2006). Since little research has been conducted to investigate the role of food service in tourist satisfaction (Nield, Kozak and LeGrys, 2000), the findings of the current study at this point appear to contribute to the literature. Also, in contrast to Tsang and Qu (2000)’s study in which the expectations of customers regarding hotel comfort (3.79) and decoration (3.70) were determined approximately equally, in this study it was found that the customers attributed three times more importance to “room comfort” criteria, under second degree criteria. Since Turkish people often have epicurean characteristics rather than exhibitionist, it was not a surprising result for the researchers. Under “other services” criteria, the most important criteria was security. This was consistent with the findings of Webster and Hung (1994) which indicated that security was one of eight factors determining service quality of hotels. In a similar vein, Gill and his friends (2003) suggested that the responsibilities of security managers in hotels were enhanced in England. This situation may stem from security demands of customers. Finally and similarly, Akbaba (2006) suggested that customers accepted the provision of a secure environment by the hotel as the second most important service quality criteria.

The findings of the third part of the study also indicate that the importance order and level attached to these criteria, in particular the first order criteria, which determine the hotel reputation changed in terms of gender and especially educational level variables. For example, “services”, one of the main criteria, is the most important reputation factor for male customers, whereas for females it was ‘room features’. There was only a statistically significant difference in the criteria of “recognition” between males and females. At the secondary and tertiary level criteria, many differences can be observed between genders. For example, at the secondary level criteria, females seem to be much more sensitive to “food and drink” criteria than males. This finding is consistent with the findings of Heung and Lam (2003) that 60% of customers who complain about restaurant services are female. This situation is possibly the result of the fact that females are generally responsible for cooking at home. Again, at the secondary level criteria, internal appearance was twice as important as external appearance for males. On the other hand, females attributed more importance to external appearance. Finally, the finding that hotel security service was the second most important criterion under “other services” secondary criteria for female customers was consistent with the findings of Howell, Morero and Demicco (1993). However, in terms of gender, statistically significant differences in importance levels of criteria were not found after supplementary statistical analysis which was performed to verify primary research findings. To sum up, although there were no significant differences between importance levels males and females attached to criteria, statistically significant differences were found between importance orders of all criteria in terms of gender except for the criteria under services provided by hotel.

Although at the basic criteria level, “services” is the common most important factor for both the “high school and lower education” and “university and higher education” groups, there are many differences as well. The second highest important factor is ‘room features’ for the first group and location for the second group. This result may stem from the fact that those in the university and higher education group often have better economic conditions than those in the high school and lower education group. Therefore, they may have more comfortable and better decorated homes. As a result, they attribute more importance to a factor they do not possess in their routine lives such as location. Finally, the statistical analysis, performed to prove the findings, indicated that there were significant differences between the importance level and order of the values these groups attributed to the basic criteria except for appearance. Statistical analysis also revealed that there were significant differences in the criteria of “entertainment” and “food and drink” between groups at the secondary criteria level. In addition, at the tertiary criteria level, some statistically significant differences were found between the values the groups attached to food variety, sport activities and transport facilities. In addition, SCA showed that importance orders of reputation criteria were significantly different in three of four exhibits in terms of education level. These differences indicate that, while delivering messages about themselves, the organizations should take into account both the expectations of the stakeholder group, and the national culture and demographic characteristics of the individuals in that group, especially their level of education. Once more, this situation underlines that reputation management is an extremely complicated task for organizations. Difficulties in the management of this concept have led to reputation being considered as one of the most important ‘*intangible resources*’ of an organization (Barney, 1991; Carmeli and Tishler, 2005; Caruana, 1997; Deephouse, 2000; Dollinger *et al.*, 1997; Goldberg *et al.*, 2003; Hall, 1992, 1993; Mahon, 2002; Rao, 1994).

In the current study, there were also findings not consistent with the researchers’ expectations. For example, in the first part of the study, the researchers anticipated that environmental sensitivity of the hotel would be an important factor which determines the reputation of the hotel for customers. This expectation is consistent with the findings of some studies (e.g., Argenti and Druckenmiller, 2004; Beren and van Riel, 2004; Bohdanowicz, 2006; Fombrun and Shanley, 1990; Fombrun *et al.*, 2000; Turban and Greening, 1996) which claimed that the social responsibility of an organization determined or strengthened the reputation of that organization in the minds of various stakeholder groups. However, only two of the 76 respondents participating in the first part of the study defined environmental sensitivity of a hotel as a factor influencing their perceptions of hotel reputation. For this reason, the concepts of social responsibility, environmental friendliness or environmental sensitivity were not included in the study as reputation factors. Carter and Ruefli (2006) note that only a few organizations manage to keep their reputation over a period of time. This may be caused by organizations failing in areas which had previously enhanced their reputation or by changes in the factors determining reputation in the minds of related groups. Bearing the second assumption in mind, if it is accepted that the criteria that determine reputation evolve over time (Beren and van Riel, 2004), it is possible that social responsibility, today not accepted as an important reputation criteria by Turkish hotel customers, could have a higher importance level in the future. Again regardless of gender and education level, the politeness and speed of service of front office personnel was equally important for the customers. However, in a study by Tsang and Qu (2000), the politeness of the hotel personnel was a more important factor than speed. The fact that equal importance was attributed to the politeness of personnel and the speed of service may be due to the high number of young people who took part in the study. It has often been observed that young people are impatient and the expectations of this group

focus more on service speed. Also, this finding may be a reflection of Turkish national culture characteristics as well. The third unexpected finding was that females attribute twice as much importance to external appearance as internal appearance of the hotel. The researchers expected females to attribute more importance to internal appearance since they spend more time in the home. However, a first impression may be more important for them. The fourth surprising finding was that females attach four times more importance to speed of service than politeness. It was expected that females would attribute more importance to politeness. Possible reasons for this finding are that females might employ an “impression management” tactic and attribute more importance to speed in this study than they would in their real lives to break their images as “laggards” in male eyes.

Originality and Limitations

This study differs from other studies in several points. Firstly, perhaps the most important difference of the study is that the analysis level of the study is sub-stakeholder groups. A limited number of studies in reputation literature have emphasized the importance of sub-stakeholder analysis level (e.g., Bennett and Gabriel, 2003; Ou, 2007). However, none of them have employed sub-stakeholder group analysis level to discuss the extent of manageability of organizational reputation. Secondly, the study deals with the concept of reputation with an eclectic approach, through an environmental determinism-voluntarism discussion. Despite not being explicitly expressed, in earlier studies it seems that a voluntaristic understanding has been overwhelmingly adopted for the concept of reputation. In particular, the frequent and unconscious usage of reputation concept with ‘management’ seems to refer to this belief. The third difference is the use of AHP as the method of analysis. As previously mentioned, AHP has been widely used in many studies. However, to the best of our knowledge, this is the first time in reputation literature. As we stressed earlier, AHP was selected as other methods failed to meet the needs of this study and had come under criticism in reputation literature. In addition, it is known that hotel enterprises are not widely favoured organizations in reputation literature so this study is a rare example using hotels in academic reputation literature. Lastly, as far as we know, the current research is one of the few reputation studies conducted in developing countries (e.g., Dortok, 2006; Şatır, 2006; Wang and Wang, 2007). These studies may enable some comparisons concerning reputation perceptions of various stakeholder groups in developed and developing countries.

However, this paper undoubtedly has some limitations as well. The first limitation was that hotel reputation criteria determined by the customers in the first part of the study in AHP were subjected to dual comparison by the customers under the guidance of the researchers. Explaining the logic of these dual comparisons to customers and data collection was time-consuming for the researchers. This is considered to be one of the main disadvantages of this method (Millet, 1998). Another limitation of the current study was that, as we mentioned earlier, the consistency of the responses of the respondents in AHP can be increased by reviewing their responses. However, following the first analysis of data by the researchers, finding the same customers who took part in the survey and making them renew their responses was not always possible. The third limitation of the study emanated from the nine point scale of AHP. According to Babakuş and Mangold (1992), five point scales can decrease the frustration levels of participants in a research study. The nine point scale of AHP, thus, might engender certain amount of frustration among participants of the study. The fourth limitation of the study is that the relatively small size of the sample of high school and lower education group ‘may affect the statistical significance of the findings for this grouping’ (Nield *et al.*, 2000: 383). The fifth one stems from the similarity of the different concepts of reputation, credibility (Herbig and Milewicz, 1995), customer relationship management (Nakra, 2000), identity, image, prestige (Smidts, Pruyn and van Riel, 2001), respectability (Dhir and Vinen, 2005) and standing (Shenkar and Yuchtman-Yaar, 1997). Although the researchers attempted during both the structured and unstructured interviews to explain and differentiate as much as possible “reputation” from other similar concepts, some of the customers might have explained their ideas with regard to concepts other than reputation. Finally, the hospitality industry is a rather new and not well-established field for reputation studies. Therefore, this study required great effort to construct a theoretical base and work with a large sample.

Future Research Directions

This study discusses the importance of the two factors on which a sub-stakeholder group is constructed within the process of reputation determination. On the other hand, these factors are not limited to gender and educational status. Further research can investigate the impact of other sub-stakeholder level factors on reputation determination processes such as age, marital status, income level, religion, ethnicity, occupation and political view. In addition, the findings of the current study could be retested with a larger sample and in different cultures. Also, as another research field, an experimental environment could be designed and in two different contexts, when senior management perceive reputation as highly unmanageable or manageable, with the investigation of public relations or reputation managers’ wages and degree of legitimacy in the minds of senior management. Also, when public relations managers perceive reputation as a highly unmanageable

element, the strategies and tactics employed by these managers to legitimize their positions in their organizations, can be researched. In addition, consistent with Knights and Morgan (1991: 251)'s critical idea that strategy 'is a mechanism of power that transforms individuals into particular kinds of subjects who secure a sense of well-being through participation in strategic practices', Shrivastava (1986) also claims that strategic management is an ideological tool and serves primarily the knowledge requirements of top management rather than being a rational or neutral technique. In a similar vein, whether organizational reputation is employed as an ideological management issue, masking reality and serving the interests of some dominant groups and fields such as public relations (Campbell, Herman and Noble, 2006), in some countries or whether it is admitted and used as a highly rational tool to increase the performance of organizations and to facilitate the construction of social order consistent with claims of orthodox management and organization literature can be investigated.

Finally, according to Weber, one of the hallmarks of contemporary industrial society is the hegemony of 'instrumental rationality' which denotes the exemption of science from societal and moral obligations (Yildirim, 2006). However, the study seems to have some benefits for different parts of society beyond its efforts to contribute to science. For example, for practitioners, the first benefit is that in different industries it may create an awareness of the difficulty and importance of reputation building. There is a risk that, influenced by the atmosphere created in literature, hotel managers and other managers can underestimate reputation management activities and avoid taking necessary measures. Secondly, the number of scientific studies in literature focusing on measurement of hotel reputation is not high. This study provides hotel managers with some clues about which criteria to focus on in particular to gain a high reputation level in the view of customers. As many hotels do not have infinite time and financial resources to provide all the criteria which may influence their reputation, a study of this kind is important. A study conducted in England revealed that 15% of communication managers in organizations seriously complained about the inadequacy of resources allotted to them (Dolphin, 2003). In addition, hotel managers who are better-informed about the sensitivity of their customers can satisfy them more easily.

CONCLUSION
