Reputation is a concept which has gradually gained importance for organizations. In earlier studies, due to different expectations of national culture and stakeholder groups, it was stressed that reputation building was a rather difficult process for organizations. In this study, it was suggested that differences in terms of reputation perceptions may emerge in both stakeholder groups and sub-stakeholder groups. It was determined that between gender and in particular educational status sub-stakeholder groups of the customer stakeholder group, there were differences in the orders and importance levels of reputation determining factors. The findings of this study indicate that reputation building is indeed a much more sophisticated task than has been stressed in related literature to date. These findings also support the eclectic idea that the management of reputation frequently can be controlled partially by the organizations themselves.

ACKNOWLEDGEMENTS

We would like to thank Arzu Wasti, Ferda Erdem and Fatma Küskü for their great comments and suggestions. An earlier version of this article was presented at the 2006 National Management and Organization Congress in Turkey.

ABSTRACT

Customer satisfaction and loyalty are key issues for organizations in today's competitive market place. Customer satisfaction index models are developed and put into practice as models to measure customer satisfaction at institutional, industrial and national basis. In this project, European Customer Satisfaction Model was taken as the reference and Turk Telekom Customer Satisfaction Model was acquired.

INTRODUCTION

The concept of customer satisfaction has attracted much attention in recent years. To improve product and service quality, and maintain customer loyalty within a highly competitive marketplace it became a central concern for companies and organizations. A key motivation for the growing emphasis on customer satisfaction is that high customer satisfaction lead to a stronger competitive position resulting in higher market share and profit (Fornell, 1992). Customer satisfaction is also generally assumed to be a significant determinant of repeat sales, positive word-of-mouth, and customer loyalty (CL). Satisfied customers return and buy more, and they tell other people about their experiences (Fornell, et al., 1996).

Until recently in most countries, telecommunications service providers were state owned, state operated, and often monopolistic. With the privatization of British Telecom and the introduction of competition in the U.S. long-distance telephone services, the late 1980s and 1990s witnessed the most dramatic policy changes the telecommunications world had ever seen. The monopoly-based system of service provision, which dominated the world's telecommunications markets for over three-quarters of the last century, gave way to more competitive supply in many markets. (Li and Xu, 2004)

There have been two major growth areas in telecommunications over the past two years in the OECD – mobile and broadband. This growth has resulted in the number of mobile and broadband subscribers as percentage of all telecommunications subscriptions or “access paths” accounting for 74% of all communications path in 2007. Mobile alone accounts for 61% while standard phone lines only account for 26%. This is a dramatic shift from the year 2000 when there were more fixed line access paths (51%) than mobile. The number of fixed analogue lines across the OECD fell by 37 million between 2005 and 2007 but the growth of broadband lines and mobile subscribers (77 million and 201 million respectively) over the same period more than compensated for the fixed line losses. The penetration rate for fixed telephone lines in 2007 was 41 subscribers per 100 inhabitants, which was less than the penetration rate ten years earlier. Overall, the penetration rate rose from 43% in 1996 to a maximum of 47% in 2000, only to decline again to 41% in 2007. (OECD, 2009)

There has been an impressive shift away from dial-up fixed internet connections to broadband. In 2005, dial-up connections still accounted for 40% of fixed internet connections. Just two years later that percentage fell to

10%. Broadband now is the dominant fixed access method in all OECD countries. Broadband subscriptions reached 251 million in June 2008, growing an average of 20% between 2005 and 2007 compounded annually. The number of broadband subscriptions corresponds to 21.2 subscribers per 100 inhabitants in the OECD. (OECD, 2009)

Turkish electronic communications market has developed rapidly since liberalization on 1st January 2004. The number of players in the market tended to increase continuously after liberalization. By the end of 2008 there exist 256 operators in the electronic communications market (ICTA, 2010).

Turk Telekom group (the leader of the telecommunication sector in Turkey) provides integrated telecommunication services from PSTN (fixed line telephone service), GSM (Global System for Mobile Communications) to broadband internet. Turk Telekom group companies have 16.8 millions of PSTN customers, 6 millions of broadband internet customers and 12.1 million GSM customers as of September 30, 2009. The privatization of Turk Telekom was closed on November 2005 (Turk Telekom, 2010).

Fixed (incumbent and long distance telephony service providers) and mobile operators' total sales revenues which constitute the most important part in total electronic communications sector revenues are shown in the Figure 1. From the beginning of liberalization process in 2004 to 2007, total revenues continuously increased. However in 2008 sales revenues decreased by 5% to 19.3 billion TL which was 20.3 billion TL in 2007. After a continuous increase, in 2008, the share of mobile operators in total revenues became 70% and fixed operators' share decreased to 30% (ICTA, 2010).

Table 1. Fixed and mobile operators' total sales revenues

Fixed line penetration rate, which has reached its peak in 2001 (28.5%) is in a slightly decreasing trend especially starting from 2004 due to mobile telephony usage. The number of fixed subscribers decreased to 17.5 million in 2008 corresponding to a penetration rate of 24.5%. (ICTA, 2010)

Regardless of technology and communication infrastructures they use, Long Distance Telephony Services (LDTS) operators can provide intercity and/or international telephony services to the end users as alternatives to Turk Telekom. LDTS operators reached a share of 13% in 2008. (ICTA, 2010)

Competition in the broadband internet services market is developing. By the end of 2008 number of internet subscribers in Turkey reached up to almost 6 million. After the opening up of ADSL and G.SHDSL ports of incumbent operator (Turk Telekom) to the use of ISPs, resale of broadband access services commenced. On the other hand, ISPs started to access to Turk Telekom's infrastructure for the provision of broadband services via bit stream access. (ICTA, 2010)

Market shares of incumbent operators in retail broadband services market in EU countries are given in Figure 2. Incumbent operators' average share in broadband market is 46% in EU countries, whereas Turk Telekom has 93% market share in Turkey (ICTA, 2010).

Table 2. Shares of Incumbents and Alternative Operators in Retail Broadband Services in Turkey and Some EU countries, (%)

The purpose of this paper is to provide information about the customer satisfaction indices (CSIs) and show the results of a CSI study carried out in Turkish telecommunication sector. The rest of this paper is structured as follows: the second section briefly presents an overview of the CSIs and their developments in different countries. In the third section, the ECSI model implemented in Turkish telecommunication sector is described. The methodology and data analysis are discussed in the fourth section, followed by the analysis of the main results. Discussions and concluding remarks are provided at the end.

LITERATURE REVIEW ABOUT CUSTOMER SATISFACTION INDEX (CSI) MODEL

The original interest in customer satisfaction research was on customer's experience with a product episode or service encounter (Anderson et al., 1994). More recent studies have focused on cumulative satisfaction. Cumulative satisfaction defines satisfaction as customer's overall experience to date with a product or service provider. This approach to satisfaction provides a more direct and comprehensive measure of a customer's consumption utility, subsequent behaviors and economic performance (Fornell et al., 1996). The ECSIs were built upon a cumulative view of satisfaction.

The ECSI model is a structural model based on the assumptions that customer satisfaction is caused by some factors such as perceived quality (PQ), perceived value (PV), expectations of customers, and image of a firm. These factors are the antecedents of overall customer satisfaction. The model also estimates the results when a customer is satisfied or not. These results of customer satisfaction are consequences factors such as complaints or loyalty of customer (Johnson et al., 2001). Each factor in the ECSI model is a latent construct which is operationalized by multiple indicators (Fornell, 1992; Chien et al., 2002).

Swedish customer satisfaction barometer (SCSB), reported in 1989, was the first national CSI (Fornell, 1992). It was applied to 130 companies from 32 Swedish industries. In 1992, the German customer barometer was introduced. The study is conducted for 52 industry sectors in Germany (Meyer and Dornach, 1996). The American customer satisfaction index (ACSI) was developed in 1993 by Claes Fornell, Founder of SCSB. The ACSI survey is conducted for seven main economic sectors, 35 industries, and more than 200 companies with revenues totaling nearly 40 percent of the US GNP (Fornell et al., 1996). The European customer satisfaction index (ECSI), developed by European organization for quality and European foundation for quality management, was first introduced in 1999 across 11 European countries (Eklöf and Westlund, 2002). Other efforts for

establishing national CSIs can be seen in Denmark, Austria, France, Netherlands, Switzerland, Taiwan, New Zealand, South Korea, Malaysia, Hong Kong and Russia (Grigoroudis and Siskos, 2003).

The original SCSB model contains two primary antecedents of satisfaction: perceived performance and customer expectations. These both antecedents are expected to have a positive effect on satisfaction. The consequences of satisfaction in the SCSB model are derived from Hirschman's (1970) exit-voice theory which describes the results of dissatisfaction. The customer either exits (stops buying from the firm), or voices its complaint to the firm in an effort to receive restitution. It is expected that an increase in satisfaction should decrease complaints and increase CL (Fornell, 1992; Anderson et al., 1994).

The ACSI model builds upon the original SCSB model specifications adapted in the distinct characteristics of the US economy. The main differences between the original SCSB model and the ACSI model are the addition of a PQ component, as distinct from PV, and the addition of measures for customer expectations. The ACSI model predicts that as both PV and PQ increase, customer satisfaction should also increase (Anderson et al., 1994). For the consequences, as in the SCSB, it is expected that when customer satisfaction increase then loyalty increase and complaints decrease (Fornell et al., 1996).

The ECSI, a modified adaptation of the ACSI model, considers the European economy as a whole, and thus, CSI scores of the countries can be compared with each other and with the European average (Eklöf and Westlund, 2002). In the ECSI model, customer expectations, PQ, PV, customer satisfaction, and CL constructs are modeled the same as in the ACSI. There are two fundamental differences between the ACSI and ECSI models. First, the ECSI model does not include the complaint behavior construct as a consequence of satisfaction. Second, the ECSI model incorporates company image as a latent variable in the model. In the ECSI model, company image is expected to have a direct effect on customer expectations, satisfaction and loyalty (Grigoroudis and Siskos, 2003).

The first studies on CSI model in Turkey were the research studies done by Turkyilmaz and Ozkan (2004) and Aydin and Ozer (2005). Aydin and Ozer (2005) developed and tested a new model for Turkish global system for mobile (GSM) users. The structural model they used includes some new constructs, such as switching cost, trust, and complaint handling. They collected the data from 1,662 GSM users in four Turkish cities using a face-to-face survey. In their study, the model is estimated using maximum likelihood (ML)-based covariance structure analysis method namely LISREL.

Then the first national model, Turkish customer satisfaction index (TCSI), was reported as a pilot study in the fourth quarter of 2005 by Turkish Quality Association (Kal-Der) and KA Research Limited. Since, the measurement model of the TCSI is same as the ACSI model, it includes customer expectations, PQ, PV, customer satisfaction, CL and customer complaints constructs. In 2006, the TCSI was implemented for 100 companies from 25 sectors (TMME, 2006).

THE CSI MODEL AND RESEARCH HYPOTHESES

The Customer Satisfaction Index (CSI) is an economic indicator that measures customer satisfaction. A model has been derived specifically for the CSI. In this model, six interrelated latent variables are introduced. It is based on well-established theories and approaches in customer behavior and it is to be applicable for a number of different industries.

The CSI model is described in Figure 3. A set of manifest variables is associated with each of the latent variables. This structure is called the CSI model.

The image construct evaluates the underlying image of the company. Image refers to the brand name and the kind of associations customers get from the product/company (Andreassen and Lindestad, 1998). Martensen et al. (2000) indicates that image is an important component of the customer satisfaction model. For the companies, image is a result of being reliable, professional and innovative, having contributions to society, and adding prestige to its user. It is expected that image has a positive effect on customer expectations, customer satisfaction and loyalty.

Customer Expectations

Expectations are the results of prior experience with the company's products. This construct evaluates customer expectations for overall quality, for product and service quality, and for fulfillment of personal needs. Customer expectations construct is expected to have a direct and positive relationship with customer satisfaction (Anderson et al., 1994)

Figure 1: Customer Satisfaction Index Model

Perceived Quality

PQ is the served market's evaluation of recent consumption experience. This construct evaluates customization and reliability of a given product or service. Customization is the degree to which a product or service meets a customer's requirements, and reliability is the degree to which firm's offering is reliable, standardized, and free from deficiencies. PQ is expected to have a positive effect on PV and customer satisfaction (Fornell et al., 1996), and to be positively affected by image (Andreassen and Lindestad, 1998).

Perceived value

PV is the perceived level of product quality relative to the price paid by customers. PV is the rating of the price paid for the quality perceived and a rating of the quality perceived for the price paid. PV structure provides an opportunity for comparison of the firms according their price-value ratio. In the ECSI model, PV is expected to be positively affected by PQ, and it has a positive impact on satisfaction.

Customer Satisfaction

The index indicates how much customers are satisfied, and how well their expectations are met. This construct evaluates overall satisfaction level of customers, fulfillment of their expectations, and company's performance versus the ideal provider.

Research hypotheses are listed below:

- H1: Customer expectations are positively related to perceived quality.
- H2: Customer expectations are positively related to perceived value.
- H3: Customer expectations are positively related to customer satisfaction.
- H4: Image is positively related to customer expectation.
- H5: Image is positively related to customer satisfaction.
- H6: Image is positively related to customer loyalty.
- H7: Perceived value is positively related to customer satisfaction.

- H8: Customer Satisfaction is positively related to customer loyalty.
H9: Perceived quality is positively related to perceived value.
H10: Perceived quality is positively related to customer satisfaction.

RESEARCH METHODOLOGY

Survey Setting

A case study method was used to collect the required data on the underlying dimensions of the research model. Turk Telekom Company which is the largest telecommunication company in Turkey was chosen as an ideal research setting in Turkey. Data were gathered from a face-to-face survey. Although the sample frame was the entire Turk Telekom customers, the sample of customer responses was drawn from five central districts of Istanbul. The survey was conducted to 280 Turk Telekom customers in 2009. The eligible respondents were those who qualify by recent experience as the purchaser and user of fixed line PSTN or broadband internet users. Among all collected data set, 266 were found satisfactory for data analysis. Occasional missing data on variables was handled by replacing them with the mean value.

Survey Instrument

The ECSI model consists of the aforementioned constructs which are based on well-established theories and approaches in customer behavior. The constructs of the ECSI model are unobservable (latent) variables indirectly described by a block of observable variables which are called manifest variables or indicators. The constructs and their observable items are given in Table 3. The use of multiple questions for each construct increases the precision of the estimate, compared to an approach of using a single question.

A survey, developed to measure the manifest variables, was prepared in Turkish language, and the first draft was issued to 30 individuals to ensure that the wording, format, and sequencing of questionnaire appropriate. Feedback from this study indicated that some questions were ambiguous, difficult to understand, or irrelevant for telecommunication sector. The final questionnaire contained 19 questions pertaining to the CSI. A five-point measurement scale was used where 1 expresses a very negative point of view and 5 expresses a very positive.

Reliability and Validity Protocols

To insure reliability and validity of the measures (i.e. internal consistency and convergent-discriminant validity respectively) as suggested by Gerbing and Anderson (1988) and Churchill (1979), the data were subjected to confirmatory factor analysis (CFA) within the causal modeling Lisarel framework. This procedure is preferable to exploratory factor analysis (EFA) in that it is a causal indicator model that requires a priori specifications of factor structure and allows for the specification of measurement errors (Venkatraman, 1989).

Table 3: The latent variables and their observable indicators in the CSI Model

Latent variables	Observable (manifest) variables
Image (IM)	IM1: being reliable IM2: being professional IM3: customer relations IM4: innovative and forward looking IM5: adding value to user (prestige)
Expectations (EXP)	EXP1: expectations for fulfillment of personal need EXP2: expectations for overall quality EXP3: expectations for product quality
PQ	PQ1: overall quality PQ2: product quality (technical) PQ3: service quality PQ4: customer services
PV	PV1: price/performance PV2: performance/price

CSI	CSI1: Compare with ideal CSI2: fulfillment of expectations
CL	CL1: repurchase intention
	CL2: recommendation to others
	CL3: price tolerance

DATA ANALYSIS AND RESULTS

The analysis used in this study is undertaken in two stages. In the first stage, the overall reliability and validity of CSI Model in Turk Telekom Company is measured. In the second stage, we measure the relationships among constructs using the covariance based Structural Equation Model. These steps are discussed in the following subsections.

Unidimensionality and Convergent Validity

CFA was used on the collected data to evaluate the unidimensionality of each of the six dimensions of ECSI Model. Table 4 summarizes the results of this analysis.

Table 4. Initial confirmatory factor analysis results

Construct	Number of indicators	Chi-square	df	p-value	GFI	AGFI	CFI	TLI	AVE	alpha
IM	5	7,331	6	0,291	0,99	0,96	0,99	0,99	0,51	0,860
EXP	3	0,608	1	0,436	0,99	0,99	1,00	1,00	0,55	0,838
PQ	4	0,049	2	0,976	1,00	0,99	1,00	1,01	0,67	0,905
PV	2	-	-	-	-	-	-	-	-	0,916
CSI	2	-	-	-	-	-	-	-	-	0,826
CL	3	-	-	-	-	-	-	-	-	0,851

Note: - CFA results cannot be obtained due to inadequate number of variables constituting this dimension.

Results provide the following model statistics for the assessment of goodness-of-fit: chi-square statistics, its associated degrees of freedom, p-value of significance, GFI, AGFI, CFI, and Tucker–Lewis index. One can conclude that each of the 3 dimensions achieves unidimensionality and convergent validity at monomethod levels of analysis. To exemplify, six items constituting the image dimension were subjected to CFA using the AMOS computer program. The chi-square statistic was 7,331 (degrees of freedom = 6, $p > 0.05$), with the chi-square/df ratio having a value of 1,222, which is less than 2.0 (it should be between 0 and 3 with lower values indicating a better fit). The goodness-of-fit index (GFI) was 0.990 and the adjusted goodness-of-fit (AGFI) index was 0.966. These scores are very close to 1.0 (a value of 1.0 indicates perfect fit). The comparative fit index (CFI) was 0.998, while the Tucker–Lewis coefficient (TLI) was 0.994. All indices are close to a value of 1.0 in CFA indicating that the constructs provide good support for the factor structure.

As is evidenced by the chi-square statistic with the associated degrees of freedom, the p-value of significance, GFI, AGFI, CFI, and TLI (Tucker Lewis Index) provided in Table 4 that measure goodness-of-fit, all of the analyzed dimensions of service quality are unidimensional, having strong convergent validity.

Convergent validity is the extent to which indicators of an ECSI construct converge or share a high proportion of variance in common. Table 4 also shows that most of the fit indices are within the acceptable range for each construct. This provides first-hand support for reliability and convergent validity of the constructs. We further looked at the significance of individual factor loadings of each item. All the individual factor loadings were found to be highly significant, giving support to convergent validity. We also calculated the average variance extracted (AVE) for each construct. These values are shown in Table 4. The values of AVE were higher than the recommended value of 0.50, providing further support to convergent validity of constructs. The standardized regression weights for all variables constituting each dimension were also found to be significant ($p < 0.01$).

Reliability

The reliability of the scales is related to the homogeneity of their items. It is a measure of the ability to produce the same results on repeated trials. Cronbach's alpha is commonly used to measure internal consistency of the scales. It is based on the average correlation between items within a test. Cronbach's alpha is calculated for each scale. Table 4 lists Cronbach's alpha values of the scales developed. All the construct measures of are over 0.80, thus exhibiting a satisfactory level of construct reliability. This establishes the internal consistency of the dimensions being studied and is reliable for this research.

The Path Model

Structural Equations Modeling (SEM) using AMOS 4.0, a software program that is a part of the Statistical Package for Social Sciences (SPSS) was used on the data set to test the causal relationships specified in the model as shown in Figure 1. For example, the causal relationships among constructs were explored and tested. The problem of missing data across the sample of 266 respondents was small at a calculated value of less than one percent. In these situations, the mean value of the variable was used. Model fit determines the degree to which the structural equation model fits the sample data. The commonly used model fit criteria are chi-square (χ^2), goodness of fit index (GFI), adjusted goodness of fit index (AGFI) and root mean square residual (RMS) (Schumacker and Lomax, 1996).

The goodness-of-fit indices for the path model [Satorra-Bentler $\chi^2 = 261.31$ with $df = 139$; GFI = 0.91; AGFI = 0.887; TLI = 0.953; CFI = 0.962; RMR = 0.040] are well within the generally accepted limits, indicating a good fit to the data.

The standardized regression weights for all variables constituting each dimension which is shown in Table 5 were also found to be significant at 0.01 level.

Table 5. Standardized Regression Weights

Latent variable	Manifest variable	Regression weight	t-value*
IM	IM6	0,669	-
IM	IM5	0,739	10,383
IM	IM4	0,686	10,606
IM	IM2	0,731	10,16
IM	IM1	0,794	10,909
EXP	EXP3	0,657	-
EXP	EXP2	0,74	10,139
EXP	EXP1	0,709	9,801
PQ	PQ4	0,777	14,709
PQ	PQ3	0,847	16,171
PQ	PQ2	0,845	-
PQ	PQ1	0,845	16,634
PV	PV2	0,913	-
PV	PV1	0,926	17,944
CSI	CSI3	0,747	-
CSI	CSI2	0,745	12,308
CL	CL3	0,684	-
CL	CL2	0,882	12,659
CL	CL1	0,891	12,733

Note: - Fixed for estimation; *all values are significant at the 0.01 level

Figure 2 presents inner regression weights for the structural relationships between causal paths based on the structural equation modeling technique. The results show that seven parameter estimates out of ten were found to be statistically significant.

Figure 2: The Results of the Path Analysis

Note: *** values are significant at 0.01.

CONCLUSION

As we can see from figure 2, the analysis related to testing the postulated hypotheses supports the first hypothesis (H1), i.e. customer expectation is positively related perceived quality. The fourth hypothesis (H4), image is positively related to customer expectation. Hypothesis five (H5), i.e. image has a positive effect on customer satisfaction is also supported. Hypothesis seven (H7), perceived value is positively related to customer satisfaction. The next hypothesis (H8), also provide a strong support between customer satisfaction and loyalty. In a similar vein, a strong support has also been found for H9 denoting that the positive relationship between perceived quality and perceived value. Hypothesis (H10), i.e. perceived quality has a positive effect on customer satisfaction is supported. Finally, no support has been found for hypotheses (H2), (H3) and (H6). These were the relations between customer expectations and perceived value, image and customer satisfaction, and customer expectations and customer satisfaction constructs. The highest impact on customer satisfaction factor was found as perceived quality. In addition that the highest score among constructs was found between customer satisfaction and customer loyalty as a score of 0.973. For the most part the findings reported in this study are consistent with the earlier research related to the customer satisfaction model.

THE ROLE OF PERSONALITY TRAITS IN STATUS CONSUMPTION: A STUDY INTO DOMESTIC AND FOREIGN BRANDS

Aysel Erciř and Sevtap Ünal
Atatürk University/Turkey

Bilsen Bilgili
Kocaeli University/Turkey

ABSTRACT

In this study, it was aimed to determine whether personal influence and self-monitoring had an impact on status consumption tendencies of consumers or not. The relationship between status consumption in consumer behaviors and domestic/foreign brand preferences was also investigated. For this purpose, 382 questionnaires were administered to the consumers shopping in İstinye Park and Kanyon shopping malls in Istanbul (Turkey). To test the research model, Structural Equation Model (SEM) test was used by using LISREL 8.7 statistics programme. In order to determine the relationship between brand preferences and status consumption tendencies of the respondents, correlation analysis was conducted by using SPSS 17.0 program. According to the results of the research, it was determined that personal influence and self-monitoring had an impact on status consumption. It was also found out that prestige and foreign brands were preferred more in status consumption. According to the results obtained, some suggestions were made for the companies in ready-to-wear sectors.

Keywords: *Consumer Behavior, Status Consumption, Self-monitoring, Personal Influence*

INTRODUCTION

Conspicuous consumption is quite an old phenomenon. It is defined as the spending mainly for the purpose of displaying the person's status and prestige to the surrounding others. Under these consumptions lies the perception of the purchased products as an indicator of prestige by the surrounding others. The person is satisfied with the buying decision when the surrounding others see the purchased product as a product of prestige (Kilsheimer, 1993). In several studies conducted in the field of marketing, conspicuous and status consumption has been considered as the concepts that define the same phenomenon. Kilsheimer defined status consumption as "conspicuous consumption that a person does to display his/her status or prestige to the surrounding others" (Kilsheimer, 1993: 341). Researchers stated that these two concepts were related but distinct phenomena (Eastman, Goldsmith and Flynn, 1999; Roberts, Gwin and Martinez, 2004). Conspicuous consumption is the purchase of goods and services consumed in the society for the purpose of enhancing one's prestige in the society and the use of these goods and services to influence other people in the society and satisfy one's ego (O'Cass and McEwen, 2005). Status consumption is defined as "the motivational process by which individuals show their social standing through the purchase of products that symbolize status for the surrounding others" (Heaney, Goldsmith, Jusoh, 2005:85). As it is seen, there are differences between the two terms. While ostentation is important in conspicuous consumption, there is a tendency to consume according to the social class in status consumption. The common point for both terms is that such spending is done to give special messages to the surrounding others. For this reason, personal traits play an important role in such spending because the conspicuous and status consumption tendencies are also high among those who are more inclined to get influenced by the social surrounding and behave accordingly (O'Cass and McEwen, 2005).

For this reason, in the study it was aimed to investigate only status consumption and determine which types of foreign and domestic ready-to-wear brands are preferred in status consumption. Additionally, in case of consumer's assessing the brands as indicators of status and prestige, the role of their ego and level of influence by the social surrounding were investigated. In the first part, theoretical information was provided about

conspicuous-status consumption, self-monitoring and personal influence; in the second part, the conspicuous and status consumer tendencies and their foreign or domestic brand preferences were examined.

The Concept and Characteristics of Conspicuous and Status Consumption

Conspicuous and status consumption was first mentioned in the studies conducted by Veblen on social classes. Veblen stated that conspicuous consumption is the spending done by the upper class and the other social classes who want to resemble them for the purpose of ostentation (Mason, 2001).

The researches related to status and conspicuous consumption mostly carried out by sociologists and anthropologists were conducted to understand the consumer behavior in the field of marketing. In status consumption, the ownership of some products and brands or the mood created by using them can be perceived as a status symbol since purchase of some products and brands is accepted as one of the most important indicators of success and power. Not all such spending is thought to be for the purpose of ostentation. Thus, status consumption is defined as “the motivational process by which individuals show their social standing through the purchase of products that symbolize status for the surrounding others” (Heaney, Goldsmith and Jusoh, 2005:85). Conspicuous consumption is defined as “the purchase of goods and services consumed in the society for the purpose of enhancing one’s prestige in the society and the use of these goods and services to influence other people in the society and satisfy one’s ego” (O’Cass and McEwen, 2005: 27).

O’Cass and McEwen, in their study (2005), argued that status and conspicuous consumption were different phenomena and tested it. According to the results they found out, status and conspicuous consumption are separate but related constructs. Taking this into consideration, conspicuous consumption and status consumption were examined separately in this study.

In the researches conducted about conspicuous and status consumption, demographic, personal and cultural characteristics of the individuals who are interested in conspicuous and status consumption were examined (Kilsheimer 1993; Marcoux, Filiatrault and Cheron 1997; Eastman, Goldsmith and Flynn 1999; Goldsmith, Clark and Goldsmith 2006). According to the research results, personal characteristics such as materialism (Eastman et al. 1997; Roberts 2000; Rose and DeJesus, 2007), social ego (Wong (1997), being different (Heaney, Goldsmith and Jusoh, 2005) and culture (Chen 2002) played an important role in such kind of spending. Conspicuous consumption tendency is higher for those who are materialist, care about social ego and have high personal influence (Bearden, Netemeyer and Teel, 1989).

Kilsheimer (1993), in his dissertation, developed a scale to measure status consumption. The researcher considered status and conspicuous consumption as the same phenomena. The author examined status consumption in detail and the antecedents, dimensions and results of the behavior. The antecedents of status consumption includes consumption for status, supporting ego by using the product, moving up the social ladder, culture, product involving status symbol and ignoring functional characteristics of the product. The three dimensions of status consumption are; socializing, showing interest in consumption to gain status, and purchasing other than functional reasons. The results are; purchasing status products, choosing status brands, positive attributions to status brands, using different media and communication sources for status products, benefiting from different type of spending to purchase these products, and low price sensitivity.

Marcoux, Filiatrault and Cheron (1997) examined conspicuous consumption behaviors of Polish students. According to the results they found out, conspicuous consumption is quite common among the students and the determinants of such consumption are generally brands of American origin. In their study, the researchers also developed conspicuous consumption scale including five dimensions. The dimensions of conspicuous consumption are as follows: 1. Materialistic hedonism, 2. Communication of belonging to/dissociation from a group, 3. social status demonstration, 4. interpersonal mediation, 5. Ostentation.

In conspicuous consumption, people who admire others try to be like them. A general characteristic of conspicuous consumption is that other people perceive products as symbols of wealth instead of benefiting from them. The reason for this is the desire to exaggeratedly show the product to the surrounding others (Mason, 2001, Wong, 1997). In a sense, people attempt to show their purchasing power to others. With these efforts, they give messages to others to show that they are wealthy, different, and belong to a specific group (Amaldoss and Jain, 2005). Therefore, only luxury and expensive goods are preferred in conspicuous consumption. It is particularly important that the goods to be consumed in the society be luxury and expensive (Eastman, Goldsmith and Flynn, 1999). The level of satisfaction is determined depending on the reactions of other people to the product. Rather than economical and psychological advantages to be gained from the product, consumption is shaped by the influence of social environment. Admiration of the product/brand by the surrounding others increases the satisfaction level of the individual (Chen, 2002, Chen, et. al 2005, Mason, 2001).

Wong (1997) examined the relationship between conspicuous consumption, materialism and self. According to the results of the study, those who are materialistic and care about social self are more inclined to

conspicuous consumption. Eastman et al. (1997) investigated the relationship between status consumption and materialism in a cross-cultural study. In the study conducted on American, Chinese and Mexican students, they found out that there are different points of view on materialism and status consumption, but there is a relationship between status consumption and materialism in the three cultures. Goldsmith et al. (2006) investigated the demographic characteristics of market mavens and the relationship of market mavenism with status consumption and innovativeness. In identifying market mavens, it was determined that demographic characteristics are not determinants. In determining market mavens, innovativeness and status consumption were found out to be more explanatory. Heaney, Goldsmith and Jusoh (2005), in their study, examined the relationship between materialism, being different and status consumption. The researcher stated that materialism and status consumption are separate but related concepts. According to the study, there is a relationship between materialism, uniqueness and status consumption. Roberts (2000) investigated the relationship between compulsive buying, materialism and status consumption. According to the results of the study, those who are materialists and have a high tendency in status consumption are more inclined to compulsive buying. Roberts, Gwin and Martinez (2004), in their study, examined the effect of family wealth, structure, and consumption tendency on compulsive buying and materialism. Additionally, they examined the relationship between compulsive buying and status consumption which is considered as intervening variable. According to the results, there is a relationship between compulsive buying and family's being materialist or not, family's being together or not (death, separation) and family's having a tendency in status consumption. The tendency towards status consumption and compulsive buying in materialistic and disrupted families is higher.

Furthermore, Marcoux, Filiatrault and Cheron (1997) examined conspicuous consumption behaviors of the students. They tried to determine the conspicuous consumption tendencies of the students in the direction of their preferences of Polish and American brands. According to the results of the study, conspicuous consumption is quite common and brands of American origin are generally more preferred in such kind of consumption. Considering the assumption that foreign brands are perceived by the consumers as an indicator of more prestige, it is hypothesized that

H1: Consumers prefer foreign brands in status consumption.

Self and Self-Monitoring

It is not possible to think of self-concept, personality, life style, and values separately while examining consumer behaviors. With the joint effect of these variables, also expressed as psychographic variables, consumer is directed to a specific behavior. Especially, self-concept appears to have a "fixed" or "adaptable" structure according to both social surrounding and personal traits. Therefore, in understanding consumer behaviors, self-concept provides descriptive information about the inner and external world of consumers (Aaker, 1999).

Self, in general, is one's perception of one's own being or identity. It is the evaluation and interpretation of individual's own characteristics by comparing their external surrounding and other people (Reed II., 2002: 236; Loroz, 2004: 326). Individuals are aware of their own self and usually define their self-concepts according to their relations with the others (Wee and Ming, 2003: 209). It is stated that self-concept has three basic dimensions. These are; the material self (one's body, physical elements and material assets), the social self (one's desire to be like the other people) and the spiritual self (one's inner world) (Abe, Bagozzi and Sadarangani, 1996: 98). Therefore, it is not possible to talk about only one self-concept for individuals. A general distinction is made as follows: *Real self* is the self that an individual has in the direction of his/her characteristics. *Ideal self* is the composite of the characteristics that an individual desires to have (Koç, 2007: 176; Solomon, 2007: 157). *Real social self* means how the others perceive the individual and *ideal social self* means how the individual wants the others to perceive him/her (Hong and Zinkhan, 1995: 54; Sandra, 2002: 53).

Another concept associated with the self is self-monitoring. Self-monitoring was first used by Snyder in 1974. *Self-monitoring* is the degree to which individuals observe the situations and behaviors in their surroundings and controls their behaviors accordingly (Aaker, 1999: 47; Darley and Lim, 1992: 332; Polat and Umay, 2003: 198). That is, it is the ability to control the susceptibility and reactions of others. Two types of self-monitoring are mentioned. First, high self-monitoring; second, low self-monitoring. High self-monitoring means adapting behaviors according to the social patterns. These people monitors social cues very carefully and do not exhibit any behaviors other than those. Low self-monitors do not get influenced by the external surrounding while exhibiting their behaviors. These people do not have the ability to modify themselves according to the social cues and behavioral patterns. They even do not want to do such a thing. On the contrary, they do what they know in any setting and under any circumstances. Therefore, it is seen that these people do not pay more attention to social norms and social self. On the other hand, it is found out that high self-monitors pay great attention to ideal social self (Graef, 1996; O'Cass and McEwen, 2005; Ricks and Veneziano, 1998; Spangenberg and Sprott, 2006).

O’Cass, in his study (2000), developed self-monitoring scale and divided it into two subgroups as self-monitoring susceptibility and self-monitoring tendency. The researcher argued that self-monitoring did not constitute one dimension and that two-factor model would be more useful to explain consumer behaviors. Self-monitoring susceptibility measures individuals’ perception level of environment, whereas self-monitoring tendency measures the conformity of behaviors to the environment.

Individuals’ having high and low self-monitoring characteristics enables them to interpret their surrounding and the world and show what kind of personality they exhibit. It is argued that five basic characteristics of self-monitoring play an important role in this: 1.the importance individual gives to social approval in expressing themselves, 2.the level of individual’s paying attention to social comparison, 3.individual’s ability to adapt their behaviors to the surrounding and control them, 4. the characteristics of using this ability in specific situations, and 5.individual’s being consistent or changeable in expressing themselves and their behaviors (Bearden, Shuptrine and Teel, 1989: 703). For example, the things high self-monitors should do or not are determined by their surroundings because these individuals pay attention to external cues and stimulants (Lammers, 2002). They are also evaluated as good actors that can get adapted to any circumstances. They are quite social people. They have a lot of friends. However, they are not sincere with their friends. Friends are those chosen to help them adapt to different settings. Each friend is influential on their own surrounding. Although high self-monitors have different behavior patterns according to the situations and conditions, they have motivating aims. This aim is to be a beloved, wanted and admired person (Ricks and Veneziano, 1998; Rose and DeJesus, 2007). Low self-monitors pays more attention to the cues and stimulants from their inner world. Therefore, they choose friends that have highly similar attitudes (Lammers, 2002). The reason for such a selection is that they increase their strength to express themselves and the level of their approval by means of individuals like them (Harnish and Bridges, 2006).

According to the researches, high self-monitors pay attention to the approval of the attraction and quality of the message source by the others while making decisions. Low self-monitors pays attention that message source should be an expert while making decisions. High self-monitors get influenced by the advertisements emphasizing image of the product. On the contrary, for low self-monitors advertisements emphasizing functional characteristics of the product are more influential because these individuals make decisions according to their functional characteristics (Graeff, 1996). Shavitt, Lowrey and Han (1992) examined how self-monitoring affected the attitudes towards advertisements. According to the results, high self-monitors mostly assessed the advertisements in the direction of social surrounding. Low self-monitors paid attention to the utilitarian message cues of the advertisements. Harnish and Bridges (2006) investigated the relationship between the characteristics of self-monitoring and making social comparisons with others, and individuals they prefer to get information. According to the results, high self-monitors make more social comparisons. While comparing they choose the information sources they use among high-self monitors like them. Low self-monitors do not have such a tendency.

Graeff (1996), in his study, examined the relationship between the preferences on consumed brands personally and among other people and self. Consumers are greatly influenced by the point of view of the surrounding others in the brand preference of consumed products in a way the other people can see. The same situation is not valid for the brands of the personally consumed products. For high self-monitors, the brands to be consumed among other people mostly depend on their reaction to the brand. Low self-monitors, on the other hand, get affected less by the reactions of the other people in their preference of brands. Rose and DeJesus (2007), in their study, examined the relationship between materialism and self-monitoring. It was seen that high self-monitors were more inclined to materialism. The researcher stated that having expensive and more products means approval by society for high self-monitors. Hog, Cox and Keeling (2000), in their study, examined the relationship between self-image of the individual and product/brand image. They investigated brand image evaluations of consumers in congruence with their self for the brands of alcoholic soft drinks. The results show that self-monitoring of the consumers in their preferences of alcoholic soft drink brands plays a distinctive role. The preferences of high self-monitors can change depending on the place and setting where they will consume drinks. For those individuals it is quite important for the drink to support individual’s self-image. For low self-monitors, image of the drink is not important, its content is important. A similar study was conducted by Ratner and Kahn (2002). They examined the influence level of the consumers by their surroundings and self-monitoring in variety-seeking. According to the results, consumers seek for more kinds and prefer different brands since they are alone in the setting they interact with people. Self monitoring is effective on variety seeking as an intervening variable. For high self-monitors, the tendency to image-oriented variety-seeking is higher. Thus, the following were hypothesized:

H2: Self-monitoring has an impact on status consumption.

Relationship of Personal Influence with Self and Status Consumption

Consumers mostly make decisions under the impact of their surroundings. Especially the advisory groups that an individual asks for advice are quite influential on consumer behaviors. The individual sees the reference group as an important data source (Solomon, 2007; Mowen, 1993).

The effect of the reference group on consumer behavior gets affected by two factors. These are; the goods/brand is luxury or compulsory goods, and the use of product/brand personally or in common areas. When the product has the status of a luxury goods and is used in common areas, the reference group has a strong effect on both product and brand choices. In case of a product for personal use or a compulsory product, the effect of reference group is weak (Solomon, 2007: 382). People interested in conspicuous and status consumption want to give some messages by showing other people either their social status or the things they own. Additionally, satisfaction with these consumptions depends on other people's or reference group's approval of these goods. Therefore, they direct people towards such kind of consumption (Amaldoss and Jain, 2005; Chen, 2002; Kilsheimer, 1993)

It is possible to find several researches investigating the impact of reference groups on consumer behavior. (Ford and Ellis, 1980; Graef, 1996; Harnish and Bridges, 2006; Ratner, Kahn, 2002). Bearden, Netemeyer and Teel (1989), in their study, developed a scale to determine the influence levels of consumers from other people. They argued that individuals' interaction with their surroundings constitutes two basic dimensions as normative and informational. That is, people interact by gathering information from reference groups or imitating their preferences. Escalas and Bettman (2005), in their study, examined the effect of the self and reference groups on brand meaning of consumers. Individuals prefer brands that support their self. However, brand meaning to support the self changes depending on the reference group's point of view. Thus, the following were hypothesized:

H3: Personal Influence has an impact on status consumption.

The model developed for the purpose and hypotheses of the research is shown in Figure 1.

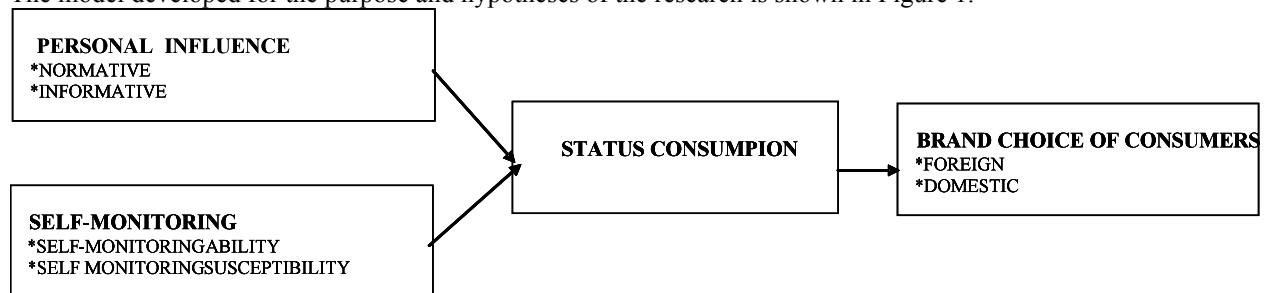

Figure 1. Research Design

RESEARCH DESIGN

Method

Within the scope of the study, consumers shopping in two shopping malls selling foreign and domestic luxury-wear brands in İstanbul (Kanyon and İstinye Park Shopping Malls) were included. Sample size of the study was determined as 400, representing 95% confidence intervals with an error margin of 5%. Firstly, data were gathered by survey method. As a survey method, convenience sampling, one of the non-probabilistic sample methods, was used. Prepared surveys were administered to the respondents during weekdays (Monday, Wednesday and Friday) and weekends at 12.00-22.00 pm. for 3 weeks in the shopping centers mentioned above during March 2010.

There were five groups of close-ended questions in the survey to be measured on nominal, ordinal, and interval scales. The first group of questions was prepared to determine the demographic characteristics of the respondents. The second group was arranged to determine brands which are considered as luxury in ready-to-wear brands and the purchase of brands by the respondents during the last two years. There were 20 luxury and non-luxury ready-to-wear brands (10 domestic - 10 foreign) in the survey. Respondents were asked to mark the brands they considered as luxury brands and determine which brands they bought during the last two years. In addition, they were asked to mark which brands were domestic and foreign. Thus, respondents' luxury brand

knowledge, choices and foreign brand rate in these choices were determined. The third group of questions was prepared to determine status consumption tendencies, the fourth group was prepared to determine self-monitoring, and the fifth group of questions was prepared to determine the level of personal influence.

Status consumption tendency was tested by the scale developed by Eastman, Goldsmith and Flynn (1999), self-monitoring by the scale developed by O’Cass’ (2000) and the level of personal influence by the scale developed by Bearden, Netemeyer and Teel (1989). Items were measured on a 5-point Likert by using SPSS 17.0 and Lisrel 8.3 statistical programmes. In data analysis, frequency distributions, confirmatory factor analysis, Correlasyon analysis and Structural Equation Model (SEM) test were used.

Data analysis and hypotheses test results

Frequency distributions of the demographic characteristics of the respondents participated in the research was shown in Table 1.

Table 1. Demographic characteristics of respondents

Demographic Characteristics		Number n	Percent %
Gender	Female	214	56.0
	Male	168	44.0
Age	18-27	95	24.9
	28-37	184	47.4
	38-47	69	18.1
	47-58	27	7.1
	58 and over	10	2.6
	Education	Primary Education	14
	Secondary Education	109	28.5
	University	244	63.9
	Postgraduate	15	3.9
Marital Status	Married	166	43.5
	Single	216	56.5
Monthly Average Income Level of the Family	0-2000 TL	18	4.7
	2001-4000 TL	65	17
	4001-6000 TL	54	14.1
	6001-8000 TL	121	31.7
	8001 and over	124	32.5
Profession	Civil Servant	46	12.0
	Worker	9	2.4
	Self-employed	43	11.3
	Those Working for Private Sector	141	36.9
	Housewife	42	11.0
	Industrialist/Businessman	53	13.9
	Student	42	11.0
	Retired	6	1.6
TOTAL		382	100.0

56% of the respondents were female, 65.5% were between the ages 28 and 47, 67.8% were university graduates and postgraduates, and 56.5% were single. The level of income of 64.2% of the respondents were 6001 TL and over. 36.9% were working for private sector. The other professional groups showed a close distribution with each other.

Ready-to-wear brand preferences and buying behaviors of respondents

In order to determine the status consumption preferences and behaviors of the respondents, 20 ready-to-wear brands, prestige and non-prestige, were given to the respondents in a list and they were asked to mark the prestige brands. Then they were asked to mark the brands they bought during the last 2 years. Thus, the level of prestige brand preferences of the respondents was tried to be determined. The results were shown in Table 2.

Table 2. Knowledge and preference levels of respondents on ready-to-wear brands

Brand Name	Prestige Brand Level of Recognition		Prestige Brand Level of Purchase		Foreign Brand Level of Recognition	
	No	Percent	No	Percent	No	Percent
Network	292	76.4	130	34.0	325	85.1
MaxMara	284	74.3	17	04.4	317	83.1
Beymen	330	86.3	122	32.0	94	24.6
Armani	349	91.3	90	23.4	219	57.3
Vakko	330	86.3	111	29.1	100	26.1
Oxxo	276	72.3	112	29.3	301	78.9
Koton	283	74.1	48	12.5	212	55.5
İpekyol	250	65.4	150	32.3	40	10.5
Moschino	289	75.7	26	06.8	296	77.4
Adil Işık	260	68.1	45	12	44	11.5
Zara	269	70.4	79	23	25	06.5
Machka	278	72.8	49	29	315	82.5
Burberry	328	85.9	134	35.1	350	91.6
Polo Garage	327	85.6	160	41.9	331	86.6
Quicksilver	289	75.7	47	12.3	340	89.0
LC Waikiki	248	65.0	90	23.6	236	61.8
Gucci	328	85.9	132	34.6	342	89.5
Colin's	275	72.1	91	23.8	285	74.6
Marks&Spencer	298	78.0	82	23	341	89.3
Louis Vuitton	336	88.0	52	13.6	346	90.5

As seen in Table 2, the level of brand recognition of the respondents was high. The level of prestige brand buying of the respondents was 30% on average. However, as seen in Table 2, respondents' distinctions of foreign and domestic brands were not fully correct. It was observed that respondents marked some domestic brands (Network, Machka, Oxxo, Colin's) as foreign brands.

Testing of research model

In the study, confirmatory factor analysis was used to test personal influence, self-monitoring and status consumption scales (the tables indicating the mean and standard deviation values of the scales were presented in the annex to this paper). The variables indicating negative variance, exceeding standard coefficients (very close to 1.0) or presenting high standard error values were checked (Hair et al., 1998, p. 610) and inappropriate variables were eliminated.

Firstly, personal influence scale was tested. It was seen that model fit values of the scale was not on an acceptable level. In the direction of the suggested modifications, with the elimination of 4 variables, 2 from the "normative" dimension and 2 from the "informative" dimension, the scale was on an acceptable level. According to the scale developed by Bearden, Netemeyer and Teel (1989), interpersonal influence constitutes two dimensions as normative and informative. As a result of the confirmatory factor analysis, it was seen that the scale developed by the authors was consistent with our sample. The model fit values before and after modifications were shown in Table 3.

Table 3. Personal influence scale test

Fit Index	Before Modification	After Modification	Acceptable Fit
Absolute Fit Value			
Chi-square (X^2)	529.93	75.86	
Degree of freedom	52	18	
Chi-square/degree	10.17	4.21	1-5

of freedom			
GFI	0.78	0.92	$0,90 \leq GFI \leq 0,95$
AGFI	0.67	0.85	$0,85 \leq AGFI \leq 0,90$
RMSR	0.11	0.070	$0,05 \leq RMSR \leq 0,08$
RMSEA	0.17	0.080	$0,05 \leq RMSEA \leq 0,08$
Incremental Fit Value			
CFI	0.93	0.96	$0,95 \leq CFI \leq 0,97$
NNFI	0.91	0.93	$0,95 \leq NNFI \leq 0,97$
NFI	0.92	0.95	$0,95 \leq NFI \leq 0,97$

Secondly, confirmatory factor analysis was conducted for self-monitoring scale consisting of two dimensions as self-monitoring ability and self-monitoring susceptibility. It was found out that model fit values were not on an acceptable level. In the direction of the suggested modifications, 4 variables, 3 from self-monitoring ability dimension and 1 from self-monitoring susceptibility dimension, were eliminated. After modification it was observed that model fit values were on an acceptable level. The results were shown in Table 4.

Table 4. Self-monitoring scale test

Fit Index	Before Modification	After Modification	Acceptable Fit
Absolute Fit Value			
Chi-square (X^2)	283.97	54.17	
Degree of freedom	52	18	
Chi-square/degree of freedom	5,46	3.01	1-5
GFI	0.87	0.97	$0,90 \leq GFI \leq 0,95$
AGFI	0.80	0.93	$0,85 \leq AGFI \leq 0,90$
RMSR	0.11	0.054	$0,05 \leq RMSR \leq 0,08$
RMSEA	0.12	0.073	$0,05 \leq RMSEA \leq 0,08$
Incremental Fit Value			
CFI	0.86	0.95	$0,95 \leq CFI \leq 0,97$
NNFI	0.83	0.93	$0,95 \leq NNFI \leq 0,97$
NFI	0.84	0.93	$0,95 \leq NFI \leq 0,97$

Confirmatory factor analysis was conducted for status consumption scale, one of the variables of the research model, and it was determined that model fit values were not on an acceptable level. In the directions of the suggested modifications, 1 variable was eliminated from status consumption scale. Model fit values were on an acceptable level after modification. The results were shown in Table 5.

Table 5. Status consumption scale test

Fit Index	Before Modification	After Modification	Acceptable Fit
Absolute Fit Value			
Chi-square (X^2)	23.53	3.72	
Degree of freedom	5	2	
Chi-square/degree of freedom	4.71	1.86	1-5
GFI	0.98	1.00	$0,90 \leq GFI \leq 0,95$
AGFI	0.93	0.98	$0,85 \leq AGFI \leq 0,90$
RMSR	0.081	0.014	$0,05 \leq RMSR \leq 0,08$
RMSEA	0.099	0.048	$0,05 \leq RMSEA \leq 0,08$
Incremental Fit Value			
CFI	0.97	1.00	$0,95 \leq CFI \leq 0,97$
NNFI	0.97	0.99	$0,95 \leq NNFI \leq 0,97$
NFI	0.93	0.99	$0,95 \leq NFI \leq 0,97$

In the study, the research model examining the relationships between personal influence, self-monitoring dimensions and status consumption was tested by path analysis. In the direction of the modifications suggested in the model, 3 variables, 2 variables from self-monitoring susceptibility dimension and 1 variable

from the “informative” dimension of personal influence, were eliminated. Model fit values were on an acceptable level after modification. The results were shown in Table 6.

Table 6. Model fit values

Fit Index	Before Modification	After Modification	Acceptable Fit
Absolute Fit Index			
Chi-square (X^2)	641.00	196.51	
Degree of freedom	221	97	
Chi-square/degree of freedom	2.9	2.03	1-5
GFI	0.86	0.94	$0,90 \leq GFI \leq 0,95$
AGFI	0.83	0.92	$0,85 \leq AGFI \leq 0,90$
RMSR	0.12	0.051	$0,05 \leq RMSR \leq 0,08$
RMSEA	0.079	0.52	$0,05 \leq RMSEA \leq 0,08$
Incremental Fit Index			
CFI	0.94	0.98	$0,95 \leq CFI \leq 0,97$
NNFI	0.93	0.97	$0,95 \leq NNFI \leq 0,97$
NFI	0.92	0.96	$0,95 \leq NFI \leq 0,97$

Standard coefficients, R^2 values, t values, Cronbach’s Alpha coefficients, construct reliability and variances were shown in Table 7.

Table.7. Values belonging to variables of research model

Variables	Standard Value	R^2	Error Variance	t Value	Const ruct Reliab ility	Expla natory Varia nce
PERSONAL INFLUENCE (Cronbach’s Alpha=0,871)						
Normative(Cronbach’s Alpha =0,778)					0,86	0,61
In social situations, I have the ability to alter my behavior if I feel that something else is called for.	0,70	0,49	0,78	12,31

STATUS CONSUMPTION (Cronbach’s Alpha =0,867)						
I would buy a product just because it has status.	0,80	0,63	0,55	10,35	0,84	0,57
I am interested in new products with status	0,85	0,73	0,39	17,31		
I would pay more for a products if it had status	0,82	0,67	0,51	16,64		
A product is more valuable to me if it has some snob appeal.	0,51	0,26	0,88	9,79		

The values belonging to construct reliability of the variables in the research model were on an acceptable level.

The relationships between personal influence and self-monitoring and status consumption were shown in Table 8.

Table.8. relations among variables of research model

Variables	Standard Value	R ²	Error Variance	t value
SELF-MONITORING ABILITY-SELF-MONITROING	0,92	0,92	0,08	5.35
SELF-MONITORING SUSCEPTIBILITY-SELF-MONITORING	0,45	0,34	0,66	4.96
INFORMATIVE-PERSONAL INFLUENCE	0,61	0,35	0,65	9,08
NORMATIVE-PERSONAL INFLUENCE	0,91	0,94	0,06	12,22
SELF-MONITORING-STATUS CONSUMPTION	0,15	0,64	0,36	2,22
PERSOANL INFLUENCE-STATÜS CONSUMPTION	0,53	0,64	0,36	7,11

As shown in Table.8 and Figure.2, personal influence and self-monitoring have an impact on status consumption. These findings show that social approval, social comparison and behaving suitably to others have an effect on status consumption. Additionally, we can say that social surroundings, particularly reference groups, affect this kind of consumption.

In the previous researches and studies on status and conspicuous consumption, it was found out that personal influence and self-monitoring had an impact on status consumption (Kilsheimer, 1993; O’Cass and McEwen, 2005; Wong, 1997). The results obtained in this research support the literature. In this case, H2 and H3 hypotheses were confirmed.

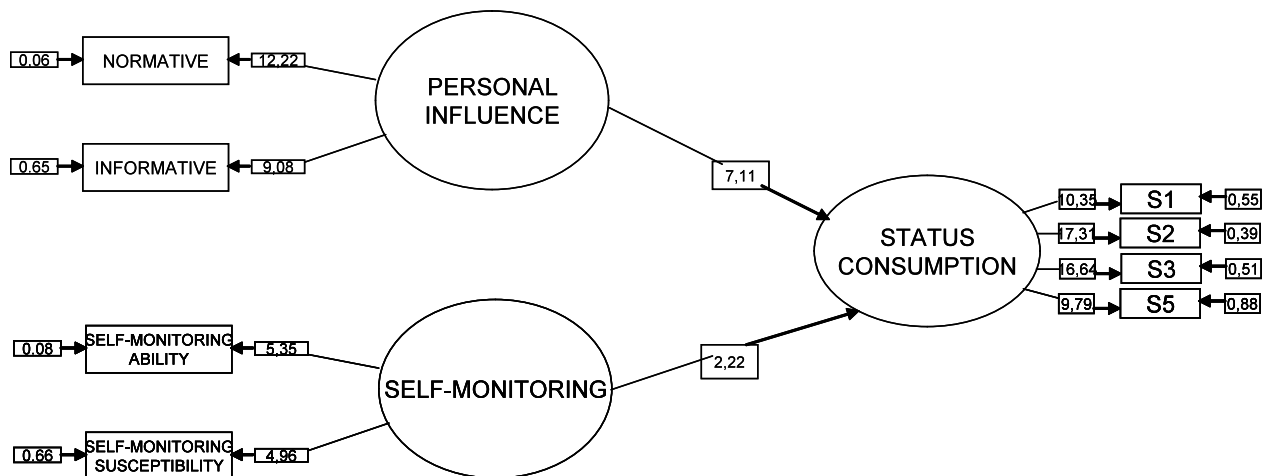

Figure 2. Research path model

Relationships between brand preferences and status consumption behaviors of respondents

Correlation analysis was conducted to determine whether there was a relationship between brand preferences and status consumption of the respondents. According to the results of the analysis, there is a significant relationship between status consumption and domestic-foreign brand preferences. In other words,

respondents with high status consumption prefer to buy foreign branded products. Thus, of the hypotheses of the study, H1 was confirmed. The results were shown in Table 9.

Table.9. Relationship between status consumption and domestic-foreign brand preferences

		Brand Preference
Status Consumption	Correlation coefficient	-0.097
	Sig	0,025*

*p<0.05

As is known, in status and conspicuous consumption, individuals benefit from the symbolic meanings of the products to give messages to the surrounding others. In brand preferences as well, symbolic meanings that brands have are determinative. Therefore, in both status and conspicuous consumption, prestige brands are preferred, and brands and products supporting social status in status consumption are preferred more. Marcoux, Filiatrault and Cheron (1997), in their study, investigated the preference levels of students for foreign branded products in their status consumption. According to the results of the research, students with a high tendency towards ostentation prefer foreign brands. O’Cass and McEwen (2005) examined prestige brand preferences both for status and conspicuous consumption. According to the results, prestige brand preference is high both for status and conspicuous consumption. The results of this study are consistent with the other studies. In status consumption, prestige and foreign brands are preferred more. Therefore, H1 hypothesis was confirmed.

CONCLUSION

In this study, the effects of personal influence and self-monitoring on status consumption were investigated. Additionally, domestic and foreign brand preferences of individuals with high status consumption were examined. According to the results, personal influence and self-monitoring have an impact on status consumption. Accordingly, the effect of social surroundings, particularly of reference groups, is high for those doing status buying. Normative and informal interaction was found to be important in communication with social surroundings. This situation shows that individuals try to be attuned to their surrounding environment by gathering information and imitating. Again, in status consumption, self-monitoring having an impact shows that they are susceptible in perceiving and adjusting the surrounding environment. At the same time, they prefer prestige and foreign brands in their brand preferences.

The following can be suggested according to the results:

Firms offering products for status consumption should concentrate on strategies that have symbolic meanings supporting social status in positioning their products because consumers doing status buying expect products to support their social status. If messages sent involve meanings of distinction, respect and status in their brand retention strategies, it will be effective for the brands to be approved. Again, personal influence will be more effective in the retention of these brands than mass media because consumers doing status buying evaluate their surroundings as an important source of information.

It was determined that prestige brands were preferred in status consumption. Domestic prestige brands are preferred in status consumption; however, foreign brands are preferred more. In this case, it will be useful for the domestic brands to compete both at home and abroad if they expand to foreign markets and become a global brand. Global brands will meet the status symbol expectations of foreign and domestic markets.

Limitations and implications

In this study, status consumption tendencies of the consumers towards domestic and foreign ready-to-wear brands were examined. When status consumption tendencies are taken into consideration for different product groups, more information can be obtained about their preferences for status consumption since, unlike conspicuous consumption, brands preferred in status consumption are not expected to be expensive. It is enough for the brand to have a symbol of status and support the ideal self of consumers. Therefore, status consumption tendencies of consumers towards inexpensive product groups and characteristics of products that are influential for this tendency can be examined.

In the study, the effect of personal influence and self-monitoring on status consumption was investigated. In the future studies to be carried out to contribute to status consumption literature, the psychographic characteristics of the consumers and the factors influential on consumers’ perception of status brands can be searched.

THE IMPACTS OF EXTERNAL IMAGE FORMED BY CUSTOMER PERCEPTION ON CONSUMER EMOTION AND BEHAVIOR

**Mevlüt Türk
Neslihan Derin
Şeyda Nur Seçkin**

Inonu University, Turkey

ABSTRACT

The theoretical frame of this study is restricted by corporate external image, the basic elements of it and its impacts on customer trust, customer purchasing behavior and customer loyalty. The relationship between the basic elements of external image (customer orientation, good employees, reliable and strong financial structure, product and service quality, social and environmental responsibilities) and customer emotion & behavior (customer confidence, customer loyalty and purchasing behavior) is investigated. As a result of canonical correlation analysis, statistically meaningful relationship between those is found.

Keywords: external image, customer perception, consumer behavior

INTRODUCTION

Corporate image refers to how a company is perceived and what it “stands for”. Being a mental picture to the public, the corporate image plays an important role as a strategic asset enabling firms to outperform in fierce competition (Cravens & Oliver, 2006). Today, corporate image becomes much more important when compared to the past and becomes one of the primary factors for firms to survive and outperform in today’s highly competitive work environment (Mignonac, Herrbach, & Guerrero, 2006).

Positive corporate image attracts high-qualified work force, leads investors to buy equity securities and brings new customers to the firm. Consequently, positive image that stakeholders have of the company results in increased sales and profits. If a positive image in the eyes of customers is developed they will be more willing to buy and be loyal to the company. On the other hand, a negative external image makes customers have a less tendency to interact with the company resulting in assuredly declined sales and profits (Ruth & York, 2004).

With the challenges of highly competitive work environment, firms today have to adapt themselves to changing conditions continuously and act strategically. Especially in last ten years, the external image of firms becomes much more important when compared to the past and plays an important role in success of firms (Küçük, 2005). Establishing a positive corporate image is vital for firms to survive and outperform in the market (Yurdakul, 2010) providing competitive advantage to firms. For this reason, it should be considered by firms more seriously and taken into account in business strategies as a vital issue (Köse, 2007).

LITERATURE REVIEW

EXTERNAL IMAGE FORMED BY CUSTOMER PERCEPTION

Regarding to corporate image’s increasing importance in business life, many studies about it were conducted in various countries. However, opinions of consumers were ignored in most of them and only a few studies taking their point of views into account were developed (Caruana & Ewing, 2009). Later on, in parallel with increasing importance of customers, studies in which their ideas and opinion are involved have increased.

Corporate image is a mental picture developed in minds of the stakeholders (Arıcıoğlu, Paksoy & Güleş, 2006). In other definition, it is an evaluation of firm’s competencies and resources by the public (Fuller,

Ravazzolo & Schweize, 2000). It is a perception of stakeholders of the company regarding to the firm's competency in meeting the demands and expectations (Brammer & Pavelin, 2004). Corporate image indicates perceptions, beliefs and opinions (Lemmik, Schuijf & Streukens, 2003) and is perceived by stakeholders outside the company (Kazoleas, Kim, & Moffi, 2001).

External image indicates perception developed in minds (Güzelcik, 1999:182). It is the starting point of building relationships with customers and associating messages which companies try to impose with customer perception (Aksoy & Bayramoğlu, 2008:85-96), resulting in mental picture formed by the messages sent from the company (Wiertz, & oth., 2004:424– 436). In summary, external corporate image can be defined as the sum of emotions, perceptions, beliefs and opinions regarding to the company name (Kandampully, Hu, 2007).

There are five basic factors in forming positive corporate external image (Walsh, Beatty & Shiu, 2009):

1. Customer Orientation
2. Good Employees
3. Reliable and Strong Financial Structure
4. Product and Service Quality
5. Social and Environmental Responsibilities

Customer Orientation

Customer orientation is an approach aiming to meet customer demands and expectations with high quality of products and services (Şimşek, 2000). The focus is on consumers (Rosenthal, 2007) and all the operations of firm are determined according to their needs, expectations and demands (Bolton, 2005). In customer oriented firms, the power is on customer side (Türk, 2006). If customers gain more than they pay; a strong, long term customer relationship will most likely to occur (Odabaşı, 2003).

Good Employees

Employees are face of the company (Bulut, 20003). Companies whose employees act ethically are perceived as more reliable in the eyes of consumers (Bailey, 2005). Competent, informative, kind and high-qualified employees play an important role in development of positive corporate image.

Reliable and Strong Financial Structure

Financial performance indicates the competency of the firm in taking risk for investment, its competitive ability and profitability. A reliable and financially strong firm tends to grow, make investments with lower risks and outperform in the market compared to its rivals (Karatepe, 2008).

Product & Service Quality

It is necessary for firms firstly to provide product and service quality for positive corporate image (Bakan, 2005). Customers are the ones who will evaluate it (Gürsakar, 2005). Quality is no longer a function; it is just a strategy. Since customers are the stakeholders of a company playing an important role in success of firm services or products which meet expectations and demands of customers have quality (Uyguç, 1998). Companies should target to improve quality and satisfy customers aiming to build long lasting relationships with customers (Sweeney & Swait, 2008). As a result, they can gain trust and loyalty of consumers.

Social and Environmental Responsibility

Although social and environmental responsibilities do not affect company profits in the short run apparently it is crucial for firms to have a positive corporate image which will affect company profitability in the long term (Türk, 2006). Researches indicate that customers of firms which are sensitive to social and environmental issues present more positive attitudes and loyalty towards the company (Hong, Yang & Rim, 2009).

CUSTOMER EMOTIONS AND BEHAVIORS

There are many factors affecting customer emotions and behaviors (Liou, Tzeng, 2010). As one of the factors, corporate image is a primary factor to gain consumer trust which is then exhibited through buying behavior and customer loyalty coming into the scene by repurchasing (Walsh & others, 2009:924-930).

Customer Trust

Trust is the basic element in establishment of customer relationships. Customer trust can be defined as the reliability of the firm perceived by consumers (Orth, Green, 2009) resulting in repurchasing behavior (Harris, Goode, 2004). Therefore, firms should avoid unfair and opportunist activities (Deng & Others 2009).

Repurchasing Behavior

The main aim of all the firms is to build strong, long lasting customer relationships. To achieve this, it is required to make customers present repurchasing behavior. There are some fundamental factors affecting customer repurchasing behavior: value perception developed in consumers' minds regarding to the price of product or service, customer satisfaction and product or service quality (Grace, Cass, 2005), interaction between customers and employees, service area (Grace, 2009) and finally positive corporate image (Caruana, Ewing, 2009). On the other hand, negative expressions spread from mouth to mouth related to the company and incompetency of the firm in resolving customers' problems will affect repurchasing behavior negatively (Blodgett, Granbois & Walters, 1993).

Customer Loyalty

Naturally, all companies target to gain loyal customers by meeting their expectations and demands (Gülmez, 2005). Loyalty is the conversion of positive attitude to behavior (Caruana, Ewing, 2009). Jacoby defines loyalty as a behavioral concept developed after psychological process. Customs, culture, interests and personality are some of the factors affecting customer loyalty (Srinivasan, Anderson & Ponnayolu, 2002). At the same time, customer satisfaction and trust, knowledge usage and competency in technology may be the other influential factors (Chiou, 2004). Also, customer complaints play an important role in establishment of loyalty (Bell, Luddington, 2006). If the causes of complaints are not removed; customer loyalty will be affected negatively (Wallin, 1999).

Behavioral reactions occur as a result of customers' assessment of company outputs (product, service). Customers apart from the loyal ones can be easily captured by rivals (Bloemer, Ruyter, 1998). Patronages have more advantage as compared to the customers who interact with the company only once (Chi, Gürsoy, 2009). The cost of rendering service to the loyal customers is less than gaining new customer portfolio; loyal customers are more inelastic to prices and spare more time to the company (Kumar, Shah, 2004).

METHOD

The field of application is based on customers of a hypermarket of a chain store which operates in nation-wide, employing 3650 personnel with 113 stores and 5 malls. The hypermarket stated above is built on 4500 m² sales areas with 19 cash-desk and 60 employees. The population of the research consists of the customers of hypermarket stated above. Since the size of population can't be determined exactly sampling is implemented. In case of the situations in which standard deviation of population is unknown; the size of sample can be calculated with a commonly used formula: $n = \frac{Z^2 \pi (1-\pi)}{e^2}$ (Kurtuluş, 2006: 191). Before data collection, pilot study is conducted on 50 customers. Customer loyalty is determined as approximately %50. This value is taken as the rate of population (π). In formula, Z indicates confidence level of %95 and e shows tolerance limit ($Z=1.96$, $e=0.04$). As a result, the sample size is found as 600. ($n = \frac{(1.96)^2 0.05(1-0.05)}{(0.04)^2} = 600.25$)

Systematic sampling which is used commonly in marketing researches is selected (Nakip, 2006: 212). Although the population is unknown it is determined that approximately 600 customers visit the hypermarket daily. Since we have limited time data collection is performed between the dates of 09.04.2010 and 18.04.2010. It is calculated that the hypermarket is visited by 6000 customers in ten days (N / n den $6000 / 600 = 10$). It is planned to interview with 60 customers during ten days ($600 / 10 = 60$). Data collection is performed from 8:00 a.m. to 8:00 p.m. Interview is realized with every 10th customer that completed his/her shopping. Since there are customers who are shopping frequently this point is taken into account to avoid repetition. Data collection can be performed in a shorter time but it is stated by store managers that majority of customers visit the hypermarket usually once a week. As a result, ten-day period including two weekends is selected to improve the reliability of the sample.

Data is collected through questionnaire forms designed according to likert scaling. In questionnaire form, there are 5 questions related to demographic characteristics of customers, 5 of them is related to customer orientation, 4 of them is related to good employees, 5 of them is regarded to strong and reliable financial structure, 4 of them is related to product and service quality and finally 3 of them is related to social and environmental responsibilities. There are also 9 questions about customer trust, customer buying behavior and customer loyalty (3 per each factor). Collected data is processed through "SPSS 16.0 for Windows" program and confidence analysis, frequency analysis, chi-square analysis and finally canonical correlation analysis are implemented. The findings of the study are presented by charts and tables.

APPLICATION AND FINDINGS

Confidence Analysis

Confidence analysis is conducted and confidence coefficients are calculated to achieve consistency of questions with each other and homology in measurement (Özdamar, 2002: 662). For this reason, it is benefited from Cronbach Alfa coefficient (Özdamar, 2002: 662-663) which has a higher validity in terms of statistics. Cronbach Alfa coefficient is interpreted as: 0-0,4; confident, 0,4-0,6; low confident, 0,6-0,8; considerably confident, 0,8-1,0; highly confident (Alpar, 2003: 382).

Cronbach Alfa coefficient is calculated as %92,6 indicating that the scale is highly reliable.

Table 1: Confidence Analysis

Cronbach Alfa	# of Questions
%92,6	35

Frequency Analysis

The frequency analysis regarded to the demographic characteristics of customers is shown in Table 2. Approximately half of the customers shopping from the hypermarket consist of women. The proportion of consumers who are in age of 26-35 is %33.7 and approximately %60 of them is ≤ 35 .

When we look at the marital status 1/3 of customers is single; the rest is married. In terms of educational background %45.5 of them have higher education followed by the ones having secondary education (%36.0). According to income groups, approximately half of them earn 1000 TL and below per month. %85.5 of them belongs to middle and low class of income groups. Table 2 indicates that majority of the customers have a relatively higher educational background, young and married and finally belong to low or middle class of income groups. Reliability of data collected regarding to income can be argued. Since people tend to show their incomes lower than reality it can be accepted as some of the customers presenting them having low income most probably belong to the middle class.

Table 2: Descriptive Statistics Related To Demographic Characteristics of Customers

	N	%		N	%
1. Sex			2. Age		
Female	302	50,3	25 \leq	152	25,3
Male	298	49,7	26-35	202	33,7

Descriptive statistics related to fundamental factors of external image are shown Table 3:

Customer Orientation:

- X11: Setting value on customers
- X12: Open communication with customers
- X13: Trying to remove the cause of customer complaints and solve problems
- X14: Dealing with customers
- X15: Creating an atmosphere for customer to express his/her problems

Good Employee:

- X21: Acting in reliable manner
- X22: Politeness
- X23: High-qualified employees
- X24: Presentable employees

Reliable and Strong Financial Structure:

- X31: Being a strong firm
- X32: Outperforming in the market
- X33: Having potential to grow in the future
- X34: Being a valuable, worthy investment
- X35: Having goals and objectives regarding to the future

Product and Service Quality:

- X41: Reliability in terms of quality
- X42: Innovative services
- X43: High quality of products and services
- X44: Being in the back of goods produced and services rendered

Social and Environmental Responsibilities:

- X51: Being sensitive to environmental issues
- X52: Making sacrifice for clean environment
- X53: Supportive actions for social issues

The average value related to the fundamental factors of external image is 3.5067. When this is interpreted in Likert it can be said that it is in the middle of the scale. “Product and service quality” has the highest value of 3.6575 and “social & environmental responsibilities” has the minimum value of 3.2639.

The average value of variables of customer orientation is 3.55098. In today’s business environment in which the importance of customer orientation increases day to day it can be said that this value is very low. “Setting value on customers” has the highest value of 3.6833 and “dealing with customers” has the minimum value of 3.4233.

The average value of “good employee” is 3.59625. “Politeness” has the highest average value of 3.8117 and “high-qualified employees” has the minimum value.

The average value of “reliable and strong financial structure” is 3.41602. In this set, the maximum value belongs to the variable of “being a valuable, worthy investment” and the minimum value belongs to the variable of “outperforming in the market”.

Among the variables of “product and service quality”, the maximum value belongs to “reliability in terms of quality” and the minimum value belongs to “innovative services”.

“Social and environmental responsibilities” has the lowest average. The maximum value belongs to “sensitivity to environmental issues and the minimum one belongs to “making sacrifice for clean environment”.

Table 3: Descriptive Statistics Related To the Fundamental Factors of External Image

		Valid	Missing	Mean	St. Deviation	Minimum	Maximum
Customer Orientation	X11	600	0	3,6833	0,85885	1,00	5,00
	X12	600	0	3,4900	0,93346	1,00	5,00

	X33	600	0	3,3567	1,05419	1,00	5,00
	X34	600	0	3,6117	1,06900	1,00	5,00
	X35	600	0	3,5317	0,94895	1,00	5,00
Product & Service Quality	X41	600	0	3,7583	0,86285	1,00	5,00
	X42	600	0	3,4617	0,93808	1,00	5,00
	X43	600	0	3,6983	0,91217	1,00	5,00
	X44	600	0	3,7117	0,86975	1,00	5,00
Social and Environmental Responsibilities	X51	600	0	3,3800	0,83071	1,00	5,00
	X52	600	0	3,1250	0,86059	1,00	5,00
	X53	600	0	3,2867	0,73398	1,00	5,00

Descriptive statistics related to dependent variables of customer emotions and behaviors are shown in Table 4:

Customer Loyalty:

Y11: Being a customer of the store for present as a result of positive interactions with organization

Y12: Being a customer of the store from the past

Y13: Being a loyal customer

Customer Trust:

Y21: Trusting firm

Y22: Belief in firm's honesty

Y23: Belief in firm's acting in the right manner all the time

Repurchasing Behavior:

Y31: Tendency to repurchase

Y32: Firm's being one of the places for shopping in the future

Y33: Tendency to shopping from the store in the future

The average value of variables related to customer emotions and behaviors is found as 3.61. The highest value of 3.84 belongs to "repurchasing behavior" and the minimum value of 3.34 belongs to "customer loyalty".

In the set of customer loyalty, "being a customer of the store for present as a result of positive interactions with organization" has the highest average and "being a loyal customer" has the lowest value.

The average value of customer trust is found as 3.6511. "Trusting firm" has the highest average and "belief in firm's acting in the right manner all the time" has the lowest.

The highest value belongs to "tendency to repurchase" in repurchasing behavior set. Although this value is the maximum one among all the dependent variables we can't say that it is high. The minimum value belongs to "tendency to shopping from the store in the future".

Table 4: Descriptive Statistics Related to the Variables of Customer Emotions & Behaviors

		Valid	Missing	Mean	St. Deviation	Minimum	Maximum
Customer Orientation	Y11	600	0	3,5650	1,00039	1,00	5,00
	Y12	600	0	3,3867	1,20259	1,00	5,00
	Y13	600	0	3,0650	1,20549	1,00	5,00
Customer Trust	Y21	600	0	3,7733	0,93099	1,00	5,00
	Y22	600	0	3,6717	0,93201	1,00	5,00
	Y23	600	0	3,5083	0,92087	1,00	5,00
Repurchasing Behavior	Y31	600	0	3,9250	0,83898	1,00	5,00
	Y32	600	0	3,8333	0,88139	1,00	5,00
	Y33	600	0	3,7700	0,92657	1,00	5,00

Canonical Correlation Analysis

Canonical correlation analysis is a technique which determines the relationship between dependent and independent variables (Kurtuluş, 2006: 373).

In this part, the relationship between the basic elements of external image (customer orientation, good employees, reliable and strong financial structure, product & service quality, social and environmental responsibilities) and customer emotion & behavior (customer confidence, customer loyalty and purchasing behavior) is investigated through canonical correlation analysis. It is thought that the fundamental factors of external image have an effect on customer emotions & behaviors. In this context, the fundamental factors of external image are defined as independent variables (5 sets with 21 variables) and the factors of customer emotions and behaviors as dependent variables (3 sets with 9 variables).

Canonical correlation analysis results are shown in Table 5, 6 and 7. To be readable, related tables are presented instead of all. In Table 5, core values of canonical correlation are shown. Since there are nine dependent variables in Table 5 nine canonic variables are calculated accordingly. The highest canonical correlation coefficient is found as 0.82480. The value indicating the relationship between the two sets is; $R_c \max = 0.82480$. It can be said that there is a high level of linear relationship between these two sets.

Table 5: Eigenvalues and Canonical Correlations

Root No.	Eigenvalue	Pct.	Cum. Pct.	Canon Cor.	Sq. Cor
1	2.12792	80.56435	80.56435	.82480	.68030
2	.18566	7.02936	87.59371	.39572	.15659
3	.09150	3.46415	91.05786	.28953	.08383
4	.07891	2.98766	94.04553	.27045	.07314
5	.06624	2.50802	96.55355	.24925	.06213
6	.05605	2.12195	98.67549	.23037	.05307
7	.01864	.70582	99.38131	.13528	.01830
8	.01311	.49629	99.87761	.11375	.01294
9	.00323	.12239	100.00000	.05677	.00322

It is necessary to test whether the correlation coefficient calculated is statistically meaningful or not. Three different test results are presented in Table 6 and Table 7 below. According to effect within cells analysis in Table 6 and constant effect analysis in Table 7, the level of the relationship between the dependent and independent variables is found as at 0,05.

Table 6: EFFECT WITHIN CELLS: Regression, Multivariate Tests of Significance

Test Name	Value	Approx. F	Hypoth. DF	Error DF	Sig. of
Pillais	1.14352	4.00612	189.00	5202.00	.000
Hotellings	2.64127	7.94089	189.00	5114.00	.000
Wilks	.19641	5.44351	189.00	4756.40	.000

(S = 9, M = 5 1/2, N = 284)

Table 7: EFFECT CONSTANT: Multivariate Tests of Significance

Test Name	Value	Exact F	Hypoth. DF	Error DF	Sig. of F
Pillais	.49631	26.74548	21.00	570.00	.000
Hotellings	.98536	26.74548	21.00	570.00	.000
Wilks	.50369	26.74548	21.00	570.00	.000

(S=1, M=9 1/2, N = 284)

According to the findings, there is a meaningful relationship between the external image and customer emotions and behaviors. When we look at the average values of variables we can express them as in the middle according to Likert Scale. The average value (3.61) of customer emotions and behaviors (set of dependent variables) is higher than the average value (3.51) of external image factors (independent variables). It can be said that more efforts should be made regarding to the factors of external image and thereby customer emotions and behaviors will be affected positively. In other words, efforts made related to “customer orientation”, “good employee”, “reliable and strong financial structure”, “product & service quality” and “social & environmental responsibilities” is going to create positive impacts on customer trust, loyalty and repurchasing behavior.

When we look at the average values of dependent variables customer loyalty has the minimum value. While the value of Y11 (Being a customer of the store for present as a result of positive interactions with organization) is 3,565; the value of Y12 (Being a customer of the store from the past) is 3,387 and finally the value of Y13 (Being a loyal customer) is 3,065. On the other hand, the average value of customer trust (3.65) indicates that the company should give more importance to establish trustworthy customer relationships. Among the dependent variables repurchasing behavior has the highest value. Although the average value of tendency to repurchase is low it is higher than the values of customer loyalty and trust. As the important factors influencing customer emotions and behaviors, the independent variables stated above have low average values. To increase customer loyalty and trust and finally stimulate repurchasing behavior the company should give more importance to those issues.

Among the independent variables, “product & service quality”, “good employees” and “customer orientation” have the higher values. However, the average values regarding to “good employee” is not adequate; indicating that a training program for hypermarket employees is needed. Since employees are the face of a company who interact with customers directly they play an important role in formation of external image and for this reason, more importance should be given to improvement of employee skills and qualifications.

The average values of “customer orientation” are also low indicating the necessity for the hypermarket to improve customer relationships and consider their problems or complaints professionally providing effective solutions.

While these three independent variables stated above have a positive effect on customer emotions and behaviors we can't say the same thing for “strong and reliable financial structure” and “environmental and social responsibilities”. In recent years, the sensitivity to environmental and social issues has increased significantly being an important factor in establishing positive corporate image. However, the results obtained indicate that the hypermarket is insufficient in undertaking its social and environmental responsibilities.

In this study, it becomes impossible to analyze dependent and independent variables separately. Because of the high quantity of variables and the restriction of the study, determining the relationship between these variables according to the demographic characteristics of customers and the level of this relation are decided to be investigated in another study.

ABSTRACT

Psychological variables, one of the many factors which affect consumers' purchasing behavior, contain an extensive field which has significant effects on consumption custom. Sentimental factors within psychological factors and nostalgia within sentimental factors can be very impressive on consumers' choice. Studies on this issue show that nostalgic factors can affect consumers' choice lifelong.

Nostalgia is defined as yearning for yesterday. Especially with the help of globalization, social and cultural structure is changing rapidly in all over the world and the societies which have to adapt these rapid changes begin to yearn for the past and develop a different perspective to products which hold the traces of the past.

Retro-marketing is in use to emphasize the yearning for yesterday by revealing that the product is trustworthy and essential. Products either conduct a sentimental relation by reminding and emphasizing the past or reveal the idea of trust and essentiality by being on since the time remembered. In this respect, many marketing executives try to differentiate the products by using the nostalgia element and lead the consumers' choices towards their products.

In this study, nostalgia element and the effects of this element on consumers and consumers' purchasing behavior will be examined.

Key Words: *Nostalgia, Consumers' Purchasing Customs, Psychological Factors, Retro Products, Nostalgia and Marketing, Retro-marketing*

INTRODUCTION

With globalization, social and cultural structure is rapidly changing. Societies which are obliged to adapt this rapid change begin to yearn for the past and develop a positive view point to products and services which have traces of yesterday. There, retro marketing develops a distinctive aspect by taking the advantage of people's power of "yearning for yesterday" emotion. Retro marketing is targeting the consumers who are curious about yesterday, trying to conduct a relationship between the past and present and who had these products in early days, lived at those times and also yearn for these times.

Products, brands or advertisements which were used in the past are targeting the consumers sometimes just as it was and sometimes with updating by getting included in the marketing process.

Nostalgia

The word "nostalgia" is derived from two Greek roots: "nostos" meaning to "return to one's native land" and "algos" which refers to "pain, suffering, or grief". Generally, nostalgia is defined as "yearning for the past", but it is also defined as "the pain or grief derived from unsatisfied return desire". (Havlena and Holak, 1991: 323)

Nostalgia may be based on the individuals' own experiences, but it is also possible that individuals that had never experienced the said past can be curious and have yearning for those times with stories or other data touching the past. (Davis, 1979: 1). Yearning yesterday with people's own individual experiences is defined as real nostalgia. Real nostalgia is about arousing the memories of individual, experienced in the past. Sometimes, a photo, a nice flavor or a formerly popular song can arouse emotions and excitements of the past by taking away the individual to the past. Nevertheless, historical nostalgia is defined as to feel yearning and curiosity due to the

historical information and expressions of near past true life stories and not depend on individuals' own experiences (Stern, 1992 : 389). In historical nostalgia, there is a phenomenon relative to time period that the individual had not experienced. With the information obtained from the data based on the history, a longing for that time and also a curiosity, since the person did not see the past times, are in question. Historical nostalgia can be conveyed from people living in that time and from constantly occurring fashion as well. Bell-bottomed pants, hair models of former stars and former automobile models that have been adjusted from the past to the present time can be the examples of this.

Both real and historical nostalgia are experienced individually. Individuals who have the same or similar social and cultural structure have common elements that they yearn concerning the past. This situation has revealed the concept of social nostalgia (Davis, 1979:103). In other words, there is a common yearning for the people who have common history and culture (Davis, 1979: 101). For Turkish society, old feasts and old Ramadans are always special and carry strong nostalgic emotions. The yearning of those who never witnessed these feasts called as 'old' is a stunning example of social nostalgia. Those who never listened to a canto but yearn for it or those who never dance tango but like the tango are good examples of social nostalgia.

Essentially, social nostalgia is more likely the desire of living the past with the future than the desire of living the past. This situation could be defined as the dreamed past or the fact of becoming real by transferring the past to the present (Kayaman and Armutlu, 2003 : 5).

The Viewpoints of the Consumer to Nostalgia and Nostalgic Products

Nowadays, marketing executives are making so much effort on directing rapidly changing consumer preference. Marketing executives who realized that nostalgia is gradually rising in this effort give a journey to consumers' yesterday or use the popular culture elements that reminds them of their past. Nostalgic elements which affect consumers' preferences most are perfume or belongings of people's younger times, hometown or images relative to hometown, turning points of lives, a present from a very loved person (Eser, 2007: 125).

Postmodern societies are the marketplaces where products comprise so many things. Consumers are one within constantly changing music, life-style and fashion (Yeygel, 2006 : 207).

The base of retro marketing is the postmodern person. Postmodern individuals do not want to think about the future due to the fact that future is uncertain. Postmodernism is in the side of connecting to the past and carrying the past to the present.

The postmodern consumer desires different themes, past and future and to have an experience without having commitment with anyone.

Present day postmodern consumers only adopt nostalgic items which have common and familiar components and also which are not apart from the past very easily (Soyer, 2007). Contents which are combined with yesterday's positive memories and today and future are introduced to consumers and consequently the preferences are being directed.

Postmodern individual who gives so much importance to sensuality and social relationship wants to live yesterday and tomorrow at now and both together. While modernism is heading for the future, postmodernism generally focuses on the past. The desire of living yesterday and tomorrow both together causes to discover traditional components again. This situation exerts some opportunities concerning marketing management. Communication campaigns which pay importance to the past, revitalizing of old and forgotten brands by customizing to present day, products and advertisements that were produced in a nostalgic way can be good samples (Odabaşı, 2004: 61).

Essentially, postmodern societies are indecisive, non-stylized and unclassified. They get together by sharing the passions and emotions. They are more likely fluid structured and symbolic rituals are highly important for them (Cova and Cova, 2001: 5). Because, it may be said that symbolic features of products are much more important than products' functional features for postmodern consumers.

Researches that made before show that consumer is not only an individual who behaves rationally, but also emotional structure of them plays important role on purchasing process. O'Shaugnessy states the effect of emotions on purchasing behavior as follows: "Emotions may motivate the behaviors; it may highlight something, lead the preferences and strengthen other drives. Therefore, social drive which is about keeping up with the times is established by the pride which is coming from exhibiting the things individual have. When

considered from this point of view, it is seen that present time consumers perceive nostalgic movements as fashion and follow these movements to propound the differences of selves (Altunışık and Çallı, 2004:235).

In addition to this, the postmodern consumer is open to surrealistic simulations to exert the reality. The surrealism concept is the concept which uses the power of simulation in determined reality. With imagination, any component which is simulated to the past can be re-generated. Simulation is the reproduction of default object as real. Today, companies are redefining the roles of man and woman in the society through commercials and advertisements and these definitions are accepted by consumers in a high percentage. It is possible to give examples about exerting a new reality in advertisements. For instance, in margarine commercials, as well as the functional values of the product, symbolic values like keeping younger, providing health, fitness and dynamism are emphasized. These new meanings present a new reality as though it was like that and they are accepted. These new values are defined as the connection value of a certain brand. In present time, cafes and restaurants are being reconstructed in terms of architecture with appropriation of old time alike, for the purpose of tourism places are constituted just like their original and it is provided that people have experiences concerning to their own past.

With this respect, the number of consumers who give importance to symbolic features like pleasure and comfort and etc. rather than functional features has increased and, surrealistic perceptions which get consumers to accept take the place of rational reality. Besides, it should be emphasized that except from the product's component postmodern consumers give importance to design and style of the product as well.

Nostalgia and Marketing

In marketing, nostalgia is in use to emphasize yearning for the past by revealing the perception that the product is reliable and deeply rooted. With emphasizing and reminding of the past role of the product, consumers connect an emotional relationship with the product, and also the sustaining of the product life from past to present exerts the idea of being deep rooted and reliable.

While nostalgia makes contact with the past, it should also reduce the sense of losing. For this reason, the product should be defined as a tool to remind the past (Eser, 2007 : 120). First of all, when a consumer buys or consumes the products which can make them feel the original senses, the sense of losing will be reduced. Here, if living the past again was possible, perhaps the consumer would not or never buy this product. However, the sense of losing dispatches people to buy something. For instance; people that never used copper coffeepot are using copper coffeepot in present time and people who never watched Karagoz play in his/her childhood are willing to watch these plays.

Secondary, if the experience has existed and remembered as nice, the sense of losing would be softer. In these kinds of situations, memories should be aroused by happiness content messages which are not so emotional. In the third situation, nostalgic component is not directly related to targeted consumer. In this situation, probably the sense of losing would not be so intense. Consumers will be attracted by the messages that remind of very distant past.

Nostalgia distinctly appeals directly to individual experience. The focus of marketers is generally individual nostalgia which is directly targeting the individual experience. The best way to stimulate individual nostalgia is to make people to live their real experience which are from their younger times again. For living the real experience again, middle-aged and old people should be targeted, because people in these age groups want their children or grand children also to experience the same things that they already did when they were young.

Even though nostalgia is related to age, it shows variability psychologically. The sense of nostalgia is valid for the consumers who value the past time more than present time.

It should be considered that the average of age is gradually increasing, namely the world population is getting older. Thus, while physical needs of these consumers are met, emotional needs are also satisfied. There, middle-aged and old people who are yearning for yesterday and want to introduce the components that they want to remind to new generation are targeted.

Postmodern consumers are sentimental and in pursuit of a social relation. So, they have a positive look to nostalgic products to experience old beauties again.

In this respect, components like brand name, logo, emblem, packaging, advertisement, advertisement message, etc. which are based on the past are introduced to the consumers with the brand image that the product

comes from the past till the present time. Products introduced to market in this way provide an additional value to the consumers and also arouse the memories.

Currently, brands that have nostalgic value are taking advantage of the situation and introduce nostalgic products at special days or their own establishment day. For instance; Arçelik – one of the biggest households appliances producer in Turkey – introduced similar designs to the models which are produced in 1955 in 50. anniversary of its establishment (www.arcelik.com.tr).

Reusing the marketing mix which was used yesterday is defined as brand heritage (Otay, 2008 : 34). Brand heritage includes former packaging, color, slogan, music and commercials of the nostalgic product. Brands that have such a long and glorious past have strong relations with consumers.

As is mentioned before; nostalgic senses can be based on individual experiences, arousals and common past. People that never experienced the time nostalgic product calls attention can impose a meaning concerning the past. As a matter of fact, people still continue to buy their roasted coffee which is their fathers' or grandfathers' roasted coffee brand – Kurukahveci Mehmet Efendi – and buy their traditional candies which have the brand Ali Muhiddin Hacı Bekir and also they all continue to eat fish sandwich at Bosphorus (www.hacibekir.com, www.mehmetefendi.com). All these activities have a nostalgic value and a sense for Turkish society.

Brown, (1999) who defines retro products' categories like retro, repro and retro – repro states these concepts as follows. Retro is defined as combination of old and new by using the old style and new technology. There, nostalgic design is produced with modern technology. Especially, it is indispensable for technological products. For instance; Volkswagen New Beetle series combined the old design and new technology in this manner. This situation creates to separate values to Beetle enthusiasts. Beetle enthusiasts have the chance to have the design that they yearn and never give up and also they have comfortable and substantial car and do not discard the technological standards for this pleasure. Again, radio and televisions which have nostalgic appearances and Arçelik's nostalgic household appliances can be good samples. Electrolux inspired by Halloween and design "Ergorapido" vacuum cleaner by regenerating the popular TV series "Bewitched" in 1960s is the product preferred by consumers who want to make a practical cleaning "just like a little nose act" (www.electrolux.com). The product was introduced to the market in sand colored, fuchsia and orange color preferences. Samantha who is the witch character in "Bewitched" TV series was used and be successful by knitwear company which has a brand name as "Samantha" and emblem as a witch flying with a broom. Another example of nostalgic products is Çamlıca fizzy drink which maintains its presence since 1947. Since 1960s, it has been under the attack of coke but it is preferred by consumers who are 40 years old or more. Company executives state that consumers find the aura of nostalgia with classical bottle and aura of present time with new packaging. Executives also state that this situation increased the sale in the percentage of 15 – 20 %. Besides, they indicate that children consumers prefer to drink coke rather than Çamlıca fizzy drink but they hope that children will take their parents as an example and therefore, sales will be increased more.

Repro products are produced stick to its original as much as possible. However, this is not appropriate for all sorts of products. For instance; technologically intense products can lose the competition power if they cannot reach the level of current technology. This is a method in use of restoration of old constructions, production of furniture and carpet, producing copper and earthenware kitchen appliances. Besides, in special collections for arousing past times' wearing styles, fashion designers stand by to their originals as much as possible. For instance; in Atatürk's clothes collection inspired by Atatürk's photos, fabric is produced with the same color, figure and texture. German brand Bosch produced the refrigerator as "Classic Edition" which was first produced in 1933 (www.bosch.com). Refrigerator was introduced to the market with different colors and sizes. It has original handmade wooden parts inside. The product is generally preferred by advertiser or architectures to use just for decoration or to place some beverages in their offices or houses.

Retro – repro is implemented by leaning a product on nostalgic senses during the first entrance to the market. Architectural constructions can be a good example for this.

There are four statements that are shown as causes of using retro marketing (Brown, 1999: 366-369). First, companies are turning back to the old one, if they have failure at the new product. Secondary, consumers prefer retro products and the preference is in this direction. Third is the necessity of leaning to the past as a sociological effect of rising of urbanization. Finally, the forth statement is proneness of back to the past.

From the beginning of 1990s, interest about yesterday has been increased in Turkey. This situation is understood by increasing the number of memory books and increasing interest on historical constructions and streets (Terzioğlu, 2010 : 56). Besides, the situation of old pop songs' becoming popular and movies that never

become old breaking records in theaters can be good example of this. The movie of “Hababam Sınıfı” which is known by everybody – even its characters are very well known – was shot again. Shooting old movies again is a kind of situation that is seen quite often.

As it is seen, retro marketing is a very important competition tool. It is assumed that – with the effect of rapid changing – the importance of it will increase in future.

To enter to the market, introducing the old and nostalgic product is sometimes much easier than introducing a new product (Lau,1997 : 28). This understanding is similar to the relationship marketing’s understanding of giving more importance to the customer that the company already has. Due to the fact that the relationship marketing is related to create new values with the customer who already has a relation with the company rather than targeting the new customers, we can say that it has a retro focus understanding. Retro is not a different form of modern marketing, but it is an essential form of marketing (Brown, 1999 : 371). It is relaxing to know that a product was useful in the past both for buyer and seller. However, exaggerating retro product unconsciously makes the product not attractive but repulsive.

CONCLUSION

Nostalgia is an important issue that attracts the attention of marketing executives. There are some different dimensions that should be taken into account while evaluating the concept of nostalgia in terms of marketing. One of them is that nostalgia gives the product the image of being deeply rooted and trustworthy. Companies which sustain their life for a long time use the statement of “since ...” proudly. There, the opinion of “if the company sustains its life for a long time, so it is a company that earns the consumers trust” is predominant. In other dimension, yearning for yesterday is emphasized. This situation, namely yearning for yesterday situation is a very common thing for present time consumers. The reality that the world is changing rapidly and consumers’ keeping up with this rapid change make consumers to yearn and value it. This circumstance is a big chance for the marketing executives who start off with nostalgia.

Nowadays, consumers have numerous product options. Companies introduce these products to the markets with the options of different functions, designs and colors with the technology which is developing more and more in every single day. Additionally, these companies are being watched and imitated by the competitors immediately. In this respect, to provide a sustainable competitive advantage, offering a different value is needed.

Offering the past with related to today to present day consumers who want to implement their past and future dreams now leads their preferences and provides an important competitive advantage to the company.

Consumers personalities’ reflection to products or services and correspond to his/her identity and providing a lifestyle to the consumer are very important added values for present day consumers. Nostalgia is seen as one of these important elements that provide these added values.

It is assumed that the numbers of the companies which introduce values to its consumers by arousing the ‘yesterday’ for young consumers today and reminding of the past for the old and middle-aged consumers will be increased in near future.

SALES PERSONS' WORK METHODS INFLUENCE ON CUSTOMER SATISFACTION AND ORGANISATION ACTIVITIES

Katri Jakosuo
Lahti University of Applied Sciences,
Faculty of Tourism and Hospitality

ABSTRACT

Service quality ideology emphasises the meaning of good services and the significance of professional personnel. Along with this ideology, the relationship between personnel and customer is one of the most important factors affecting estimations of service quality. The purpose of this paper is to ascertain how personnel work methods influence a customer's satisfaction.

The analysis is based on a customer satisfaction survey (n=40,692), and a personnel satisfaction survey (n=1,507) from the year 2000 carried out by Finland Post (today Itella). In this study I compare post offices in which customer satisfaction is particularly high (n=10) and post offices wherein customer satisfaction is particularly low (n=10). The results of the analysis were complemented by interviews with five service experts in spring 2010.

The main finding of the research is that those post offices in which customer satisfaction is particularly high have aimed at certain methods of procedure which are mutually directed at customer satisfaction. Also, target-oriented and dexterous activity, the quality of the supervisor's work, openness and experience of working under a fair amount of pressure are typical of these post offices. In the future, the organisations will be able to improve their procedures by checking that all employees know and understand the organisation's targets and their own job descriptions. It is also important to encourage employees to work together and monitor how employees treat the customers.

INTRODUCTION

Ongoing global regression affects an organisation's operational environment. In this situation it is important to monitor costs and take care of customers. Customer service is one area where different organisations can compete and where they can develop a competitive advantage. The service-oriented organisational culture creates higher value and a better result.

The purpose of this paper is to ascertain how personnel work methods influence a customer's satisfaction. The article proceeds in the following manner. First, I briefly review the literature regarding service quality and service innovations. Second, I analyse via quantitative and qualitative data how personnel work methods influence a customer's satisfaction. In the analysis, I compare post offices in which customer satisfaction is particularly high and post offices wherein customer satisfaction is particularly low. Finally, I present the implications and limitations of the research.

LITERATURE REVIEW

Connections between Job Satisfaction and Customer Service Quality

The service quality ideology emphasises the meaning of good services and the significance of professional personnel. Along with this quality ideology, the role of the personnel is becoming more significant. The relationship between the personnel and the customer is one of the most important factors affecting estimations of service quality. In most cases, services are delivered during the interaction between customers and employees. Thus employees' attitudes and behaviours towards customers affect how customers perceive service quality and how satisfied they are. Skilled and professional personnel are considered the essential resources and a strategically competitive advantage for organisations. (Buzzell & Gale 1987; Bowen & Lawer 1992; Heskett,

Jones, Loveman, Sasser & Schlesinger 1994; Zeithaml, Berry & Parasuraman 1996; Chance & Green 2001; Román & Ruiz 2005.) Some researchers even claim that the personnel are one of the most important resources of any organisation. (Ulrich 1997; Ganesh, Arnold & Reynolds 2000; Farrell, Souchon & Durden 2001.) Especially in service sector is the role of the personnel important, because their actions affect customer satisfaction and an organisation's profitability: job satisfaction is the mainstay of customer-oriented behaviour, and satisfied workers provide better service for their customers (Saura, Contrí, Taulet & Velázquez 2005). Also, it has been observed in Finnish quality research that the personnel significantly affect the way in which customers evaluate the quality of service (Jakosuo 2002; 2005).

Thus managing the customer relationship also means monitoring how employees treat the customers. According Kaplan and Norton (1996; 2001; 2004), without understanding the organisation's vision and strategy, employees cannot adapt their work to contribute to effective strategy implementation.

Like service in general, the quality of service is also quite difficult to describe. Simplistically, we can say that the quality of service is based on the customer's experience, that is, what s/he gets (technical quality) and how s/he experiences the service process (functional quality) (Grönroos 1990; 2009, Jakosuo 2002). Usually customers' evaluations of the quality of service are based on many different factors. During the service process they normally evaluate the quality of interaction, how long they must queue and what kind of premises the organisation has. Further, the organisation's corporate image effects a customer's willingness to use services. This business image is build upon what the customer's experience of the business is. Even though the organisation's top management creates the outward prerequisites, the personnel can affect the outcome of the service process.

The quality of interaction is built upon the customer's experience, which in turn depends on how the personnel behave, what their attitude towards work and customer service is, how willing they are to serve customers and how well they are able to co-operate (Grönroos 1990; 2000; Jakosuo 2002). As we shall see, the quality of interaction is composed of those things which are related to an organisation's culture and the behaviour of its personnel.

The qualities of the physical resources are composed of elements in the service production process and those products that the organisation offers its customers. These resources consist of, for example, goods, the physical environment, machines, business premises, furnishing and clarity of signs. Although the personnel cannot normally affect an organisation's physical resources, they have the responsibility of ensuring the tidiness of the service points (Jakosuo 2002; 2005). Equally, when we consider the availability of a service, the personnel cannot affect what the location of a service with regard to transport facilities will be, but they can affect the length of time the customer must queue.

Previous studies have found that the way the organisation treats employees and puts the emphasis on customers, affects the feelings and attitudes of employees, and their ability to deliver service quality. The service-oriented organisational culture creates higher value and a better result (Saura, Contrí, Taulet & Velázquez 2005; Little & Dean 2006).

A supervisor's actions are also significant. The supervisor's actions have a significant influence on the employees' commitment and ability to provide high quality service. The supervisor who acts as a role model, builds employee self-confidence and enhances employee satisfaction. If the supervisors do have a clear vision, then usually job satisfaction in the work environment and customer satisfaction will be greater (Kantabutra & Avery 2006; Little & Dean 2006). Yoon, Seo and Yoon (2004) found that the degree of supervisory support influences the employee's motivation, job satisfaction and performance. They also found that the employees' cognitive appraisals of customers' active participation in the service delivery process have a direct, positive impact on their job satisfaction and service efforts, and this in turn influences the customer's perception of employee service quality.

According Emery and Barker (2007, 93), in successful teams workers have a high degree of responsibility, authority for making day-to-day decisions in areas such as tasks, assignments, training, work methods, quality control and problem solving. Team work has been found to increase job satisfaction and decrease employee turnover. The commitment of the team is important, because it has been shown that team commitment translates into a willingness to help co-workers and an increase in job performance. Employees who are committed are also less likely to change employer and require less time-consuming and costly supervision. Allred (2001, 9) emphasises that it is very difficult to create high levels of external customer satisfaction without equivalent levels of internal customer satisfaction.

Practices and Procedures as Service Innovations

The definition of innovation is hard to pin down. Innovation can be an idea, a practice or an object that is perceived as new. Also, an innovation can be an old idea in a new application or exploitation used as a new method of production or product handling. Innovations can incorporate or adopt new technology for improving products, services or/and processes. Innovations can be so-called marketing innovations, which introduce new marketing methods for products, or so-called organisational innovation, which is linked to practices, workplace organisations or external relations. (Orange, Elliman, Kor & Tassabehji 2007, 244–245.)

According to Lin, Chen and Chiu (2010, 114) there are two key aspects of innovation: the degree of innovation and the scope of innovation. The degree of innovation varies from radical innovation to incremental innovation. Radical innovation is a dramatic breakthrough in new areas and incremental innovation modifies current products, services or technology. The scope of innovation capability consists of both technical and administrative innovation. Technical innovations include products, marketing, services and the technology used to produce products, product sales or render services directly related to the basic work activity of an organisation. Administrative innovation is related to organisational structure and administrative processes. These are indirectly related to the basic work activity of the organisation and are more directly related to its management. Snyder and Duarte (2003) emphasises that innovation should create a new, better product or service that offers something valuable for customers and a sustainable competitive advantage for the supplier.

Service sector innovations can relate to different practices and procedures. Den Hertog (2000) proposes five patterns for service innovations. These are 1) supplier-dominated innovation, 2) innovation in services, 3) client-led innovation, 4) innovation through services and 5) paradigmatic innovation. Thus, service sector innovations can fluctuate from environmentally friendly banking services to facility management of commercial centres. According to Allred (2001), for example in Browning Company innovations were linked into the activities. The company improved its activities and profit, that is, organised specific product and service training for employees and developed new procedures which improved customer satisfaction (e.g. all customer orders would be imported directly into the ordering system and all incoming calls would be answered within ten seconds).

Lin, Chen and Chiu (2010, 116) emphasise that customer involvement has a positive effect on product, process, administrative and marketing innovations. The organisations which are more customer-oriented than their competitors are more capable of understanding and forecasting the changes in future markets.

According to service quality theories and innovation theories, the personnel's work methods influence customer satisfaction quality. One way organisations can increase their competitiveness is by improving the work methods. In this study I shall try to discover if there are any features which are common to those post offices in which customer service quality can be described as quite excellent.

DATA AND METHODS

Themes typical of personnel surveys are, for example, motivation, professional skills, the physical environment, management, a supervisor's actions and rewarding (Staines & Quinn 1979; Ang & Soh 1997; Morrel-Samuel 2002; Rollison & Broadfield 2002; Hampton & Hampton 2004). Customer satisfaction surveys usually measure a service point's physical resources, personnel kindness and professional skills, corporate image and waiting times (Parasuraman, Berry & Zeithaml 1991; Zeithaml, Berry & Parasuraman 1993; Jakosuo 2002; 2005). These themes were included in Finland Post's customer satisfaction surveys (Service Quality Indicator) and personnel satisfaction surveys (Personnel Inquiry).

The analyses are based on post office customer feedback and Finland Post's Personnel Inquiry from the year 2000 and interviews from the year 2010. The customer material had been supplemented by post office customer feedback from spring 2000 (n=40,692), while the personnel material comprised Finland Post's Counter Services personnel research in autumn 2000 (n=1,507). This study considered of only Finland Post's own post offices, and not other postal agencies. I augmented the results of this analysis by interviewing five service experts in spring 2010. The interviewees represented different fields in the service sector (e.g. management, development and education) and different regions (Uusimaa and Päijät-Häme).

Once a year Finland Post measures how satisfied post office customers are. This survey is called the Service Quality Indicator. By answering this survey, customers can contribute to the development of the Post's services.

In the year 2000 all post offices owned by Finland Post and the 300 biggest agencies took part in the survey. The inquiry was based on 12 questions. These questions considered the quality of customer service, such as interaction, the quality of actions and physical resources. By answering this survey, personnel could contribute to the development of their work. In the year 2000 the inquiry was based on 93 questions. These questions considered such areas as work climate, the Post’s image as company and employer, leadership and management.

For this research the postal codes taken from the observations were used for connecting the data (Figure 1).

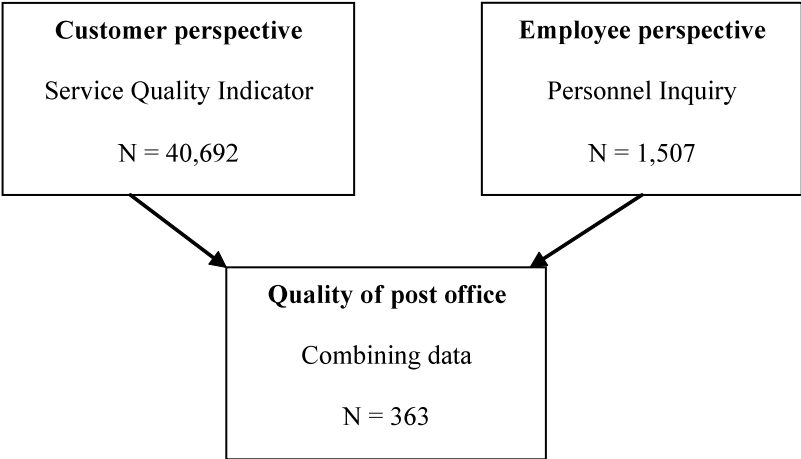

FIGURE 1. THE COMBINING OF CUSTOMER SATISFACTION DATA AND PERSONNEL SATISFACTION DATA

Here I took into account only those post offices for which the results of customer satisfaction surveys and personnel satisfaction surveys were available (n=363) (Table 1). The Personnel Inquiry was based on structured statements on a scale of one to seven (1 = totally disagree, 7 = totally agree and 4 = neither agree nor disagree). The Service Quality Indicator measures level of service on the scale: excellent (5), very good (4), good (3), satisfactory (2) and poor (1).

TABLE 1. STRUCTURE OF THE COMBINING DATA MATRIX (N=363)

Personnel Inquiry		Service Quality Indicator		Background questions		
Q1... (mean)	...Q93 (mean)	Q1... (mean)	...Q12 (mean)	personnel (n)	customers (n)	postcode
1. post office information						FIN-00100
.
.
.
363. post office information						FIN-99980

After data connection, I made a sampling based on the offices’ customer satisfaction results. First, I calculated the general customer satisfaction index for each post office and then I sampled the ten best and the ten weakest post offices. This grouping was based on a mean which was determined from the Service Quality Indicator’s questions 1–11. In this research, I did not take question 12 into consideration because it did not measure the post office’s internal activities. In this study I concentrated only on those customer service factors which the post office personnel can influence.

RESULTS

The Analysis of Quantitative Data

In Figure 2 it can be seen that in customer satisfaction, the biggest differences were related to the post offices' physical resources (Q7), smoothness of carrying on business (Q10) and swiftness and efficiency of service (Q5). The difference between the best and weakest post offices was the smallest in that question which measured Finland Post's image (Q12). It is noteworthy that in this study those factors which describe the interaction between sales persons, such as the smoothness of doing business and the office's general appearance and tidiness, are high. This result suggests that in the weakest post offices the quality of the individual sales person is quite good, but teamwork between different sales persons needs to be developed.

FIGURE 2. CUSTOMER SATISFACTION: A COMPARISON BETWEEN THE BEST POST OFFICES AND THE WEAKEST POST OFFICES

Next, I tried to establish those Personnel Inquiry variables which distinguish the best offices from the weakest. In this analysis, I took into account only those Personnel Inquiry questions in which the differences between different variables were the highest. The selection criteria were the differentials between the best offices' scores and the weakest offices' scores, which must be at least 0.50.

According to the results, the best post offices' personnel feel that their work unit operates smoothly and the quality of action is good (Table 2). It is interesting that in the best post offices, the personnel critically evaluate those questions which measure the quality of a supervisor's actions and Finland Post's employer and corporate image. The differences between the best and the weakest post offices are the clearest in those questions which measure the work unit's actions and quality of actions.

TABLE 2. STRENGTHS OF THE BEST POST OFFICES

Personnel Inquiry questions	Difference *
Q10. Our unit adheres to established methods	1.08
Q16. Our rewarding promotes initiative and responsible action	0.98
Q4. The work climate is good	0.88
Q11. Our methods support Post' targets and are parallel with other units	0.83
Q46. Amount of work stress is reasonable	0.81
Q65. We react quickly and flexibly to customers' requirements	0.77
Q18. Our unit goals support company goals	0.74
Q13. Our work is focused on reaching our targets	0.73
Q8. We have a good chance of learning from others' behaviour	0.70
Q5. We handle disagreements constructively	0.65
Q64. The quality of work arrangements is good	0.64
Q9. Different groups can work together while not seeking their own interests	0.59
Q7. I can easily obtain all the information I need in my work	0.55
Q89. I know the bases of rewards	0.54

* In this table the score differences between the best and weakest post offices have been calculated. For example: the best post offices Q10 (mean 5.70) - the weakest post offices Q10 (mean 4.62) = difference between means is 1.08.

In the best post offices, the personnel feel that the work climate is good (Q4), rewarding systems promote initiative and responsible action (Q16) and all adhere to established methods (Q10). It is typical that in these post offices employees can easily obtain all the information they need at work (Q7), different groups work together and they do not seek their own interests (Q9), possible conflicts are handled constructively (Q5), and people have a chance to learn from the behaviour of others (Q8). Also, target-oriented and parallel activity is usual in these post offices (Q11 and Q13).

In those questions which measure the quality of activity, respondents are especially satisfied with work arrangements (Q64) and methods through which they can react quickly and flexibly to customer needs (Q65). Why then are the personnel satisfied with their work arrangements? One explanation might be that in the best post offices, the personnel's view is that the amount of work stress is reasonable (Q46). They also understand the bases for rewarding, unlike the personnel in the weakest post offices (Q89).

In Table 3 it can be seen that in the best post offices the personnel evaluate critically those questions which measure the quality of a supervisor's action, and discussion of development (Q40, Q49, Q52, Q53, Q56, Q72, Q73 and Q76). In addition, these employees take a critical view of the Post's future (Q24) and statements that Finland Post is a successful company (Q23) and a good place to work (Q26).

TABLE 3. WEAKNESSES OF THE BEST POST OFFICES

Personnel Inquiry questions	Difference*
Q72. Supervisor know my educational and developmental needs	-1.70
Q24. I trust in the Post's future	-1.09
Q40. I have enough information to evaluate performance	-1.03
Q73. The development discussion with my supervisor is useful	-0.77
Q35. The Post's top management respects employees	-0.75
Q23. The Post is a successful company	-0.75
Q56. Supervisor tell us how to obtain our targets	-0.75
Q41. I get acknowledgement and feedback in my work	-0.66
Q53. I get feedback from my superior	-0.61
Q49. I have an open relationship with my superior	-0.59
Q76. My supervisor tells me about and clarifies my targets	-0.54
Q26. The Post is a good place to work	-0.54
Q52. My supervisor gives me acknowledgement	-0.53

* In this table the score differences between the best and weakest post offices have been calculated. For example: the best post offices Q73 (mean 2.92) - the weakest post offices Q73 (mean 4.62) = the difference between means is -1.70.

These results confirm earlier studies: high customer satisfaction seems related more to a post office's internal quality than to its external quality (Jakosuo 2002). For example, the critical evaluations of Finland Post as an employer do not have a negative influence on customer service quality. High customer satisfaction seems to be more linked to the post office's internal quality of action than to the Post's employer image. It is interesting to bear in mind that in this study the supervisor's actions do not much influence customer satisfaction quality. One explanation might be found in the construction of the data. Over 90 per cent of Finland Post's salespersons have worked over 11 years for Finland Post. This means that they are professionals who do not need the supervisor's guidance as much as their younger colleagues.

The Analysis of Qualitative Data

After the qualitative data analysis, I conducted five interviews in which I tried to identify how organisations can improve their procedures. In the interviews my aim was to discover how organisations can help employees to adhere to established methods, how organisations can help employees to learn from others and motivate them to work together without seeking their own interests. I was also interested in their opinions about information and rewarding. These themes were based on the results of the quantitative data.

According to the findings from the interviews, increasing interaction between different employee groups is one way of helping employees to adhere to the established methods. At the work places there are two key aspects of interaction: the degree of interaction and the scope of interaction. It is very important that interaction from the top down functions properly and the organisation culture supports an attitude of receptiveness. If the organisational culture is open and healthy, possible conflicts can be handled constructively together. Successful work units confer together and reach a common, shared understanding of what the organisation's targets and processes mean to the unit. It is very difficult to provide a high level and homogeneous customer service without a common, shared view.

Organisations can enhance the way in which employees learn from the behaviour of others so that clear targets and understandable indicators may be established. Also, it is important to encourage employees to continuously improve their service to customers. Learning one another is linked to the employee's motivation and satisfaction. If employees are unmotivated and dissatisfied, they will not usually be prepared to share their know-how. According to the findings from the interviews, organisations can motivate different groups to work together without seeking their own interests, thus setting a clear vision, making clear job descriptions and providing attainable targets. Further, it is important for the monitoring to be continuous and for the organisation culture to reward success.

The interviewees emphasised the important of information. Employees which work on routine tasks do not have much time to read messages and guidelines. Therefore, the length of the text must be short and the content of the message clear and unambiguous. The service sector uses a lot of part-time and temporary employees. These employees do not always understand the operational environment and the organisation's projects catchwords. Hence, it is also good to avoid abbreviations and work slang.

The interviewees also discussed rewarding, which affects employees' job satisfaction and the way in which they treat customers. These interviewees observed that it is important for the reward system to be fair, justifiable and open. It is important for the supervisor to set the targets at the beginning of the year, so that employees will have enough time to reach the targets. Also, it is necessary for the organisation's middle and top management to stand behind these targets and act as a role model. For example, if the supervisors are not interested in monitoring the standard of activity and the results, it is difficult to expect the employees to adhere to these procedures. Two of the interviewees emphasised that the rewarding system must consist of two parts: individual performance and team performance. They said that this model rewards individuals for outstanding results and yet also takes into account those employees who have their own important role in common projects, although they do not belong the group of top sales people. One of the interviewees noted that if the reward system is based solely on the supervisor's own opinion about an individual employee, an employee who is not the supervisor's favourite might find it hard to receive a merited increase.

DISCUSSION AND IMPLICATIONS

The main purpose of this study was to find out how the personnel's work methods are related to customer satisfaction. My qualitative examination is based on two large quantitative research studies: Finland Post's customer satisfaction (n=40,692) and personnel satisfaction surveys (n=1,507) from the year 2000. In this research, I benchmarked post offices wherein customer satisfaction is particularly high (n=10) and post offices in which customer satisfaction is particularly low (n=10). I augmented the results of the analysis by interviewing five service experts in spring 2010.

According to the results, those post offices in which customer satisfaction is particularly high have aimed at certain methods of procedure which are mutually directed at customer satisfaction. Also, target-oriented and dexterous activity, the quality of the supervisor's work, openness and experience of working under a fair amount of pressure are typical of these post offices. This receptiveness showed up especially in conflict and learning situations. In such cases differences of opinion were handled in a constructive way and people had a good chance of learning from the behaviour of others.

In the best post offices, the personnel were satisfied with their working arrangements, and they considered that the workloads are reasonable. In practice, the benefit of a good working arrangement is that the personnel are in less danger of becoming overworked and this means better opportunities to offer a good service to customers.

It was noticeable that in the best post offices, the personnel adhered to established practices and different groups did not seek their own interests. These post offices reacted quickly and flexibly to customer needs, too. One explanation for this finding may be that in the best post offices the personnel were awarded a prize for initiative and responsible action. Also, a target-oriented approach guided the personnel's activities in these post offices. For example, in all the best post offices the personnel knew how their own work unit's targets were related to Finland Post's targets. Target-oriented and parallel action is very important, because it helps to attain Finland Post's targets.

This finding, related to target-oriented action, supports a view that the personnel's understanding of an organisation's target has a positive effect on its profitability (Kaplan & Norton 1996; 2001; 2004). In Finland Post's case target-oriented action affected customer satisfaction positively.

Even the best post offices' personnel, who were satisfied with their own work unit, criticised Finland Post as an employer. This result does not support the view of Grönroos (2000; 2009) that an organisation's internal climate also reflects an organisation's culture. In this research the personnel felt that the work unit's work climate was good—even then they felt that Finland Post's upper management does not appreciate its employees enough. This result supports the opinion that an organisation's internal and external reputations are connected (Bromley 1993; Young 1996). Also, the findings support the theory that a good work climate improves employees working ability (Robbins 1986).

My empirical findings suggest some important managerial implications. First, I found that it is important to identify the organisation's positive and negative attitudes and procedures and determine how these things affect the organisation's activities. In Finland Post's Counter Services in 2000 positive attitudes were reflected in established methods, responsible action based on rewarding systems, flexible procedures, the chance of learning from others' behaviour and constructive methods to handle disagreements. Lack of information, lack of acknowledgement and undervaluation of employment were examples of negative attitudes.

Another important finding is that in the view of the day-to-day management's it is important that supervisors

- check that all employees know and understand the organisation's vision and targets
- check that all employees know and understand their own job descriptions
- encourage employees to work together
- continuously encourage employees to improve customer service
- reward teams and individuals for success
- monitor how employees treat customers
- act as a role model.

One way to encounter future challenges is to improve the organisation's managerial skills and supervisors' actions. The other way to encounter future challenges is to admit that maybe not all wisdom comes from within the organisation; rather from customers. Customer-oriented organisations see customers as active partners and they are able to utilise the customer's know-how. Customers can, for example, test new procedures and products in authentic situations. Employees can also, for instance, observe and follow customers' actions so that they understand better customers' needs. These processes help organisations to make their action comprehensible to the personnel and focus on the right things. In the service innovation's view these new procedures are incremental innovation, because these procedures modify current services and create higher value for customers (Snyder & Duarte 2003; Lin, Chen & Chiu 2010).

LIMITATIONS

The principal limitations of this study concern four aspects: the scope of the study, the task type, the simplicity of the data and the age of the data. First, this study was carried out in the context of the Finnish postal services, which represent public services. Therefore, there may be several possible problems related to cross-national or cultural research. In addition, the employees represented sales persons, whose tasks consist of routine services. For this reason, the results may vary in non-routine services. Because the data consisted of results from only 20 post offices, these data represent only a small part of the post office network and generalisation from the results is impossible. Finally, the quantitative data is 10 years old and only the qualitative data is new. Therefore, the combination of the quantitative and qualitative data is questionable. On the other hand, according to the interviews, the questions concerning developing work methods and rewarding are still current.

EXPLORING LIFESTYLE VERSUS CONSUMPTION PATTERNS IN EMERGING MARKETS

Yulia Lukinih
Siberian State Aerospace University, Krasnoyarsk, Russia

Zoltán Veres
Budapest Business School, Budapest, Hungary

ABSTRACT

Lifestyle research has been conducted relying on a great number of attitudes, products and brands. In spite of this, value orientation and consumption concept of certain lifestyle groups is not subtle enough. The paper intends to explore consumer clusters of leisure time consumption, shopping and brand attitudes in a Hungarian market setting combined with a comparative pilot survey in Russia. By a series of factor and cluster analyses eight distinctly different attitude groups could be identified: the sit-at-home and balanced, the successful, the moderate and particular, the thrifty and adapted, the hedonistic and ambitious, the quality-oriented and moderate, the quality-oriented and successful and finally the poor. Cluster profiles have been also investigated. However, results to some extent were contradictory. In a second research wave two improvements of the research design have been made. First, we measured the family's financial situation among the working and non-working population based on the possession of 20 assets. This was combined with the ESOMAR status forming method. Second, leisure time attitude questions have been partly replaced by measurement of leisure time activities of the respondents. The modified questionnaire resulted in a completely new lifestyle structure of the surveyed population. In a third research wave a pilot survey has been conducted in March 2010 in collaboration with the Siberian State Aerospace University in Krasnoyarsk region. Based upon the findings of this third wave we can state that leisure time preferences and activities are – beside a few exceptions - very similar in different regions of the same economic development level. As a further research programme a postquantitative qualitative research module is planned in order to make a finetuning to the quantitative results. Our research can be a useful contribution to development of marketing practices in the Hungarian and Russian market.

INTRODUCTION

In advanced societies, lifestyle research has been carried out for several decades, pushing conventional approaches focusing on social status into the background. Part of it was rather momentary, and no follow-up research was based on it. Yet there are certain lifestyle typologies that are continuously created. In the lifestyle research however consumption concept of certain lifestyle groups is not subtle enough. The transitions between the lifestyle groups are not known, nor do we know in which areas of consumption the differences between lifestyle groups are the most or the least conspicuous. In our research, we intend to explore consumer clusters of leisure time consumption, shopping and brand attitudes in two emerging markets: Hungary and Russia. Russian consumers stronger than probably all over the world can feel shopping as not only a process of satisfaction of their own needs both tangible and emotional. It is in Russia due to the peculiarities of the market, mentality, history and social practice, shopping is a process of class self-identification. In Russian consumer goods market, the one who has a buying ability and how one prefers to spend money as well as clothes is hardly the only 'language' about social status. This interesting phenomenon needs independent and detailed research.

LITERATURE REVIEW

The notion of lifestyle in marketing was introduced by William Lazer (1963). Our research adopted the definition by Veal (1993). This defines lifestyle as 'a distinctive pattern of personal and social behaviour characteristics of an individual or a group'. In practice, it refers to how 'the people live and spend their time and money' (Kaynak and Kara, 2001). One of the earliest forms of lifestyle measurements is AIO rating which looks

at how the people examined spend their working and leisure time (Activities), what they place importance on in their immediate surroundings (Interests), how they view themselves and the world around them (Opinions). Then, some basic characteristics are added, such as stage in life cycle income, and where they live (Plummer, 1974, p. 34). These were later completed and replaced by methods that took values into consideration (Schwartz and Bilsky, 1990). Values are 'desirable, trans-situational goals, varying in importance, that serve as guiding principles in people's lives' (Vyncke, 2002, p. 448). Some of the best known value based methods are VALS (Reece, 1989), and Kahle's LOV (List of Values) (1983). Speaking of lifestyle-based segmentation methods, we need to mention the Sinus Milieu model which is primarily employed in Germany and Austria. Experience from previous research suggests that in many segments, price fundamentally influences consumer decisions, therefore the determining power of their means may distort or even suppress the effect of lifestyle characteristics on consumption. Principally, research explored the relationship between social status and lifestyle. This alone raises the question what explanatory force lifestyle typologies have on leisure time activities, shopping and brand attitudes.

Traditionally, marketing classifies individuals by demographic criteria. This technique can be easily quantified but tells little about the factors or the motivation behind the consumption of group members. Its predictive capabilities can be improved by including groups-specific sociological and psychological factors in our investigations (Corrigan, 1997; Plummer, 1974; Ritzer, 1996; Veal, 1993; Vyncke, 2002; Wells, 1975). Research carried out in the USA and Western Europe place most emphasis on the significance of the involvement of psychological factors (Edris and Meidan, 1989; Fenwick et al., 1983; Fullerton and Dodge, 1993; Morgan and Levy, 2002). Psychographic analysis can be classified in two types, depending on how complex the analysis of consumer lifestyles is. "One dimensional" analyses look at only specific key areas of a consumer's lifestyle. In general, focus is on lifestyle elements of particular products. The other type is "multidimensional" which seeks to explore complexly defined general lifestyles that can have an explanatory force in other areas of consumption.

The practical application of lifestyle-based segmentation is especially suitable in marketing communication, the market of leisure activities, in Internet advertising, apparel marketing and banking, but even in the non-profit sector – e.g. for museums. Knowing the lifestyle of the target group can assist marketing communication to approach consumers with appropriate messages through the channel that suits the segment the best (Edris and Meidan, 1989; Vyncke, 2002). In the leisure activities market (Green et al., 2006), just as in banking (Peltier et al., 2002), apparel marketing (Richards and Sturman, 1977) or museum marketing (Todd and Lawson, 2001), it is important to know the lifestyle of our target market, so that we can offer them with suitable recreational or cultural activities.

In 1998 international advertising agency Leo Burnett conducted a research of changing values, psychological and behavioral stereotypes in Russia, Ukraine, Estonia, the Czech Republic, the Slovak Republic, Poland, Romania, Hungary, Germany. About two thousand people were questioned at the age of 16-70 years in 12 big cities (Melikyan, 2008, p. 148). According to the results, there were singled out three groups of consumers for Russia as well as for other countries of the region: mobilizers, optimists and disappointed. According to Russian Life Style typology the following factors influencing consumer's behavior were determined: orientation toward quality; orientation toward brand; spontaneity / thrift (planned purchase or impulsive); innovation / tradition; orientation toward foreign or local goods (Zalesky, 2002, p. 11).

EMPIRICAL SURVEY

1st Wave – Lifestyle clustering in Hungary

Considering the above mentioned, we have set the following research objectives: to investigate leisure time activities, shopping, brand attitudes and to identify consumer clusters based on these three dimensions. Concerning the research methodology after exploring the phenomenon by focus group discussions we conducted a face-to-face survey. Respondents were asked to judge 19 statements on their leisure time attitudes and 37 mixed statements on shopping and brand preferences. In the questionnaire a 5-point Likert scale was applied.

In the survey, our population included residents of the town of Szeged in Southern Hungary, aged between 18 and 75. The data collection was managed by the Marketing Department at University of Szeged. About 200 undergraduate students have been involved in the fieldwork under the supervision of a research team. The sample was selected from a mailing list using a randomized method. During the survey, 2,690 people were interviewed. The sample composition could be characterized as follows: 58 per cent of our respondents were female and 42% male. In terms of education, the members of the sample are representative of the composition of

Szeged's inhabitants: 10% had elementary school education (upper or primary level), about 20% had vocational school education. Concerning the rest of the sample the proportion of people with secondary school education was above 30%, as was the case with people possessing a degree from higher education. Education and the classification of respondents into social classes was slightly controversial, because more than half of the respondents classified themselves as middle class, almost a third to lower middle class, and only 5% consider themselves as belonging to upper middle class or the upper class. Considering their family status, slightly more than half of the respondents were married. It must be noted, however, that every fifth person was single, and about 10% divorced and living alone.

The following *opinions and attitudes on leisure time were measured* in the first wave: work versus leisure time; holiday (holiday abroad, holidays in Hungary and at home); light entertainment (going to the cinema, reading crime stories); consumption of high culture (going to the theatre, classical music) and other leisure time activities (eating out, sports, physical exercise)

We conducted a factor analysis on opinions about leisure time to determine, what opinion structures can be found. We identified three typical attitudes which together explain 59 percent of variance: the *sit-at-home*, the *outgoing* and the *high culture* factor.

For *shopping attitudes*, we found 6 factors that jointly explain 55% of variance:

Table 1: Brand-focused Factor (explained variance 12 %)

Shopping Attitude	factor weight
I think that well-known brands are worth buying	0.755
I think that only branded products are worth buying	0.717
I tend to stick to the brands I have become fond of	0.661
Some brands suit me better than others	0.588

Table 2: Thrifty Factor (explained variance 11 %)

Shopping Attitude	factor weight
I hunt for bargains and discounts	0.750
In my purchases, I seek the lowest possible price	0.678
I wish to economize when shopping	0.602
I always notice special offers	0.590

Table 3: Information-gathering Factor (explained variance 10 %)

Shopping Attitude	factor weight
Some people ask me for advice before they buy new things	0.792
I usually ask for advice, before I buy new things	0.744
I like trying out various brands, even of the same product	0.510

Table 4: Careless Factor (explained variance 9 %)

Shopping Attitude	factor weight
Sometimes I buy things I do not really need	0.724
I buy a product I like very much, even if it might not be the best quality	0.723
I really enjoy shopping for clothes	0.389

Within this attitude structure, economizing is absolutely not typical.

Table 5: Non-fashion-oriented Factor (explained variance 7 %)

Shopping Attitude	factor weight
I prefer buying comfortable clothes instead of fashionable ones	0.771

Table 6: 'I don't like shopping' Factor (explained variance 6 %)

Shopping Attitude	factor weight
I find shopping for food boring	0.683
I think the quality of Hungarian products is not good enough	0.506

For *brand attitudes*, we found 4 factors that jointly explain 59% of variance:

Table 7: Prestige-oriented Factor (explained variance 22 %)

Brand Attitude	factor weight
It tells a lot about me what brands I choose	0.772
A brand that a person consumes tells a lot about him/her	0.760
There are brands whose ownership truly reflects how I think of success	0.703
A brand tag on a piece of clothing enhances an individual's image	0.666
People who consume the same brands think in a similar way	0.601
The brands I am loyal to suit my personality	0.481

Table 8: Exhibitionistic Factor (explained variance 15 %)

Brand Attitude	factor weight
I would like to keep up with fashion	0.797
I spend a lot of money on toiletries and cosmetics	0.760
I find it important to appear well-dressed	0.614
The brands I am loyal to suit my personality	0.388

Table 9: Quality-oriented Factor (explained variance 14 %)

Brand Attitude	factor weight
I think it is worth paying more for quality products	0.749
Buying a branded product is more economical, because even if it is more expensive, its quality justifies its price	0.703
The brands I am loyal to suit my personality	0.322

Table 10: Brand-switching Factor (explained variance 8 %)

Brand Attitude	factor weight
I am usually not attached to any brand	0.945

The typical attitude structures explored tell nothing about what consumer clusters can be distinguished. To identify them, we conducted cluster analysis which took all measured attitudes – leisure time; shopping; brand attitudes – into consideration. Based on this cluster analysis, 8 significantly different attitude groups can be identified.

Cluster No. 1: Sit-at-home and balanced. They prefer relaxing and recreation in their free time. Typically, they give preference to spending the evenings at home in peace and quiet to going out. They do not go to the cinema regularly and they usually do not eat out in restaurants. As for their shopping habits, they prefer shopping for comfortable clothes. They stick to the brands they have become fond of. They are willing to save up when they want to buy something new, but they are not ready to give up a part of everyday products. They like having good quality products around them. However, they do not wish to keep up with fashion and spend little money on toiletries and cosmetics. They do not believe that brand tags can enhance an individual's image. They do not appreciate brands very much and they do not think that some brands suit them better than others. They see no relationship between their personality and the brands they use. Typically, they do not care what brands their friends and acquaintances buy. They do not seek to buy branded products. Usually, they do not try out various brands and wish to avoid buying the most expensive products. They take not much interest in special offers.

Cluster No. 2: Successful. In their leisure time, they need recreation and fun, which in part means an interest in high culture. They like going to the theatre. They love spending their free time doing things they can learn from: arts. They like going on holiday to far-away, interesting and exotic places. They enjoy having things of good quality. Above all, they buy clothes that are comfortable but they also find it important to appear well-dressed. They stick to the brands they have become fond of. They know that it is worth spending more on good quality. Whenever they want to buy something, they are willing to save up. They disagree with the idea that brands are symbolic of a person. They do not agree that

- a brand tag enhances an individual's image
- brands reflect how people think
- brands tell a lot about an individual's personality
- people who buy the same brands think in a similar way.

They do not seek to buy the brands that their acquaintances do.

Cluster No. 3: Moderate and particular. They are particular about what products they buy and like having things of good quality. Also, they are willing to pay more for better quality. However, they are ready to save up when they want to buy something, but they currently cannot afford to buy it. They prefer to buy rather comfortable than fashionable clothes. They think carefully how much they spend on a particular thing. They do not buy expensive toiletries or cosmetics. They are brand loyal and stick to the brands they have become fond of. Typically, they do not care what brands their friends and acquaintances buy. Their leisure time is mostly taken up by relaxing and recreation. They like spending the evenings at home in peace and quiet. They prefer to use their free time doing things that make them think or they can learn from, namely arts. This, however, does not prevent them from attending events or programmes they are interested in. They usually spend their holidays in Hungary. They do not like going to far-away, interesting and exotic places. Neither do they go to the cinema regularly, or surf on the Internet very often.

Cluster No. 4: Thrifty and adapted. Relaxing and recreation are most important to them in their free time. Thus, mostly, they spend their evenings at home in peace and quiet. They do not travel abroad for their holidays. They only work for money and are not particularly interested in their jobs. As a rule, they do not eat out in a restaurant. They do not go to the cinema regularly, or browse the Internet intensively. They enjoy having things of good quality. At the same time, they try to economize as much as they can and seek the lowest possible prices. They take advantage of bargains and discounts. Very often they save up money to buy something. In their clothes purchases, they give a preference to comfort over fashion. They do not necessarily want to buy branded products. They do not think that certain brands would suit them better. They do not agree that brands are symbolic or representative of an individual's qualities or values.

Cluster No. 5: Hedonistic and ambitious. They love doing sports in their free time. They often go out to have a meal. They like going on holiday to far-away, interesting and exotic places. Spending a holiday at home is not their thing. They like buying new products. They try to keep up with fashion. Whenever possible, they buy good quality things. It is important to them to look well-dressed. They are aware that good quality costs more. They are willing to save to be able to buy certain products. They especially enjoy shopping for clothes. They prefer to buy well-known brands. They stick to the brands they have become fond of. There are brands that particularly suit their personality. Besides, they attach great importance to the relationship between a brand and personality.

Cluster No. 6: Quality-oriented and moderate. They find relaxing and recreation important. Typically, they attend events that they are interested in, but they also like things that they can learn from and which have to do with arts. They like travelling abroad. They enjoy having things of good quality. In their purchases of clothes, they give a preference to comfort over fashion. They find it important to appear well-dressed. They are aware

that good quality costs more. They prefer buying high quality brands. They stick to the brands they have become fond of.

Cluster No. 7: Quality-oriented and successful. They are happy to stay at home in the evenings, but they like dealing with things in their free time that they can learn something from, such as arts. They do not go to the cinema or surf on the Internet very much. They are highly quality-focused. They are especially fond of good quality and are ready to pay more for it. If necessary, they save up to buy a desired product. In their purchases of clothes, they look for comfortable rather than fashionable clothes. Yet they find it important to appear well-dressed. For them, branded clothes clearly enhance a person's image. They prefer well-known brands. They tend to stick to the brands they have become fond of. They think that buying branded products is more economical, because good quality justifies the higher price. Therefore, they only buy branded products, because the brand they purchase tells a lot about them.

Cluster No. 8: Poor. They prefer spending their evenings at home in peace and quiet. Also, they stay in their homeland for their holidays. They think it is not so important to go abroad. They are not keen on the Internet; they do not go out to restaurants or to a cinema or to do sports. They always budget and in their clothes purchases, they give a preference to comfort over fashion. When shopping, they always try to find the lowest possible price. They are typical bargain hunters. They try not to buy useless things. They are convinced that branded products are not better quality, but we have to pay more for them because of their brand name. For them, brands are no prestige-factors. This is why they never consider what brands their acquaintances buy. They reject the relationship between brands and an individual's personality.

In the Table 11 the over-representation of certain segments in the clusters are figured.

Table 1. Cluster Profiles

	1	2	3	4	5	6	7	8
gender	-	F	F	-	F	M	-	-
social class	middle	middle & upper middle	lower middle	lower & lower middle	middle & upper middle	middle & upper middle	upper	lower & lower middle

sphere of activity	public	public	public	comp.	comp.	comp.	public	civil

2nd Wave – Improved status typology

From the basic data, we concluded that the majority of respondents no longer spent their free time working, and although the theatre, the cinema and doing sports were not too attractive forms of recreation, many people still chose to spend their spare time on programmes they were interested in. As for buying habits and consumer characteristics, basic data showed that the subjects in the sample were price sensitive and rational consumers. However, results were contradictory. Although this study did not make it definitely possible to show interrelationships, it was apparent that attitudes to brands were complexly interrelated. Data on consumer attitudes required further analyses, as merely from basic data, apparently, no far-reaching conclusions could be drawn.

Examination of status is a crucial element of lifestyle research. This is supported by findings of both literature and by our own research so far. It is a characteristic feature of economies in transition that the middle layer of society is not wide enough, thus consumption is significantly determined by social standing i.e. status. This,

however, is by no means easy to measure. In our first research wave status categories were created based on the ESOMAR (European Society for Opinion and Marketing Research) status classification, i.e. individual status groups have been developed based on school qualification and the type of activity. Concerning retired people, activity was replaced by the possession of 10 assets.

Our experience showed that a method of classification using school qualification and the type of activity as criteria among the working population as well as the 10 assets in the ESOMAR recommendation among the non-working population makes only highly inaccurate measurements possible to identify status differences in a Hungarian setting. It is partly because of the transitional state of the society in an emerging country, such like Hungary, and in the other hand because of the local differences in owning products by the households. Due to the above, in the second research wave we measured the family's financial situation among the working and non-working population based on the possession of 20 assets. This was combined with the ESOMAR status forming method. The previously used ESOMAR product categories are by now out-dated and reflect the product range of the beginning of the '90s, thus we had to use some new ones instead. We considered 20 products to describe a household equipped with various devices. Based on judgment from four experts each product was assigned a weight number reflecting their average market value. The list of products considered was as follows:

- Traditional colour television
- LCD, plasma television
- Music centre
- DVD player
- VCR
- Two or more cars
- Digital camera
- Desktop computer
- Laptop, notebook
- Handheld computer (iPaq, PDA)
- Multi-purpose oven (baking, microwave, grill)
- Washing machine
- Dishwasher
- Electric drill
- Angle grinder
- Microwave oven
- Gasoline-powered lawnmower
- Freezer or a combined fridge-freezer with at least 3 deep freezer shelves
- Two or more portable radios with CD player
- Home sauna

Based on possession of the 20 examined products, we developed wealth status groups. First a cumulative distribution curve from the weighted average market values has been calculated. The main criterion for classification was what scores lead to points of inflection on the distribution curve (see Figure 1). There was only one exception: within the "poor" category we made a further distinction based on what products someone has to own to belong to Hungary's existential minimum nowadays (the very poor). By this procedure we developed five main wealth status groups: very poor; poor; respectable middle-class; well-to-do and the group of rich

Table 12: *The difference in distribution in the sample between the ESOMAR and the new status classification*

Traditional status classification		Improved status classification	
A	6.9 %	A	9.7 %
B	4.6 %	B	16.4 %
C	42.1 %	C	16.0 %
D	39.6 %	D	28.9 %
E	6.8 %	E	29.0 %

Thus according to the improved classification method, the status-specific pattern of the sample has changed considerably. Taking the above financial situation, school qualification and the type of work performed by the family's main breadwinner into consideration, we developed status groups using clustering. The results of the previous ESOMAR status classification and those of the new one differ significantly (Table 12)

Figure 1: *Cumulative distribution of products' possession*

In the second research wave - beside the status classification improvement - we carried out a significant modification in the measurement of leisure time consumption. When comparing the answers to former research results it turned out that there was an extremely big difference between leisure time attitudes and activity. Consequently leisure time attitudes play a less significant role in forming lifestyle groups. It can be mentioned that also in case of shopping and brand attitudes the unstructured percentage of variance turned to be high enough, but a more differentiated factor structure has been resulted by the analysis. It means the cluster analysis was able to explore significantly different attitude groups in these dimensions.

Due to the above mentioned in the second research wave the leisure time attitude questions have been partly replaced by measurement of leisure time activities of the respondents. In the questionnaire the frequency of 26 different leisure time activities have been registered as follows:

- listening to light music
- listening to classical music
- reading magazines
- playing on computer games
- cultivating the garden
- going for shopping
- reading books
- knitting, crocheting, tailoring
- surfing on the web
- reading newspapers
- cooking
- cleaning of the flat

- private usage of PC
- chatting, e-mailing etc.
- Listening to the radio
- Promenade
- Relaxation
- Learning
- Making sports, fitness
- Entertainment with friends (pub, disco etc.)
- Indoor games (playing cards etc.)
- Watching TV
- Eating out
- Watching video, dvd
- Going to a party or receiving guests
- Going to cinema

At the same time 13 leisure time attitude questions remained in the questionnaire. Mixing these leisure time questions with 19 shopping and 20 brand attitude questions we repeated the survey on a similar sample as in the first research wave. Based on a cluster analysis the same significantly different lifestyle groups could be identified as it happened in the first research wave. It could be observed however that the modified questionnaire resulted in a completely new structure (i.e. different proportions) of the surveyed population.

3rd Wave – Pilot survey in Russia

In the third research wave we intended to go forward in two directions. On the one hand – since we consider culture as the most significant aspect in any activity - we were planning to investigate and compare Russian and Hungarian cultures in service consumption (tourism, sport, theater, wellness, cosmetics etc.). On the other hand - in order to make a fine-tuning to the quantitative results - we plan to conduct post-questionnaire focus group discussions (FGD).

The comparative pilot survey in Russia has been carried out in March 2010 in collaboration with the Siberian State Aerospace University in Krasnoyarsk region on a sample of 130 respondents. In the sociodemographic profile of the sample students were slightly overrepresented but the results can be considered as valid for founding a large sample survey in the near future. As hypothetical top line findings following results have been derived by comparing the Hungarian with the Russian data file:

- Entertaining music; cars, car tests; travel and tourism; internet, computer games; healthy life style, healthcare and belles-lettres, poems have higher, while pop-music lower preference in the Russian sample than in the Hungarian.
- Concerning everyday leisure time, such activities as learning; private internet, web surfing; going to cinema and doing trendy sports (roller-skate, skateboard, kickboard) are much more frequent in the investigated Russian region. As a contrary, having holiday in Europe; going for pop music concert; going for excursion, hiking; reading daily newspapers and gardening, tending pot plants are more frequently practiced in the Hungarian sample.
- If we put standard deviations under investigation in a few preferences and activities, significant difference of segment-heterogeneity can be detected, like e.g. knitting, crochet, tailoring; board games, playing card; going to cinema; doing trendy sports (roller-skate, skateboard, kickboard) or doing extreme sports (bungee jumping, rafting, jet-ski). These latter findings however – due to size of the Russian pilot sample - are not more than hypotheses before the large sample survey.

FURTHER RESEARCH

Our research can be a useful contribution to development of marketing practices in the Hungarian and Russian market. Nevertheless it is already clear even at this stage that leisure time preferences and activities are – beside a few exceptions - very similar in different regions of the same economic development level. Generalization of our findings can be expected from a representative survey in selected regions of the Russian Federation and from the fine-tuning post-questionnaire FGDs.

PERFORMANCE RISK PERCEPTION IN SERVICE PROJECTS

Zoltán Veres
Budapest Business School, Budapest, Hungary

ABSTRACT

This research investigates the role of intangible resources that aim at reducing the buyer's perceived risk, enhancing his value and satisfaction, and thus lead to the acceptance of the provider's offer and the success of the project. The focus is on how intangible assets create customer value in service projects by decreasing perceived risk. This research is the second wave of a research programme being launched in 2008. A review of the area of perceived risk and value reveals an absence of sources that explicitly study and integrate the concept of risk-value interrelationship. By our definition, performance risk derives from goals. With particular projects, the goal is so complex that performance-related risks are very high. Risk-reducing communication has to be based upon a continuous, phase-specific and clear message on problem solving competence of both sides. Qualitative minifocus group discussions have been conducted at actors of project market. The industry profile of the 180 respondents included ad hoc market research, construction industry, IT systems, marketing-communication projects, consulting, business tourism, web design, business trainings etc. Respondents' task was to discuss six thesis-like statements based on their project-experience. The verbatim transcripts of the discussions have been evaluated by content analysis. The findings affirmed that especially large projects are unique therefore the ad hoc task has to be divided into routine-like phases in order to be able to cover the risk. Even if offers are highly standardized in numerous industries client's problem is always unique. There are new services that even the supplier lacks knowledge about, consequently this is a learning process for the supplier as well. At numerous firms risk reducing is systematic and standardized. Clients seek the extension of immaterial competence: expect certificates and/or charge third (neutral) parties. Client's competence is a leverage, but if it fails a communication-facilitator has to be involved in the process. Frequency of communication is risk reducer in itself.

INTRODUCTION

There are several reasons why companies of the project industry succeed (Cova and Holstius, 1993), such as financial arrangements, entrepreneurial culture and reputation (Cova and Salle, 2007). It is not clear why some suppliers are better at closing a deal and successfully finishing a project with a buyer, than others. According to our hypothesis the answer can be found in the presumed competence of the actors. The core problem is originated in the interrelated risk and value perception (Ruofan, 2009).

Srivastava et al. (1998) coined the term market-based assets in response to the need for facilitating the application of the resource-based view (Barney, 1991). Market-based assets represent intangible assets, such as relational assets and intellectual assets that are rare, hard for competitors to imitate.

This research investigates the role of intangible resources that aim at reducing the buyer's perceived risk, enhancing his value and satisfaction, and thus lead to the acceptance of the provider's offer and the success of the project. The focus is on *how intangible assets create customer value in service projects by decreasing perceived risk*. Projects are usually characterised as being complex, unique, interactive and discontinuous (Mandjak and Veres, 1998). Therefore, the research aims to primarily investigate the *impact of knowledge (functional competence) and relationships (relational competence) on the buyer's perceived risk* and further, explore how risk can be effectively managed in order to enhance the buyer's value perception. This research is the second wave of a research programme being launched in 2008 and since this year it is supported by the National Found for Scientific Research (No. 81565 K).

The remainder of the paper is structured as follows. The next section reviews the literature to develop the conceptual background to our three core concepts, competencies, risk and value. The subsequent section outline the research methodology, present the findings and discuss their implications.

LITERATURE REVIEW

The concept of perceived risk has been around since the 1960s and the domain of consumer behaviour has conceptualised perceived risk as corresponding to situations when there are potentially negative outcomes (Bettmann 1973, Dhalakia, 2001). Therefore, perceived risk is considered as an inhibitor to purchase. Several studies do not distinguish between risk and uncertainty (see. Taylor 1974). Later studies (e.g. Dowling and Staelin 1994) distinguished between uncertainty before the outcome and the outcome itself, which points to the timing of the perceived risk. Risk from the customer's point of view can be described as the comparison of alternatives (Aqueveque 2006). Jacoby and Kaplan (1972) developed a classification of perceived risk, which includes the following dimensions, such as 1) heterogeneity of offer (Veres 2009; Guseman 1981; Murray és Schlacter 1990), 2) buyer-supplier interaction, 3) price, 4) company image, 5) personality of decision makers, 6) history of seller-buyer relationship (Ganesan 1994; Sheth és Parvatiyar 1995) and heterogeneity factor. Research on these dimensions shows that transactions that are services at a high price from a company with a poor image (e.g. Havlena és DeSarbo 1991), with a low level of interaction and/or lack of history between the partners result in higher perceived risk., and where the offered at a higher price are associated. Based on the dimensions of perceived risk developed by Jacoby and Kaplan (1972), this paper focuses on the performance risk in relation to the supplier's expected performance.

Perceived value is usually considered before the transaction, however, its role is more apparent through the entire transaction. Besides the "is worth what paid for" approach (e.g. Newman 1988), Zeithaml (1988) proposed the trade-off of benefits and sacrifices approach. Similarly to studies in the area of perceived risk, research on perceived value was primarily undertaken in the end-consumer setting, however, there are a few examples in the business-to-business context (e.g. Lapiere 2000; Menon, Homburg and Beutin 2005). Research has identified various dimensions of value, such as cognitive and affective components (e.g. Anderson and Narus 1990; Sweeney and Soutar 2001), and goal performance and financial performance value, and in case of services, the process performance value.

Although both perceived value and risk has been investigated by researchers, no research has focussed on their relationship. Therefore, this study focuses on the interaction of the two concepts and specifically, how perceived risk impacts perceived value, and further, how risk communication can neutralise the unfavourable impact of perceived risk on value (Van der Valk and Johnston 2006). The role of risk communication is extremely important due to the unique nature and high value of projects, however, its role has not been explored in projects.

Perceived risk in project settings

As mentioned in the introduction this study focuses on projects that are usually associated with industrial transactions. These transactions are complex and have a physical (hardware, building) and an intangible component (software, engineering consulting, financial products, production know-how, etc.). In general, projects have the following characteristics: 1) time-bound (it has a start and a finish), 2) undertaken by a team and 3) for a specific purpose. Therefore, this definition allows the inclusion of services, such as engineering consulting, planning, production know-how transfer, ad-hoc market research, management of advertising campaigns, event management, etc).

Projects have several unique characteristics (Cova and Salle 1999; Cova, Ghauri and Salle 2002; Veres and Buzás 2006). 1) The most crucial risk element is the supplier's performance commitment, which is the responsibility to complete the project successfully in every respect. This risk applies until the project has been completed. 2) The project is a unique transaction even for the buyer. 3) The solution to the problem requires system thinking. Hence, project transactions are also referred to as system selling. 4) In the buyer-seller relationship, so-called cooperative risks emerge due to the conflicting interests of the parties. These risks allow each party to leverage the knowledge gaps of the other party (Schmidt-Wagner 1985). 5) Projects have a series of interactions between the parties that can be grouped into phases, such as feasibility study, briefing, supplier selection, project implementation, debriefing, etc. 6) The supplier-buyer relationship is periodic.

Although some projects have a substantial product content, it is unclear which component (product or service) dominates the transaction from the buyer's point of view. From a buyer's perspective the only relevant aspect is the successful outcome of the project as the buyer lacks the required knowledge to complete the project himself. (Schmidt and Wagner 1985). In essence, the buyer acquires competence-based expectations of benefits (Page and Siemplenski, 1983), where the knowledge is the major contributor of competitive advantage (Vargo and Lusch 2004). Summarising, projects are discontinuous, unique, complex and phase-specific transactions, where

the acronym of the first three characteristics created the DUC model (Mandják and Veres, 1998). Although the history of the buyer-seller relationship is an important moderator of risk perception, due to the discontinuity and the presence of inactive phases projects can last for years (Mandják and Veres, 1998, Cova, Ghauri and Salle, 2002).

Cova, Ghauri and Salle (2002) developed a model that describes the process of a project from the planning to the contract from the supplier's perspective. In this process, the specification of priorities is followed by a project-neutral phase, in which, the supplier prepares for leveraging his functional (core) competences as well as he manages his relational milieu by potentially involving external suppliers. The next phase of the process is the pre-tender phase, in which the supplier considers the potential demand, and selects the potential buyers in the market. Buyers are selected based on a set of criteria (project screening), whose problems are worth the investment from the supplier's perspective. The proposal phase includes the delivery of the proposal, the negotiation and the contract.

The uniqueness and performance risk of the project necessitate a very interactive, and problem-oriented partnership from buyer and seller from the beginning to the end of the project (in strong partnerships even beyond). Due to the unique nature of projects there are some strategic considerations to need to be emphasized (Cova and Salle 1996, Engelhardt 1993, Veres 2009). 1) The uniqueness of projects does not enable standard solutions, and hence, the project details need to be specified through the interaction of buyer and seller. 2) The process of quality management places a large emphasis on promised competences that can demand a price premium to be paid by the buyer. 3) Due to the lengthy process both parties bear a bilateral risk of the project implementation. As the project comes to an end the functional risk decreases for the supplier as he was able to finish the project, but the risk of non-payment (by the buyer) still exists and increases. The buyer's risk perception, however, only starts to increase once the project finishes. Although for the buyer non-delivery risk exists during the process, which might stay constant or it might even increase during the project. This risk perception flow is depicted by risk perception funnel (see Figure 1).

Figure 1. The risk perception funnel for services

Source: Veres 2009

The risk perception funnel describes:

a/ the process of risk flows in a project environment (horizontal dimension), which means that risk and risk perception are not independent from the transaction episodes of the project implementation. These episodes might also include access to new market information.

b/ the variability of risk (vertical dimension), which means that as the project progresses the parties reach the 'point of no return' and hence, are less likely to abandon the project and seek alternative suppliers. In our view, risk can be managed through effective/targeted risk communication, which can be considered as a marketing competence that is able to increase the buyer's satisfaction (see Golfetto and Gibbert 2006).

Competencies in projects

Resources can be tangible (e.g. hardware) and intangible (e.g. technology, reputation, alliance, know-how, relationship). The authors hypothesize that the intangible resources (or competences) can be one of the key determinants of the buyer's risk perception. For instance, a construction company's most important competence lies in the execution of complex tasks, whereas a consulting company's main competency revolves around its employees and their relationships with their clients (Sveiby 1997). Competences are classified as epistemic and heuristic competences, where the former represents evidences of previous project successes of the supplier (e.g. references), whereas the latter represents a promise for a reliable and successful delivery (c.f. Grant 1995; Möller 2006).

The Service Dominant (SD) Logic (Vargo and Lusch 2004) provides a useful framework for explaining how competences are used in achieving competitive advantage for the company. According to the SD logic the basic unit of exchange is the competence in use. Value creating problem solving is the key part of any projects, and hence, in order for the firm to create competitive advantage they have to leverage their intangible assets of the company. These intangible assets can manifest themselves in products, technology or management, which develop under competitive pressures. Therefore, competences can be interpreted as the organisation's learning capability. Competences provide significant advantages in three main areas; in project development, network management and customer service management. The SD logic further states that the supplier only makes a value offer, whereas value creation is the buyer's task. This interactive process between buyer and supplier results in value creation, where the exploration of the customer's value preferences is a key aspect an active client management. Therefore, the pre- and post-transaction phases are sometimes play a more vital role than the transaction itself.

A systematic evaluation of competence-based value creation was undertaken by Möller (2006), who concluded that the supplier's (value) offer can be communicated in three ways. These three aspects are the exchange, relational and proprietary, where the latter two extends the boundaries of the exchange (tedchnological problem solving) competence.

The parties usually take a position in the transactional-relational continuum, hence, these two orientations present a rather mixed orientation than a pure transactional or relational approach.

Project buyers are, in general, competent and involved actors in the transactions (Cova and Salle, 1999, Bettencourt et al., 2002, Axelsson and Wynstra, 2002). The uniqueness of projects contributes to higher uncertainty, which in turn, leads to a higher level of perceived competencies. The authors hypothesize that the supplier's reputation is the major driver of his perceived competence. Hence, this paper focuses on whether the buyer actually investigates the supplier's competencies or he might basis his judgment on the supplier's competence communication. At the start of the project, the buyer's risk evaluation is most likely to be based on the supplier's communication, whereas during the project the communication's role decreases. Receiving information about the supplier's competence profile reduces the buyer's market uncertainty (especially in the pre-transaction phase) (Golfetto és Gibbert 2006) and its transaction uncertainty in the implementation phase (Ford 2002). This phenomenon is referred to as the marketing of competencies (Golfetto és Gibbert 2006).

METHODOLOGY

Data was collected in 2009 by using in-site expert mini-focus group interviews in the contexts displayed in Table 1. Equal number of focus groups was conducted with buyers and suppliers in each context, hence 90 buyer and 90 supplier-side interviews were undertaken. Every mini focus group included 2-3 decision makers, such as project experts, business marketers. During the interview a standard qualitative interview guide was used that consists of 6 main topics, which are as follows: 1) project uniqueness, 2) problem solving as the supplier's main competitive advantage, 3) interdependency in projects and its relation to performance risk, 4) the role of competences in decreasing risk perception, 5) the role of risk communication in reducing uncertainty and 6) the role of supplier-buyer relationship in influencing perceived risk. These topics aimed to explore the decision makers' view on the competence-based risk perception. The decision makers who participated in the interviews were asked to discuss their views on these topics based on their own experiences.

Table 1. Number and context of expert mini focus groups

Project activity	Number of mini focus groups
Ad hoc market research	20
Construction	12
IT consulting	20
Marketing communication/PR	20
Media agency	12
Finance (eg loan, insurances)	16
Consulting	16
Event management	32
Business tourism	8
Business education	4
Other industrial services	8
Web development	12
Total	180

Qualitative *minifocus group discussions* have been conducted at actors of project market. The industry profile of the 180 respondents included ad hoc market research, construction industry, IT systems, marketing-communication projects, consulting, business tourism, web design, business trainings etc. In the organisation of focus groups the following criteria have been followed:

- Equal proportion of participants from supplier and buyer side
- 2-3 decision makers in each focus groups
- In-site focus group discussions to avoid distortion from place of discussion
- Professional discussion moderators

The phenomena under consideration are explored using the following scenario. Respondents' task was to discuss six statements based on their project-experience:

Statement 1: A project is always unique and system-like.

Statement 2: The major benefit of the "product" for a client is the supplier's ability to solve problems.

Statement 3: The success of performance can only be identified after the project process has closed (hence the dominance of performance risk).

Statement 4: Perceived risk is reduced by competence. This competence is asymmetric.

Statement 5: Communication of risk may moderate the uncertainties felt by the customer.

Statement 6: As confidence strengthens, supplier-buyer relationship reduces the risks perceived.

The verbatim transcripts of the discussions have been evaluated by content analysis.

FINDINGS

This section will provide a summary of the findings gained from the interviews according to the six main topics mentioned above.

1. Project uniqueness

The respondents agreed that projects are unique, especially due to the rapid technological and environmental changes. Therefore, in order to reduce the buyer's risk perception complex problems need to be divided into smaller, routine (modularised) tasks, whereas suppliers often make the mistake of developing highly standardised offers.

"...buyers do not want standardised answers... but they expect us to find a solution for them."

This challenge requires sophisticated service adaptation. In services standard solutions emerge due to the buyer's attitude and his time constraints. Uniqueness makes sales more difficult. Projects are unique systems that coupled with new products represents a knowledge gaps on the supplier side that he needs to fill.

"When we talk about project selling, we do not mean the sale of a physical thing, but rather that of a future intangible, and hence you have to provide some evidence to the client that we are able to implement the project, and hence he becomes more efficient and will also save some money."

Projects usually have a professional side and a methodological side. The methodology has always the same components, such as survey, needs assessment, planning and testing. Needs assessment is vital as sometimes by the time the project finished there was no need for the solution anymore. These tasks are repeated over and over again.

"When the client has a need...the best situation is, when we find out together what this needs it exactly, whereas some clients try to fix every problem in the same way every time irrelevant of the nature of the problem."

2. Problem solving as the supplier's main competitive advantage

The interviews revealed that the client side has several talented managers, who can find solutions for managing their own business processes, however, they do not take responsibility as they cannot influence other members of their organization. In this respect the governmental and non-profit clients are very different.

"Clients who have a set budget have a weak position in negotiations."

High-tech industries (e.g. telecommunication) take a proactive approach in problem solving, and they might also demand the imitation of a competitor's innovative system in a short period of time. Nowadays, cost efficiency is part of problem solving. In classical project markets, such as the construction industry, the effective recovery is a key factor. All in all, in some industries the involvement of the client is vital, whereas in some other industries the involvement is not required at all:

"The supplier is there so the client can get comfortable."

3. Interdependency in projects and its relation to performance risk

It should be noted that this topic was the hardest to interpret for most participants. Interdependency in projects means that if a project is abandoned then the outcome of it is destroyed.

"...we try to emphasize this. At every milestone our ties become stronger and hence it becomes clearer what we aim to achieve...Provided it is a long project, then we will have a situation analysis, a needs assessment, a concept plan, a concept and all of them should be approved by both, the client and the supplier, which becomes a joint knowledge that takes us further."

Many companies aim to consciously reduce risk and their processes seems very much standard: continuous project monitoring or setting up milestones (status meetings) and iterations. Nevertheless, it is impossible to create a project briefing with flawless specifications as the outcome of the project provides new challenges in terms of its use. Hence, this post-delivery refinement creates a new learning curve for the supplier, which takes a year at least.

4) The role of competences in decreasing risk perception

It can happen that behind the communication/image of a particular competence there is no real content. Therefore, clients, in order to avoid this pitfall, usually look for tangible evidences of competences, such as accreditations (eg. ISO). The higher the competence level of the client the better they understand the problem, however, if it is missing a third (neutral) party might need to be involved. This phenomenon is commonly referred to as competence-asymmetry, which is high in some sectors (eg. finance), whereas low in others (eg. training), and again in others (eg. business tourism) the client tends to overestimate his competencies. Asymmetric competencies represent the biggest challenge in the pre-transaction phase due to client's need uncertainty, whereas the extent of asymmetry decreases over the course of the project. In the area of consulting, the client's professional competencies might outweigh that of the supplier, however, the consultant has higher levels of system and experience competencies. These asymmetries start to disappear as the client gets to know the system and the consultant gets familiar with the company's business processes. Finally it is to underline that the *impact of knowledge (functional competence) and relationships (relational competence) on the buyer's perceived risk* can be extremely different as it has been explored by Awuah (2001).

5) The role of risk communication in reducing uncertainty

Our findings in this issue confirmed the research results of, among others, Garner (1986) and Brashers (2001). The respondents agreed that the client's risk is larger than the cost of the project as the client's business is at stake.

"...it seems like a public relations exercise that at the start of every project we inform the clients about certain risk factors for self-defense."

Solely communicating the risk factors will certainly increase the level of perceived risk, and thus, risks always have to be presented with the solution in order to decrease the risk perception. Due to the risk communication of the supplier the client's risk perception changes during the sales process. At the start the client is usually open to various options, but subsequently – as his knowledge and involvement increases its risk perception also increases. Frequent communication between supplier and buyer can, however, lead to a decrease of perceived risk. Clients should be convinced about not to follow unrealistic objectives.

6) The role of supplier-buyer relationship in influencing perceived risk. The confidence-dimension.

Respondents thought that emphasizing trust in the buyer-supplier relationship is commonplace, however, eventually participants agreed that long-term relationships are disadvantageous and do not serve the client's needs. In several industries supplier changes are carefully planned.

If retention is the goal, then investment into the relationship is vital in order to increase the client's trust. Suppliers have to visit the client regularly in order to achieve a certain level of trust, which can also be institutionalised by introducing support contracts, which can lead to new projects.

"...if there is no contract like this, then maintaining the relationship is costly, but its return is uncertain."

The value of the relationship is relative, therefore, both orientations (transaction, relationship) are present in the marketplace. Due to high level of trust in the consulting domain, everyone is perceived to be relationship-oriented. Although there are no calculations on the return on relationship (ROR) rather they intuitively manage their relationships with their clients.

On the international dimension

Taking into consideration that numerous project transactions are realized in an international environment, an additional dimension, namely the international one, has to be added to the analysis. In this dimension the uniqueness and the communication can be considered as of special concern. From the uniqueness point of view problems appear in a more intensified manner. International context of the project is a unique attribute in itself and its correct management needs special business competences. The difficulties of (risk) communication are similar to that of intercultural communication in the international business practice.

CONCLUSIONS

Finally, the following conclusions can be drawn from this research.

From the data collection it became clear that the size of the company has a significant impact on reducing the client's risk. This can be explained by the principle of substitution, which means smaller companies have 1 or 2 key people, whom the client interacts with. If they leave the company, this jeopardizes the success of the project. This principle is in contrast with the principle of flexibility, where smaller companies are more flexible in project implementation than bigger ones. Subsidiaries of multinational companies can tap into each others' organizational knowledge and hence experiences through accessing their global databases. However, ample differences (economic, legal, cultural, language, etc.) between contexts can make this knowledge look rather difficult to transfer.

The interviews further revealed that both parties' competencies contribute to value creation in projects, however, the competence-asymmetry should also be acknowledged. Most project actors feel that the other side lacks relevant competencies, however, they also assume this asymmetry is of a small extent. The research revealed this asymmetry is mutual and hence these should be referred to as discrepancies. Clients usually do not learn much from projects and even if they do they do not internalize this knowledge, but rather they rely on creativity and routine at the start of the next project. The project team composition, selection and the human resource

management process are of ad-hoc nature rather than systematic on both sides, which is a large risk factor in itself.

Quality assurance and control systems and references clearly communicate competence, and hence reduce the client's perceived risk, however, these do not work in every context. (eg. event management) Clients work with the same event management companies because in case of a failure the stakes are high, which will result in poor image and thus financial loss. Furthermore, mutual communication and interactivity can decrease risk perception and thus, represent enhanced problem solving capability. Nevertheless, risk communication has to focus on both, the risk factors as well as the solution.

Finally, this research confirmed that there are more common characteristics across project activities than differences between them. This research aimed to explore some of these characteristics, which can be a significant contribution towards the interrelationship between competences, risk perception and value creation. Further research will be aimed to undertake a quantitative survey to generalise our qualitative findings and to understand – as a conceptual framework of our study – in what way competence, confidence and communication affect minimization of risk attached to project performance.

SUPPLY CHAIN MANAGEMENT

MANAGING SUPPLY CHAIN-BASED CONFLICT: A STUDY FROM TEXTILE EXPORTERS PERSPECTIVES

ABSTRACT

Conflict is a common event in interactions among persons, companies and supply chains. The main objectives of this paper are to (1) explain the importance of conflict management in a supply chain, (2) bring out the sources and resolution methods of the supply chain-based conflicts, and (3) explore the differences between upstream and downstream textile supply chain-based conflicts. The survey conducting on textile companies provides insight into supply chain-based conflict from textile exporter perspectives. According to the survey results, the conflicts between the supply chain partners just appear to be a fact of business atmosphere. The underlying sources of conflicts are price changes for downstream partners and demand for faster delivery from upstream partners. The underlying conflict resolution methods are compromising for downstream partners and sharing for upstream partners. Moreover, the independent-samples T-tests make clear that the sources and resolutions methods of supply chain-based conflicts are different between downstream and upstream supply chain, and cannot be generalized for all the supply chains. Thus, the supply chain-based conflict management should be divergent for downstream and upstream partners.

Keywords: *Supply Chain Management, Conflict, Conflict Management, Textile Supply Chain*

INTRODUCTION

Over the last decade, the competitive business atmosphere has pushed companies to compete not solely on their own capabilities but with their entire supply chain and suppliers (Hult et al., 2007). Moreover, increased customer requirements and globalization have forced managers to ensure that their organization's resources are well aligned not only across all functional areas but also throughout the entire supply chain (Vachon et al., 2009). Nowadays, an effectively managed supply chain is one of the main requirements because the efficiency of companies is heavily dependent on their suppliers and supply chain partners. Thus, the supply chain, its processes and supply chain management have been begun to be implemented increasingly by companies as an important strategic option for pursuing their strategies from automobile to textile industries.

Supply chain management is a field, comprised of many disciplines, especially Business (such as Marketing, Management and Finance), Production Management, Logistics and Industrial Engineering etc. Therefore, supply chain management has been studied in respect of a number of perspectives. One of them is the conflict management in a supply chain, because it is important for the success of companies and their relationships with the suppliers. Affecting the performance of supply chain management, conflict is inevitable between persons, companies and supply chains. In the management literature, most of the conflict researchers studied the types of conflict between workers, persons or groups in a company, between company and persons. In the marketing literature, most researches on conflict focuses on channel relationships and conflicts between marketing and production departments or persons. In the supply chain management literature, there are limited researches on conflict management focused on the sources of conflict, the factors leading to conflict and the methods for conflict resolutions in order to reduce the negative effects and increase the positive effects of conflict.

This paper analyses the sights of conflict management in the textile supply chain so as to accomplish harmonious and productive working relationships within both downstream and upstream textile supply chain. Thus, the concepts of supply chain, supply chain management, conflict, conflict management, the textile supply chain, the causes and resolutions of conflicts in the textile supply chain are explained. The survey results conducted on textile exporters to understand which conflict and conflict management methods are used in supply chain-based conflict are presented, and what are the differences between downstream and upstream textile supply chain-based conflict are compared.

CONCEPTUAL FRAMEWORK

Supply Chain Management

As the world economy becomes increasingly competitive, competition among companies is becoming fierce and no longer between companies and companies, but supply chains to supply chains, and companies can no longer effectively compete in isolation of their suppliers and other entities in the supply chain (Lummus and Vokurka, 1999; Christopher, 2000). Hence, one of the most significant paradigm shifts of modern business management is that individual companies no longer compete as solely autonomous entities, but rather as supply chains (Lambert and Cooper, 2000). Moreover, sustaining competitiveness and the resulting profitability depends less on the ability to raise prices. Instead, companies need to compete on the basis of product innovation, higher quality, and faster response times, all of which must be delivered, in most cases simultaneously and always at the lowest costs attainable. Those competitive dimensions cannot be delivered without an effectively managed a supply chain (Presutti, 2003). As a consequence, competition shifts from company versus company to supply chain versus supply chain, and the supply chain management has been considered as the most popular operations strategy for improving organizational competitiveness, because this system incorporates the entire exchange of information and movement of products between suppliers and final customers, including manufacturers, distributors, retailers, and any other companies within the extended supply chain (Gunasekaran et al., 2008).

A supply chain can be defined as a network of various organizations involved both through upstream and downstream linkages in different kinds of activities and processes (Christopher, 1998) and involves interdependent units within a company and across divisions that belong to both downstream and upstream partners (Ballou et al., 2000). The term supply chain management has been used to describe the planning and control of materials and information flows as well as logistics activities not only internally within a company but also externally between companies (Cooper et al., 1997). According to various studies, supply chain management can be defined in many ways. For example, the Global Supply Chain Forum defines Supply Chain Management as the integration and incorporation of key business processes from end user through original supplier that provides materials, products, services, and information that add value for customers and other stakeholders (Lambert et al., 1998; Soroor and Tarokh, 2006). Udin et al. (2006) defines supply chain management as a system that contains multiple entities, processes and activities from suppliers to customers. Stadler (2004) summed up the many definitions of supply chain management by various authors and researchers as 'the task of integrating organizational units along a supply chain and coordinating materials, information and financial flows in order to fulfill customer demands with the aim of improving competitiveness of the supply chain as a whole.

Supply chain management aims at four major targets: (1) waste reduction; (2) time compression; (3) flexible response; and (4) unit cost reduction. These goals have been articulated in several contexts associated with supply chain management, emphasizing the importance of coordination. Companies practicing supply chain management seek to reduce waste throughout the supply chain by minimizing duplication, harmonizing operations and systems, and enhancing quality. When production and logistics processes are accomplished in less time, all entities in the supply chain are able to operate more efficiently, and primary outcome is the reduced inventories throughout the system (Brewer and Speh, 2000). Thus, supply chain management can positively impact many functions and outcomes of the company including product quality, customer responsiveness and resultant satisfaction, manufacturing cost control, product and market flexibility, and macro performance outcomes including market share and profitability (Meier et al., 2004). Successful supply chain management requires cross-functional integration (Lambert and Cooper, 2000). The basic concept behind supply chain management is how the raw materials and information flow from the supplier to the manufacturer, before final distributions to customers as finished products or services. The capability of sharing and exchanging information is essential to improve the effectiveness of the supply chain management (Udin et al., 2006). Thus, the crucial task of supply chain management is to gather the customers' demand more efficiently by providing the right product, in the right quantity, at the right location, at the right time, and in the right situation. However, one of

the problems that suppliers come across is conflict among companies in a specific supply chain. Although conflict can occur at anytime and anywhere in the human life, there are some differences between human life-based conflict and the supply chain-based conflict. Thus, it is important for the supply chain to manage conflict effectively so that the positive consequences of conflict can be realized. Coordinating and managing distributed entities in a supply chain is a challenging task due, in part, to conflicts present in such systems. If not handled effectively, the conflict can degrade the performance of the system (Blackhurst et al., 2008).

Conflict and Conflict Management

Conflict has been a hot topic studied by researchers in the discipline of psychology, sociology and business (Rahim, 2001), and revised by academicians in the discipline of management, marketing, psychology and sociology etc. Whenever people or companies work together, conflict in a team, company or among companies is inevitable (Daft, 1997: 608), and a ubiquitous phenomenon that covers all activities among companies. Researchers, in different fields, have recognized conflict as an important issue that affects organizational and supply chain performance (Bradford et al. 2004; Lam and Chin, 2005). For example, there is a negative relationship between conflict intensity and performance of supply chain in terms of product quality, delivery time, meeting of target development costs and etc. The effects of conflict in the workplace are widespread and costly. Its prevalence, as indicated by three serious studies, shows that 24-60% of management time and energy is spent dealing with conflict. This leads to decreased productivity, increased stress among employees, hampered performance, high turnover rate (Fiore, 2004).

In the literature, conflict can be termed in many ways. For example, conflict can be defined as the interaction of interdependent people who perceive opposition of goals, aims, and values, and who see the other party as potentially interfering with the realization of these goals (Putnam and Poole, 1987), as disagreement between two or more individuals, groups or parties (Griffin, 1990: 531), any situation in which two or more parties feel themselves in opposition (Newstrom and Davis, 1997: 312), as a process that begins when company or persons perceives that another company or person has negatively affected, or is about to negatively affects, something that the first party cares about (Robbins, 1998: 434) and as the behaviors or feelings of interdependent parties in response to potential or actual obstructions that impede one or more of the parties achieving their goals (Coughlan et al., 2001). There are many studies about conflict in different areas. For example, Geyskens et al. (1998) studied conflicts in channel relationship and retailing. Shaw and Shaw (1998) analyzed conflicts between engineers and marketers from engineer's perspectives. Rahim (2001) asserted that conflict has both functional and dysfunctional outcomes. Functional outcomes include stimulating innovation and creativity, and better decision making, whereas dissatisfaction, mistrust, damaged commitment and relationship are the common dysfunctional outcomes. Bradford et al. (2004) researched supply chain-based conflict and how affect company performance. They analyzed (1) inter-personal conflict and (2) task conflict in the retailing industry because retailers increasingly are becoming involved with groups of other firms to improve their effectiveness in performing business activities. The results of their research show that conflict can have negative effects on network outcomes. Lam and Chin (2005) analyzed conflicts in new product development process. Kozan et al. (2006) analyzed conflict management in Turkish buyer-supplier relationships, and studied buyer-supplier relations from a conflict management perspective capturing data from 50 buyers in automakers and 72 suppliers. In sum, conflict has been studied in terms of conflict among departments, ideas, companies and individuals. Specifically, the area of supply chain-based conflict is particularly important due to importance of supply chain management.

Conflict Management in the Textile Supply Chain

Conflict Management in the supply chain is not a new concept, but it is a very important aspect of supply chain management dynamics and performance of companies. Therefore, managing supply chain relationships is a particular challenge, since their very nature includes conflicting objectives in addition to a need for cooperation (Bradford et al., 2004). Since the conflict differs from company to company and textile supply chain to food supply chain, on the one hand, the textile supply chain-based conflict can be defined as an ongoing state of disagreement and incompatibility between partners in the textile supply chain or the processes that start on when one supplier perceives that the other suppliers have bothered. On the other hand, the textile-based conflict management can be defined as the short or long-term management processes used to resolve disagreement and incompatibility. Pondy (1967) identifies three conceptual models to deal with the major classes of conflict in organizations, (1) Bargaining Model: conflict among interest groups which are in competition for scarce resources; (2) Bureaucratic Model: conflicts between a superior and a subordinate, or along any vertical dimension in the organizational hierarchy; (3) Systems Model: conflict among parties in a lateral or functional relationship, and in particular, the problems of coordination. The textile supply chain-based conflicts are related

with all these models because there are many relationships among person and companies in the textile supply chain.

The Sources of Supply Chain-Based Conflict

Since conflict prevention is always easier than conflict handling, foreseeing sources of supply chain-based conflict will be more useful. In general, conflict is widespread within and among the supply chain partners, and there are some kinds of conflict arisen in the supply chain because of following reasons, (1) differences in objectives; (2) lack/scarcity of trust among the partners; (3) use of coercive power and strategies by chain members, (3) inefficient system structure, (4) win-lose mentality, (5) slippery and arduous global business environment, and (6) lack or scarcity of collaboration and cooperation within the organization and among the supply chain partners (Barutçu et al., 2005). Naturally, there is an ongoing conflict between manufacturing, finance and marketing departments because of different cultures, mentalities and goals. For example, group or party interdependence, differences in goals, resource competition, and interpersonal dynamics etc. can cause conflict within and among organizations (Griffin, 1990: 532-533). Many times conflicts arise because individuals or groups are trying to control resources in pursuit of their own goals (Milgram et al., 1999: 297). Good supply chain management means openly talking through and coming to a real agreement on difficult organizational issues, such as authority, performance, collaborative decision-making, power imbalances, and the sharing of risks, costs, and improvement benefits. But, none of the system of collaboration is perfect. Moreover, the supply chain can often be complex because of the large network of suppliers and different objectives across the supply chain. The difficulties imposed by this complexity are compounded by the increase in competitive pressure with the demand for ever greater levels of responsiveness, shorter cycle times and a simultaneous increase in the complexity of products (Handfield and Nichols, 1999). Buyers and suppliers would also conflict intensively for blaming each other for responsibility once the consequences such as redesign and delay occur because of the different interpretations of product specifications (Lam and Chin, 2005). For example, at a manufacturing company, when the supplier of a component promises delivery dates to another supplier and components don't arrive on time, production facilities fail, customers may change or cancel orders, etc. and conflict arises among the parties involved. The level of structure in the relationship can influence the potential of conflict. Structure, by formalizing the form, process, and content of the relationship implies a level of agreement about mutual expectations. The structure of an organizational relationship is the level of specification of roles, obligations, rights, procedures, information flows, data, and analysis and computational methods used in the organizational relationship. Lack of structure would, therefore, contribute to the risk of conflict. Given the different levels of interdependence (pooled, sequential, and reciprocal), they imply different levels of structure and therefore imply different potentials for conflict (Kumar and Dissel, 1996). In a typical supply chain, there is a sequential interdependence among the partners and this kind of interdependence requires one group's output to serve as another group's input, thereby providing basis for great potential conflict (Gibson, 1997: 228).

The Resolution of the Supply Chain-Based Conflict

Generally, optimal level of conflict stimulates creativity, innovation, and improvements. But excessive level of conflict may harm relationships in the supply chain. Provided that textile companies are currently facing a conflict situation, they should look at the ultimate cause of this conflict. In the conflict resolution, conflict handling system that enables to handle with the conflict efficiently and effectively is important. The system is comprised of conflict management culture, conflict handling skill, conflict handling process, and conflict monitoring and improvement parts (Lam and Chin, 2005). Conflict Resolution provides instruction on conflict resolution through an interactive relationship. A number of different models have been proposed with which to classify responses to conflict. Thomas (1976) conceptualized five conflict-handling styles as (1) competitive—one partner seeks to dominate the process, without regard for the others, (2) collaborative— partners seek to understand their differences and achieve a mutually beneficial solution., (3) avoidant— the conflict is recognized to exist but is suppressed by one or more parties, or handled by withdrawal., (4) accommodative— a partner becomes self-sacrificing to appease another, and places the interests of the other above their own., and (5) sharing models— each partner makes some concessions in order to reach a compromise for resolution conflict. According to Griffin (1990: 535-536), managers used one of the following conflict resolution strategies; avoidance, smoothing, compromise, and confrontation. Avoidance approach is simply to ignore the conflict and hope it will go away. It is sometimes effective in the short run, but it does little to resolve long run or acute conflict. Smoothing is minimizing the conflict and telling everyone that things will “get better.” Compromise can work if it is used with care, but in most compromise situations someone wins and someone loses. The confrontation approach to conflict resolution involves bringing the parties together to confront the conflict. Newstrom and Davis (1997: 318-319) repeated the same strategies with some minor differences; Avoiding,

smoothing, forcing (using power tactics to achieve a win), compromising (searching for middle ground), confronting (facing the conflict directly and working it through to a mutually satisfactory resolution).

Textile-based conflict resolution means how to deal with conflict between supply chain partners. In order to manage conflict in the supply chain, Hau (1997) recommended that managers must create a more trusting relationship, enhance communication, and accurately measure gains and an investment in collaborative efforts. Johnston et al. (2004) emphasized that higher levels of inter-organizational cooperative behaviors such as shared planning and flexibility in coordinating activities were found to be strongly linked to the supplier's trust and less conflict in supply chain. Bradford et al. (2004) emphasized that negative effects of conflict can be reduced by the use of the appropriate conflict management approaches. Collaboration, coordination, problem solving mechanisms systems and early supplier involvement in the design of products can provide better communications among supply chain partners, solve operational conflicts in supply chain, and facilitate better cooperation. Especially, effective communication enhances mutual understanding among companies in supply chain. Barutçu and Tanyeri (2004) offered the development of Strategic Supplier Alliances for better supplier-producer-distributor-buyer integration and less supply chain-based conflicts and problems. Kumar and Dissel (1996) emphasized the importance of conflict management approach in the supply chain with the analogy of peace and diplomacy. Companies seeking to build and sustain successful supply chain need to recognize and implement the roles of corporate statesmen, diplomats, and peace observers who not only seek out build peace agreements and treaties (i.e., negotiate, design, and implement technical) but also guard against misunderstandings, misinterpretations, and perceived or real betrayals that may lead to the disintegration of the relationships. Blackhurst et al. (2008) presented a methodology, extending the concept of basic Petri Nets, to discover supply chain conflict before they occur and cause detrimental effects to system performance. The approach involves linking hierarchical levels of the supply chain system and detecting conflicts occurring when the single entities, each optimized for its own operations, are combined together in a supply chain. These conflicts are not obvious or intuitive in examining the single entities of the supply chain, but when integrated the conflicts are discovered by the methodology.

RESEARCH FOR CONFLICT MANAGEMENT IN THE TEXTILE SUPPLY CHAIN FROM EXPORTER PERSPECTIVES

The global textile supply chain is a world-wide network of suppliers, manufacturers, warehouses, distribution centers and retailers through which cotton are acquired, transformed and delivered to customers as textile products. There may be many processes, materials, suppliers and customers (final customers, retailers or hotels etc.) on information and product (material/ machines/textile products) flow in the textile supply chain. Another set of common terms in the supply chain language are upstream and downstream partners in the supply chain. In the case of textile industry, the upstream suppliers consist of manufacturing and processing textile products, the downstream suppliers hand concerns the distribution channel's functions where the product passes through to the final wholesaler/customer.

If the managers fail to manage the entire textile supply chain without any conflicts between the partners, the supply chain cannot work efficiently. As a matter of fact, conflict is inevitable in every organizations, companies and supply chain. However, it is important to search what are the sources of conflict, how the managers of textile companies handle with, and resolve these conflicts. However, little attention has been given to identifying differences between upstream and downstream supply-chain based conflict. In addition to identify the sources and resolutions of the conflicts, the findings of this survey contribute to determine the differences between upstream and downstream textile supply chain-based conflicts. A questionnaire survey was developed and pilot tested so as to test the following alternative hypotheses:

H₁: The sources of conflict are different between upstream and downstream supply chain.

H₂: The methods of conflict resolution are different between upstream and downstream supply chain.

Research Methodology

Data for this research was collected through survey methodology from the managers of the textile exporters in Denizli, Turkey. The questionnaire was developed and adapted from the existing studies (Thomas, 1976; Bradford et al., 2004; Arend et al., 2005; Lam et al., 2007) and self-created. Before being conducted, the questionnaire was pre-tested on three managers in order to construct validity of measurement scales.

Sample size is determined as 125 questionnaires because of the time and cost limitations. Judgmental sampling, one of the non-probability sampling methods, is used to select 25 textile exporters and 125 respondents in Denizli, Turkey. 125 questionnaires were distributed to textile companies. 95 questionnaires returned and 87 of them were usable for the final data analysis. In the questionnaire, there were 14 questions. In the first section, there were 4 questions provided respondents' positions, profiles of the company (sizes, types and their supplied products and services). In the second section, there were 2 questions provided attitudes towards supply chain-based conflicts (5-point scale, 1-strongly disagree, 5-strongly agree) and whether the conflict occurs or not. In the third section, there were 8 questions and 58 items about supplier/customer selections, the sources of conflicts and the resolutions of conflict for downstream and upstream partners separately. In this section, the respondents were asked to rank the factors supplier/customer selection from the most-preferred to the least-preferred with an ordinal measurement scale (not analyzed in this paper), also asked to indicate on a 5-point scale how often conflict had occurred in their supply chain activities (1-never, 5-always) and which strategies had been used to solve supply chain-based conflict (1- never, 5-always) in upstream and downstream suppliers separately. SPSS 16.0 for Windows were used to analyze survey data. Descriptive data analysis was used to analyze data collected from survey. The hypotheses are empirically tested by independent samples t-tests. The reliability of the questionnaires was assessed by the Cronbach alpha reliability coefficient. Reliability value calculated 0,826 and exceeded the suggested value of 0,70. This survey is delimited in two ways. Firstly, instead of personality-based, conflicts are studied on the supply chain-based. Secondly, the pilot survey is conducted in Denizli, Turkey due to limited time.

Research Results

Table 1 provides the characteristics of respondents and companies of the sample. In terms of the respondents' positions, among the 87 respondents, 21,8% were general managers, 18,4% were purchase managers, 19,5% were operation managers, and 8% marked the others were finance and accounting managers. In terms of the company sizes, there are 37 companies employing less than 200 workers, 18 companies employing between 201 and 400 workers, 16 companies employing between 801 and 1200 workers. In terms of the supplied products and services from downstream partners, among 87 companies, 94,3% (82 companies) are providing logistics and transportation services, 90,8% (79 companies) are providing Cotton & Thread, 75,9% (66 companies) are providing Painting & Printing and 5,7% (5 companies) are providing Packaging and Security services from their textile supply chain partners. Moreover, among the 87 companies, 28,7% has between 5001 and 10000 square meters, and 25,3% has between 1001 and 5000 square meters production areas.

Table 1: The characteristics of respondents and companies

Variable	N	%	Variable	N	%
<i>Respondent's positions</i>			<i>Supplied products and services</i>		
Owners	15	17,2	Cotton & Thread	79	90,8
General Managers	19	21,8	Weaving & Knitting	75	86,2
Operation Managers	17	19,5	Painting & Printing	66	75,9
Purchasing Managers	16	18,4	Sewing	44	50,6
Marketing& Export Managers	13	14,9	Logistics	82	94,3
Others	7	8,0	Others	5	5,7
<i>The number of workers</i>			<i>The production area</i>		
≤ 200	37	42,5	≤ 1000 square meters	4	4,6
201-400	18	20,7	1001-5000 square meters	22	25,3
401-800	12	13,8	5001-10000 square meters	25	28,7
801-1200	16	18,4	10001-15000 square meters	21	24,1
≥ 1201	4	4,6	≥ 15001 square meters	15	17,2

According to survey results, 72 of the 87 companies are in a conflict with their supply chain partners, and 15 of them are not. Given the survey results, it appears that there are many conflicts on the textile supply chain. As seen in Table 2, this result is also supported by respondents' attitudes towards supply chain-based conflicts. The respondents of the survey believe that the textile supply chain-based conflict is inevitable between supply chain partners. Besides, they manage the textile supply chain-based conflict successfully in their management control areas. They also agree that the conflict can degrade their performance. However, they consider that their partners do not manage the textile supply chain-based conflict successfully as much as they manage.

Table 2: Attitudes towards supply chain-based conflict

Attitude statements*	Mean	Std. Deviation
a. The conflicts are inevitable between companies in the textile supply chains.	3,9625	,86337
b. The conflicts in our management control areas are managed very well.	4,0875	,67868
c. The conflicts can degrade the performance of the textile supply chain.	3,6000	1,19704
d. The managers with whom we are disagreement handle conflict very well.	3,1000	1,01383

*Scale: 1. Strongly Disagree - 5 Strongly Agree

It is crucial to understand the sources of the conflicts before using strategies to solve them. The sources of supply chain-based conflicts with downstream and upstream partners are presented in Table 3. As the statistics make clear, the fact that supply chain-based conflict exists, and the levels of the supply chain-based conflict differ considerably in terms of their sources. The main sources of conflict with downstream partners are price changes, last minute changes in orders, substandard performance for delivery and quality, demand for faster delivery, delayed payment, volume changes in orders, by whom logistics/transportation cost will be paid, and order cancellations. The main sources of conflict with upstream partners are demand for faster delivery, last minute changes in orders, price changes, substandard performance for delivery and quality, volume changes in orders and lack of cooperation. Thus, conflict is common between the supply chain partners, and there are different types of conflicts in the textile supply chain. The underlying sources of most conflicts are price changes for downstream partners, the demand for faster delivery from upstream partners and last minute changes in their orders for both of them.

Table 3: The sources of conflict in downstream and upstream partners

The sources of conflict*	Downstream Partners		Upstream Partners		t**	p
	Mean	Std. Deviation	Mean	Std. Deviation		
a. Changes in price	3,2375	,83049	2,6625	,87067	4,274	,000***

Although conflict is common between textile supply chain partners, and there are some kinds of conflicts arisen in the supply chain, it is also important to compare the sources of conflicts between downstream and upstream partners. In testing H_{1i} , to compare the sources of conflicts, independent-samples T-tests were performed to determine the differences between them. The results of testing on the main differences of them are presented in Table 3. According to statistical analysis, some sources of conflict appear to display notable differences. For example, a price change, substandard product and service quality performance, delayed payment, non-compliance company rules and policies and the logistics/transportation costs in the downstream supply chain are more important reasons to come into conflict than upstream supply chain. In contrast, demand for faster delivery in the upstream supply chain is more important reason to conflict than downstream supply chain. As a result, the alternative hypotheses such as H_{1a} , H_{1d} , H_{1f} , H_{1g} , H_{1l} and H_{1n} are accepted. Findings indicate that in comparison to downstream partners, the level of conflicts with upstream partner is lower. Consequently, the sources of textile supply chain-based conflicts are different between downstream and upstream partners.

Managing supply chain-conflict is one of the major responsibilities of the textile managers, and is an important skill to use when working as supply chain partners. Thus, the textile supply chain-based conflict ought to be managed either resolved or used beneficially. As seen in Table 4, respondents have tried to solve the supply

chain-conflicts rather than ignore and avoid them. The main resolution methods, a range of methods for alleviating or eliminating sources of conflict, with downstream partners preferred by textile managers are compromising, sharing, smoothing, offering options, joint planning and competing, but methods such as handling authority and power, bargaining, collaborating, avoiding and forming strategic supplier alliance are the least methods preferred. However, the main resolution methods with upstream partners preferred by textile managers are sharing, compromising, offering options, developing trust, collaborating joint planning and smoothing. The respondents do not prefer to use conflict resolution methods with upstream partners such as avoiding, handling authority and power, forming supplier alliances and competing. Besides, sharing, each party making some concessions in order to reach the midway solutions, has been preferred for all supply chain partners. It is also important that avoiding conflict is one of the least preferred methods since it has some negative consequences.

Table 4: Conflict handling methods for downstream and upstream partners

Conflict handling methods*	Downstream Partners		Upstream Partners		t**	p
	Mean	Std. Deviation	Mean	Std. Deviation		
a. Competing	2,9750	1,00599	2,1625	1,08434	4,913	,000***
b. Sharing	3,4000	,94935	3,4500	1,21071	-,291	,772
c. Compromising	3,5250	1,05513	3,4000	1,27884	,674	,501
d. Avoiding	1,7375	,88223	1,4250	,56870	2,663	,009***
e. Handling authority and power	2,5000	1,01881	1,7125	,79863	5,441	,000***
f. Collaborating	2,9500	1,33027	3,3625	1,10515	-2,133	,034***
g. Offering options	3,1625	1,11881	3,4250	1,32908	-1,351	,178
h. Bargaining	2,2875	,94392	2,3125	1,23856	-,144	,886
i. Smoothing	3,3875	1,24772	3,2375	1,38018	,721	,472
j. Developing trust	2,9125	1,37052	3,3875	1,38247	-2,182	,031***

l. Forming joint problem solving unit	2,0375	1,18475	2,3375	1,46645	-1,423	,157
m. Forming supplier alliances	1,7375	1,05235	2,1125	1,20120	-2,100	,037***

* Scale: 1. Never - 5. Always

** Equal variances assumed

*** $p \leq 0,05$

It is also important to compare the resolution methods between downstream and upstream partners. The results of testing the main differences of them are presented in Table 4. According to statistical analysis, the preferred conflict resolutions methods are different between downstream and upstream partners. For example, the some conflict handling methods for upstream partners such as competing, avoiding and handling authority and power are less preferred than downstream partners. In addition to this, developing trust and forming strategic supplier alliances are more preferred for upstream partners than downstream partners. As a result, the alternative hypotheses such as H_{2a} , H_{1d} , H_{2c} , H_{2f} , H_{2j} and H_{2m} are accepted. Based on a comparison of conflict resolution methods, it appears that the preferred conflict resolution methods in the textile supply chain-based conflicts are different between downstream and upstream partners. For example, competing with partners, a win-or-lose style of handling conflicts has been preferred from downstream partners rather than upstream partners. Offering options, third options for bringing the conflicting parties together, has been preferred more by upstream rather than downstream partners. The surveyed textile companies have used conflict resolutions methods such as avoiding and handling authority and power for downstream partners rather than upstream partners. Moreover, collaborating is one of the ideal ways of resolution to conflict, and respondents have been more willing to collaborate and work together for finding some solutions with upstream partners rather than downstream partners.

CONCLUSION

Supply chain management, conflict management and supply chain-based conflict management have become some of the popular topics. The growing importance of buyer-supplier relationship urges a need to study conflict and conflict management in the supply chain processes. To implement supply chain management processes successfully, managers who are responsible from supply chain should manage conflict occurred among companies, their suppliers, distributors, retailers and customers etc. Managers who do not manage conflict in supply chain effectively may possibly fail to manage their companies and lose not only money but also their suppliers or customers. Nowadays, the entire supply chain is becoming increasingly important in many industries, and this is especially right for the textile industry. One of the major components of valuable textile

supply chain management is effective communication, the ability to work effectively and the ability to handle conflicts between supply chain partners. In sum up, in order to high performance of supply chain, companies must operate supply chain functions in a coordinated manner. The ability to determine the sources of conflicts would be an important benefit because the conflict can degrade the performance of the textile supply chain.

According to survey results, the respondents consider that the textile supply chain-based conflict is unavoidable and common between the supply chain partners. They also believe that their partners do not manage the textile supply chain-based conflict successfully as much as they manage. There are different types of conflicts in the textile supply chain. The underlying sources of the most of the conflicts are price changes for downstream partners, the demand of faster delivery for upstream partners. Moreover, the sources of textile supply chain-based conflicts are different between downstream and upstream partners. Textile managers have applied various methods for supply chain-based conflict resolution such as compromising, sharing, smoothing, offering options, joint planning and competing in downstream supply chain. The methods such as sharing, compromising, offering options, developing trust are preferred to solve the conflicts with upstream suppliers. Avoiding of conflict is one of the least preferred methods both downstream and upstream partners. In terms of textile managers' conflict handling methods, there are some differences between upstream and downstream supply chains. Given the results of this survey, most of the respondents have their own conflict handling methods.

From the perspective of the textile exporter, some managerial implications seem very clear. Specifically, the literature and survey results help textile managers to be aware of the existence of supply chain based-conflict in their textile supply chain. They also enable practitioners and academicians to identify conflict management for both downstream and upstream suppliers separately, and conceptualize supply chain-based conflicts as their relative importance. Moreover, there are also several ideas for future researches. In further studies, (1) the relationship between the personalities (Pragmatist, Idealist, Hothead, Tyrant etc.) of managers and their effects on preferring conflict handling methods should be investigated, and (2) in terms of their priorities for choosing key downstream partners and upstream partners, the differences between the managers who face with the conflicts and the managers who do not face with the conflicts in their textile supply chains should be also analyzed.

IMPACT OF RELATIONAL FACTORS ON SUPPLIERS PERFORMANCE: THE MALAYSIAN EXPERIENCE

**Mohammad Ikram Ahmed Fadzil,
Sharifah Faridah Syed Alwi and
Tengku Faziharudean Dato Feisal
University of Malaya, Malaysia**

ABSTRACT

A sustainable competitive advantage is now essential for survival in a hyper-competitive global marketplace, with its rapidly vanishing borders. The changing forces new firms or existing firms to manage resources better in order to be competitive. One option is to use global supply chain management that can optimize costs in an integrated fashion along the entire chain. Within SCM environment managing relationship is a central issue. This paper seeks to understand relational factors do have an impact on supplier performance. The findings show that relational factors such as trust, cooperation and communication are significant in influencing suppliers' performance.

BACKGROUND

This study seek to identify the relevant relational factors and examine their impact on influencing and improving supplier performance and whether they can be used as strategic tools that can provide competitive edge in a supply chain context. The following are research questions for the study.

- ❑ What is the impact of communication by the buyer on supplier's price, delivery and quality?
- ❑ What happens to supplier's price, delivery and quality when buyer instills a high level of trust for the supplier?
- ❑ What is the impact on supplier's performance when buyer is highly cooperative?
- ❑ In buyer and supplier relationship, there is a moderating effects on bargaining power of the buyer has on relational factors and supplier performance?
- ❑ Do the buying firms realize and practice using trust, communication and cooperation to influence supplier performance?

LITERATURE REVIEW

Sako (1992) and Hine (1994) studies implied that relationship and the factors that influence relationships also contributes greatly in affecting the success of Supply Chain Management (SCM) and network management practices. These factors enable better relationship management. They find that competence, trust and dependence should lead to supplier's competence, loyalty and compliance. The buyer's core management objective is to work with a supplier who can provide low cost, high quality and on-time delivery. Integrated supply chain management through enhanced relationship management brings about those competitive benefits because cycle time is reduced, product quality improved and labor costs can be lowered. In the end administrative complexities could also be reduced. Consequently the supply chain or network will be able to better compete with other less efficient supply chain.

There is also increasing recognition of the importance of the formation and maintenance of long-term relationships in marketing. Further investigation shows that such relationships require an effective use of

relationship management tools. Therefore the recognition together with use of relational tools is important it allows relationship to be managed in an effective manner. In the end the whole performance of firms in a specific supply chain in general and the suppliers are expected to improve and enhance. The methods by which relationships between organizational buyers and sellers might be expedited and better managed are being urgently researched. In the process firms are strongly advised by practitioners and academicians to develop and maintain overall quality of product, service and delivery as these are means of fostering loyalty in relationships with customers. Firms are even encouraged to implement programs and commit resources specifically to nurturing relationships with customers. Long-term and closer ties between different partners or organizations in a network are advocated by many recent marketing, management, logistics and purchasing thinkers (Ellram and Hendricks, 1995). The strength of network management lies in maintaining closer, better, more efficient and long-term relationships. Multiple benefits can be exploited from having such a relationship that can be used to increase firms efficiency and performance.

Meanwhile organizations need to understand factors that are important for the notion of SCM efficiency to succeed. Some of the factors common to SCM initiatives are the development of trust, commitment and long-term understanding in the supplier-manufacturer dyad. Sustaining the supply chain relationship is critical because it is probably the most fragile, and the most susceptible to breaking down. A weak link in any part of the supply chain can have disastrous consequences for all members of the chain (Ferguson, 2000). That is why strong relationship must be maintained. Many supplier-reseller relationships are highly asymmetrical. However asymmetry creates the potential for exploitation rather than cooperation since powerful firms have been known to take advantage of in dealing with their more vulnerable channel partners (Heide and John, 1988). This can hurt the efficiency of supply chain management. Therefore to better manage supply chain a relationship that manifested a high level of trust; commitment and stability have to be in place.

Researchers have defined relationship quality as being manifested in several distinct though related constructs (Crosby, Evans and Cowles, 1990). Although there is no consensus on which constructs comprise relationship quality, the critical importance of trust and involvement with the supplier in developing long-term relationships has been emphasized (Dwyer and Oh, 1987). Three constructs are critical at the present stage of our understanding of the process of relationship development. They are trust, commitment and disengagement (Anderson and Weitz, 1992). Therefore we can see that relationship quality encompasses cooperation, trust and commitment in information sharing or increased and efficient communication.

THEORETICAL AND HYPOTHESES DEVELOPMENT

Trust and supplier performance

Doney and Cannon (1997) found that trust is a criterion buyers use to evaluate suppliers. This is because developing trusting relationships represents an investment with long-term payoffs. Therefore salesperson's primary role is institutionalizing trust in the supplier firm. Marketing research on trust primarily focuses on suppliers. Trust of a supplier firm can influence long-term relationships. It can be jeopardized by a company representative who proves to be dishonest and unreliable. In marketing, much research on trust has been conducted in the context of distribution channel (Anderson and Narus, 1990; Morgan and Hunt, 1994) because high degree of interdependence is usually found in channel relationships. It is also where vulnerability due to uncertainty is high. Because of this importance of trust, it forms the basis of the hypotheses one to three:

Hypothesis 1: The level of trust between buyer and supplier has significant positive impact on supplier's pricing

Hypothesis 2: The level of trust between buyer and supplier has significant and positive impact on supplier's quality

Hypothesis 3: The level of trust between buyer and supplier has significant and positive impact on supplier's on-time delivery capability

Communication and supplier performance

According to Johnson and Johnson (1989), frequent, accurate and open communication is required to move the conversation past cooperating on simple task assignments to understandings the other's perspective and building trust. According to Lewicki and Bunker (1996), frequent and regular communications allows the exchange of information about each party's preferences, values and approaches to problems. It is important for enhanced relationship, leading to better supplier performance. Therefore it is reasonable to hypothesize that:

Hypotheses 4: The extent of the communication between buyer and supplier has significant positive impact on supplier's pricing

Hypothesis 5: The extent of the communication between buyer and supplier has significant positive impact on supplier providing quality results

Hypothesis 6: The extent of the communication between buyer and supplier has significant positive impact on supplier's on-time delivery capability

Cooperation and supplier performance

To help ensure long-term survival, organizations strive to control resources. However when the cost of controlling essential resources is prohibitive or if the risks are high, a firm may attempt to minimize its dependence and reduce uncertainty through formal or semiformal links with other firms (Heide, 1994). With this in mind it is of no surprise that the two parties would find it is mutually attractive to work together and achieve mutual and individual goals and lead to the formulation of the following hypotheses.

Hypothesis 7: The extent of cooperation between buyer and supplier has significant positive impact on supplier's pricing

Hypothesis 8: The extent of cooperation between buyer and supplier has significant positive impact on supplier providing quality results

Hypothesis 9: The extent of cooperation between buyer and supplier has significant positive impact on supplier's on-time delivery capability

Bargaining power in the buyer-seller relationship

Bargaining power as argued by Dowlatshahi (1999), has an impact on buyer-supplier relational factors and supplier performance which should be pertinent as well if expanded into a SCM environment. The following hypotheses are developed to test its moderating effect.

When bargaining power of buyer is high, they are more likely to be in a better position to dictate terms and conditions. Suppliers will be placed in position where they will have to supply better quality products, provide reliable delivery and a lower cost in order to maintain and secure future orders. Therefore we formulate these last set of hypotheses:

Hypothesis 10: A high bargaining power on the part of buyer will have a positive moderating effect on the relationship between trust and supplier performance.

Hypothesis 11: A high bargaining power on the part of buyer will have a positive moderating effect on the relationship between communication and supplier performance.

Hypothesis 12: A high bargaining power on the part of buyer will have a positive moderating effect on the relationship between cooperation and supplier performance.

Figure 1: Theoretical Framework

METHODOLOGY

Trust

Five items are used to evaluate the level of trust in the dyadic relation. Two are extracted and adapted from Morgan and Hunt (1994), they are the level of confidence in the accuracy of information provided by the supplier and whether buyer is convinced that supplier had respect for any confidential information received from it. One on mutual expectation to reciprocate is adapted from Anderson and Weitz (1961), Anderson and Weitz (1989). The other two are from Kumar et al. (1992), asking whether buyer feels comfortable in sharing confidential information with the supplier even though it is apparently necessary to do so, and whether any reports asked by buyer is accurately filed by supplier and if it is on the time designated.

Communication

Extent of communication is operationalised through constant exchange of information with supplier, simultaneous and continuous exchange of idea with supplier, comfortable personal relationship of buyer with supplier, the ease of obtaining supplier's attention. The rest asked the buyer about the extent of significant disagreement in the working relationship, the frequency of conflict and the tension level. The first three were adopted from Anderson and Narus (1990). The last four are adapted from Kumar et al. (1992).

Cooperation

There are seven items used in the questionnaire to measure cooperation level between buyer and supplier. It is adopted in the first question to ask the interaction level between buying organization and the chosen supplier. The study from Heide and Miner (1992) was used to ask whether there are joint solving efforts directed at solving problems that may arise. The last four is focused on finding out the extent of supplier's involvement in new product or customization design, not violating terms and conditions of contract, whether supplier invested money to be more competent in servicing the buyer and whether supplier amasses knowledge about the features and attributes of the buyer's end product. They were sourced and adapted from Kumar and Stern (1992) and Turner, Le May, Hartley and Wood (2000).

Bargaining Power

The bargaining power measurement scale is adapted from items cited in Lean (1999). The questionnaire uses three questions to assess it. Each is aimed at gauging the bargaining power that is inherent in the buyer in its relationship with the supplier. A high bargaining power of the buyer means the opposite to the supplier. The items are the number of suppliers for the materials/components, the substitution available in the market for components/materials and the switching cost for the organization to source out for the components/materials.

Context of Study and Sample Characteristics

The unit of analysis is organization. The population of this study is firms and organisations located in Malaysia. Particular emphasis focused on manufacturing firms. As the study is about buyer-supplier relationship the unit of analysis is the buyer-supplier dyad. However the source of data from which the characteristics are obtained is the buyer. This is due to the fact that the performance of the dyad can best be described by the buying firm. Thus the

respondent for this study will come from the buying firms. Questionnaires were distributed either through e-mail or postal service to the firms previously identified. Questionnaires sent by post also contained returning self-addressed envelopes to facilitate responses. The questionnaires were directed to the person in charge of purchasing and procurement.

ANALYSIS AND RESULTS

Descriptive analysis

A breakdown of the analysis shows that the major responding firms are involved in the electronic industry. This does not come as a surprise as Malaysia has many electronic and electrical parts' firms operating in most of its industrial zones. Most of the respondent firms' are manufacturers, about 56.4% of the total response rate. Only 12.9 % are wholesalers and retailers. The firms are to a large extent locally owned while Japanese firms made up the largest foreign owned. The size of the respondent firms is mostly small to medium size. 25% of the respondent firms have had more than 5 years relationship with their respective suppliers. The firms have leverage to evaluate the performance of the suppliers. On the supplier's demography, most of them constitute 87% locally owned and providing the buyer with more than 40% of the total components used. About 20% of the components supplied are electronics and electrical parts. The second largest components supplied are related to automotive parts. In short the study evaluated local suppliers, providing at least 40% parts in the forms of electronic and electrical parts.

Statistical analysis

A multiple regression was used to test all the hypotheses. First the regression model needs to be tested for its validity. To be valid, the regression model must not violate any of the critical assumptions. The first assumption is that there is linear relationship between independent and dependant. The methods used is observing and graphing the scatterplots. In this case the shapes of the scattered points are within the normal pattern. No abnormal or tightly clustered patterns were observed. The first assumption of linearity and homogeneity of variance has not been violated.

The second assumption is the independence of the error terms. Examination of this assumption requires the interpretation of the Durbin-Watson values. The values achieved are 1.939, 1.934, 1.619 and 1.973 respectively. They are within the acceptable range that precludes any serious autocorrelation problem. Therefore the assumption of independence has not been violated.

The third assumption is of normality of the error term. The assumption is met since a bell shape is detected from the histogram and the normal probability plot shows the points are clustered along the diagonal line. This represents the normality of the error terms. Further checks of the VIF and Tolerance, the values are all within the acceptable range. Therefore there seems to be no multicollinearity problem, and the independent variables of trust, communication and cooperation can be assumed to be independent of each other.

The next level of analysis is determining the goodness of the regression model by observing its explanatory power. This is represented by R-square value. The value represents the level of variances observed in the overall performance explained by all the individual variables namely trust, communication and cooperation. For this model the R-square shows a positive explanation of 20.8% of the variation in overall performance. The value is considered significant as the F change value of 15.518 is statistically significant at 5% level.

The next analysis is establishing and verifying the effect of trust, communication and cooperation on overall performance. The values observed are the standardized coefficients or Beta in the regression equation. Only trust and cooperation seemed to have any significant positive relationship with overall performance, as their beta of 0.231 and 0.326 are significant at the 5% level (0.001 and 0.000 respectively). Cooperation seems to have the largest impact on overall performance. The result leads to the acceptance of hypothesis 1, 2, 3, 7, 8, 9 while hypothesis 4, 5, 6 has to be rejected.

For cost, only cooperation has a positive relationship as the Beta coefficients is statistically significant with the value of 0.358 (significant at the 5% level). For quality, trust and cooperation have positive impacts, their Beta coefficient values of 0.284 and 0.217 are statistically significant at the 5% level of significance. Trust seems to have the larger impact.

For delivery, it is positively affected by trust and cooperation. Communication does not have a statistically significant impact on delivery. This model has the highest explanatory power of 22.4% as compared to the other models.

The overall mean of bargaining power of buyer is 3.49 indicating that the extent of the level of bargaining power is moderate. The variation (standard deviation of 0.89) is moderately high indicating that there are variations amongst the respondents in term of bargaining power. In order to determine the impact of bargaining power of the buyer on the relation between relational factors and supplier performance, a hierarchical regression was carried out.

The analysis involves a 3-model regression analysis on overall performance, cost, quality and delivery. The first model seeks to establish the relationship of the all independent variables on overall performance. The second model saw the introduction of bargaining power as an independent variable, to observe its effect on overall performance. The final level analysis involves regressing overall performance as a function of trust, communication and cooperation, bargaining power and the interaction of bargaining power with each of the independent variables.

The relevant values needed to be analysed were the standardized coefficients (Beta), R-square, change in R-square and the significant change in F value. Model 2 has 26.1% explanatory power. The inclusion of bargaining power has increased the explanatory ability of the regression model by 0.11%, however this is not considered significant based on the F statistics at the 5% level. Observation of the Beta value also shows that bargaining power does not have any impact on overall performance. However, for Model 3, the analysis provided significant evidence that bargaining power moderates the relationship between communication and cooperation and supplier performance as the change in F value is significant.

For cost, bargaining power acts as a predictor variable from Model 2. Model 3 show significant moderation behaviour of bargaining power of the buyer on the relationship between cooperation and cost. Bargaining power shows to have a moderation effect on the relationship between trust and quality. In the case of delivery, there is evidence of moderation effect of bargaining power between cooperation and communication and delivery when the change in the F statistic is significant at 5% level and the explanatory power in Model 3 improves by 7.2% to an R-square of 36.7% from 29.5% in Model 2. The inclusion of interaction factors of bargaining power and communication has a positive impact whilst the interaction with cooperation seemed to have a negative effect.

The conclusion that can be made is that on overall performance, there is a moderating effect of bargaining power of the buyer on the relationship between communication and cooperation and supplier performance. For cost bargaining power have a moderating impact only between cooperation and cost. On quality, the moderating effect of bargaining power is between trust and quality only. Finally for delivery, the moderating impact is on the relationship between communication and cooperation and delivery. Thus, hypotheses 11 and 12 are accepted, while hypothesis 10 is partially accepted.

DISCUSSION AND CONCLUSION

There are several managerial implications that can be derived from this study. The first implication points to the building of trust by both buyer and supplier. Since trust is shown to have an influence and improve supplier performance, action and attitude that can promote trust should be encouraged. Buyer should not appear hesitant to invest time, money and human resources in project-specific or relationship investment or assets. Relationship-specific assets refers to adaptations in products and plant equipments that are dedicated to one degree or another, to the customer-partner. In short it is investments in plant or product modifications that are specific to their customer or supplier, marketing expenditures, adaptations to the areas of product, process and organization. Another trust promoting action is showing the willingness to share confidential information. The concept of reliability and accountability should be rigorously practiced. One manifestation is keeping to promises made either verbal or written and followed instituting procedural fairness.

Secondly increased communication should be in place by the buyer through engaging in more frequent interaction. There should be more a proactive when it comes to supplier relationship so as potential problems are quickly identified and avoided or resolved before it becomes a threat to the entire chain operations. Furthermore there should be willingness to share information that might not be relevant to their operations but of use and benefits to the supplier. Investment in improving communication technology should be of concern to the organizations.

Thirdly organizations must engage in activities that fosters closer and more intimate cooperation. Cooperative behaviours are reflected in showing their availability and readiness to solve the problems of their supplier while at the same time share risks and benefits with their supplier. Another reflection of cooperative behaviour is showing the ability to be conducive in receiving advice and suggestion and also able to provide advice and suggestion. Buyer and supplier should establish the norm and practice of sharing sources and resources.

By having higher level of trust, increased communication and closer cooperation, buyers and their suppliers may experienced better quality product and services that can be passed and transferred throughout their respective supply chain and the benefit enjoyed by all network partners so that in the end their supply chain may be equipped with the much sought after competitive edge.

HUMAN RESOURCE MANAGEMENT AND ORGANIZATIONAL BEHAVIOR

EFFECTS OF CORE EMPLOYEES ON ORGANIZATIONAL CAPABILITIES AND FIRM PERFORMANCE

Oya Erdil
Hakan Kitapçı
Beyza Timurlenk

Gebze Institute of Technology, KOCAELİ, TURKEY

ABSTRACT

This study explores the impact of core employee characteristics on organizational capabilities and firm performance. The resource based view asserts that organizations with valuable and inimitable resources will attain competitive advantage and organizational performance. The effects of valuable and unique core employees on organizational capabilities namely managerial, technical capabilities and output based capabilities and overall firm performance are analysed in this study. We used a statistical methodology to test the relationships hypothesised in the research model. The results indicated a higher organizational capability and organizational performance for firms using the most valuable core employees.

Keywords: core employees, value, uniqueness, organizational capabilities, firm performance.

Theory and Hypotheses Development

Resource-based theory, one of the most widely accepted theories of strategic management and originally formalized in 1991, views the firm as a bundle of resources and emphasizes that competing firms possess heterogeneous resource bases (Song et al., 2007). It explains the importance of developing resources and capabilities which are valuable, rare, inimitable and non-substitutable. The attainment of such advantages will enable the firm to improve its short-term and long-term performance (Newbert, 2008). Although it is necessary for a firm to possess valuable and inimitable resources and capabilities, firms seeking a competitive advantage must also demonstrate the ability to alter them for full realization of their potential (Newbert, 2007). Therefore, resources are the substance of strategy because competitive advantage (CA) is a match between the organization's resources and capabilities and the environmental opportunities and risks it faces, and the objectives of the organization. They are considered to be the very essence of CA because a firm's ability to gain and preserve its profitability depends on its ability to defend its advantageous position that is related to its resources and capabilities (Carmeli, 2004).

Whereas resources usually are considered to be finite in supply and to diminish in value when shared with other parties, capabilities refer to the dynamic, non-finite, firm-specific and path dependent processes that are not obtainable in the market place, are difficult to copy, and are accumulated through long-term, continuous learning (Spanos and Prastacos, 2004). Hence, capabilities are seen as the ability to coordinate and deploy resources in order to achieve the firm's goals (McKelvie, Davidsson, 2009). This implies that while resources seldom lead to performance differences on their own, the application of resources (i.e. capabilities) is what causes performance differences. Capabilities are defined as complex bundles of skills and accumulated knowledge that enable firms to coordinate activities and make use of their assets (Day, 1994). Every business develops its own configuration of capabilities that is rooted in the realities of its competitive market, past commitments and anticipated requirements (Song and Benedetto, 2007). The resource-based view (RBV) of the firm explains how firms allocate their scarce resources to obtain and exploit competitive capabilities. Therefore, the firm that has the resources and abilities to put its capabilities to best use, and that invests in capabilities that complement the existing capability structure will be able to exploit its distinctive competences (Song and Benedetto, 2007).

Capabilities may enhance competitive advantage by preventing imitation. Organizational capabilities may be defined as the ability of a company to create and develop differentiating features and advantageous internal processes and structures (Lado and Wilson, 1994). To create economic value, sustain competitive advantage and achieve superior organizational performance, an organization requires a wide range of capabilities. Organizational capabilities can be grouped according to their orientation. One classification of organizational

capabilities is given as a set of dynamic capabilities, namely idea generation capabilities, market disruptiveness capabilities, new product development and new process development capabilities (McKelvie, Davidsson, 2009). In another study, Song and his colleagues (2007) focus on four capabilities; technology, IT, market-linking and marketing capabilities. Another classification of organizational capabilities focuses on managerial capabilities, technical capabilities and output-based capabilities (Turner and Crawford, 1994). In our study we operationalize this classification of capabilities which are given as managerial, technical and output based capabilities in order to test the hypotheses given in the research model investigating relationships between core employee characteristics, organizational capabilities and firm performance.

Human Capability and Key Employees

Development of human capital consistently enables superior performance (Gimeno et.al., 1997). Firms which attract highly educated and/or highly skilled workers, provide skill-development and cross-training develop difficult to trade and imitate, scarce and appropriable specialized human capital assets (Amit and Shoemaker, 1993). Attracting and retaining high-quality personnel is considered a critical innovation strategy, particularly for high-tech firms (Branzei and Vertinsky, 2006).

The HR component of organizational capabilities usually includes the knowledge, expertise, talents, creativity, and skills of a firm's personnel. The RBV asserts that the unique skills and experiences of internally-based personnel can give the firm a competitive advantage. This can be achieved by recruiting, and maintaining a well-trained labor force and managers whose knowledge, skills and abilities serve as a source of innovation (Zahra and Nielsen, 2002).

Employee human capital of the firm refers to the knowledge, skills and abilities that employees possess and use in their work. Studies of employee human capital have found direct positive effects on firm performance (McKelvie and Davidsson, 2009). Empirical studies have examined the role of employees as an enabling factor which allows the firm to acquire and apply new knowledge (Celuch et al., 2002) to allow other resources and capabilities to be developed fully (Ranft and Lord, 2002). Therefore, firms should base employment sourcing decisions on the degree to which skills contribute to the core capabilities of the firm. The resource-based perspective encourages a shift toward the employee skills and their relative contribution to value creation. This theory suggests that core employee skills should be developed and maintained internally specifically based on value-creating potential and uniqueness of employees (Lepak and Snell, 1999).

The Value of Human Capital

If a resource or capability yields the potential to enable a firm to reduce costs and/or respond to environmental opportunities and threats, it is valuable, and to the extent that a firm is able to effectively deploy such a resource it will attain competitive advantage (Barney, 1991). Employee skills as core assets are vital and often require continual internal development. A core employee can be considered to be the worker who is specifying the core activity in the firm and performs the organization's base operations related to making the product or providing the service (Lopez-Cabrales et al., 2006). These skills must somehow contribute toward consumer-based perceptions of value. Thus employees can add value if they can help firms offer lower costs or provide increased benefits to consumers (Lepak and Snell, 1999). Irwin et al., (1998) measure value as the degree to which the resource in question can increase customers, occupancy, and reputation and then measure the dependent variable. As such, in this study it is formally proposed that valuable core employees is positively related to firm performance.

Uniqueness of Core Employees

Employee uniqueness is defined as the extent to which a particular form of human capital is idiosyncratic to a particular firm. Human capital uniqueness can be measured with an index that includes the difficulty of replacing the employees and the difficulty that competitors would have in duplicating them (Lopez-Cabrales et al., 2006). Specifically, such practices as team-based production, and unique operational procedures that lead to enhanced social complexity, and the development of tacit knowledge will enhance the uniqueness of a firm's human capital. Because these skills often involve idiosyncratic learning processes, firms are not likely to find these skills in the open labor market (Lepak and Snell, 1999). In this study it is proposed that unique employees are positively related to firm capabilities and firm performance.

Organizational Capabilities

A great deal of theoretical work began to emerge regarding the types of processes to which resources must be subjected in order to exploit their latent value such as core capabilities, competences and organizational capabilities (Newbert, 2007). In his study, Barney (1991) argued that in addition to simply possessing valuable, rare, inimitable and unique resources, a firm also needed to be organized in such a manner that it could exploit the full potential of those resources if it was to attain a competitive advantage. He further suggested that the implementation skills that could ensure proper resource exploitation included such organizational components as structure, control systems and compensation policies. While resources are no doubt important to a firm's competitive advantage, firms need to also possess and be able to replicate routines to gain competitive advantage and maintain organizational performance. In this study, organizational capabilities are classified into three groups according to their orientations based on the research of various authors: managerial capabilities, technical capabilities and output-based capabilities (Lopez-Cabrales et al., 2006, Lado and Wilson, 1994).

Managerial Capabilities

Managerial capabilities were defined as possessing the ability to create a strategic vision and identity for the company, communicate these throughout the organization, and encourage the workforce to achieve them (Lopez-Cabrales et al., 2006). Recent theoretical developments suggest that organizational capabilities evolve over time, and several organizational and environmental levers contribute to their founding, development, maturation and alteration. Managerial decisions are acknowledged as some of the most critical antecedents of capability transformation (Helfat and Peteraf, 2003). Suitable strategic choices help firms overcome the constraints of their existing resource endowments by guiding the development of extant skills and by facilitating the emergence of new capabilities (Branzei and Vertinsky, 2006). The literature suggests four main managerial capabilities: reinforcement of the organizational culture, strategic vision, obtaining employee potential, and flexible design (Lado and Wilson, 1994). In this study, we use this classification of managerial capabilities with the above stated four dimensions.

Technical Capabilities

Technical capabilities concern the manufacturing processes, technology, new product development, production facilities in the industry. These skills are contained within the organization and are activated by market, competitor, and external challenges (Song et al., 2007). These are organizational capabilities that contribute at the time of turning inputs into outputs. They refer to the technological aspects of the creation, production, and development of products and services. The technical capability for innovation is key to carrying out new combinations of resources, methods, systems and processes to generate new products and services (Lopez-Cabrales et al., 2006). There is no shortage of literature that illustrates the importance of knowledge, and innovation for superior firm performance (Cho and Pucik, 2005). The literature also suggests that CEs with firm specific knowledge and skills contribute to technical innovation because they possess the proper set of behaviors for making improvements in current operations (Lopez-Cabrales et al., 2006).

Output-based Capabilities

A subset of capabilities in any firm involves creating physical or intangible assets that provide value to the customer. These capabilities are called output-based (Lado and Wilson, 2006). In this study, we used three organizational capabilities from the customer viewpoint: quality orientation, customer loyalty, and product diversity based upon the study of Lopez-Cabrales et al.,(2006). A good company reputation may arise from a firm's dedication to creating and delivering products or services of superior quality that may yield competitive advantage in the market. Firms also promote close relationships with customers that will in turn generate high sales and returns relative to competitors. Product diversity enables the firms to anticipate customers' needs. CEs play a critical role in developing output-based capabilities.

Firm Performance

Conceptualization and measurement of organizational performance is a thorny topic in strategy research and many different variables have been used. Organizational constructs include such variables as competitive advantage, market share, profit, costs, sales revenue and customer satisfaction. Authors classify these into two

wide categories: objective measures (such as return on assets) and perceptual measures (comparisons of self with competitors). When conducting surveys managers have been more open to offering their general views than to offering precise quantitative data (Montes et al., 2005). We tested the model using a perceptual measure of financial and operative performance in which each respondent rated his or her organization's performance relative to that of other firms in the sector.

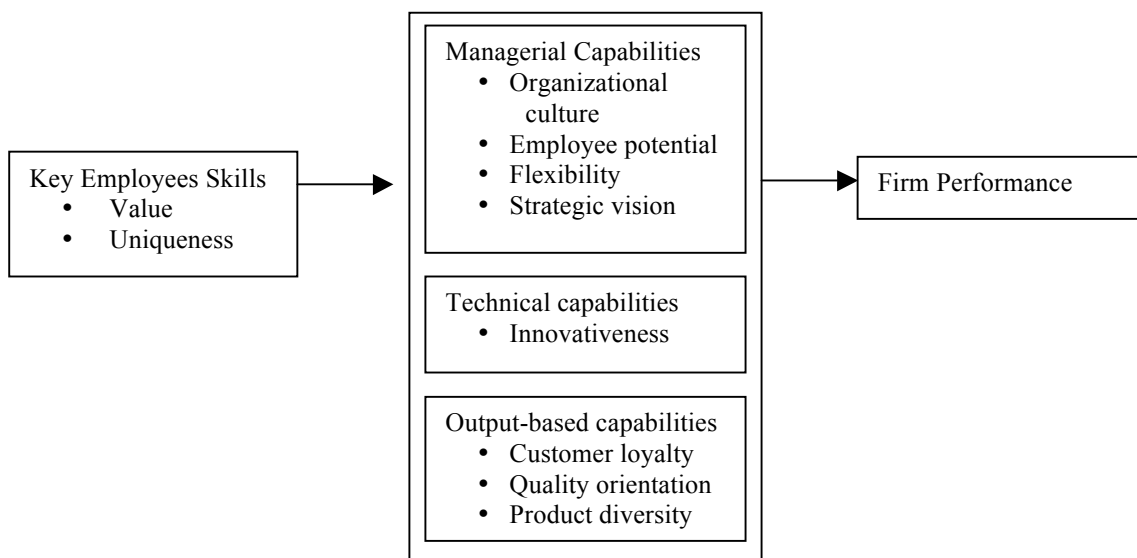

Research Methodology

Data Collection and Sample

The study employs a questionnaire survey approach to collect data for testing the validity of the model and research hypotheses. Variables in the questionnaire include key employee capability, managerial capabilities, technical capabilities, outcome based capabilities and firm performance. All dependent and independent variables are measured by seven-point Likert-type responses ranging from “strongly disagree” to “strongly agree”. The population for the study is the firms located in Gebze and Tuzla industrial zone. A list of randomly selected 300 firms has been taken as the sample for the survey. The final sample included 104 firms (34% response rate).

As for the characteristics of the final sample, the majority of the respondents were male (54,8%), and mean respondent age was 33 years old, and 64,4% of the respondents were at least college graduates.

Figure 1: The proposed model of the study

Measures

Following the distinction of previous researchers (e.g. Barney, 1991) the present study adopts two dimensions of key employee characteristics including value and uniqueness. A 12-item scale to measure uniqueness and another 13-item scale to measure value based on the work of Lopez-Cabrales et al., (2006) is used in the empirical research. Drawing upon previous researches (e.g. Newbert, 2005; McKelvie and Davidsson, 2009) this study adopts three aspects of organizational capability including managerial capabilities, technical capabilities and outcome-based capabilities. The management capability construct consists of four dimensions including organizational culture, employee potential, flexibility and strategic vision measured with 6, 6, 5 and 5 questions respectively. Technical capability is limited to innovativeness and measured with a four-item scale. Output-based capabilities construct consists of 3 dimensions, namely customer loyalty, quality orientation and product diversity measured with 5 questions each. Lastly, firm performance construct consists of 7 items to indicate the extent of perceived overall firm performance compared to that of competitors. The scale is adopted from the research study conducted by Choi and Lee(2003).

Measurement Validation

Before testing the hypotheses, we performed principal factor analysis with varimax rotation. Core employee characteristics were loaded into two factors with 52% of variance explained. We entered 22 managerial capabilities items into a separate exploratory factor analysis. The resultant factor structure clearly reflected four managerial capabilities with 70% of variance explained. The second component of capabilities namely technical capabilities was loaded into one factor. The final capability component, output-based capabilities, was measured by 14 items producing three factors as expected and 64% of the variance is explained by the three factors. Lastly, seven items measuring firm performance was loaded into one factor explaining 54% of the variance.

The internal consistency measures (Cronbach's alpha) were obtained in order to assess the reliability of the measurement instruments. The alpha reliabilities of the factors were 0.89, 0.85, 0.70, 0.72, 0.69, 0.84, 0.81, 0.70, 0.83, and 0.83 respectively. Construct reliabilities for all measures exceeded the critical value of 0,70 suggesting that the measures are highly reliable except flexibility dimension with an alpha value of 39.96% which is far below the critical value of 70% and thus flexibility is excluded from the proposed model. Examination of the patterns of item-item correlations and regression models indicate conclusions for the hypotheses in the study.

Correlation Analysis

We further studied strength of the relationships between the variables included in the research model. Results of the correlation analysis indicate that value of core employees and uniqueness of core employees are correlated with all dimensions of organizational capabilities and with firm performance with the exception of product diversity dimension at 0.05 significance level. Organizational culture is correlated with strategic vision, use of employee potential, innovation, customer loyalty and quality orientation. Strategic vision is correlated with all of the variables. Obtaining employee potential is correlated with all other variables with the exception of product diversity at 0.01 and 0.05 significance levels.

Regression Analyses Results

We performed a series of regression analysis to explore the proposed relationships in our hypotheses. In regression analyses we modeled five separate regression equations (Model 1, 2, 3, 4 and 5). In all four models within the first group of analyses, value and uniqueness constitute independent variables. On the other hand dependent variables are Managerial Capabilities in Model 1, Technical Capabilities in model 2, Output-based Capabilities in model 3 and Firm Performance in model 4 and 5. All regression models are found to be statistically significant with ($F_{\text{Model-1}}=19,769$, $p < 0.01$; $F_{\text{Model-2}}=27,066$, $p < 0.01$; $F_{\text{Model-3}}=10,604$, $p < 0.01$; $F_{\text{Model-4}}=6,204$, $p < 0.01$; $F_{\text{Model-5}}=9,823$, $p < 0.01$). Results of the regression analyses are displayed in Table 1.

Table 1. Regression Analysis

Independents	Model 1 Managerial Capabilities		Model 2 Technical Capabilities		Model 3 Output-based Capabilities		Model 4 Firm Performance		Model 5 Firm Performance	
	β	Sig.	β	Sig.	β	Sig.	β	Sig.	β	Sig.
Value	0,476	0,000*	0,519	0,000*	0,380	0,000*	0,216	0,035**	-	-
Uniqueness	0,116	0,207	0,147	0,093	0,079	0,420	0,182	0,076	-	-
Customer loyalty	-	-	-	-	-	-	-	-	0,213	0,037**
Quality orientation	-	-	-	-	-	-	-	-	-0,293	0,002*
Product diversity	-	-	-	-	-	-	-	-	0,266	0,011**
<i>F</i>	19,769		27,066		10,604		6,204		9,823	
<i>R</i> ²	0,281		0,349		0,174		0,109		0,228	
<i>Sig.</i>	0,000*		0,000*		0,000*		0,003*		0,000*	

*Significant at the level of $P < 0,01$

**Significant at the level of $P < 0,05$

In the first four models, core employee value is found to be significantly and positively associated with managerial capabilities, technical capabilities, output-based capabilities and firm performance (Model 1, $\beta=0,476$, $p < 0.01$; Model 2, $\beta=0,519$, $p < 0.01$; Model 3, $\beta=0,380$, $p < 0.01$; Model 4, $\beta=0,216$, $p < 0.05$).

In model 5, customer loyalty, quality orientation and product diversity are considered as independent variables. Dependent variable is firm performance. Customer loyalty and product diversity are found to be positively associated with firm performance ($\beta=0,213$, $p < 0.05$; $\beta=0,266$, $p < 0.05$). Whereas quality orientation is found to be negatively associated with firm performance ($\beta=-0,293$, $p < 0.01$).

Conclusions and Discussion

Human capital within an organization includes knowledge, skills, abilities and perceptions of employees which maintains firm competitiveness and performance. This research study has revealed a link between core employee characteristics, organizational capabilities and firm performance. The results of this study imply that value of core employees seem to be the key to organizational capabilities and firm performance. This suggests that the organizations should focus on valuable employees in achieving business performance outcomes.

Lopez et al., (2006) found out that core employees value and uniqueness has a significant effect on organizational capabilities. Similarly, Choe and colleagues (2006) identified a positive relationship between employee skills, organizational structure and firm performance. In their research, Gatignon and Xuereb (1997) found the impact of human skills on firm performance. Therefore, in our study we tested the hypotheses stating that valuable and unique core employees will increase firm performance.

Regression analyses held in order to test the effect of valuable core employees on firm performance revealed a significant relationship whereas no significant relationship exists for the uniqueness. This result is inconsistent with the previous research. This might be due to the inclusion of the value and uniqueness characteristics as separate dimensions into the model rather than taking the two factors as one single dimension as is the case in some research models in the literature.

As with the organizational capabilities, the results of the research indicate a positive significant relationship between value of core employees and managerial capabilities. Furthermore, valuable core employees have been found to be significantly related to technical capabilities and output based capabilities with sub dimensions of quality orientation, customer loyalty and product diversity.

Resource based view deals with the assumption that organizational resources and competencies have a direct impact on firm performance (i.e., Baker and Sinkula, 2005). In this research study, organizational capabilities have been investigated under three sub-dimensions: managerial, technical and output-based capabilities. Research results indicate that output based capabilities with its three dimensions of customer loyalty, quality orientation, and product variety have a positive impact on firm performance which is consistent with previous research (i.e., Morgan et al., 2009).

Inconsistent with previous research (i.e., Hartog and Verburg, 2004), our findings indicate that there exists no significant relationship between sub-dimensions of managerial capabilities namely organizational culture, obtaining employee potential and flexibility and firm performance. Another surprising finding is that technical capabilities taken as innovativeness also was not found to be related to firm performance.

This result, inconsistent with the previous research might stem from the use of firm performance as dependent variable. Although most of the academics and managers consider firm performance as a basic factor for firm success, it does not always seem to be true for the RBV. Companies operating in a variety of businesses might be successful in gaining competitiveness in some areas still becoming not that much successful in some other areas. Therefore, measuring overall firm performance might reveal surprising conclusions in analysing the relationships between various business processes and firm specific resources. Furthermore, the firm still having resources and capabilities for attaining competitive advantage might not become in a position to make full use of these resources (Ray et al., 2004). Another reason for inconsistency might be the time period in which the research was conducted.

During the last financial crises period, firms probably have been able to get use of human potential which have been more available in labor market than before. Hence, these effects might have been influential in explaining the stronger impact of value of core employees rather than uniqueness on organizational capabilities and firm performance.

MODERATOR EFFECTS ON HUMAN RESOURCE FLEXIBILITY AND INNOVATION

University of Zaragoza, Spain

ABSTRACT

This paper analyzes the relationship between external human resource flexibility and innovation with the moderator effects of inter-organizational technology cooperation, environmental (market) dynamism, and the use of flexible technology in Operations. We propose a conceptual model grounded on the resource-based view and dynamic capabilities of the firm that develops several research hypotheses. Logic and linear hierarchical regressions test the hypotheses with panel data in the period 2003-2006 collected from a sample of 1,626 Spanish industrial firms.

Keywords: Human Resources Flexibility; Innovation; Inter-organizational Cooperation; Market Dynamism; Flexible Technology.

INTRODUCTION

It is often claimed that innovation is one of the main factors underlying a country's international competitiveness, economic growth rate and employment performance (Stokey, 1995). Interest is increasingly focused on understanding the processes and determinants of innovation, adoption and diffusion within and between firms, industries and countries. A firm's capacity to innovate is the ability to adopt or implement new ideas, processes, or products successfully. This capacity enables the firm to respond more successfully to its environment and develop new capacities to achieve a competitive advantage and higher performance.

At the same time, global competition and expanding customer expectations creates the need for faster new product development to stay ahead from competition which requires greater combinations of innovation and flexibility. Among the factors influencing innovation, the relationship between human resource flexibility and innovation has received little attention. Human resource flexibility focuses on adapting employee attributes (such as skills or behaviours) to changing environmental conditions (Wright and Snell, 1998). This flexibility is important because it influences innovation in several ways. For instance, skill polyvalence enables employees to respond better to stimuli which have appeared previously by thinking of new ideas and introducing more products, more quickly than competitors.

However, prior research has not established consistent relationships between human resource flexibility and innovation. Whereas some theoretical perspectives and empirical research suggest the need to build and sustain committed and capable human resources, others argue that looser employment relationships could be beneficial for innovation because they would exert a discipline upon labour which counteracts complacency, and would also enable firms to gain access to external knowledge from contingent employees (Barney, 1995; Matusik and Hill, 1998; Newton, 1998; Storey et al., 2002). The failure to comprehensively analyze moderator effects could be one reason to explain these non-conclusive relationships.

The purpose and main contribution of this paper is the development of a conceptual model that links human resource flexibility and innovation with three moderator effects to reconcile prior non-conclusive findings: (1) inter-organizational cooperation in technological activities, (2) environmental (market) dynamism, and (3) the use of flexible technology in the production process. Several hypotheses are formulated and tested with panel data collected from a sample of 1,626 Spanish industrial firms in the period 2003-2006.

THEORY AND HYPOTHESES

Innovative products and processes are the ‘outgrowths’ of underlying resources and capabilities. Innovation depends not only on the firm’s ability to exploit its resources but on exploring new not yet existing or at least fully realized dynamic capabilities (Rothaermel and Hess, 2007). Capability theory (Teece et al., 1997) predicts that the firm’s ability to build and reconfigure internal and external competencies to respond to rapid changes in their environment lies at the centre of innovation. Some scholars (e.g., Wu, 2010) find that the explanatory power of the dynamic-capability view exceeds that of research-based view in volatile environments. Firms that possess dynamic capabilities can effectively enhance their competitive advantages, despite facing uncertain and turbulent environments.

Flexibility options have the potential to broaden the range of capabilities necessary to innovate. To attain the level of organizational flexibility that customers value (i.e., quick delivery of a variety of innovative, high-quality, low-cost products), firms must manage different types of flexibility. An overview of the literature reveals that the taxonomy of flexibility is very extensive, due to the fact that this concept is widely applied to different areas of the organization. This paper focuses the analysis on flexibility dimensions related to human resources and external relations because labour flexibility constitutes a platform to build other levels of flexibility (Karuppan, 2004; Upton, 1995) and because external relations are sources of knowledge that contribute to innovation.

Since the seminal contribution of Atkinson (1984) about the flexible firm, the literature distinguishes between internal and external human resource flexibility. Internal flexibility involves efforts to increase the firm’s ability to adjust to uncertainty by changing the internal labour market or work organization, whereas external flexibility uses changes in the external labour market through layoffs or temporary employees.

From the resource based view of the firm, it might be expected that emphasize secure, long-term and high-commitment-based employment policies, would be more conducive to innovation. On the contrary, flexible employment contracts, such as fixed-term contracts or external work arrangements, could damage innovation. Thus, Michie and Sheehan (2003) in a survey of 242 UK manufacturing organizations found that the use of short-term and temporary contracts was negatively correlated with all categories of innovation. Storey et al. (2002) also found that employers rarely used flexible working to achieve innovation in a large-scale survey of 2,700 UK companies.

However the increasing complexity of markets makes it difficult for firms to have all of the resources necessary to innovate. External technology sources are sometimes the only option for firms that wish to keep up-to-date. Barney (1999) has suggested that firms do not need to own all relevant capabilities to innovate, as long as they have sufficient access to them. While the capability to manage resources in the innovation process may be internal to the organization, the resources to be mobilized may be external – they are complementary assets.

This line of argument begins to suggest that even quite extensive use of flexible employment contracts may be compatible with the in-house capabilities of innovation in dynamic environments to ensure the presence of knowledge and technological resources that may be beyond existing internal capabilities. Matusik and Hill (1998) argue that contingent work, although so far mainly introduced for cost reasons, can be more positively used for the creation and accumulation of new knowledge. Externals may bring knowledge and industry best practices into a firm, and they may stimulate exploration of new processes and ideas outside the firm’s knowledge stock. For instance, Nesheim (2003) found in a sample of 26 Norwegian firms that firms in dynamic environments often use external personnel deliberately in core value-creation areas: the use of external arrangements in the core value-creation areas was positively related to innovation strategy.

There are even studies that challenge the assumption that the use of flexible employment (e.g., temporary contracts) will have negative consequences for innovation. For example, Guest et al. (1999) report that, overall, contingent workers displayed no differences in levels of motivation, organizational commitment or innovative behaviour compared with permanent employees. Indeed, the authors suggest that those on fixed term and temporary contracts, especially when they have chosen this form of employment, sometimes actually report a more positive ‘psychological contract’ and a potential higher propensity for innovation. Other scholars find positive relationships between flexible employment contracts and innovation but they suggest a different causal relationship because innovation may sometimes influence flexibility.

Prior research has established more consensus about the impact of internal human resource flexibility (e.g., functional flexibility) than about the influence of external human resource flexibility. Whereas some theoretical perspectives and empirical research suggest the need to build and sustain committed human resources with full-time and permanent contracts (Atkinson, 1984; Michie and Sheehan, 2003), others argue that looser employment relationships are beneficial to innovation (Nesheim, 2003). When properly planned and executed, firms that hire knowledge-intensive activities reduce innovation process obstacles and improve innovativeness (Huang et al., 2009). Mol et al. (2004) find that during periods of increased product innovation, firms intensify their global searching activity to obtain and combine knowledge from various specialised sources. Similarly, firms that conduct their own R&D and seek external knowledge related to their core competences can more effectively incorporate this external knowledge and use it to enhance innovativeness (Bierly et al., 2009).

Thus, firms concerned with developing innovations may acquire the services of consulting/contracting firms or universities/R&D centres. These external employees bring knowledge of occupational and industry best practices into the firm, and may stimulate exploration of ideas outside the firm's knowledge stock (Nesheim, 2003). This flexibility offers increased opportunities for potentially faster and lower-cost innovation to firms that develop their core competences and integrate outside knowledge properly. Hoecht and Trott (2006) indicate that hiring specific individuals with tightened legal contracts is a better option to benefit from external knowledge than participating in networks.

The non-conclusive findings can be explained by the absence of moderators in prior studies and because that research is mostly focused on the influence of single practices related to flexibility and on limited measures of innovation output (e.g., Arvanitis, 2005; Michie and Sheehan, 2003; Storey et al., 2002; Verdú-Jover et al., 2005). The failure to analyze moderators could explain the non-conclusive relationships between external human resource flexibility and innovation. This paper proposes a research model that links external human resource flexibility and innovation with three moderator effects to reconcile prior research: (1) inter-organizational cooperation in technological activities, (2) environmental (market) dynamism, and (3) the use of flexible technology in the manufacturing process.

Moderator effect of inter-organizational cooperation

The role of inter-organizational cooperation is important because as a firm increases interactions with other members in the supply chain, it may experience changes in its organizational flexibility. External cooperation may modify (increase or decrease) the need to be flexible internally and this could have implications for the firm's innovation performance. Firms that cooperate in new product development within the supply chain can broaden their knowledge base and contribute to diffuse innovative work practices along the supply chain. High-cooperation firms can access a broader knowledge base than low-cooperation firms, and therefore they may be more able to deploy a wider dispersion of knowledge through human resource flexibility that contributes to greater innovation performance.

Firms that combine resources can gain a competitive advantage over firms that are unable to do so, and this is viewed as one of the key benefits of inter-organizational cooperation. For instance, Baptista and Swann (1998) found that firms in clusters are more product-innovative. Gupta et al. (2000) also found that involvement of suppliers and participation in joint-venture/strategic alliances in the R&D process is greater in high-R&D effective organizations than in low R&D-effective.

Previous experiences of inter-organizational cooperation in the supply chain forge close bonds over time and increase confidence that exchange partners will pursue mutually compatible interests thereby facilitating the exchange of knowledge crucial for innovation performance. Accordingly, cooperation experience may foster supports adaptability, and deters opportunism that can positively contribute to innovation performance. Besides, inter-organizational cooperation will require the use of inter-organizational systems which other studies have demonstrated that provide flexibility in relationships with connected trading partners, improving responsiveness and other flexibility dimensions relevant to innovation (Golden and Powell, 2004).

Thus, inter-organizational cooperation may positively moderate the relationship between external human resource flexibility and innovation, which enables high-cooperation firms to benefit from external flexibility. This moderator effect could reconcile competitive results from the literature about the relationship between external flexibility and innovation. Employing contingent workers in combination with internal employees might be advantageous to upgrade the firm's knowledge stock. External from inter-organizational cooperation activities may also bring knowledge of occupational and industry best practices into a firm, and stimulate exploration of new processes and ideas outside the firm's knowledge stock. Thus, we propose:

Hypothesis H1. The firm's inter-organizational cooperation moderates positively the relationship between external flexibility and innovation performance.

Moderator effect of environmental dynamism

Environmental dynamism describes the rate and unpredictability of change in a firm's external environment. Dynamic environments are characterized by changes in technologies, and variations in customer preferences and product demand. In less dynamic environments, firms might efficiently fit their human resources with the demands of the competitive environment, by developing a human capital pool with a narrow range of skills. However, when the firm's operating environment is highly dynamic, previously developed capabilities may not be able to keep up with the frequent changes in technological conditions. The misfit between a firm's existing capabilities and the firm's operational environment may be mitigated if the firm can explore new areas and build new capabilities. Firms engaging in continuous exploration of knowledge are likely to have technical groups with varied perspectives and are then better able to reframe problems and overcome competitive traps when the environment demands organizational change (Wang and Li, 2008).

Firms in highly dynamic environments may also need more access to relevant external knowledge than firms in more stable environments. These externals may bring knowledge of occupational and industry best practices into the firm (Nesheim, 2003). External knowledge may leverage the internal stock of knowledge to develop innovations in order to overcome greater environmental uncertainty. At the same time, firms in highly dynamic environments may need to enhance the in-house dispersion of knowledge and the deployment of employees' skills through core innovation activities. Thus, we propose that external flexibility and innovation is more positively related in highly dynamic markets than in low-dynamic markets.

Hypothesis H2. The firm's environmental dynamism moderates positively the relationship between external flexibility and innovation performance.

Moderator effect of level of flexible technology in Operations

We also propose a positive moderator effect in the flexibility-innovation relationship of the level of flexible technology in the production process. Flexible production environments need more deployment and access to knowledge than traditional production environments in order to accommodate changes in the business environment and the increasingly demanding needs of well-informed customers. Flexible production technologies also require the use of flexible employment to accommodate changes in production and market demand enabled by increasing levels of flexibility in production technology. The development and implementation of flexible production technologies may need as well the access to external experts and consultants on the technological activities required to carry out such projects.

Hypothesis H3. The firm's level of flexible technology in the production process moderates positively the relationship between external flexibility and innovation performance.

METHODS

In order to test these hypotheses, we conducted an empirical study on Spanish industrial firms. We use the Survey of Business Strategies (SBS) questionnaire which contains a set of statements that permit the study of human resources and innovation for a great number of Spanish industrial firms. The SBS is an annual survey conducted by the SEPI Foundation (The SEPI Foundation is responsible for the survey design and control through the Economic Research programme) in collaboration with the Spanish Ministry of Industry with the objective of knowing the evolution of the characteristics and strategies of Spanish industrial firms. This survey contains information about markets, customers, products, employment, technological activities and economic-financial data of the firms. The reference population comprises industrial firms operating in Spain and with more than 10 employees, with representativeness being one of its characteristics. We develop a database with panel data from 1,626 industrial firms in the period 2003-2006.

The research hypotheses were tested through hierarchical regression analysis: we entered the control variables in the first step, the 'main effects' in the second step, and then the three interaction terms (cross products) in the next three consecutive steps. To reduce the potential negative effect of multicollinearity after introducing

interaction terms of moderator variables, we used Lance's (1988) residual centering technique to control this problem.

The dependent variable in the study is innovation performance at the firm level. We use three variables to run two logistic regressions and one linear regression: product innovation (dummy), process innovation (dummy), and number of granted patents. The independent variables are three measures of external flexibility: the percentage of temporary employees in the workforce, the use of R&D external employees from technology centres/contracting firms (dummy), and the outsourcing of R&D activities (dummy).

The three moderator variables are: inter-organizational cooperation in technological activities with customers, competitors, suppliers and R&D centres (categorical variable from 0 to 4), market dynamism (index of change in the marketplace), and flexible production technology (use of flexible production technologies – categorical variable from 0 to 6 that takes into account the number of flexible technologies implemented in the production process: robots, flexible manufacturing systems,...).

The regression analysis controls for: firm size (logarithm of number of employees), R&D effort (percentage of employees in the workforce), export-intensity (percentage of sales exported), the percentage of foreign capital, identity between firm ownership and control (dummy), firm age (number of years), and industry

RESULTS

Table 1 shows the results from the three regressions. The first model is a logistic regression for product innovation. Several control variables explain if the firm has developed a product innovation. Firm size, R&D effort, and firm ownership-control identity are positively related to product innovation. The industry is also significant. Regarding the independent variables, the percentage of temporary employment is negatively related to product innovation ($\beta = -1.569$; $p < 0.01$), whereas the use of R&D external employment ($\beta = 1.517$; $p < 0.01$) and R&D outsourcing ($\beta = 0.783$; $p < 0.01$) are positively related to product innovation.

There are three moderator effects analyzed in the logistic regression of product innovation. The first moderator is inter-organizational technology cooperation that is positively related to product innovation ($\beta = 0.796$; $p < 0.01$) which indicates that technological cooperation moderates partially the relationship of the independent variables. Thus, inter-organizational technology cooperation moderates negatively the relationship between R&D external employment and product innovation ($\beta = -0.333$; $p < 0.01$), as well as between R&D outsourcing and product innovation ($\beta = -0.155$; $p < 0.01$).

The second moderator of product innovation is market dynamism that is marginally related to product innovation ($\beta = 0.005$; $p < 0.1$). There is only one significant for R&D outsourcing and product innovation ($\beta = -0.002$; $p < 0.05$) that indicates a negative moderator effect. The other two dimensions of external flexibility are not moderated by market dynamism.

The third and last moderator in the logistic model of product innovation is the use of flexible production technology that is positively related to product innovation ($\beta = 0.124$; $p < 0.05$) which indicates that flexible technology moderates partially the relationship of the independent variables. Temporary employment is positively moderated by flexible production technology ($\beta = 0.349$; $p < 0.05$), whereas R&D outsourcing is negatively moderated ($\beta = -0.039$; $p < 0.05$).

The second logistic model of Table 1 explains process innovation. Firm size and firm ownership-control identity are positively related to process innovation. The industry is also significant. Regarding the independent variables, the percentage of temporary employment is marginally related to process innovation ($\beta = -0.874$; $p < 0.1$), whereas the use of R&D external employment ($\beta = 1.138$; $p < 0.01$) and R&D outsourcing ($\beta = 0.450$; $p < 0.01$) are positively related to process innovation.

The first moderator in the logistic model of process innovation -inter-organizational technology cooperation- is positively related to process innovation ($\beta = 0.592$; $p < 0.01$) which indicates that technological cooperation moderates partially the relationship of the independent variables. There is only one significant and negative moderator effect for R&D outsourcing and process innovation ($\beta = -0.094$; $p < 0.01$).

The second moderator of process innovation is market dynamism that is positively related to process innovation ($\beta = 0.010$; $p < 0.01$) which indicates that market dynamism moderates partially the relationship of the

independent variables. There are two significant moderator effects: a positive moderator for temporary employment ($\beta = 0.019$; $p < 0.01$) and a negative moderator for R&D outsourcing ($\beta = -0.002$; $p < 0.01$).

The third moderator in the logit model of process innovation is the use of flexible production technology that is positively related to process innovation ($\beta = 0.210$; $p < 0.01$) which indicates that flexible technology moderates partially the relationship of the independent variables. There is only a marginal moderator effect on the relationship between temporary employment and process innovation ($\beta = 0.233$; $p < 0.1$). The other two dimensions of external flexibility are not moderated by flexible production technology.

The last regression in Table 1 is a linear regression of patenting (number of patents) as a proxy of innovation performance. Firm size and R&D effort are control variables positively related to patenting whereas the percentage of foreign capital is negatively related. Regarding the independent variables, the use of R&D external employment ($\beta = -0.334$; $p < 0.01$) and R&D outsourcing ($\beta = -0.121$; $p < 0.01$) are negatively related to patenting.

The first moderator -inter-organizational technology cooperation- is negatively related to patenting ($\beta = -0.129$; $p < 0.01$) which indicates that technological cooperation moderates partially the relationship of the independent variables. Thus, inter-organizational technology cooperation moderates negatively the relationship between temporary employment and patenting ($\beta = -0.050$; $p < 0.01$), and moderates positively the relationship between R&D outsourcing and patenting ($\beta = 0.142$; $p < 0.01$).

The second moderator of patenting is market dynamism that is not significantly related which indicates that market dynamism fully moderates the relationship of the independent variables. There are significant and positive moderator effects for R&D external employment ($\beta = 0.225$; $p < 0.01$) and R&D outsourcing ($\beta = 0.072$; $p < 0.05$).

The third and last moderator in the linear model of patenting is the use of flexible production technology that is negatively marginally related to patenting ($\beta = -0.049$; $p < 0.1$). There is a marginally negative moderator effect on the relationship between temporary employment and patenting ($\beta = -0.041$; $p < 0.1$). The other two dimensions of external flexibility are positively moderated by flexible production technology: R&D external employment ($\beta = 0.300$; $p < 0.01$) and R&D outsourcing ($\beta = 0.135$; $p < 0.01$).

DISCUSSION AND CONCLUSIONS

This empirical research to a sample of 1,626 Spanish industrial firms finds that the percentage of temporary employment in the workforce is negatively related to product and process innovation at the firm level, whereas R&D outsourcing and the use of R&D external consultants and experts are positively related to both product and process innovation. However, the number of patents obtained from these innovation activities is negatively related to R&D outsourcing and R&D external experts.

These results indicate that we have to differentiate between the influence of external flexibility on the decision to innovate (dummy variables of product and process innovation), and on the intensity of innovation measured by a variable like the number of patents. Thus, firms with greater percentages of temporary employment have less probability to obtain product and process innovation. On the contrary, the access to external knowledge through R&D individual experts or outsourcing activities may positively contribute to a successful product or process innovation. However, the analysis of patenting indicates that external workplace flexibility is not beneficial to a higher intensity of innovation: firms with fewer patents have more access to R&D outsourcing and R&D external experts than firms that generate more patents as innovation output.

Therefore, we can deduct relevant managerial implications when we take into account moderator effects like those studied here that contribute to analyze the different impact of external workplace flexibility on innovation performance. First, the influence of inter-organizational technological cooperation compensates the influence, either positive or negative, of external workplace flexibility on the three studied measures of innovation output. Thus, there is a less positive effect of R&D external experts and R&D outsourcing on innovation in highly cooperative firms than in less cooperative firms. Inter-organizational cooperation in technological activities can be interpreted as a substitute for contractual access to external technological knowledge through R&D outsourcing and consultants. At the same time, the negative impact on patenting of R&D consultants and outsourcing is less important in highly cooperative firms than in low-cooperative firms which supports hypothesis H1. Inter-organizational cooperation may leverage the use of external work arrangements and R&D outsourcing to facilitate the creation and dissemination of knowledge that contributes to patenting. To benefit

from external relations, cooperative rather than adversarial relations in external transactions should be sought when the level of core-related change is high. As the cooperative relationship develops, the persons brought in may be given more vital tasks closer to the core of the firm. In combination with employees and internal competence, the firm's innovative capabilities may be strengthened. Thus, high-cooperation firms that use more external flexibility practices could develop more innovations faster and cheaper.

The second moderator effect of market dynamism positively moderates the relationship between R&D consultants/outsourcing and patenting which supports hypothesis H2. Firms in highly dynamic environments may benefit more from this external flexibility than firms in low-dynamic environments. Environmental dynamism may enhance the need to access relevant external knowledge, as well as the internal dispersion and deployment of knowledge through employees' skills and abilities. This external flexibility may contribute to the firm's patenting by enhancing the stock of knowledge and its flow through core employees towards innovation. However, the positive contribution of R&D outsourcing to a successful product or process innovation is less important in highly dynamic environments than in low-dynamic environments. This result indicates that low-dynamic environments are less uncertain to develop innovations with the support of external sources of technology, whereas firms in highly dynamic environments may be less reluctant to outsource R&D activities.

Finally, the third moderator effect is the level of flexible technology in the firm's production process. Flexible production technology moderates positively the relationship between temporary employment and product and process innovation which supports hypothesis H3. There is less probability to innovate in firms with larger percentages of temporary employment than in firms with lower temporary employment. However, when there is a greater use of flexible technologies in the production process, firms may benefit more from temporary employment than in more rigid production environments.

However, flexible production technology negatively moderates the relationship between outsourcing R&D activities and product and process innovation. This means that firms with less flexible production systems can benefit more from R&D outsourcing than firms with highly flexible production processes. This external workplace flexibility may help compensate the less dynamic internal environment that contributes to the deployment of knowledge through flexible processes. On the contrary, flexible production technology positively moderates the relationship between R&D consultants/outsourcing and patenting. Firms in highly flexible production environments may patent more intensively when outsource technological activities and have access to the best industrial practices through external experts. Flexible production technologies may enhance the need to access relevant external knowledge, as well as the internal dispersion and deployment of knowledge through employees' skills and abilities. This external flexibility may contribute to the firm's patenting by enhancing the stock of knowledge and its flow through core employees towards innovation.

The results reported and commented so far indicate that it is important to differentiate even further the implications of moderator effects on the impact of external human resource flexibility dimensions on firm performance. Our research suggests that future studies should separately formulate hypotheses for each dimension of external flexibility. It should also be necessary to differentiate among several dimensions of innovation performance, at least for dimensions focused on the decision to innovate and for dimensions that measure quantitative outputs of innovation.

Future studies could also extend the group of moderator effects that may influence the relationship between external human resource flexibility and firm performance. For instance, the level of product innovativeness may also be relevant. When an innovation is less familiar, a project team may require more face-to-face communication as opposed to that involved in more familiar tasks and smaller changes which would reinforce the positive impact of functional flexibility on innovation performance but it would reinforce the negative impact of external flexibility as well. Another extension could be to enlarge the moderator dimension of inter-organizational cooperation activities to include network measures like the intensity or formalization of the firm's relations with the other organizations in the supply chain.

ACKNOWLEDGEMENT

The authors greatly appreciate the financial support of the Spanish Ministry of Science and Innovation (Grant SEJ2007-62964/ECON), and the access to the Survey of Business Strategies provided by the SEPI Foundation and the Spanish Ministry of Industry.

THE IMPORTANCE OF PEOPLE CAPABILITY MATURITY MODEL IN A STRATEGIC APPROACH IN HUMAN RESOURCE MANAGEMENT AND BUSINESS EXCELLENCE

Hessam Zandhessami
Shahrzad Alijani
Zeinab Molaei
Ghazaleh Goudarzi
Qazvin Islamic Azad University, Iran

ABSTRACT

Nowadays quality management and Excellency is one of the important topics that are discussed in most organizations. There is no doubt that organization's success in achieving premier quality and organizational excellence is depended on innovative, expert and motivated human resources. With a strategic perspective it is possible to predict that establishing such a property wouldn't accessible without a continuous and integrated programming. Excellence in each organization is directly linked to its human resource excellence and top management can prepare growth and development situation for this valuable possession. Thus standardizing human resource management system at national and organizational level is a rational key to effective and efficient managing. In this people human capability maturity model was introduced, meanwhile the model dimensions and process area were explained as well as model importance in industrial organizations was analysed considering to group decision making and expert verdict technique. As a result, an integrated model of development and change will helps organizations managers to preparing business excellence.

Keyword: P-CMM, maturity model, human resource development, key process area

1) INTRODUCTION

Best workforce practices which lead to profits, sales, earnings, and dividends growth are usually considered to be integral to a total quality management (TQM) program, and are included as criteria in the Malcolm Baldrige National Quality Award (Commerce, 95). Nevertheless, most software organizations have improved their workforce practices with the help of the Capability Maturity ModelSM for Software (CMMSM) (Paulk, 95). These improvements have resulted in improved productivity, quality, and time to market (Herbsleb, 94). Even so, many of these organizations have discovered that their continued improvement requires significant changes in managing people, changes that are not fully accounted for in the CMM for Software. To date, most improvement programs for software organizations have emphasized process or technology, not people (Curtis, Hefley, Miller, 2001). Despite the importance of talent, human resources and other workforce practices in many organizations are often ad hoc and inconsistent, and software managers are insufficiently trained in performing them. Consequently, managers often expect their human resources departments to be responsible for the administration of most people-related practices. Compounding the problem, these practices are often applied with little analysis of their impact. In many cases, even when software organizations are aware of the problem and want to include people-related activities in their improvement programs, they don't know where or how to begin (Curtis, Hefley, Miller, 2001).

2) LITERATURE REVIEW

2.1) Evolution of human resource approaches

As people are one of a major factor in organizations, without them there would be no structure and identity of organizations. Thus there are several roles and approaches in human resource management which is illustrated in figure1.

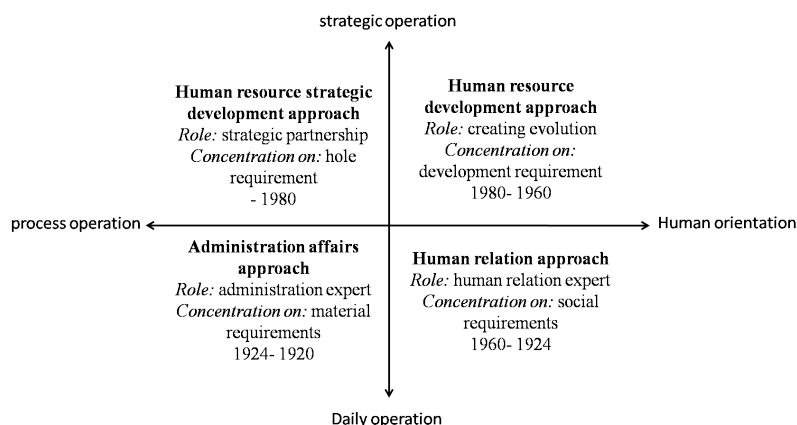

Figure1: Evolution of human resource approaches model

2.1.1) Administrative affairs approach:

This approach is discussed by focusing on daily operations and process orientation. It has mentioned organization by maintaining current situation sight and the only process in this approach is compensation process. Structural presentation of this approach is administrative affairs department in organizations which is only a documentation department.

2.1.2) Human resource approach:

This approach is discussed by conforming on human and daily operation. It supplies social requirements by crossing over material needs. Structural presentation of this approach is personnel relation or human resource observation department and its process presentation are job satisfaction, personnel moral and etc.

2.1.3) Human resource development approach:

This approach is concentrating on identifying and developing human capabilities by emphasizing on human orientation and strategic orientation. Elements of HRD are learning, altering and development. Structural presentation of that department is human resource development and its process presentation include; team learning, competencies design, management assessing center, exchanging learning, knowledge management, university institute and information technology.

2.1.4) Strategic human resource development approach:

If there is a link between all human resource processes and organization strategic orientations, strategic human resource development approach will discussed. This approach is a pattern or people adoption method based on some purposeful and defined practices in order to achieve strategic orientations and organizational performance increment. Structural presentation of this approach is excellence human resource committee or human resource department and its process representation is strategic human resource programming, human resource strategies and all previous approaches processes. Such this approach in human resource administration is developing organization capabilities based on strategic orientations in order to achieve competency advantage and value added for organization.

Figure2: Strategic value chain (Qafarian, Emadzadeh, 2005)

2.2) Definition of the P-CMM Maturity Levels

People capability maturity model guides organizations in establishing and improving their workforce practices through five evolutionary stages. Achieving each maturity level in the P-CMM transforms new capabilities for developing the knowledge and skills of the workforce, resulting in an overall increase in the talent of the organization. Maturity levels alter working culture through people development. Each maturity level provides a layer in the foundation for continuous improvement of an organization's workforce practices. In maturing from the Initial to the Repeatable level, the organization installs the discipline of performing the basic practices. In maturing to the Defined level, these practices are tailored to enhance the particular knowledge, skills, and work methods that best support the organization's business. In maturing to the Managed level, the organization develops competency-based, high-performance teams and empirically evaluates how effectively its workforce practices are meeting objectives. In maturing to the Optimizing level, the organization looks continually for innovative ways to improve its workforce capability and to support individuals in their pursuit of professional excellence (Curtis, Hefley, Miller, 2001).

2.2.1) Level 1 - The Initial Level

At the Initial level, the performance of workforce activities is inconsistent. The organization typically provides forms for activities such as performance appraisals or position requisitions, but offers little guidance or training in conducting the activities supported by these forms.

Typically managers have not been trained in performing most of their workforce responsibilities, so their ability to manage those who report to them is based on previous experience and their personal "people skills."

These organizations are not necessarily abusive or inconsiderate. Their problem is that they do not have the ability to systematically develop the competitive capability of their workforce.

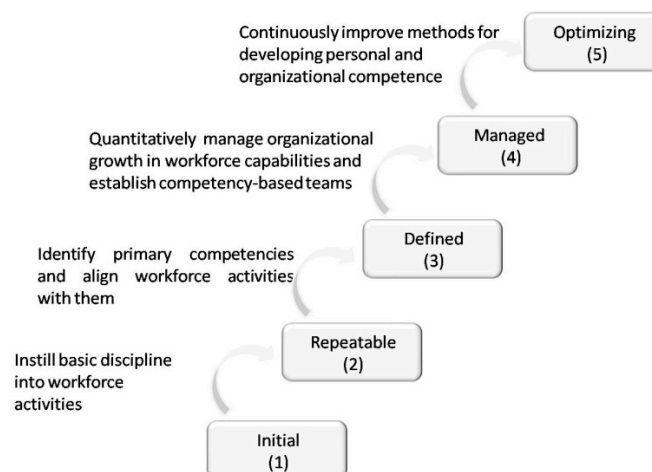

Figure3: P- CMM levels (Curtis, Hefley, Miller, 2001)

2.2.2) Level 2 - The Repeatable Level

The primary objectives at the Repeatable level are to eliminate problems that keep people from being able to perform their work responsibilities effectively and to establish a foundation of workforce practices that can be continuously improved in developing the workforce. The most frequent problems that keep people from being able to perform effectively in low maturity organizations include

- environmental distractions
- unclear performance objectives

- lack of relevant knowledge or skill
- poor communication

In maturing to the Repeatable level, an organization establishes policies that commit it to developing its people. A primary objective in achieving a repeatable capability is to establish a sense of responsibility and discipline in performing basic workforce practices. These practices ensure that the people in each unit will have the knowledge and skills required to perform their current assignment. When these practices are institutionalized, the organization has laid a foundation on which it can build improved methods and practices.

At the Repeatable level, those who have been assigned responsibility for performing workforce activities accept personal responsibility for ensuring that all workforce practices are implemented effectively. In doing so, they accept the growth and development of their staff as a primary responsibility of their position. When people take their workforce responsibilities seriously, they begin to develop repeatable methods for performing specific activities such as interviewing or establishing performance criteria. Individuals will notice greater consistency in the performance of workforce functions within their group, although different managers or groups may have individual variations in the specific methods they use (Curtis, Hefley, Miller, 2001).

2.2.3) Level 3 - The Defined Level

Organizations at the Repeatable level find that although they are performing basic workforce practices, there is inconsistency in how these practices are performed across units. The organization is not capitalizing on opportunities to standardize its best workforce practices, because it has not identified the common knowledge and skills needed across its units and the best practices to be used for developing them. The organization is motivated to achieve the Defined level in order to gain a strategic competitive advantage from its core competencies.

At the Defined level, the organization begins to adapt its workforce practices to the specific nature of its business. By analyzing the skills required by its workforce and the business functions they perform, the organization identifies the core competencies required to perform its business. The organization then adapts its workforce practices to develop the specific knowledge and skills that compose these core competencies.

A common organizational culture can develop at the Defined level, because the organization becomes focused on developing and rewarding a set of core competencies. This culture places importance on growing the organization's capability in its core competencies, and the entire workforce begins sharing responsibility for this growth (Curtis, Hefley, Miller, 2001).

2.2.4) Level 4 - The Managed Level

Organizations at the Defined level have established the foundation for continuously improving their workforce. At the Managed level, the organization takes the first steps in capitalizing on managing its core competencies as a strategic advantage. It sets quantitative objectives for growth in core competencies and for the alignment of performance across the individual, team, unit, and organizational levels. These measures establish the quantitative foundation for evaluating trends in the capability of the organization's workforce. Further, it seeks to maximize the effectiveness of applying these competencies by developing teams that integrate complementary knowledge and skills.

At the Managed level, high-performance teams composed of people with complementary knowledge and skills are developed where conditions support their functioning. Team-building activities are performed to improve the effectiveness of these teams. When applied to teams, workforce practices are tailored to support team development and performance.

Mentors are made available to both individuals and teams. Mentors use their experience to provide personal support, guidance, and some skill development. Mentors also provide another way to retain and disseminate lessons learned across the organization (Curtis, Hefley, Miller, 2001).

2.2.5) Level 5 - The Optimizing Level

At the Optimizing level, there is a continuous focus on improving individual competencies and finding innovative ways to improve workforce motivation and capability. The organization supports individuals' effort toward continuous development of personal competencies. Coaches are provided to support further development of personal or team competencies.

Data on the effectiveness of workforce practices are used to identify needs for innovative workforce practices or technologies. Innovative practices and technologies are evaluated and the most promising are used in exploratory trials. Successful innovations are then transferred into use throughout the organization.

The culture created in an Optimizing organization is one in which all members of the workforce are striving to improve their own, their team's, and their unit's knowledge, skills, and motivation in order to improve the

organization's overall performance. The workforce practices are honed to create a culture of performance excellence (Curtis, Hefley, Miller, 2001).

2.3) The Key Process Areas of the P-CMM

Figure 4 displays the key process areas for each of the five maturity levels in the P-CMM. Each *key process area* (KPA) identifies a cluster of related activities that, when performed collectively, achieve a set of goals considered important for enhancing workforce capability. Key process areas have been defined to reside at a single maturity level.

Key process areas identify the capabilities that must be institutionalized to achieve a maturity level. They describe the practices that an organization should implement to improve its workforce capability (Curtis, Hefley, Miller, 2001).

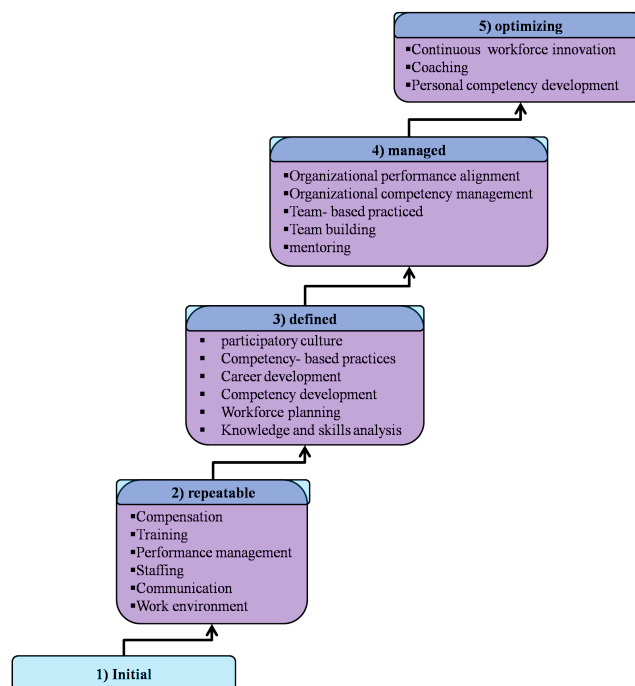

Figure4: the Key Process Areas of the P-CMM by Maturity Level (Curtis, Hefley, Miller, 2001)

2.3.1) Key Process Areas at the Repeatable Level

The key process areas at the Repeatable level focus on establishing basic workforce practices and eliminating problems that hinder work performance. Descriptions of each of the six key process areas at

Level 2 are presented below (Curtis, Hefley, Miller, 2001):

Key Process Areas at the Repeatable Level	
Work Environment	Work Environment is designed to establish and maintain working conditions that allow individuals to concentrate on their tasks without unnecessary or inappropriate distractions. Conditions which ensure that the work environment complies with all applicable laws and regulations, improvements to enhance performance are available, impediments to performance are removed and distractions are minimized.
Communication	Communication is designed to establish a social environment that supports effective interaction and to ensure that the workforce has the skills to share information and coordinate their activities efficiently. Communication involves establishing effective top-down and bottom-up communication mechanisms

	within the organization, and ensuring that all individuals have the necessary communications skills to perform their tasks, coordinate effectively, conduct meetings efficiently, and resolve problems.
Staffing	Staffing is designed to establish and use a formal process by which talent is recruited, selected, and transitioned into assignments in the organization. Recruiting involves identifying the knowledge and skill requirements for open positions, motivating all individuals to seek out qualified candidates, announcing the availability of positions to likely sources of candidates, and reviewing the effectiveness of recruiting efforts. Selection involves developing a list of qualified candidates, defining a selection strategy, identifying qualified candidates, thoroughly evaluating qualified candidates, and selecting the most qualified candidate. Transitioning involves attracting selected candidates, orienting them to the organization, and ensuring their successful transition into their new positions.
Performance Management	Performance management is designed to establish objective criteria against which unit and individual performance can be measured, to provide performance feedback, and to enhance performance continuously. Performance Management involves establishing objective criteria for unit and individual performance, discussing performance regularly and identifying ways to enhance it, providing periodic feedback on performance, identifying development needs, and systematically addressing performance problems or rewarding extraordinary performance.
Training	Training is designed to ensure that all individuals have the skills required to perform their assignments. Training involves identifying the skills required to perform critical tasks, identifying training needs within each unit, and ensuring that needed training is received.
Compensation	Compensation is designed to provide all individuals with remuneration and benefits based on their contribution and value to the organization. Compensation includes developing a documented compensation strategy, developing a plan for administering compensation, and making periodic adjustments to compensation based on performance.

2.3.2) Key Process Areas at the Defined Level

The key process areas at the Defined level address organizational issues, as the organization tailors its defined workforce practices to the core competencies required by its business environment. Descriptions of each of the six key process areas for Level 3 are given below (Curtis, Hefley, Miller, 2001):

Key Process Areas at the Defined Level	
Knowledge and Skills Analysis	Knowledge and Skills Analysis is designed to identify the knowledge and skills required to perform core business processes so that they may be developed and used as a basis for workforce practices. Knowledge and Skills Analysis involves identifying the business processes in which the organization must maintain competence, developing profiles of the knowledge and skills needed to perform these business functions, maintaining a knowledge and skills inventory, and identifying future knowledge and skill needs.
Workforce Planning	Workforce Planning is designed to coordinate workforce activities with current and future business needs at both the organizational and unit levels. Workforce Planning involves developing a strategic workforce plan that sets organization-wide objectives for competency development and workforce activities, and developing near-term plans to guide the workforce activities of each unit.
Competency Development	Competency Development is designed to constantly enhance the capability of the workforce to perform their assigned tasks and responsibilities. The core competencies identified in Knowledge and Skills Analysis and Workforce Planning provide the foundation for the organization's development and training program. Competency development involves establishing training and other development programs in each of the organization's core competencies. Development activities are designed to raise the level of knowledge and skill in the organization's current and anticipated core competencies.
Career Development	Career Development is designed to ensure that all individuals are motivated and are

	provided opportunities to develop new skills that enhance their ability to achieve career objectives. Career development includes discussing career options with each individual, developing a personal development plan, tracking progress against it, identifying training opportunities, and making assignments that enhance career objectives.
Competency-Based Practices	Competency-Based Practices is designed to ensure that all workforce practices are based in part on developing the knowledge and skills of the workforce. Competency-Based Practices involves recruiting against knowledge and skill needs, basing selection methods on assessing the knowledge and skills of candidates, assessing job performance against the tasks and roles assigned to the position, and basing compensation at least in part on growth in knowledge and skills.
Participatory Culture	Participatory Culture is designed to ensure a flow of information within the organization, to incorporate the knowledge of individuals into decision-making processes, and to gain their support for commitments. Establishing a participatory culture lays the foundation for building high-performance teams. Participatory Culture involves establishing effective communications among all levels of the organization, seeking input from individuals, involving individuals in making decisions and commitments, and communicating decisions to them.

2.3.3) Key Process Areas at the Managed Level

The key process areas at the Managed level focus on building competency based teams and establishing a quantitative understanding of trends in the development of knowledge and skills and in the alignment of performance across different levels of the organization. Analyses of the five key process areas at this level are highly interdependent, as described below (Curtis, Hefley, Miller, 2001):

Key Process Areas at the Managed Level	
Mentoring	Mentoring is designed to use the experience of the organization's workforce to provide personal support and guidance to other individuals or groups. This guidance can involve developing knowledge and skills, improving performance, handling difficult situations, and making career decisions. Mentoring involves setting objectives for a mentoring program, designing mentoring activities to achieve these objectives, selecting and training appropriate mentors, assigning mentors to individuals or groups, establishing mentoring relationships, and evaluating the effectiveness of the mentoring program.
Team Building	Team Building is designed to capitalize on opportunities to create teams that maximize the integration of diverse knowledge and skills to perform business functions. Team Building involves matching potential team members to the knowledge and skill requirements of the team, training all new members in team skills, defining objectives for team performance, tailoring standard processes for use by the team, and periodically reviewing team performance.
Team-Based Practices	Team-Based Practices is designed to tailor the organization's workforce practices to support the development, motivation, and functioning of teams. Team-Based Practices involves ensuring that the work environment supports team functions, setting performance criteria and reviewing team performance, involving team members in performing workforce activities, and reflecting team criteria in individual compensation decisions.
Organizational Competency Management	Organizational Competency Management is designed to increase the capability of the organization in its core competencies and to determine the effectiveness of its competency development activities in achieving specific competency growth goals. Organizational Competency Management involves setting measurable goals for growth in the organization's core competencies, defining and collecting data relevant to them, analyzing the impact of competency development activities on achieving these goals, and using the results to guide the application and improvement of competency development activities.
Organizational Performance	Organizational Performance Alignment is designed to enhance alignment of performance results at the individual, team, unit, and organizational levels with the

Alignment	appropriate goals and to quantitatively assess the effectiveness of workforce practices on achieving alignment. Organizational Performance Alignment involves setting measurable goals for aligning performance at the individual, team, unit, and organizational levels, defining the data and analyses, collecting the data, analyzing trends against objectives, acting on exceptional findings, analyzing the impact of people-related practices on performance alignment, and reporting results.
------------------	---

2.3.4) Key Process Areas at the Optimizing Level

The key process areas at the Optimizing level cover the issues that both the organization and individuals must address in implementing continuous improvements in their capability. Descriptions of each of the three key process areas for Level 5 are given below (Curtis, Hefley, Miller, 2001):

Key Process Areas at the Optimizing Level	
Personal Competency Development	Personal Competency Development is designed to provide a foundation for professional self development. Personal Competency development consists of a voluntary program for continuously improving individual work processes. This program involves developing goals and plans for personal work activities, establishing and using defined personal processes, measuring and analyzing the effectiveness of these personal processes, and implementing improvements to them.
Coaching	Coaching is designed to provide expert assistance to enhance the performance of individuals or teams. Coaches engage in close relationships with individuals or teams to guide development of skills that improve performance. Coaching involves selecting appropriate coaches, analyzing data on personal or team performance, providing guidance on methods for improving performance, and evaluating progress toward goals for improving performance.
Continuous Workforce Innovation	Continuous Workforce Innovation is designed to identify and evaluate improved workforce practices and technologies, and implement the most promising ones throughout the organization. Continuous Workforce Innovation involves establishing a mechanism for proposing improvements in workforce activities, identifying needs for new practices and technologies, surveying and evaluating innovative practices and technologies, conducting exploratory trials of new practices and technologies, and implementing the most beneficial ones across the organization.

3) METHODOLOGY

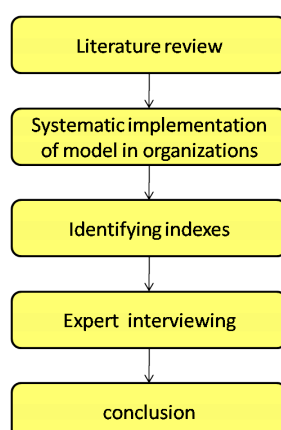

Figure5: Research methodology

In this research after reviewing the model concept and its levels, some industrial organization was selected for implementing the model. After gap analyzing and model implementation some industrial experts and clear-sighted in university who have the best knowledge about this field were chosen to identifying index for comparing the previous and current situation of organization and the main point in model implementation.

4) CONCLUSION

In many today evolutions after gap analysis and improvement project implementation, the distance to ideal and based point are depicted. Nevertheless the way by which can pass through it and how to pass a well as projects integration are ambiguous.

In maturity models, following maturity level identification and distance recognition to ideal point, projects are determined integrated and in sequence. Evolution managers and leaders can pass over the integrated and continues path by means of these modes references and guidance.

It is essential to have integrated sight in evolution and altering approach because improvement projects recommendation and cross over improvement and evolution without integrated and specified roadmap can have destroyable effects. Because without systematic approach

UNIVERSITY STUDENT'S PERCEPTIONS AND ATTITUDES ABOUT TIME USING, AND HOW TO DEAL WITH THEIR DAILY LIFE STRESS: AN INVESTIGATION FROM TURKEY

Mehmet Sariisik
Sakarya University, Turkey
Hatice Guclu Nergis
Kocaeli University, Turkey
Ozgun Ergun
Sakarya University, Turkey

ABSTRACT

This purpose of the study to investigate the attitudes, thoughts and perceptions of fulltime university graduate students at tourism management department, about time management, time using and its effects on their daily life. Participants (N=235) were the students attending the department of Tourism Management Department of three different universities. A questionnaire with 4 sections was developed by applying to past researches in order to collect data for the study. As well as analysing arithmetic mean and standard deviation, ANOVA and independent samples t-test were used to point out differences about perceptions and attitudes of students depending on their characteristics as gender and age.

The results showed that most of the students believed the importance of time, and they could manage time by themselves. On the other hand, they pointed out they weren't given any information about how to manage the time, in their schools or daily life. In additionally, results indicated that there were meaningful differences among students about time using and procrastination behaviour.

Keywords: time management, time using, time pressure, stress, students

INTRODUCTION

Time can be explained as the whole of life and is irreversible, irreplaceable and also cannot be tied down by definition or confined inside a formula. Time management is important and different for everyone. It is not only how to get more out of a person's time, but also how to use his/her time effectively. In the recent years, many researchers and academicians has been interested in this subject. Most of them have tried to explain how to use people (students, workers, etc) time effectively and what it impacts on life and stress.

Technology and also globalisation affect all the people about using their time more efficient in their private or working life. Issues of time and timing have become more and more essential to managers and employees. Especially in the last two decades, as a result of expanding global competition and increased demands for immediate availability of products and services, the temporal dimension of work has become more important (Orlikowsky and Yates, 2002). Time management has been a bigger challenge in today's world where life seems to be a speeding train that stops for no one. It refers to a range of skills, tools, and techniques utilized to accomplish specific tasks, projects and goals. It means, people need to plan, to analyse of time spent, to set goals, to organize and also to monitor, because of being successful in their business life to reduce stresses effects. In last two decades, many researchers have begun to discuss procrastination behaviour with time using. In the past researches, some of researchers argued that procrastination behaviour affected people negatively; (Owens and Newbegin 1997; Tice and Baumeister 1997) while some did positively as Chu ve Choi (2005).

Tourism is a vital and an important part of the economy. Many countries try to get more revenues from tourism and to increase their GNP by using all resources they have. The development of the tourism industry has played an important part in the economy of the world in recent years. In 2008 there were 922 million tourists travelling to foreign countries (reflecting 2% growth year on year) where they spent US\$ 944 billion, according to the World Tourist Organization. Of course, 2009 is to bring a decline in tourism due to the recession - in the first four months of the year there were 8% less people travelling around our globe in comparison to the same months

of 2008. Still, by 2010 international arrivals are estimated to reach 1.6 billion. Since tourism is essentially a service industry it is labour intensive, it is a major employer. Turkey is an important tourism country by getting 30 million tourists and about 20 billion dollars every year. And Turkey is a unique country around the world with 2% rate of growth in tourism in 2009.

Due to the characteristics of tourism, many units operate 24 hours a day and 7 days a week. It makes the time fundamental and valuable for tourism workers. It is not easy to service the guests for workers and it causes some physiological pressures as stress. Many managers try to overcome this cause by using different kinds of techniques and skills for their personnel. In addition this, many researchers try to explain how to use time efficiently in business life in their investigation.

In the globalizing world, using the time effectively and efficiently depends on the efficient management of time. With his statement about the time management, which follows as, "Time is a scarce source, if it is not managed properly, then nothing is considered to have been managed well", Peter F. Drucker emphasized the importance of time management. (Mackenzie 1985: 14, Guven ve Yesil 2004: 59).

The importance of time management and time practices have been increasing day by day and especially there is lack of studies related to time management and academic achievement (Macan et al., 1990; Britton and Tesser, 1991; Trueman and Hartley, 1996) and also student's daily life. Numerous studies have investigated what time management means and how to refer to. For instance, Adams & Jex (1999), Jex & Elacqua (1999), Davis (2000), Macan, *et al.* (1990), Macan (1996) and Mudrack (1997) have referred to time management as techniques to manage time. While Orpen (1994), Slaven & Totterdell (1993), Woolfolk & Woolfolk (1986) have explained it as a technique for effective time use, especially having enough time to accomplish the many tasks required. Time management has been referred by others as a planning and allocating time (Burt & Kemp, 1994; Francis-Smythe & Robertson, 1999); the degree to which individuals perceive their use of time to be structured and purposive (Bond & Feather, 1988; Strongman & Burt, 2000; Vodanovich & Seib, 1997); a way of getting insight into time use (Koolhaas, *et al.*, 1992); a technique to increase the time available to pursue activities (King *et al.*, 1986); time management practices intended to maximize intellectual productivity (Britton & Tesser, 1991); an application of self-regulation processes in the temporal domain (Griffiths, 2003); coping behaviour in at-risk populations (King *et al.*, 1986); self-regulation strategies aimed at discussing plans, and their efficiency (Eilam & Aharon, 2003); the use of procedures that are designed to help the individual to achieve his or her desired goals (Hall & Hirsch, 1982); ways to assess the relative importance of activities through the development of a prioritization plan (Kaufman-Scarborough & Lindquist, 1999); clusters of behavior that are deemed to facilitate productivity and alleviate stress (Lay & Schouwenburg, 1993). Some authors gave no definition at all (Barling, Kelloway, & Cheung, 1996; Simons & Galotti, 1992; Trueman & Hartley, 1996). (Claessens, *et al.*, 2004)

Today the use of time or managing time is a critical issue both for individuals and organizations. The value of time management is not control of time per se, but the ways people can use time to improve their life (Mackenzie, 1990). An individual, who cannot effectively manage time, cannot manage his professional life and daily life (Gautschi, 1988). Time is the most precious resource available to any business owner and unless it is carefully managed, nothing else can be. It is well known fact that planning promotes performance (Hassanzadeh and Ebadi, 2007). Time management makes success by reducing stress, maintaining balance, increasing productivity and also setting and trying to reach goals. From this broadened perspective, people can see that the real value of time management is that it enhances their lives in all dimensions (Alay and Kocak, 2002).

The question of why time management is a problem for people has only recently attracted the attention of researchers. In particular, economists and psychologists (Fischer, 2001; Koch & Kleinmann, 2002; O'Donoghue & Rabin, 2001) have developed theoretical arguments about why time management is difficult for many people. Most studies have only examined zero-order correlations between time management behaviours and stress-related outcomes (Jex ve Elacqua 1999: 183). As Macan (1994) showed, however, time management behaviours are related to stress-related outcomes because they enhance employees' feelings of control over time. It is also possible that engaging in time management behaviour moderates the relation between stressors and strains, although only Lang's (1992) study has examined this possibility. Many work stressors lead to an increase in time demands on employees. For example, if an employee is faced with many job demands, or if job demands are conflicting, this will likely lead to increased time pressure.

At the University level, students are regarded as adults and are assumed therefore to be capable of making appropriate decisions on time allotment and utilization (Ogonor and Nwadiani, 2006). However, research findings have shown that students in tertiary institutions particularly first timers find management of time stressful and the most difficult aspect of university life to cope with. (Oquinonez *et al.* 1997). Dipboye and Phillips (1990) showed that university students who had more sense of purpose and structure in their use of time reported greater psychological well-being and more efficient habits of study. Also, Vodanovich and Seib (1997) illustrated that procrastinators tend to have weak, if any, structure in their time use. Despite the fact that it can be

measured time, the perception of time is a truly subjective experience (Macan, 1994). Lay (1990) found passive procrastinators to underestimate the overall time that was required to complete tasks. Consequently, they often failed to complete tasks on time, triggering the perception of reduced control of time (Lay & Schouwenburg, 1993).

For example, several researchers have linked time –management skills with successful college performance, including higher achievement scores and greater maturity (Britton & Tesser, 1991; Trueman & Hartley, 1996). There have been fewer examinations of issues of time -management with students who have disabilities. Manganello (1994) stressed the importance of such skills for older students with learning disabilities and provided strategies, including use of a time-management log, to promote better skills. Sowers, Rusch, Connis, and Cummings (1980) examined the impact of training in time –management skills with three adults who had mental retardation and basic time-telling abilities, finding that these individuals could be taught to engage in independent time-management (Davies *et al*, 2002)

METHOD

As an exploratory study, this research aimed to investigate the student’s perceptions and attitudes about time using, procrastination behaviour and evaluate how procrastination’s affected them on their daily life. Based on the relevant literature, several open-ended interviews were conducted with students studying at department of Tourism Management in three universities were called Istanbul, Kocaeli and Sakarya. Based on these interviews, a survey was drafted. The survey consisted of three sections. The first section included 5-point Likert scale (1; never, to 5; always) concerning 37 items about time using and time management behaviours. The second section included also 5-point Likert scale statements about the time pressure and its effects on daily life with 9 items. The statements in those two sections were taken from Choi and Moran (2009) and Stainton and *et al*, (2000). And the last sections were concerned about the characteristics of participants. A Cronbach’s Alfa reliability of 0.85 was obtained for the questionnaire in a pilot test with 45 students in Sakarya University and based on the test results, items in each section were revised, and some of them were removed.

The sample consisted of 235 full-time undergraduate students at Tourism Management Departments of Istanbul University, Kocaeli University and Sakarya University. The sampling frame chosen was especially from upper second class. Respondents were randomly selected. The main reason of selecting upper second class students was to choose the participants who had some experiences in tourism industry as trainees or workers. Thus, they could compare themselves both in schools and in industry about their time management skills and time using affects on stress.

Of the total 270 surveys prepared and were given to the students, 254 completed questionnaire were returned, yielding a response rate of 94%. Consent for participation was obtained prior to the survey. During the 2009 Spring Semester, data was collected from undergraduate students concerning with their attitudes and perceptions related to the time management skills and also the affects of time using on stress. Input was collected completely from those universities students (Kocaeli University with 72 students and Sakarya University with 106 students and Istanbul University with 57 students, totally 235 students).

The data gathered from the university students and they were tested by spss 13.0 program. Depending upon the certain distribution of data and using 5-point Likert scales for questions, parametric tests were applied. Student t-tests and ANOVA were used to examine gender and age differences in perceptions and attitudes of students about time management and time pressures.

FINDINGS

The characteristic of the subjects is given in Table 1. Of the total number of participants 45,1 (N=235) were from Sakarya University. Among the participants, 56 percent were female and 44 percent were male respectively. The age of participants ranged from 18 to 27, and the average age was 21,3 years with 91 percent of them were between 19 and 24. 94 of them were in 3rd or 4th class.

Table 1. The Characteristics of the Subjects in the Study.

	n	%	class	n	%
sex			prep	4	1,7
female	131	55,7	1	7	3,0
male	104	44,3	2	3	1,3
Total	235	100,0	3	153	65,1
age			4	68	28,9
18 and under	5	2,1	Total	235	100,0
19-21	98	41,7	University		
22-24	115	48,9	Istanbul U.	57	24,3
25-27	15	6,4	Kocaeli U.	72	30,6
36 or older	2	0,9	Sakarya U.	106	45,1
Total	235	100,0	Total	235	100,0

It can be seen on Table 2, the beliefs and thoughts of the students about time and time management also with their behaviours about how to use time effectively. 37 items are chosen and were given to the students to rate themselves on a five-point Likert scale ranging from 1 to 5. The results were listed in the table according to the scores of them. The results indicated that items such as “I prioritize the tasks I have to do during the day according to their importance and urgency”, “I know what my time is worth”, and “I have to wait for the right mood to do creative work” were given high scores (4 or up) by the students. On the other hand, items such as “I have difficulty finishing activities once I start them”, “I make a list of tasks to accomplish each day”, and “I have a list of long range personal objectives” were seen with low average scores.

Interestingly, about a half of them (44%) determined that they didn’t make a list of tasks, 63 percent interpreted that they concentrated on one important task a time. 50% of them expressed that they had no knowledge and any systems about how to solve their time management problems. 63 percent indicated that the worth of the time in their life.

To test preference differences about time management and time using habits among participants’ demographics, independent *t-test* and *ANOVA* were performed. And results of analysis showed that there were meaningful differences about student’s perceptions and attitudes between groups in demographic. While, “I postpone things which aren't very urgent, even though they may be”, was significantly higher among female respondents, “I have a list of long range personal objectives” and “I plan for tomorrow” were higher among male ($0,05 < p$) as a results of *t-test*. *ANOVA* analysis of our survey data shows that there are meaningful differences about students thoughts such as “I concentrate on only one important task at a time”, “I keep track of the use of my time (with devices such as a time log)”, “Unnecessary socializing takes up too much of my day”, “Most people would say they are fast starters”, “I have to wait for the right mood to do creative work”, “I know when to cut my losses” and “I invest time to make time” according to their age group ($0,05 < p$)

Table 2. Student’s thoughts about the time management and their behaviours how to use their time (N=235)

Items	Mean	St.Dev.
<i>I prioritize the tasks I have to do during the day according to their importance and urgency</i>	4,02	,998
<i>I know what my time is worth</i>	4,00	1,071
<i>I have to wait for the right mood to do creative work</i>	3,97	1,207
I do things right the first time	3,86	1,019
I do complete work. I finish what I start	3,80	1,085
I keep everything in its proper place at work	3,75	1,110
I concentrate on only one important task at a time	3,66	1,014
I obtain all the facts of every situation before I make a decision	3,65	,981
I schedule some time during the day for personal time alone (for planning, meditation, prayer, exercise)	3,64	1,038
I take care of my body	3,60	1,098

I do redundant "busy work" at one set time during the day	3,59	1,031
I tend to do the quick, easy, enjoyable things first	3,58	1,092
I can find quiet, non-interrupted time whenever I need it	3,56	1,121
I can develop a high energy level quickly and maintain it a long time	3,54	1,102
I produce many of my results with and through others	3,54	1,129
I plan for tomorrow	3,49	1,095
I don't procrastinate. I do it today when it needs to be done.	3,46	1,163
Most people would say they are fast starters	3,45	1,050
I know when to cut my losses	3,37	1,064
I allow enough recovery time to maintain my energy	3,35	1,016
I limit excessive socialization during business hours	3,35	1,073
I invest time to make time	3,28	1,040
I take a period of quiet time each day for concentration and creative thinking	3,26	1,062
I don't do well if I have to rush through a task	3,23	1,078
I make appointments with myself	3,20	2,473
I use techniques to maximize the value of my commute time	3,14	1,159
I have a list of all the smaller tasks, jobs, and assignments that need to be handled over the next few weeks	3,00	1,175
I do multiple trivial tasks at once (like signing letters while talking on the phone)	2,98	1,052
I take notes and don't rely on my memory	2,95	1,188
It's usually easy for me to say "no" to other people	2,94	1,256
I postpone things which aren't very urgent, even though they may be important	2,87	1,063
In order to make better use of my time, I intentionally put off some tasks	2,86	1,142
I don't have to interrupt the time I need to spend with my family in order to get church-related work done	2,83	1,194
I make a list of tasks to accomplish each day	2,66	1,118
I have a list of long range personal objectives	2,63	1,203
I've investigated how to solve time management problem	2,58	1,179
I have difficulty finishing activities once I start them	2,56	1,136

As presented in Table 3, a half of all participants had no information about time management and 53 percent of them pointed out that no information about time management were offered them while they worked in tourism establishments. Interestingly, more than half determined that their time was related to their duties and a higher percentage (80,9%) of them expressed that they believed the importance of time management. 58 percent of them pointed out that they could arrange their time about duties.

Table 3. Participants' thoughts about time management

	n	%
Do you have any information's about time management?		
yes	115	48,9
no	119	51,1
Total	234	100,0
Have any information's about time management offered you as a part of trainee in establishments you worked in?		
yes	38	16,8
no	126	53,2
a little bit	69	30,0
Total	233	100,0
Can you arrange your time about your duties?		
yes	136	58,0
no	11	4,7
sometimes	87	37,3
Total	234	100,0
Do you believe the importance of time management?		
yes	190	80,9
no	13	5,5
no idea	32	13,6
Total	235	100,0

The overall scores (mean) and standard deviations of 9 expressions about student's thoughts towards time pressure are shown in Table 4. 35% of them didn't feel themselves on time pressure, while 27 percent did. As it can be seen from the table, many students' thoughts such as "I can make my duties at time", "I can have a break if I need" and "I can find enough time for me" are with high arithmetic mean scores. According to answers of students, it can be said that they can control their time in their daily life. ANOVA analysis of our survey data shows that there are meaningful differences ($0,05 < p$) about students thoughts such as "I can find enough time for myself" and "I can make my duties at time" depend on their age level. The age group of 21-24 had given higher scores than younger participants. More than a half (57%) expressed that they could their duties at time. And female participant's scores are higher than others. According to the results of analysis, it can be expressed that many students could manage time and didn't feel any stresses on their daily life that was caused by time pressure.

Table 4. Thoughts of students about time using and time pressures on their daily life with ANOVA results between age groups. (N=235)

I can make my duties at time	3,55	1,009	3,191	,014
I can find enough time for myself	3,47	1,091	2,936	,021
I can have a break if I need	3,47	1,022		
I don't feel myself under time pressures	3,11	1,092		
I needn't to delay my duties	3,11	1,115		
I don't feel any pressures about long working hours	3,09	1,091		
I don't think about I must work fast	3,07	1,008		
I don't feel myself that I am under heavy work pressures	3,06	1,108		
I find the working hours flexible	2,96	1,085		

CONCLUSION

The first aim of the study was to point out student's thoughts and perceptions about concept of time management, and second was to investigate how to manage their time and time pressure effects on their daily life stress. When the results of the study are considered as a whole, it is seen that time management skills haven't been completely placed at universities. However, students' thoughts and perceptions emerged positively about time management. Interestingly, most of them indicated that they knew the worth of their time and they could prioritize their tasks. According to the t-test there is no significant difference between the means of female and male students. The similar results can be seen between age groups as a result of ANOVA. On the other hand, there are significant differences between age groups on time pressures and its effects on stress, while there is no significant difference between female and male students. Female participants had lower average means than male about finding enough time while the opposite situation on making duties at time.

As a result of study, it can be said that many students weren't given any information about time management skills and how to use their time effectively. So it should be developed and implemented some special programs to increase students' awareness of time and time management skills.

THE EFFECTS OF MENTOR'S EMOTIONAL INTELLIGENCE IN RELATIONSHIP MANAGEMENT: THE EVALUATION OF LECTURERS' EMOTIONAL INTELLIGENCE'S EFFECTS

Ali Şahin Örnek
Tanju Çolakoğlu
Canakkale Onsekiz Mart University

ABSTRACT

The emotional intelligence literature is developing in these days. The applications of these studies are expanding day by day. The aim of this study is investigating the effect of emotional intelligence of leader over group member's perceptions and motivation. To prove the existence of such relation a model developed and applied over university students and academicians. The results show that some of the dimensions of Emotional Intelligence have significant effects over group member's perceptions and motivation.

Keywords: Emotional intelligence, leadership, relationship management, mentor perception, motivation.

INTRODUCTION

Contemporary studies show that emotional intelligence has the key role in understanding and satisfying the emotional expectations of the mankind. Therefore, the people having high emotional capabilities (managers, leaders, academicians etc) would be perceived positively and motivate the others (labor, team mates, students etc). With this presupposition the aim of this study is to research the relation between emotional intelligence, perception and motivation in work life. Evaluating the integration of this relation and maintaining with application results are important since these reflect the possible functionality of the subject in work life.

It's clear that managing human communities require emotional intelligence more than intelligence quotient. That's why emotional intelligence level is big factor in determining human relations. Unfortunately the need of specifying "which sectors of business needs more emotional intensity and which dimensions are required weightily for different areas of business" is still uncovered. Finding out how to obtain emotional qualifications of organization (by recruiting new members or educating the existing ones) would be easy by determining the emotional expectation of the human resources. With the perception of satisfied emotional expectations, high level of efficiency would surely be reached.

The purpose of the present study is to investigate the effects of emotional intelligence dimensions both in perception and motivation fields that may effectively be used in relationship management. To find out this we develop a model that measures both emotional intelligence and effects of emotional intelligence over perceptions and motivation.

LITERATURE REVIEW

Emotional Intelligence

As mentioned, past studies show that emotional intelligence is more effective than intelligence quotient in all kinds of human relations including management. This is the reason why recent studies focus on sub dimensions of emotional intelligence. These studies are results of different emotional needs used in relationship management in social and business life. Every firm has its unique conditions forming differentiated emotional expectations. As an emotional human resource manager or a specialized emotional labor (probably an experienced or specialized subordinate) the emotional intelligence manager needs to know required emotional intelligence qualifications in order to satisfy them.

Publilius Syrus explained the importance of emotional management by “Rule your feelings, lest your feelings rule you” statement in the first century B.C (Salovey and Mayer, 1990). The way of avoiding to be ruled by emotions is seems to be ruling emotions rationally. On the other hand Stoic philosophers accepted emotions as dangerous and unpredictable and therefore not to be trusted for a long period of time as well (Meredith 2007). Emotional intelligence term refers to the capacity of recognizing individual’s own feelings and those of others, for sustaining self motivation, managing self emotions and relationships (Goleman, 1998). Goleman, Boyatzis, and McKee (2002) claimed that having a larger repertoire of emotional intelligence strengths can make a leader more effective since it means that the leader is flexible enough to handle the wide-ranging demands of running an organization. Emotional intelligence is a key aspect to leadership effectiveness and individual and organizational success at high performing organizations (Legier Jr., 2007). The influence of Daniel Goleman’s publishing Emotional Intelligence book in 1995 over number of articles may easily notices from the figure below.

Figure: The Number of Studies about E.I. Between 1990 - 2003

<http://www.dattnerconsulting.com/presentations/ei.pdf>

Recommendations for emotional intelligence training and emotional intelligence development may be ordered as fallows (Goleman 1998):

- Assess the job,
- Assess the individual,
- Deliver assessments with care,
- Gauge readiness,
- Motivate,
- Focus on clear, manageable goals,
- Prevent relapse,
- Give performance feedback,
- Encourage practice,
- Arrange support,
- Provide models,
- Encourage,
- Reinforce change,
- Evaluate.

The actual management of the physical plant requires leadership and managerial skills, but the majority of decisions that principals make are in dealing with people, and this requires emotional intelligence skills (Spaeth, 2007). For successful leadership, emotional intelligence can be learned (Goleman, 2002). Emotional intelligence has been accepted to be a valid predictor of important outcomes such as leadership, teamwork, job performance etc. But is emotional intelligence so trustworthy predictor argument still questionable (Whitman and others 2008).

Perception

The transform of energy changes, namely stimulants in environment to nerve flux and transportation of these fluxes to brain called as sensation. Perception on the other hand is the meaning given to these sensations (Orhan 1998: 243). Perception is “the process of explaining the environmental objects and events by organizing the sense data (Şimşek et. al 2001: 85). The success of the manager depends on ability of urging subordinates realize organizational goals with their behaviors (Koçel, 1995). Every behavior of the employee has a reason, the motivation level of the employee is related with “How much organization fulfilling the needs of employee” (Ağırbaş et. Al 2005: 328).

Every behavior of an employee has a reason, the motivation level of an employee is related with the level of compensation of individual needs by organization (Ağırbaş et al. 2005: 328). It's known that the perception is not a objective concept that may differ for individuals since it has a definition like "the comments of data taken from inputs" (Şahin 2008: 27). It's also clear that emotional intelligence structures is one of the elements that creates individual differences. In modern world, everybody has clients that have perceptions to be traced (Goleman 2000: 169-203).

Motivation

Motivation is, entire operations that persuades, disposes and influence individual or people to act in a certain subject (Güney 2000: 17). The word incentive (motive), is meaning the reason of action and emotion are derived from the same origin "motore" (activate). The emotions are activating us to reach targets while incentives activate perceptions to shape our activities (Goleman 1998: 137). Motivation is manager's stimulation of employees. The modern manager have to create organizations that automatically has high levels of motivation in addition to maintaining individual motivation (Pamukoğlu 2004: 25-26). Motivation, cannot be observed directly, but through the interpretation of people's behavior it is perceived as indirectly. Each behavior is a symbol of an expression. This is why leaders have to comment the behaviors of employees and develop models that will maintain high levels of motivation (Yiğit 2002: 18). Leader have to create positive emotions (harmonize) that will uncover the best sides of people. Goleman named this as dominant leadership (Goleman 2008: 7). A study realized by Riordian, Gatewood ve Bill shows that the organizations which can manage employee perceptions about corporate reputation and the social activities of organization, will guarantee the job satisfaction and also high motivation (Özdemir 2007: 93-94). The motivation process starts with the needs that they always try to satisfy. The individual will act to reach a goal in order to obtain these needs. The manager that wants to maintain motivation needs to maintain satisfy of employees that will feel comfortable and happy by satisfaction of needs (Şahin 2004: 525).

The importance of motivation in Organizational Effectiveness

Adapted from Başaran 1991: 35

The factors effecting job satisfaction (Luthans 1995: 126):

- Job's itself,
- Wages,
- Promotion opportunities,
- Controls,
- Work team,
- Working conditions.

H1: There is a relation between emotional intelligence levels of lecturers and emotional intelligence perceptions of students.

Emotional intelligence organizes the emotional displays of leader that influences the target group. By using hierarchical linear modeling it's found out that the manager's displayed controllability of outcomes has a positive effect on the entrepreneurial motivation of employees. Confidence displayed by managers as an emotion has high importance regarding employees' willingness to act entrepreneurially (Brundin and others, 2008).

The results of sub hypothesis tests

Hypothesis (Emotional Intelligence Dimensions)	Results
H1a: Self Awareness	Confirm
H1b: Self Organizing	Deny

H1c: Individual Motivation	Deny
H1d: Social Awareness	Confirm
H1e: Social Skills	Confirm

H2: The perception of emotional intelligence of students effects their motivation as well.

Interaction between emotional intelligence and cognitive intelligence found out for organizational citizenship behavior directed at the organization (Cote & Miners, 2006). Magnus and colleagues found out a significant positive correlation between socially desirability and emotional intelligence by applying the Marlowe-Crowne scale with surveys (Magnus and others, 2006). Depending on a research based on meta-analysis of 48 studies about emotional intelligence between 1990 and 2008 years, a statistically significant relation was found between emotional intelligence and leadership effectiveness (Martin 2008).

The Relation of Emotional Intelligence Perception and Motivation Perception

Constant Value: Main Motivation Question						
		B	Standard Error	β	t	P
Constant		0,245	0,163	-	1,505	0,000
Independent Variables	Self Awareness	0,379	0,044	0,321	8,628	0,000
	Self Organizing	0,175	0,047	0,149	3,711	0,000
	Individual Motivation	0,132	0,043	0,114	3,062	0,000
	Social Awareness	0,186	0,045	0,169	4,134	0,000
	Social Skills	0,117	0,043	0,099	2,750	0,000
R= 0,614 R ² = 0,377 F= 106,931 P= 0,000 Durbin-Watson= 1,972						

The 38% of the variation in the dependent variables included in the model are described by the independent variables. Statements obtained in the other parameters of the model and associated t values are included in table. The table shows that each parameter is significant at %5 significance level.

Constant value is 0,245. The effects of the 1 unit of independent values over constant (motivation is given at table. The effect of self awareness is 0,379 unit. The effect of self organizing is 0,175 unit. The effect of individual motivation is 0,132 unit. The effect of social awareness is 0,186 unit. The effect of social skills is 0,117 unit. According to this results the most influential variable is calculated as self awareness.

METHODS

Data were collected through surveys with lecturers and students of Canakkale Onsekiz Mart University in Turkey. The sampling frame consists of randomly selected 982 students and 62 lecturers of three faculties (Faculty of Engineering and Architecture, Agriculture, Economics and Administration). As a result, the effective sample size of the study is determined as 900 students and 30 lecturers.

The constructs in our study are developed by using measurement scales adopted from prior studies. All constructs are measured using five-point Likert scales with anchors strongly disagree (= 1) and strongly agree (= 5). Items for measuring Emotional Intelligence are adopted from Bar-on Emotional Score Inventory adapted to Turkish by Gursoy (2005) and Acar (2001). Items for measuring Emotional Intelligence Perception are adopted from Yılmaz (2007) and Gondelen (2007). Emotional Intelligence scale consists of 25 items measuring the five emotional intelligence dimensions with five questions for each dimension and 5 motivation questions. The Emotional Intelligence Perception consists of 25 items measuring the perceptions about five emotional intelligence dimensions with five questions for each dimension perceptions and 5 motivation questions.

The Model of the Research: Emotional Intelligence, Motivation And Perception Interaction

THE INFLUENCE OF KEY OCCUPATIONAL STRESS SOURCES ON EMPLOYEE TURNOVER INTENTION DURING GLOBAL ECONOMIC RECESSION

Meral Elçi
Gebze Institute of Technology, Turkey

İrge Şener
Çankaya University, Turkey

ABSTRACT

This study examines the effect of the three key sources of occupational stress (work overload, role ambiguity and career concerns) on employees' intention to leave their organizations. Work overload, role ambiguity and career concerns create a vital problem for both individuals and organizations. These stressors are much more significant during economic recession times, when compared to other factors. Since, employment rate decreases during such times, workload of the remaining employees are much higher. During these times, employees undertake more work which they are not responsible of, and this creates role ambiguity. Besides, recession times are a main challenge for the companies to survive; therefore employers do not concentrate on career development of their employees. A model based on these factors was developed and tested. Data were gathered from 190 participants working in 6 different organizations in İstanbul. The study provides empirical evidence for the effects of 3 dimensions of occupational stress on turnover intentions. The results indicate that, although work overload and career concern have a positive effect on turnover intention, there exists no significant effect of job ambiguity on employees' intention to leave. These findings suggest that, indeed during the economic recession when the opportunities for changing jobs is limited, employees still wish to leave their current jobs due to the work overload and their career concerns. The findings also demonstrate a difference according to gender and position of the participants.

Keywords: Occupational stress; work overload; role ambiguity; career concerns; turnover intention

INTRODUCTION

No occupation is exempt from stress. Since stress is associated with negative consequences both for the individuals and the organizations, it became an important issue to be considered by the organizations. One of the most important consequences of occupational stress for the organizations is the employee turnover. Employees' voluntary turnover is a major problem for many organizations. Voluntary turnover incurs significant direct and indirect costs and the loss of organization's social capital (Dess and Shaw, 2001). Voluntary turnover is much more important especially during economic recession. Such recession times characterize involuntary turnover of many employees, which result in increase of workload for the employees. Besides, due to the changing conditions, role ambiguity is also uncertain. During such times, it is also difficult to develop programs for career development, so that instead of career concerns employees care about not losing their jobs. Although the lack of availability of potential jobs is low, we suggest that the turnover intention of employees is still high due to the effect of these factors.

The relation of occupational stress sources and turnover intention of employees attracted the attention of many researchers. In most of these studies, the relation of work overload, role ambiguity and career concern with the turnover intention of employees was found out to be positive. With this study, it was intended to test these relations during the economic recession time. The study was conducted just after the effects of the recession begun to be felt, both by the organizations and the employees. Our intention was to emphasize the role of the increasing stress factors during economic recession.

LITERATURE REVIEW

Topper (2007) explains stress as a person's psychological and physiological response to the perception of demand and challenge. Tehrani (2002) argued that stress is caused by unsympathetic organizational culture, poor communication between managers and employees, lack of involvement in decision-making, bullying and harassment, continual or sudden change, insufficient resources, conflicting priorities, and lack of challenges.

Occupational stress is, on the other hand, defined as the perception of a discrepancy between environmental demands (stressors) and individual capacities to fulfill these demands (Ornelas and Kleiner, 2003; Topper, 2007). Occupational stress is associated with negative consequences both for the employees and also for organizations. It often shows high dissatisfaction among the employees' job mobility, burnout, high absentee rates, low employee morale, poor work performance and less effective interpersonal relations and internal conflicts at work (Grunfeld, 2000; Manshor, Rodrigue, and Chong, 2003; Christo and Pienaar, 2006).

Occupational stress can arise from different sources. These sources can be either exogenous (those are related to occupational conditions and occupation itself) or endogenous (related to individual characteristics) (Antoniou et al, 2006). In this study, we focus on some exogenous sources, which are work overload, role ambiguity and career concern. According to Cooper and Marshall's (1976) classification, 'work overload' is a factor which is intrinsic to the job; 'role ambiguity' is related to the role in the organization and 'career concern' is a factor of career development. Other factors related to relationships at work and organizational structure and climate according to this classification were not considered in this study.

Work overload, role ambiguity and career concerns create negative work-related attitudes and represent a vital problem for both individuals and organizations. Work overload refers to too much work or work that is beyond one's capability (Locke, 1983). On the other hand, Katz and Kahn (1978) define role ambiguity as "uncertainty about what the occupant of a particular office is supposed to do" (p. 206). Role ambiguity is determined in terms of either the predictability of the outcome or responses to one's behavior, or the existence or clarity of behavioral requirements, often in terms of inputs from the environment, which would serve to guide behavior and provide knowledge that the behavior is appropriate" (Rizzo, House & Lirtzman., 1970, p. 155-56). Career concerns model developed by Holmstrom (1999) suggest that, in order to influence the market's beliefs, managers will undertake more unobservable behavior during the early stages of their careers; while more senior managers are expected to undertake less effort in the later stages of their careers since their type has already been established in the labor market.

Turnover intention is defined as a conscious and deliberate willingness to leave the organization (Tett and Meyer, 1993). Ling & Phillips (2006) consider increased working hours to be a cause of work stress and turnover intentions. The experience of job related stress and the range of factors that lead to job related stress cause the employees to quit their organizations (Firth et al, 2004).

During economic recession times, work overload is high due to lack of enough number of employees within the organization. Role ambiguity is uncertain since the conditions are unpredictable. In addition, career concerns are low due to lack of employment opportunities in other organizations and shortage of career related expenses. During economic recession times, perception of individuals of the alternative jobs availability in the organization's environment is low. However, work overload, role ambiguity and career concern still have a positive effect on their turnover intention. Within this frame, the following hypotheses are developed:

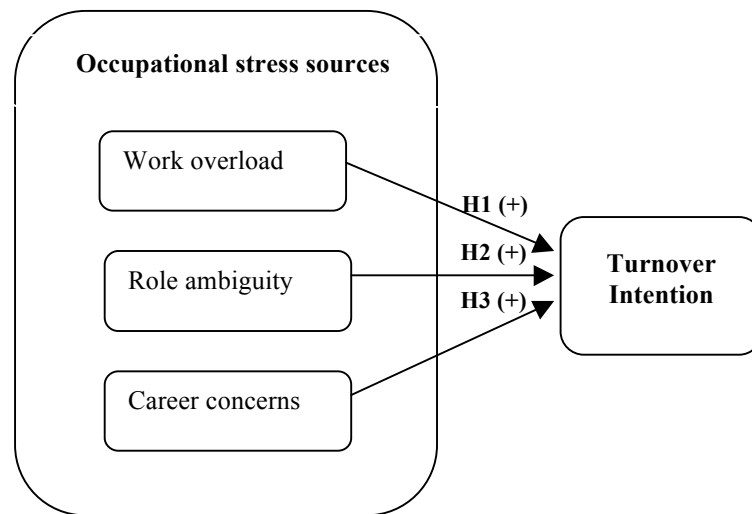

H₁: Work overload positively influences turnover intention.

H₂: Job ambiguity positively influences turnover intention.

H₃: Career concern positively influences turnover intention.

Research model is demonstrated in Figure 1. As indicated the research model is designed to exhibit the effects of work overload, role ambiguity, career concerns on turnover intention.

Figure 1: The Theoretical Model

METHODOLOGY

A questionnaire that comprised three sections was developed, which is the source of data for the study. The first part of this questionnaire included demographic questions and work related questions, such as gender, marital status, age, tenure, position and the department at which the participant is working. The second part of the questionnaire consisted of questions related to work overload, role ambiguity and career concerns. These questions were adopted from Lim and Teo (1999). While turnover intention does not measure actual turnover, research suggests that an individual's intentions to quit or stay tends to be a good predictor of turnover behavior (Mobley et al., 1978). Therefore, in order to measure the turnover intention of the participants, Mobley et al's (1979) turnover intention scale was utilized, as the final part of the questionnaire. The scale ranged from 1 (*strongly disagree*) to 5 (*strongly agree*), indicating that a higher score implies a higher turnover intention.

The sample for this study consists of 190 employees working in either domestic or foreign companies operating in manufacturing industry, producing plastics, metal and electricity equipments. The survey, which lasted for 3 months, was carried out in 6 organizations, in İstanbul and Kocaeli. Since, the population that is employed in industry is high when compared to other cities; these two cities are selected for the study. Of the 300 questionnaires sent out, 190 useable responses were obtained, representing a 63% return rate. Table 1 summarizes the demographic profile of the sample.

Male employees comprised approximately 68% ($n=129$), whereas female employees represent 31.1% ($n=59$) of the sample. Of the 190 respondents, 59% were married ($n=112$), 39% ($n=74$) were single. The age range was between 20 to 51 years. Of this, the largest proportion of the participants (41%) was less than 30 years old.

Table 1. Sample profile of the respondents

Demographic Variables	Categories	Frequency	Percentage
Gender	Male	129	67,9
	Female	59	31,1
Age	Less than 30	78	41,1
	30-35	44	23,2
	36-40	33	17,4
	41-50	20	10,5
	More than 51	11	5,8
Marital Status	Married	112	58,9
	Single	74	38,9
Working experience	1-5	104	54,7
	6-10	36	18,9

	11-15	27	14,2
	More than 16	21	11,1
Department	Locked / purchase	40	21,1
	Accounting / finance / financial jobs	27	14,2
	Sales and marketing	30	15,8

	Journeyman-master	4	2,1
	Engineers	33	17,4
	Director, conductor	54	28,4
	Senior managers	4	2,1

FINDINGS

The result of the factor analysis of research variables is provided in Table 2. a strong factor structure is supplied through the factor analyses performed upon variables concerned with work overload, role ambiguity, career concerns and turnover intention. This indicates that the questionnaire statements used to measure these concepts were loaded to the variables. The total variance explained by this analysis is 65,047.

As it can be inferred from Table 3, the instruments used in this study were reliable, with coefficients ranging from 0,86 to 0,91, that exceeded the minimum acceptance level of 0,70 (Nunnally, 1978). The mean score and standard deviations for each variable are listed in the same table. Correlation Analysis indicates a significant relationship between the variables. There is a high positive relation of turnover intention, respectively with, career concerns ($r=,384^{**}$), work overload ($r=,370$) and role ambiguity ($r=,359^{**}$).

Correlation analysis with demographic variables indicate that, there exists a positive relation of turnover intention with marital status ($r=,231^{**}$), whereas a negative relation exists between turnover intention and age of participants ($r= -,199^{**}$). According to these results, the turnover intentions of married people are low when compared to single people. In addition, turnover intention of employees decreases with age.

Table 2: Results of Factor Analysis

Instrument items	Components			
	Work overload	Role ambiguity	Turnover intention	Career concerns
Work overload – Having far too much work to do	,785			
Time pressures/deadlines	,733			
Fear of not being able to complete projects on time	,670			
Working on unnecessary tasks/projects	,655			
Staff shortage	,631			
Dealing with difficult people at work	,570			
Keeping up with new technology, techniques and ideas	,563			
Having to perform tasks not in my job description	,561

* Correlation is significant at the 0.05 level (2-tailed).

** Correlation is significant at the 0.01 level (2-tailed).

Since, the major purpose of this study is to examine the influence of different occupational stress sources on turnover intention, regression analysis was conducted. As demonstrated in Table 4, when all of the three independent variables (Model 1) were included into the regression equation, the coefficient of determination (R^2) was found out to be 0,214 indicating that 21% of job stress is explained by the three variables. Regression analysis indicated that work overload had a significant positive impact on turnover intention. Thus, H_1 , proposing that perceptions of work overload positively influences turnover intention, was supported. Among the dimensions of the occupational stress career concern had a significant positive impact on turnover intention. Hence the hypothesis H_3 was also supported. Finally, job ambiguity had not a significant positive impact on turnover intention. Therefore H_2 was not supported.

Table 4: Regression Analysis of Occupational Stress Sources on Turnover Intention

The Dependent Variable: Turnover intention			
Model 1's Independent variables	Standardized Coefficients	t	Sig.
Work overload	,176	2,115	,036
Role ambiguity	,151	1,811	,072
Career concerns	,246	3,331	,001
$R^2 = 0,214$; $F = 16,861$; $p\text{-value} = 0,000$			

Considering, stressors as independent variables, turnover intention dependent variable and gender as control variable; it was noticed that the independent variable that has an effect on males' turnover intention is their career concerns ($\beta_{\text{career concerns}} = ,402^{**}$; $F = 15,037^{**}$), and the independent variable that has an effect on females' turnover intention is work load ($\beta_{\text{work overload}} = ,361^*$; $F = 4,322^{**}$).

On the other hand, considering stressors as independent variables, turnover intention dependent variable and position of employees as control variable; it was found out that, work load ($\beta_{\text{work overload}} = ,358^{**}$; $F=15,232^{**}$) and role ambiguity ($\beta_{\text{role ambiguity}} = ,297^{**}$) have an effect on lower level employees' (workers, office employees, journeyman-master) turnover intention. Career concerns ($\beta_{\text{career concerns}} = ,361^{*}$; $F=7,102^{**}$) have an effect on higher level employees' (engineers, director, conductor, senior managers) turnover intention.

Table 5: Regression Analysis of Occupational Stress Sources and selected demographics on Turnover Intention

The Dependent Variable: Turnover intention			
Model 2's Independent variables	Standardized Coefficients	t	Sig.
Work overload	,069	,792	,430
Role ambiguity	,109	1,302	,195
Career concerns	,354	4,582	,000
Department	-,070	-1,051	,295
Age	-,136	-1,609	,110
Marital Status	,225	2,543	,012
Number of children	,120	1,239	,217
Distance	-,097	-1,433	,154

$R^2 = 0,271$; $F = 8,671$; $p\text{-value} = 0,000$

As it can be inferred from Table 5, when some of the demographical variables are included in the regression analysis, the results indicated that career concerns ($\beta_{\text{career concerns}} = ,354^{**}$) and marital status ($\beta_{\text{marital status}} = ,225^{*}$) had an effect on turnover intentions. This model suggests that marital status among other demographical variables and career concerns among other stressors are important variables for turnover intention of employees.

DISCUSSION

This study tested the effect of three dimensions of occupational stress (work overload, role ambiguity and career concerns) on turnover intentions of employees. Work overload and career concerns were found out to have an effect on turnover intention. From the managerial point of view, in order to reduce stress level and the rate of turnover among employees, organizations should follow a strategy which will reduce the symptoms of the causes of stress. Job Analysis may be a key technique for managing job overload. A study by Gutteridge, Leibowitz and Shore (1993), found that individual career needs should use employees' strong ways, should target development needs, should provide an attractive work environment, should match the career with employees' interests, values and personnel style. Management styles that satisfy the employees' such needs will decrease their anxieties about their careers and eliminate turnover intention idea. Schneier, MacCoy and Burchman (1988) argued that managers who coach, counsel, mentor, and train their employees can enhance their skills and motivation. By seeking out opportunities to develop new competencies in different areas, employees may make themselves more valuable to their present firm and at the same time make themselves more valuable in the external labor market should they decide to leave.

This study carries some limitations. Other stressors (such as, work demands, relationship with others, role conflict, alienation, unfavorable work environment) could be included in further studies, undertaken during the recession time. Without the use of longitudinal studies, the relationships between stress and turnover intentions could not be understood. For future research, a longitudinal research should be preferred. The data which will be collected after the recession, will lead to comparative findings. It is also possible to extend the theoretical model by including additional (1) dependent variables such as organizational commitment, job performance, burnout, absenteeism and (2) control, moderating or mediating variables such as: personality, locus of control or organizational trust and justice perceptions. In addition, the sample could be extended by including organizations that have activities other than manufacturing industry, such as service and trade.

EXPLORING COMPANIES' BEHAVIORAL PARADOX BY USING "THE CORPORATION" DOCUMENTARY

Selim YAZICI
Ayşegül ÖZBEBEK
Esra KILIÇARSLAN TOPLU

Istanbul University, Turkey

ABSTRACT

Films are widely used in business education to illuminate management concepts. Since films can provide the real view of the theories and concepts worked in issues, they have more lasting impression. Ethical matters are more complex and involve many different and interlinked processes and influences. This makes the subject difficult for students lacking business experience or frame of reference to enable them to understand potential conflicts of interest that occur in business practices. In this study, "The Corporation", a documentary film by March Achbar, Jennifer Abbott and Joel Bakan, which has received awards in film festivals around the world, has been used for analysis to illustrate the behavioral paradox of corporations. Film analysis has been used as an educational tool for teaching organizational behavior and management concepts since 1970s. Through showing "The Corporation", a quantitative analysis has been conducted by comparing the essays written by students.

Keywords: *Business Ethics, corporate social responsibility, decision-making, business ethics education, film analysis*

INTRODUCTION

Film is a powerful tool for teaching students conceptual flexibility and the ability to shift perspectives (Champoux, 1999) and can be used as a case study, for problem solving, to give substance to abstract concepts, to provide vicarious experience and to illustrate historical events. It is also a powerful tool for illustrating concepts and demonstrating the application of theory, providing students with meaningful opportunities to observe and understand stakeholder interactions (Buchanan&Huczynski, 2004; Champoux, 1999).

The documentary, "The Corporation" can be used as a valuable teaching tool to provide students with a context and imagery that allows them to experience the fundamental conflicts that occur as a result of corporate actions. Students need to be aware that their decisions will encounter some ethical or environmental problems. Real illustrations of ethical dilemmas faced by corporations everyday, discussed by business people involved in the problems, is a very effective method for students to face some of these issues and make their own judgments.

In this study, "The Corporation", a documentary film by March Achbar, Jennifer Abbott and Joel Bakan, which has received awards in film festivals around the world, has been used to illustrate the behavioral paradox of corporations (Bakan, 2005) as a result of ethical dilemmas, that occur in everyday business. The film starts with the premise that corporations have been given the rights of a legal person, so one must evaluate what kind of person is the corporation. As one of the indispensable actors of society, positions and responsibilities of corporations in society are examined with a critical perspective in the film.

Since ethical problems are complex, interrelated, and often have more than one correct answer, the use of films like "The Corporation" documentary, help students to understand the ethical issues the business people face during their everyday work.

THEORETICAL BACKGROUND

The use of films as an educational resource to illustrate management concepts like ethical decision-making, risk taking, leadership, communication, have been discussed by many researchers for many years (Scherer&Baker, 1999; Tyler, et.al., 2009; Smith, 2009). Since the 1970s, educators experienced in using film as a teaching tool have urged its adoption by others. Wegner (Wegner, 1977) was the first researcher in using this medium. In his 1977 booklet, he described various film types and how to use them in classroom. Many others have reported successfully using films in teaching a broad range of disciplines or topics. (Foreman&Thatchenkery, 1996; Scherer&Baker, 1999; Champoux, 1999; Comer, 2001; Champoux, 2004; Buchanan&Huczynski, 2004; Clawson, 2006; Frieden&Deborah, 2007).

Films have a particular value when teaching inexperienced students whose knowledge is limited about business practices and workplace. Champoux (1999) advocated the use of film scenes because they offer a visual portrayal of abstract theories and concepts taught in organizational behavior and management courses. Feature films can also be used to demonstrate the dynamic complexity and untidiness in organizational settings (Smith, 2009). This use of films can be a valuable complement to traditional textbook accounts that, of necessity, tend to fragment and simplify for presentational purposes (Dunphy, Meyer, Linton, 2008). Films also provide a familiar attention-capturing visual medium to engage the student and encourage retention (Scherer&Baker, 1999). They also provide platforms for analyzing the integration of topics normally taught discretely or separately (Buchanan&Huczynski, 2004).

Films that have been used in management courses include *Enron* to illustrate the business ethics (Cox, 2009); *Rising Sun* to learn cross cultural communication and to understand transplant organizations (Foreman&Thatchenkery, 1996); *12 Angry Men* to see biases, conflict and power issues, *Thirteen Days* to illustrate complex and politicized decision processes (Buchanan&Huczynski, 2004); and *Dead Poets Society* to stimulate class discussion on issues such as ethics, values, and organizational pressures toward conformity, and on role conflict and autonomy (Berger&Pratt, 1998).

Students also learn how to see the application of the concepts in various contextual settings with films. It is noted that using films as an effective pedagogical tool heightened student interest without sacrificing academic rigor, allowed classes to observe and evaluate processes in action, exposed students to a world beyond their own, and offered opportunities for discussion, values clarification and personal assessment (Berger&Pratt, 1998).

Previous research suggests a framework for analyzing the movies or for “connecting things up” either to the relevant concepts of management or to the topic under discussion in the textbook (Dunphy, 2009). The use of the documentary film “The Corporation” in the classroom has also been discussed. Hatfield (2008) has argued the using of “The Corporation” as a powerful illustration of ethical issues facing the financial manager in classroom settings. She argues that the documentaries can be used as a platform for lively discussions with regard to issues that could potentially occur, but her hypotheses were left untested.

STUDY DESIGN AND METHODOLOGY

One of the most challenging problems facing academicians are developing techniques for teaching business ethics that truly engage the student. Goals of business ethics education have included the teaching of ethical theory and the particular contexts unique to making ethical decisions in the workplace. The objective of some courses is to have an effect on student awareness of ethical issues and attitudes towards ethics, while other courses focus on reasoning ability, with the third type of course seeking to integrate the two objectives of awareness and reasoning (Cox, 2009).

Business Ethics courses include abstract concepts and are abstruse for students. Students need to be aware of the potential conflicts that they will face. Students need to develop skills and awareness that will allow them to personally asses the harm and benefit of business decisions, not just for the shareholder but for all stakeholders of the company (Hatfield, 2008). At this point the documentary, “The Corporation” can be used as a valuable teaching tool to provide students with a context and imagery that allows them to, in a virtual sense, experience the issues, thereby making the material more relevant and creating a more pronounced impression on the student.

In this study the documentary film “The Corporation” is used as a teaching aid but not as a primary medium in an elective “Business Ethics and Corporate Social Responsibility” course. “The Corporation” is a documentary film based on interviews with corporate insiders, carefully composed resulting in a documentary that provides a

challenging view of corporations' responsibilities to society in general. There are no actors in the film that ensures that any character dramatizations are minimal.

The main question considered in "The Corporation" is "if corporations are considered to be a person, what kind of person are they?" The answer came early in the film: a psychopath. By using many different ideas from experts, business thinkers to corporate people, the film concludes that the corporation is today's dominant power, it is a greedy, amoral entity based on acquiring as much profit as possible and not caring about ethical, social and environmental responsibilities.

In this study, we hypothesize that viewing of the documentary "The Corporation" as a supplemental teaching material will attract students and create more awareness than traditional lecturing methods. This will in turn result in a change in understanding of ethical problems created by the corporations in the society. Thus our hypothesis is that using of the documentary "The Corporation" in a Business Ethics and Corporate Social Responsibility course will create a relatively higher level of understanding on students watching the film, than that of the other group, for ethical dilemmas caused by behavioral paradox of corporations.

H₀: The viewing of "The Corporation" documentary will not create a significant difference between two groups on their understanding levels.

H₁: The viewing of "The Corporation" documentary will create a significant difference between two groups on their understanding levels.

Method

Forty business administration undergraduate students from a public university in Istanbul, who are attended of an seventh semester undergraduate level course entitled "Business Ethics and Corporate Social Responsibility", participated in the study. The average age was 21,3.

Students were attended to the class given by the professor for 12 weeks. The students were randomly divided into two groups at the end of the 12th week. The control group was consisting of 20 students and experimental group was 20 students. The control group received no extra material about the course, while experimental group viewed "The Corporation" documentary. Then, both groups were asked to write an essay (at least 300 words) considering the role and responsibilities of the corporations in the society at a 40 minute session in the classroom. Each essay was graded blindly by a teaching assistant over 100.

Upon grading the essays, the grades were analyzed statistically by using SPSS 17.0. Compared to the control group, students in the experimental group reported results that were highly significantly different ($p \leq .01$ or lower). The results of independent samples t-tests were outlined in table 1 through table 4.

Table 1: Group Statistics

Group	N	Mean	Std. Deviation	Std. Error Mean
Control Group	20	43,3333	33,36665	7,28120
Experimental Group	20	76,3158	17,06541	3,91507

To test the null hypothesis, t-test for independent samples was used. Before implementing the test, the normality assumption is checked. Two non-parametric tests (Mann-Whitney U test and Kolmogorov-Smirnov test) were also used to test the same null hypothesis.

Table 2: Independent Samples Test

	Levene's Test for Equality of Variances	t-test for Equality of Means	
			95% Confidence Interval of the Difference

	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	11,156	,002	-3,872	38	,000	-32,98246	8,51898	-50,22822	-15,73669
Equal variances not assumed			-3,990	30,412	,000	-32,98246	8,26702	-49,85639	-16,10853

Table 3: Test Statistics^b

Mann-Whitney U	84,000
Wilcoxon W	315,000
Z	-3,153
Asymp. Sig. (2-tailed)	,002
Exact Sig. [2*(1-tailed Sig.)]	,001^a

a. Not corrected for ties.

b. Grouping Variable: Group

Table 4: Test Statistics^a

Most Extreme Differences	Absolute	,514
	Positive	,514
	Negative	,000
Kolmogorov-Smirnov Z		1,623
Asymp. Sig. (2-tailed)		,010

a. Grouping Variable: Group

Both the parametric test (see Table 2) and the two non-parametric tests (see Table 3 and Table 4) show that there is highly significant evidence against the null hypothesis; that is, there is no difference between the means of the grades of the two groups. Therefore, we assume that the viewing of "The Corporation" documentary will create a significant awareness to the students' understanding of ethical and social issues.

RESULTS

Our analysis prove that using the documentary "The Corporation" as a supplementary tool in a Business Ethics and Corporate Social Responsibility course raise the awareness of students about the role that corporations play in ethical, social, and environmental issues.

Study Limitations

Before making a conclusion, it is important to consider the following limitations of this study:

- The film was in English with Turkish subtitles. Since the students' English was intermediate-level, this might result some lack in understanding. Also, following both the subtitles and watching the scenes might take more effort for students.
- This documentary is copyrighted material. Therefore supplying a legal copy of the film might also bring some extra costs to be considered.
- No structured questionnaire were used to collect data, instead data were collected from the grades students have collected from their written essays.
- The cultural dimension might also be considered as a limit because of the content of the film was based on mainly economical issues of USA, including corporations, regulations, ethical beliefs, and social structure.

DISCUSSION AND CONCLUSIONS

This study was designed to explore whether using "The Corporation" documentary in classroom settings will raise the awareness of the role that corporations play in ethical, social, and environmental issues legitimate

factors for consideration in business decisions, and understand the paradoxical behaviors of corporations for future business managers. At this point, the main objective was to make an evaluation about how the students assess this paradox including conflicts and dilemmas between what is right and how it is perceived in the business world.

In conclusion, the results of this study suggest that using "The Corporation" documentary in classroom can have a significant impact on students' understanding of ethical and social problems created by the corporations in the society.

Future Research

For the future research about using films in business education it might be convenient to consider the following statements:

- Since the population (the number of students enrolled in this course) was relatively small, using larger samples might enable researchers to make a content analysis, which could bring the benefits of qualitative research.
- In this study, "The Corporation" was used as secondary material to supplement learning. It might be useful to test whether this documentary will create more benefit as a primary medium.
- The documentary is a relatively long one. It can be divided into segments, and can be shown and discussed separately supporting the course material for each week, thus comparing the reinforcement affect on the learning outcome.

Although there were many studies highlighting using films in different classes, only a few made statistical analysis to support their ideas. "The Corporation" presents the negative aspects of business without regarding the positive effects and provide some anecdotes about the behavioral paradox of corporations. Thus, it is emphasized that the students (as future business managers) need to understand and assess of impact their business decisions have on other stakeholders of the corporation by using this documentary in this study.

THE EFFECTS OF AFFECTIVE COMMITMENT AND ORGANIZATIONAL CITIZENSHIP BEHAVIORS ON CREATIVE BEHAVIOR: AN EMPIRICAL INVESTIGATION IN TURKISH CHEMISTRY INDUSTRY

Hülya Gündüz Çekmecelioğlu

Kocaeli University, Turkey

İrge Şener

Çankaya University, Turkey

Meral Elçi

Gebze Institute of Technology, Turkey

ABSTRACT

The aim of this study is to empirically investigate the impact of affective commitment and organizational citizenship behaviors on individual creative behavior. This study considers organizational citizenship behaviors as a multidimensional construct and compares the effects of four components of organizational citizenship behaviors (altruism, courtesy, conscientiousness, civic virtue) and affective commitment on creative behavior. Furthermore, in this research relationship between affective commitment and citizenship behaviors has been examined. Data obtained from 247 chemistry industry employees in Kocaeli-Turkey were used to examine the hypothesized variables. The results of this research indicate that affective commitment and several dimensions of the organizational citizenship behaviors have significant positive effects on employees' creative behavior. The findings also demonstrate that affective commitment is an important antecedent of citizenship behaviors.

Keywords: *creativity, creative behavior, affective commitment, organizational citizenship behaviors*

INTRODUCTION

With increasing global competition and shortened product life cycles, creativity became an important source of competitive strength for organizations. Organizational scholars and the business community have become increasingly concerned with enhancing individual creativity, since it is the foundation of organizational creativity and innovation. Since the development of the concept, much research has been focused to explore the antecedents of creativity and creative behavior (Abbey and Dickson, 1983; Amabile et al, 1996; Cummings and Oldham, 1997; Shalley, Gilson, Blum, 2000; Gündüz Çekmecelioğlu, 2005, 2006; Gündüz Çekmecelioğlu and Eren, 2007).

Organizational citizenship behaviors (OCB) are discretionary helping actions that promote organizational effectiveness. Many studies have noted social functionality and contribution of helping behaviors, volunteering and altruism towards individuals, groups or institutes. In recent decades these topics had also received considerable attention in management studies and added new insight into our understanding of organizations, and the workplace in the modern societies. Hence, beyond its general social relevancy, this altruistic and helping behaviors has proven to have interdisciplinary meanings (Gadot, 2006: 77). It has been argued, however, that OCBs benefit organizations in ways besides contributing directly to group or organizational performance, most notably, by making organizations more attractive places to work for one's coworkers (Podsakoff and Mac Kenzie, 1995; Tepper, et al., 2004). This perspective which has not been tested, suggests that coworkers' OCBs have a positive influence on fellow employees' attitudes and behavior (Tepper, et al., 2004, 455). Thus, the purpose of this research is to examine and compare the effects of four components of organizational citizenship behaviors and affective commitment on creative behavior.

LITERATURE REVIEW

Creative Behavior and Creativity

Earlier creativity theory and research focused almost exclusively on a personality approach and, personal characteristics of individual. However, recent developments have witnessed an emergence of systems theories of

creativity, which generally emphasize the interaction between the individual and the environment and maintain that multiple components must converge for creativity to occur (Amabile, 1988; Woodman, Sawyer, Griffin, 1993; Shalley, et al, 2000; Sternberg and Lubart, 1999; Wang and Netemeyer, 2002). Researchers are in general agreement that personal characteristics including self-confidence, locus of control, high energy, task motivation, autonomy, toleration of ambiguity, intuition, critical thinking, curiosity relate positively and consistently to measures of creative behavior. For example, Amabile (1997) suggested three major components in particular as important for creative behavior in organization: expertise, creative thinking or skills, and intrinsic task motivation. Expertise refers to knowledge, proficiency, and abilities of employees to make creative contributions to their fields. Creative-thinking skills include cognitive styles (e.g., divergent thinking, ideational fluency) as well as personality variables that influence the application of these creative thinking skills. Task motivation (intrinsic motivation) refers to the desire to work on something because it is interesting, involving, exciting, satisfying, or personally challenging. Task motivation is crucial in turning creative potential into actual creative ideas. Studies confirm that the higher the level of each of these three components, the higher the creativity is (Amabile, 1997; p.42).

Research has found that R&D professionals believe that intrinsic motivation is critical for creativity and creative performance has been found to be positively correlated with intrinsic motivation to engage in a task (Amabile and Gryskiewicz, 1987). Intrinsic motivation is inner directed interest in a task. In order to be creative, individuals have to be both interested in the issue or problem to be addressed and motivated to find a solution. Since creativity requires a great deal of mental activity, individuals need to be motivated to work hard to achieve breakthroughs. According to cognitive evolution theory (Deci and Ryan, 1980) the presence of salient extrinsic constraints on performance, shifts an individual's perceived locus of causality from internal to external, so task engagement is perceived primarily as a means of achieving an extrinsic end. This means-end relation between the task and constraint undermines intrinsic motivation. But when individuals are free to focus on task activities, they are more likely to be creative (Shalley, 1995,484).

Creative behavior is defined as behavior that results in identifying original and better ways to accomplish some purpose (Amabile, 1983; Abbey and Dickson, 1983). Shalley (1995: 483) defined individual creative behavior as developing solutions to job-related problems that are judged as both novel and appropriate for the situation. Similarly, in Nickerson's view (1999), creativity is best described as the human capacity regularly to solve problem or to fashion products in domain, in a way that is initially novel but ultimately acceptable in a culture. Creativity is also defined as useful novelty for its own sake, but novelty that can be applied and add value to an organization's products and services (Oldham and Cummings, 1996: 608). Similarly, Wang and Netemeyer (2002) in their qualitative study conceptualize salesperson creative performance as the amount of new ideas generated or behaviors exhibited by the salesperson in performing his/her job activities. However, this creativity does not happen automatically. Firms and their managers must ensure that their employees will make creative contributions. They must first hire people with potential for creativity, and then they must structure their employees' environment in order to bring out this creative potential. Only by fostering the right people in the right place, creativity in organizations can be maximized (Cummings, Oldham, 1997: 22). It's clear that the social environment is an important means of improving creativity. Especially modern social psychology and creativity theory pointed the role of social environment on creative behavior. For example, Amabile (1983, 1996) focused on the role of social environmental characteristics as well as personal characteristics on creativity, and assumed that the social environment can influence both the level and frequency of creative behavior. Amabile et al (1996) have described the development and validation of a new instrument, KEYS: Assessing the Climate for Creativity, designed to assess perceived stimulants and obstacles to creativity in organizational work environments. According to this scale stimulant scales can be described as; organizational encouragement, supervisory encouragement, work group supports, freedom, sufficient resources and challenging work. On the other hand, obstacle scales can be described as workload pressure and organizational impediments. Like Amabile, some other researchers (Woodman, Sawyer, Griffin, 1993; Cummings, Oldham, 1997; Scote and Bruce, 1994) pointed out that work environment characteristics can influence individuals' creative behavior.

The majority of research regarding creativity has found that organizational encouragement, supervisory support, autonomy and freedom, challenging job (Amabile et al., 1996) non-controlling and supportive supervisors (Cummings and Oldham, 1997), goal setting, rewards, and choice or personal discretion in work procedures can affect creativity. Furthermore others have noted that innovative organizations are characterized by an orientation toward creativity and innovative change, support for their members in functioning independently in the pursuit of new ideas (Kanter, 1983; Siegel and Kaemmerer, 1978), and a tolerance for diversity among their members (Siegel and Kaemmerer, 1978). Adequate supplies of such resources as equipment, facilities, and time are critical for innovation (Amabile, 1988; Angle, 1989) and the supply of such resources is another manifestation of the organizational support for innovation (Scott and Bruce, 1994).

In sum, creativity literature focused on the effects of personal characteristics of individual and work environment on creative behavior. However, the contemporary social psychological research on creativity has not explicitly examined the relationship between affective commitment, citizenship behaviors and creative behavior. Hence, the aim of this study is to contribute to the field in this domain by examining the relationship between affective commitment, organizational citizenship behaviors and creative behavior of employees.

Organizational Citizenship Behaviors and Organizational Commitment

The widespread interest in organizational citizenship stems primarily from the belief that these behaviors enhance organizational effectiveness (Podsakoff and MacKenzie, 1997, 134). Because of this, most of research has focused on the antecedents of employees' OCBs and suggests that individuals who hold more favorable attitudes perform OCBs with greater frequency (Organ, 1988; Tepper et al., 2004). But a few research has explored the relation between OCB and employee or organizational effectiveness (Podsakoff and Mac Kenzie, 1997, p.134) or creativity (Gündüz Çekmecelioğlu, 2006).

According to Organ's definition (1988: p.4), "*OCB represents individual behavior that is discretionary behavior not directly or explicitly recognized by the formal reward system, and in the aggregate promotes the effective functioning of the organization*". In other words, a "sense of citizenship" translates into a willingness to go "above and beyond" literal contractual obligations. Some examples of OCBs are assisting coworkers, going out of one's way to protect organizational property, not taking work time to attend to personal matters, and making innovative suggestions that help the overall productivity of the work group (Organ, 1988). Although, there is no clear consensus in the literature on the number of dimensions of OCBs, five dimensions of OCB identified by Organ (1988) were later operationalized by Podsakoff, MacKenzie, Moorman and Fetter (1990), including altruism (discretionary behaviors that aid a specific other person or group in task related matters) courtesy (constructive gestures that help prevent problems for coworkers), sportsmanship (tolerating in good spirit the occasional hardships and deprivations that unpredictably befall individuals in the course of organizational endeavors), civic virtue (constructive involvement in the political life of the organization), and conscientiousness (discretionary behavior on the part of an employee that goes well beyond the minimum role requirements of the organization, in the areas of attendance, obeying rules and regulations). The practical importance of OCBs is that they improve organizational efficiency and effectiveness.

Most contributions to the literature characterize OCB as contributing to organizational effectiveness (Organ, 1988). Empirical research generally supports this notion. OCBs benefit organizations in ways besides contributing directly to group or organizational performance, most notably, by making organizations more attractive places to work for one's coworkers (Podsakoff and Mac Kenzie, 1997) and by contributing to resource transformations, innovativeness and adaptability (Organ, 1988). OCBs in the form of setting aside one's own work responsibilities to come to the aid of others give employees the sense that the organization is the kind of place where individuals treat each other with kindness and consideration, and they implicitly communicate that fellow employees' feelings are valued. These experiences, in turn make organizations more attractive places to work and foster loyalty and commitment to the organization. OCBs have also been posited to clarify and fostering a sense of stability (Podsakoff and Mackenzie, 1997; Tepper et al., 2004). Helping fellow employees perform their responsibilities improves the understanding that they have of their role requirements, which in turn, increases their satisfaction and commitment (Mathieu and Zajac, 1990; Tepper et al., 2004). Organizational citizenship behaviors may create collective atmosphere and supportive work climate. Thus, following this we also expect that OCBs will be positively related to employee creative behavior, and suggest the following hypotheses.

H1: Employees' OCBs will be positively related to creative behavior.

On the other hand, organizational commitment is defined in the present context in terms of the strength of an individual's identification with and involvement in a particular organization. Such commitment can generally be characterized by at least three factors: a strong belief in and acceptance of the organization's goals and values; b) a willingness to exert considerable effort on behalf of the organization; c) a definite desire to maintain organizational membership (Porter, et al, 1974: 604). Today, it is well recognized that employees' commitment to the organization can take different forms. Allen and Meyer (1990), for example, identified three common themes among the uni-dimensional conceptualizations of commitment (Meyer, Allen, and Topolnytsky, 1998: 82). The first dimension or form of three components model of organizational commitment is affective commitment (AC), which represents the idea that one's commitment to the organization is driven simply by an emotional attachment to the organization and identification with the organization. In simpler terms, it is a mind-set characterized by a personal desire to follow a course of action, which in this case is staying with the organization. The second form is normative commitment (NC) or a feeling of perceived or moral obligation to stay with a particular course of actions (i.e., stay with one's organization). The third form is continuance commitment (CC) or an attachment based on the perceived costs of not continuing with a course of action (i.e.,

what would be given up if one left the organization) (Bentein, et al., 2005:469). One major approach to the study of organizational commitment is to view it in terms of an affective attachment. Furthermore, researchers found that strong relationship between affective commitment and positive work outcomes. Because of this, in this study the only dimension that is used from the Allen and Meyer (1990) study was affective commitment.

Organizational commitment develops naturally and contributes positively to the organization, and may be considered a value added factor in work environments. It connotes such attributes as attachment, allegiance, dedication, devotion, engagement and responsibility (Marchiori and Henkin, 2004). According to Randall (1989), committed employees internalize company goals and accept efforts to increase production and their own performance (Tuomi, et. al, 2004). Moreover, affective commitment also benefits the employees. These benefits are derived not only from the commitment itself, but also from the enhanced work environment that leads to commitment (Meyer and Allen, 1988). For example, employees benefit from challenging jobs that improve their work skills (Gault et al., 2000) and creative behavior (Amabile et al., 1996; Gündüz Çekmecelioğlu, 2006, 2007) Furthermore according to Meyer and Allen (1988) affectively committed employees may benefit from a sense of importance and belonging that comes from attachment to an organization. Thus, it is also expected that affective commitment will be positively related to employee creative behavior. It is suggested that:

H2: Affective commitment will be positively related to creative behavior of employee.

Theoretical and empirical studies have examined relationship between job attitudes and organizational citizenship behavior. Previous research discovered that organizational commitment is important predictor of citizenship behaviors (Brief and Motowidlo, 1986 ; Organ, 1988; Organ and Ryan, 1995; Meyer et al., 2001). For example, the meta-analysis' conducted by Organ and Ryan (1995) revealed that organizational commitment was significantly correlated with both altruism and compliance dimensions of OCB at roughly the same level as satisfaction. In addition, study of Meyer et al (2001) found that affective organizational commitment consistently has been linked to positive employee behaviors such as OCBs and helping behaviors. Additionally, Cohen (2006) found organizational and group commitment have significant effect on OCB altruism. Furthermore Cohen (2005) found that organizational commitment, group commitment, and job involvement will be related to OCB and in-role performance more strongly than occupational commitment. According to organizational commitment study, employees who experience positive exchanges with the organization, the job, or the work group will reciprocate with higher levels of commitment, which will motivate them to contribute to the organization in other ways, such as reduced turnover, better performance (Cohen, 2006, p.108) or citizenship behavior (Organ and Ryan, 1995; Meyer et al., 2001). Thus, the following hypothesis is suggested:

H3: Affective commitment will be positively related to OCBs.

METHOD

Sample, Procedure and Measures

In order to test the hypotheses, data was collected from three firms that have activities in chemistry industry in Kocaeli-Yalova region. After deleting records with missing cases 247 completed questionnaires were remained, which constituted the sample for this study. 80 % of the respondents were men and 81 % of the respondents were married. The mean age of the sample was 33 years. 40% of the participants are university graduates and 60% of them have a high school degree. 41% of the participants had worked for at least ten years for their organizations. 53 % of the sample are staff and whereas 43 % of them are middle level managers.

The constructs in this study are developed by using measurement scales adopted from prior studies. All constructs are measured using five-point Likert scales with anchors strongly disagree (= 1) and strongly agree (= 5). Items for measuring "affective commitment" (6 items) were adopted from Meyer and Allen (1997). Scale of OCBs was adopted from Podsakoff's (1990) 20-item scale. Similarly, selected items from Sungur (1997) are used for measuring Creative Behavior (6 items).

Factor Analysis and Correlations

The best fit of the data was obtained with a principal component analysis with a varimax rotation. After eliminating four poor performing items of sportsmanship dimension, the exploratory factor analysis of all scale items displayed an eight-factor structure including affective (AC), normative (NC) and continuance (CC) commitment, civic virtue (CV), consciousness (CN), altruism (AL) and courtesy (CO) dimensions of citizenship behaviors and intention to leave (IL). Therefore, the construct of citizenship behaviors have been utilized as a four-dimensional variable in the subsequent analysis. The Alpha reliabilities of the factor were 0.87, 0.75, 0.72, 0.80, 0.78, 0.84, 0.69 and 0.82 respectively (Table 2). The factor loadings are included in Table 1.

Means and standard deviations of each variable and correlation matrix of all variables were calculated. Means, standard deviations, reliabilities and correlations among all scales used in the analyses are shown in Table 2. As it can be viewed from this table, the internal consistency reliabilities of all variables measured in this study were quite reliable. The findings in Table 2 indicated that, all the independent variables investigated were significantly related to creative behavior. According to correlation analysis affective commitment is correlated with creative behavior positively ($r=.336$). All dimensions of citizenship behaviors were positively correlated with creative behavior. However, civic virtue is the strongest variable that was correlated with creative behavior ($r=.625$). The other most variable correlated with creative behavior is affective commitment. Besides, it was found that affective commitment was positively related to all dimensions of OCBs. In sum, these findings support H1, H2 and H3.

Table 2. Descriptive Statistics, Correlations and Alpha Reliabilities of the Measures

Variables		Mean	Std Dev.	1	2	3	4	5	6	7
Affective Commitment	1	4.34	.64	0.92(a)	.303**	.341**	.518**	.589**	.581**	.336**
Altruism	2	4.53	.56		0.73(a)	.496**	.421**	.386**	.759**	.299**

Regression Analysis

In order to examine the effects of affective commitment, and organizational citizenship behaviors on creative behavior, four multiple regression models were developed and the relative effects of the dimensions of citizenship behaviors and affective organizational commitment on creative behavior of employees were compared. All models were found to be statistically significant ($p < 0.001$). In Model 1, the effects of affective commitment on creative behavior was investigated and the results revealed that affective commitment has significant effect on creative behavior ($\beta=.336$). In Model 2, the effects of altruism and courtesy based citizenship behaviors on creative behavior were investigated and the results revealed that altruism and courtesy have significant effects on creative behavior and the effect of altruism is higher than the effect of courtesy on creative behavior. According to Model 3, both consciousness and civic virtue have significant effects on creative behavior. In the last model (Model 4) the effects of all dimensions of citizenship behaviors on creative behavior were investigated and results indicated that altruism and civic virtue have positive effects on creative behavior. Furthermore, the effect of civic virtue on creativity is stronger than the effects of other variable on creative behavior.

Table 3: The Effects of Affective Commitment and Citizenship Behaviors on Creative Behavior

Independent Variables	Creative Beh. Model 1		Creative Beh. Model 2		Creative Beh. Model 3		Creative Beh. Model 4	
	β	t	β	t	β	t	β	t
Affective Commitment	.336	5.57**

RESULTS

A key source of organizational creativity is the creative behavior of the people they employ. Employees may exhibit creativity by developing solutions to job-related problems, developing new knowledge, new products and technologies, or making process improvements. However, this creativity does not happen automatically. Firms and their managers must ensure that their employees will make creative contributions (Cummings and Oldham, 1997: 22). This study suggests that coworkers' OCBs and affective commitment have a positive influence on fellow employees' creative behavior by making organizations more attractive places to work for one's coworkers.

This study considers citizenship behaviors as a multidimensional construct and compares the effects of altruism, courtesy, conscientiousness and civic virtue dimensions of organizational citizenship behaviors and affective commitment on creative behavior. Consistent with the developed hypotheses, correlation analysis revealed that affective commitment was positively related to altruism, courtesy, conscientiousness and civic virtue. Especially, the results indicated that the relationship between affective commitment and civic virtue ($r=.587$) is higher than the relationship between affective commitment and the other dimensions of citizenship behaviors. These results have indicated that affective commitment to organization is an important antecedent of OCBs in a Turkish chemistry work context and employees who have affective commitment with their organization are more likely to engage in OCBs. Similarly, some other research indicated that organizational commitment has positive effects on OCB in Western countries (O'Reilly and Chatman, 1986; Morrison, 1994; Organ and Ryan, 1995"; Meyer et al., 2001).

One of the other main results of this study is that affective commitment has a positive and strong effect on creative behavior. This result indicates that, employees' affective committed to an organization's goals internalize organization goals and develops original and better ways to accomplish these purposes. Since the development of the citizenship behaviors concept, some research has explored the relation between OCB and employee or organizational effectiveness (Podsakoff and Mac Kenzie, 1997: 134). But the relationship between OCBs and creative behavior were not examined. For this reason this study is important. Research indicated that especially altruism and civic virtue based citizenship behaviors of employees have increased creative behaviors. These findings show us helping and voluntary activities of employees contribute to create healthier work environment, leading to increase creative behavior and promote the goals of the organization as a whole.

This research indicated that affective commitment and organizational citizenship behaviors of employees have increased subordinates' creative behavior. Therefore, managers who want to benefit from employee' creative behavior should encourage especially affective commitment and citizenship behaviors of employees. They should first discover the right kind of activities that may contribute to organizational commitment and citizenship behaviors of employees and they should constitute work environment that encourage creative behavior of employees. Supervisors and top management should understand the other antecedent factors of citizenship behaviors and take necessary actions to strengthen the positive influences of such factors if they are willing to increase creativity and innovativeness in their organizations.

ABSTRACT

Strategic projects are main parts of strategy performance in organizations and failure in such projects causes failing in strategies, targets and missions of the organization.

Nowadays, strategic management entirely develops in various contexts such as strategic thought, strategic decision making and usage of technical and analytical management methods.

Despite of the basic role of behavioral issues within strategic executive teams, the effect of these behavioral patterns has been disregarded.

In this paper, the strategic behavior concept and the importance of attention to behavioral issues in strategic project management are stated. In addition, by representing of some techniques in recognition and management of strategic behavior, applied guidance are proposed to strategic project managers.

Keywords: Strategic Behavior, Management of Strategic Projects, Project Management, Management techniques of Strategic Projects

INTRODUCTION

In explanation of the most credible references, strategic projects are main elements in execution of strategy in organizations. [1,2,3,4,5,6] Although strategic projects are known as major ways to relate operation management and strategic management in recent years, but shortage of analytical and behavioral techniques in management of such projects prevents the complete success of them.

As shown in Fig.1. , nowadays, some issues such as defining objectives and strategies, planning and controlling the time and resources of project (top of iceberg) often were focused in project management but still lower levels of this iceberg encompass issues were not scrutinized.

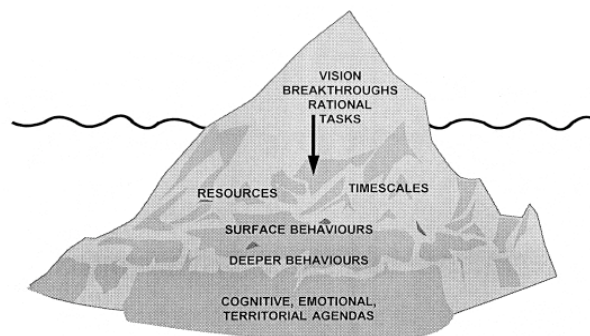

Fig.1 : Underlying strategic project iceberg

Management of the behavioral motivation which affects strategic projects is important as much as other analytical and quantitative motivation. It is needed to create some techniques for decreasing and removing behavioral shackle in project management especially project with strategic nature.

In this paper, first, some concepts like strategy, strategic projects and strategic behavior are clearly stated, then by analyzing history and importance of subject in strategic behavior management, some useful techniques of strategic behavior will be identified. Last, after a short analytical argument, the conclusion of this paper is presented accompanied with suggestions for management of behavioral issues in strategic project.

2- BASIC CONCEPT

For comprehensive understanding of all issues in this paper, acquiring with some concepts such as strategy, strategic project, and strategic behavior is necessary. Thus the definitions of these concepts will be presented as below:

2-1- Strategy

First definition of strategy was stated about 5 centuries ago when Greek word “strategia” translated as military government and after that strategy was known as an issue which was used in military organization and leading war in offensive and defensive deploy.[7]

For most people strategy is a plan. In other word, strategy is a collection of aimed acts and carriers.

Therefore: first, strategy is created before occurrence. Second strategy is rational but Mintezberg makes difference between deliberate strategy and emergent strategy. He says that a deliberate strategy codifies with predecessor purpose and then becomes unfold while the second type emerges without predecessor purpose.

Strategy at managers’ viewpoint is a future based and large scaled project having relationship with competitive environment in order to optimize achieving the organization objectives.

Although strategy do not state all of future needs (human resource, financial, material) but create a framework for managing decision making [9].

A general definition adapted to Chandler's, Wright et al and his partners, stated below:

“Strategy is senior management plans to achieve result according to organization objective and mission”[10]

Porter says that strategy is doing different duties or doing the same duties in different ways.[10,11,12]

Regardless to what strategy is and how codified, and based on definition mentioned above, it can be concluded that strategy is an approach that an organization selects to achieve its objectives.

2-2- Strategic Project

Strategic project is a project that initiated to perform the organization strategies.[3] Business development, employment of human recourses, business processes reengineering, quality management and continuous improvement are samples of strategic projects. One of main objectives of strategic projects is development of capabilities and competitive advantages of an organization. Strategic projects are types of projects which generate growth and result in organization learning. In other words, strategic projects both fruit and fructify.

Asrilhant, in a research about strategic project management in oil industry in 2004 says that strategic projects are large, high risk, innovative, value-creative and position creator in market.[14]

2-3- Strategic Behavior

Strategic behavior is defined as: "The cognitive, emotional and territorial interplay of managers within (or between) groups when the agenda relates to strategic issues.[4]

This definition of strategic behavior stresses on the extent where cognitive, emotional and territorial perspectives and agendas of managers are interwoven. Thus, we are more able to understand those aspects of strategy implementation which perhaps, are less easily discussible by managers. This difficulty could be due to this fact that they involve power (Whether manifested through offensive or defensive behavior or through alliance) or because of emotional sensitivities. [1]

3- IMPACT OF BEHAVIORAL ISSUES ON STRATEGIC PROJECT PERFORMANCE

In order to understand the impact of behavioral issues on strategic projects performance, we study the result of two famous but defeated strategic projects as below:

The first project is West Bridge in Australia. In this project, the price and time increased three times over the base schedule. Furthermore, 35 people were killed during the project execution. A comprehensive investigation about this project showed its main problems are behavioral issues such as lack of confidence in project team to senior managers (Trust Gap), lack of problem reflection (Reflective Gap), lack of opportunity for expression of idea (Openness Gap) and disproportion of progress tools with project. Unlike initial expectation, technical problems had the least impacts in this project.

The second project is Colombia satellite that exploded in the space and in some experts opinion it postponed NASA space research process. The reason of this disaster backed to the history and culture of the executive program in NASA. Because of the official and unfixable atmosphere in the project, individuals did not reflect problems. Manager had imperious manner and focused on bureaucracy and organization process was very usual. In this project, the responsible individual (project manager) did not like to believe most of problems and this point disturbs the space of openness and reflection of problems. [13]

Regard to main impact of behavioral issues on strategic project performance, concentration on behavioral issue should be noticed accompanied by technical issues. It can be said that behavioral issues management is the same important as technical issues. In the next section we will study the history of some issues related to strategic behavior and the amount of attention in strategic project management literature.

4-HISTORY OF STRATEGIC BEHAVIORAL ISSUES

On the contrary of the technical issues, there are few regards to behavioral issues in project management texts published in recent years, beside few empirical researches with focus on strategic issue had been done before 2000. [1] Johnson in his book in 1986 says: "it is so wonderful that a few regular researches tend to analyze the role of individuals relation in strategic decision making." [15] Mintzberg criticizes the process of strategic planning and says:"this process considers strategic development as an analytical process whereas managers do not use this". Other authors of strategic issues seldom notice to strategic behavior. For instance, Ansoff in 1987 wrote about the effect of paradigms and how organizations adopt themselves to critics with passive behavior; however he did not define strategic behavior. Dixit and Nalib in 1991 began their book with this question "what the strategic behavior is", although they did not define it.

In strategic learning literature, Peter Senge in 1990 and Pitman in 1986 emphasis that organization learning is an important process in strategic relations even if these relations be full of passive behaviors. Except this, Janis in 1989, Schein in 1986 and Pascal in 1990 noticed to strategic behavior and its importance in strategic learning literature. In project management standards and books in recent years, behavioral issues have been mentioned, however ICB European standard -one of the main standards in project management- regards particularly to behavioral capabilities of a project manager. This standard allots 15 items out of 46 capabilities which are needed for a project manager to be used as his behavioral capabilities (table 1). By defining an optimum model for a project manager in each of behavioral capabilities, this standard tries to identify which capabilities a manager should grow.

Behavioral capabilities of a manager based on relations between individuals and groups involved in project, program, and portfolio of projects.[14]

1- Leadership	2- Proficiency
3- Motivation	4- Advisory
5- Continent	6- Negotiation
7- Courage	8- Critics
9- Solace	10- Trust
11- Open mind	12- Ordinance
13- Creativity	14- Profession manner
15- Result-based	

Table 1- behavioral capabilities needed for a project manager

Regards to what stated above, a gap in this case can be seen and it needs more research in this field.

5- TOOLS AND TECHNIQUES OF STRATEGIC BEHAVIOR MANAGEMENT

[This section is written mainly based on Grundy research]

before introducing tools and techniques of strategic behavior management, it is necessary to mention that amounts of behavioral analysis methods are extremely limited and a few quantitative researches had been done about this subject. The techniques introduced for the strategic behavioral management were used in a research in British Telecom with focusing on strategic behavior of a senior team and it had satisfactory results. [1, 4] It is essential to say that some of these techniques had been known during this research. For better understanding of behavioral issues methods in strategic project management and their functions, these methods categorized in 3 groups in Fig 2 as below:

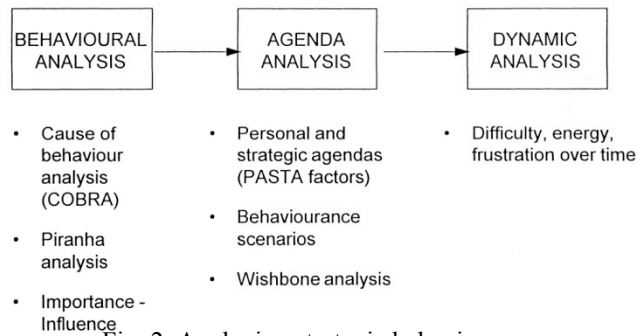

Fig. 2. Analyzing strategic behavior.

First group analyze the behaviors. It is important that a specific behavior from individuals, managers and other stakeholders be analyzed and its personal and behavioral factors illustrated. Thus, In this group, the probably problems, were studied and possible solutions were presented too. In second group, the main objective is prediction of future behavior of individuals according to their internal features and type of activities. Therefore, the main objective is future events not current. In third group, which includes only one method (frustration and energy over time curve) has been stepped and dynamic behavioral analysis is measured.

5-1- Cause of behavior analysis (COBRA)

This method applies root cause or fish bone analysis [1] to behavioral issues. It can be used for getting hold of less tangible factors.

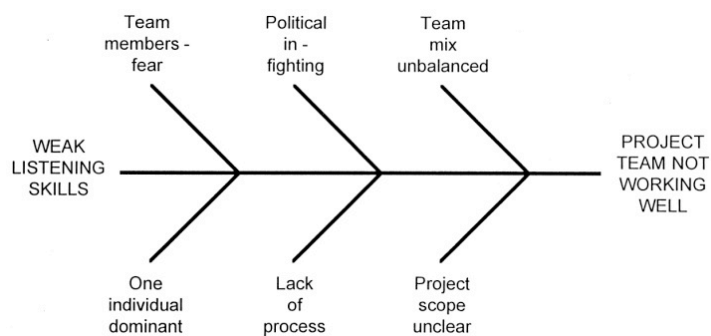

Fig. 3. Cause of behavior analysis. (Factors of insufficient performance in project team) (COBRA)

CORBA analysis can be used to understand:

- Reasons of inappropriate behavior of a team
- Dysfunctional behavior of an individual related to project team
- Recognition of areas which need to deal with

Potential weakness of COBRA analysis might be:

- Managers often noticed to apparent causes rather than root causes
- Generally, main root causes are missed because these factors are usually hidden or mis-defined.

- Using of this analysis result may cause sensitivity; therefore COBRA hardly might be used.

5-2- Piranha analysis

This method is a refinement of fishbone technique. Each behavioral problem may not affect the project success but a complex of these factors can lead the project to defeat. (Piranhas are small fish but they move and attack in shoal form.)

sometimes the sub problems in a project might be mis-defined. Thus, managers should try to analyze all dimensions of problems.

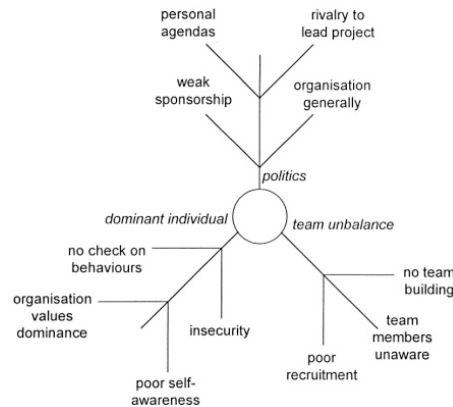

Fig. 4: Sample of Piranha analysis

5-3- Importance-Influence Diagram

This method presents the sketch of key assumption related to behavioral impacts in project as a graph and illustrates the comparison of them. Beside, this analysis shows that how the less important assumptions arrive at high risk area rapidly. This analysis can be used for prioritizing behavioral interventions. As shown in Fig. 5, the north east quadrant is the main area because having the most important and effective factor at the same time.

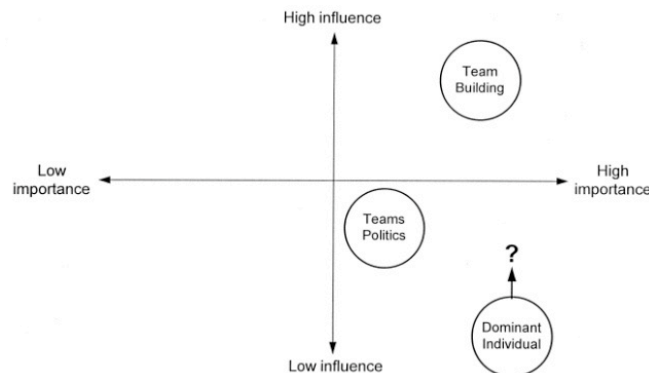

Fig. 5: Importance-influence analysis based on Piranha analysis.

5-4- Personal and strategic agenda

Sometimes, we may need to perforate the internal layers of individuals. Because both personal and strategic agenda are often intertwined, this method called PASTA (spaghetti)

This method can yield some important insight. For instance, Fig. 6 shows a fore field of one individual's personal and strategic agenda. There are two types of force in this analysis: attractors and repellers. The enabling forces called attractors. In order to get a proper handle on someone's PASTA factors, it is necessary to simulate the out of body experience which entails one imaging. PASTA analysis is an important prelude for creating behavioral

scenarios in strategic project.

For instance, a certain stakeholder might have different sub personalities

- Objective of one personality might be the cleverest in team.
- Another personality may wants to keep all of his doing in the past and protect them.
- The third personality might be helpful, kind and supportive in changes.

PASTA analysis needs to weigh up the likelihood of a certain sub personality coming to the fore in this position.

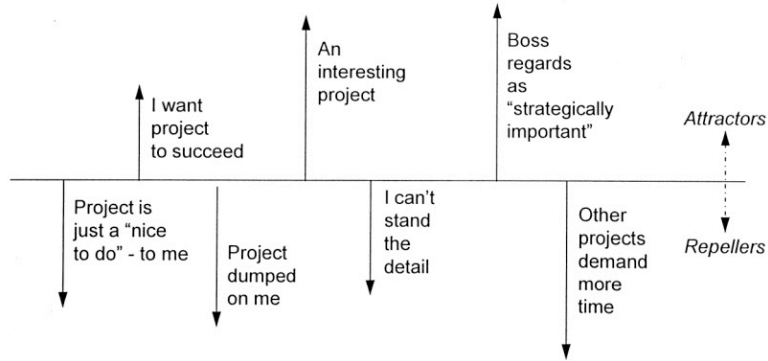

Fig. 6 : a sample of PASTA factors

5-5-Behavioral scenarios and wishbone analysis

Behavioral scenarios include organized prediction about how the future of strategic project can progress. The first step is plotting some key assumptions about behavioral effect in the project. Fig. 7 illustrates this situation. Besides, it indicates where particular behavioral assumption -either less importance or lesser uncertainty- can quickly move into the south east of uncertainty grid. (its danger zone)

Fig. 7: Importance- Certainty diagram

Behavioral scenarios can be refined by storytelling. It is very possible that these scenarios turn to be completely off-beam and this is a potential problem in using these scenarios. Despite that, the alternative does not see viable. If there would be a real doubt about one certain scenario that fails to taste out main behavioral turning points, then we can develop a second or even a third scenario. Wish bone analysis is a powerful method for making sure that not only the necessary but also the sufficient condition are created to achieve a behavioral outcome. [4]

By using wishbone analysis, the important area to guard against is that however imaginative managers are they may fail to capture the one or more factors which still need to be aligned but currently are not.[4]

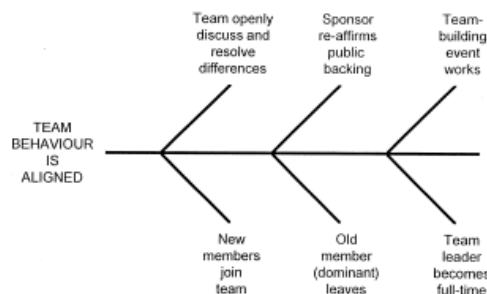

Fig. 8 : Wish bone analysis

5-6 Difficulty, energy and frustration over time curves

Although what stated is useful for deep perception to strategic behavior factors related to strategic projects, still dynamic of these behaviors should be considered. For this purpose, difficulty, energy and frustration curves over time were used by Nokia & Amersham for the first time. Nokia, especially uses these curves for encouraging managers to anticipate future behavioral problems.[1] Fig. 9 plots behavioral difficulty and energy over time for a typical strategic project.

Fig. 9: Difficulty and energy over time curves

We can see when the behavioral difficulty increase; the energy of team goes down frequently. This reduction in energy is owing to the team that gets less eager as well of increasing behavioral difficulty (obviously, if the tools mentioned in source [1] were used, this could be avoided). By using Fig. 9, we can understand that why strategic project fails at an interval of six month right after beginning. Fig. 10 shows energy and frustration curves over time. Like before, as the energy goes down, the frustration increases unless the energy be injected to the system.

Fig. 10. Energy and frustration over time curves.

At Nokia, drawing these curves revealed patterns referred before. This supported the idea that managers direct project from now to future rather than the backward from future to present. Of course, for extending these cases, activities, belief and confusion are combined over time to previous events.

The main concern about this technique is the probability of occurring subjective behavior while plotting. For solution, besides collecting various and independent inputs, we can ask different question like "why do you think this project will get more difficulty at time T ?" from managers.

6- RESULT OF USING STRATEGIC BEHAVIOR MANAGEMENT'S TECHNIQUES

Mr.Grundy – the British Telecom counselor- was charged to prepare the way for success in doing some strategic projects from behavioral view. In sequence, he used these steps:

- 1-Opening interview with team members.
- 2- Observation at a primary strategic workshop where managers interacted in their usual style.
- 3- Making an abstract of interview in order to reflect behaviors and recognize what is known as behavioral problems.
- 4- Feedback to the team by presenting obtained behavioral pattern with discussing.
- 5- Facilitation by the researcher on another strategic workshop for making changes in team behaviors.
- 6- Observation of final strategic workshop to change the manager's behavioral patterns from previous case.
- 7- Preparing a final feedback from entirely finding.

The process above took long about 4 months to give chance for changes in behaviors. The results were as below:

- 1- Managers get disappointed in confrontation with low speeds of strategic projects' rate. Some discussion finish without any clear result and others usually become conclusive, because of behavioral disagreements.
- 2- The cause of behavior analysis (COBRA) is a powerful assay for managers o analyze and feedback. This method let managers to intervene in the team properly and can be used for anticipating future in order to change for betterments.
- 3- It is an interesting point that in sessions, the members focus on slight and unimportant subjects compared with important and strategic ones. Feedback of this situation shows the level and dynamic of discussion and reveals the effect of surplus punctiliousness. (This situation named rabbit hole thinking). Fig. 11 and 12 shows the level of generality in sessions over time.

Fig.11: COBRA analysis related to behavioral problems in BT strategic projects

Fig. 12: levels of discussion over time in BT sessions

4- Another important finding obtained from next projects interview. Only when the team focuses on subject and shares comprehensive and assumptions between members, it can reach to maximize cumulative power and harmony in behavior thus by having more clarity in the team, less behavioral problems occur.

5- The next finding is about certain behavioral factors which direct managers' insight. The main factor is managers' personal intentions Including feeling, emotions, thought, abilities and other individual characteristics. This territory is very important specially when the project is complicated and its efficiency depends on team's comprehensions. When managers can challenge their behaviors, fundamental changes occur in manner and idea challenges changes to potencies. The result of this research shows the satisfaction of members about revealed structure of behavioral patterns and needed changes. Thus this method got used for next project also. COBRA analysis was powerful in reflecting managers' behavior. Therefore it was effective in changing manners. By using individual instruction method, the area of members' idea can be detected and disputes got prevented.

7- CONCLUSIONS

1- There is no doubt in value of strategic management, but its success gets weak without behavioral and analytical techniques. Although there are many researches on these techniques and they are widely used by managers, few effective and applicable tools for recognition behavioral factors are introduced and used by managers.

2- Generally, interaction between members in project, leads them to the success. Many authorities think to make stronger team work, regardless to the importance of behavioral and individual patterns. In strategic management literature, mostly paid attention to strategic decision making and there is a few cases about behavioral patterns dealing with problems.

3- On the other hand, suchlike cases that handle with behavioral subjects have usually positivistic look and neglect the human role which is the nature of topic. This mechanical look to human's manner and character causes unreliable and time variable results from analysis.

4- It can be seen that in behavioral discussions the focus is on strategic project members and managers and their behavioral factors whereas the other beneficiaries are noticeable and inputting them in our analysis is very important.

PERCEIVED ORGANIZATIONAL SUPPORT AND ORGANIZATIONAL CITIZENSHIP BEHAVIOR: A STUDY OF HOTEL EMPLOYEES IN CAPPADOCIA

Emine Ogut
Selcuk University, Turkey

Ibrahim Ilhan and Metin Kaplan
Nevsehir University, Turkey

Melis Attar
Selcuk University, Turkey

ABSTRACT

The aim of this study is to analyse relationship between perceived organizational support and organizational citizenship behaviour in hotel businesses. According to results of correlation analysis a positive relationship between perceived organizational support and conscientiousness and civic virtue, subdimensions of organizational citizenship behavior, was determined while no significant relationships were found between perceived organizational support and other three variables such as altruism, courtesy, and sportsmanship.

Key words: *Perceived Organizational Support, Organizational Citizenship Behavior, Hotel Businesses*

INTRODUCTION

Customer satisfaction is based on employees' performance to a great extent in tourism businesses in which they work hard and at irregular work hours. Cooperation and mutual assistance is an indispensable prerequisite to provide an efficient service in hotel businesses, which requires employees' organizational citizenship behaviour.

Development of organizational citizenship behaviour is based on some antecedents. This study focuses on perceived organizational support defined as "global beliefs concerning the extent to which the organization values their contributions and cares about their well-being" (Panaccio and Vandenberghe, 2009: 224). Employees who feel that they have been well supported by their organizations tend to reciprocate by performing better and engaging more readily in citizenship behaviour than those reporting lower levels of perceived organizational support (Wayne et al., 1997: 90).

In this context, the research objective of this study is to investigate the relationship between perceived organizational support and organizational citizenship behavior (altruism, courtesy, sportsmanship, conscientiousness, and civic virtue) in five-star hotel businesses.

Perceived Organizational Support

Perceived Organizational Support (POS) is a unidimensional measure of the general belief held by an employee that the organization is committed to him or her, values his or her continued membership, and is generally concerned about the employee's well-being (Hellman et al., 2006: 631). According to organizational support theory, POS meets socioemotional needs, provides assurance that aid will be available when needed, and indicates the organization's readiness to recompense efforts made on its behalf (Eisenberger et al., 2001: 42). POS corresponds to the degree to which employees feel that the organization that employs them is willing to equitably compensate them for their efforts, help them in case of need (e.g. illness, work-related problems), make their work interesting and stimulating, and provide them with adequate working conditions (Aube et al., 2007: 480).

Eisenberger and colleagues suggested that an employee's perception of how an organization values him or her may be vital for determining if any attitudes or behaviours benefiting the organization emerge from social exchange relationship (Moorman et al., 1998: 351). Employees having the perception of strong organisational support are more likely to behave on behalf of the organisation theoretically. In this frame POS is usually associated with Blau's (1964) social exchange theory, which argues that employees will trade their efforts for the promise of material and personal rewards that the organization may offer in the future (Stamper ve Johlke, 2003: 571).

Organizational support theory also addresses the psychological processes underlying consequences of POS. First, on the basis of the reciprocity norm, POS should produce a felt obligation to care about the organization's welfare and to help the organization reach its objectives. Second, the caring, approval, and respect connoted by POS should fulfil socioemotional needs, leading workers to incorporate organizational membership and role status into their social identity. Third, POS should strengthen employees' beliefs that the organization recognizes and rewards increased performance (i.e., performance-reward expectancies). These processes should have favourable outcomes both for employees (e.g., increased job satisfaction and heightened positive mood) and for the organization (e.g., increased affective commitment, performance and organizational citizenship behaviour reduced turnover) (Rhoades and Eisenberger, 2002: 699).

Organizational Citizenship Behavior

Organizational Citizenship Behaviour (OCB) is one of the positive behavioural consequences of POS, and defined as extra-role behaviour that is discretionary and not explicitly related to the formal reward system of an organization but is conducive to its effective functioning (Niehoff and Moorman, 1993: 529; Organ, 1997: 86). OCB displays the following characteristics: (1) behaviour which is above and beyond that formally prescribed by a person's organizational role, (2) discretionary behaviour on the part of the employee, (3) behaviours not directly or explicitly rewarded in the organization's formal reward system, and (4) behaviours important for the effective and successful functioning of the organization (Piercy et al., 2006: 247). Volunteerism is the prerequisite for OCB. Organ (1988) classifies OCBs into five categories: altruism, courtesy, sportsmanship, conscientiousness, and civic virtue.

Altruism is described as those behaviours that have to do with helping a specific person, (supervisor, co-worker, or client) (Barksdale and Werner, 2001: 146). (e.g., voluntarily helping less skilled or new employees and assisting coworkers who are overloaded or absent) (Yoon and Suh, 2003: 598).

Courtesy, which describes the gestures that people exhibit at work to help prevent work problems for others (Konovsky and Organ, 1996: 255).

Sportsmanship consists of actions that employee refrain from complaining, doing petty grievances, railing against real or imagined slights, and making federal cases out of small potatoes (Yoon and Suh, 2003: 598).

Conscientiousness is discretionary behaviour that goes well beyond the minimum role requirements of the organization (e.g., working extra-long days, returning phone calls from the home office promptly, never bending the rules, entertaining only when it is clearly in the best interest of the company to do so) (MacKenzie et al., 1993: 71).

Civic virtue, responsibly participating in the life of the firm (e.g. attending meetings/functions that are not required but that help the firm, keeping up with changes in the organization, taking the initiative to recommend how procedures can be improved) (Dimitriades, 2007: 473).

Previous research has demonstrated that POS relates positively to organizational citizenship behaviour (e.g., Shore and Wayne, 1993: 777; Moorman et al., 1998: 354). Shore and Wayne (1993) investigated the relationship between perceived organizational support and organizational citizenship behaviour on employees and their direct supervisors working in a large multinational firm headquartered in the southeastern United States. According to the results, positive relationship between POS and OCB was found out. Results also indicate that POS is a predictor of OCB. Wayne et al., (1997) found out positive relationship between perceived organizational support and organizational citizenship behaviour of employees with at least five years of tenure at a large corporation in the United States. Wayne et al., (2002) found out positive relationship between perceived organizational support and organizational citizenship behaviour in the research on employees and their direct supervisors from two metal fabricating plants that are subsidiaries of a Fortune 500 company. Piercy et al., (2006) found out positive relationship between perceived organizational support and organizational citizenship behaviour in the research

on sales persons. Liu (2009) examined the relationships between organizational support and organizational citizenship behaviour in multinational corporations located in Mainland China. Results indicate that perceived organizational support is significantly related to organizational-directed OCB.

Researches in the related literature support the social exchange view that POS develops feelings of obligation that contribute to organizational citizenship behaviours. In the light of these findings, the following hypothesis will be tested:

H₁: There is a positive relationship between perceived organizational support and altruism.

H₂: There is a positive relationship between perceived organizational support and courtesy.

H₃: There is a positive relationship between perceived organizational support and sportsmanship.

H₄: There is a positive relationship between perceived organizational support and conscientiousness.

H₅: There is a positive relationship between perceived organizational support and civic virtue.

METHODOLOGY

Sample

The sampling is from employees in five-star hotel businesses licensed by the Tourism Ministry in the Cappadocia Region. Participants work in front offices, food and beverage, and storey services departments of these hotels. Interviewers were recruited to distribute to 150 subjects. In total 135 employees responded to the survey. Of the employees who responded, 128 provided useable questionnaires on all study variables for a response rate of 85.3 per cent.

TABLE 1

The demographic profiles of employees are shown in Table 1. 32.8% of participants that responded to the questionnaire were female and 67.2% were male. 68.8 percent of the respondents were married and 31.3 percent were single. Almost 75.0 percent of the respondents were younger than 30 years old. In terms of education levels, 21.1% of participants had graduated from primary school, 55.5% from secondary school, and 17.2% from high school. 6.3 percent of the participants had a bachelor's degree. When worked departments are taken into consideration, it is seen that the participants to the survey are more employed in food and beverage (43.8 percent), front offices (28.9 percent), and storey services departments (27.3 percent) in these hotels. 52.3% of the participants completed the tourism and hotel management training.

Measures

Organizational citizenship behavior (altruism, courtesy, sportsmanship, conscientiousness, and civic virtue) was designated as the dependent variable in this study, while perceived organizational support was considered as the independent variables. To measure perceived organizational support, we used the short version of Perceived Organizational Support Scale with 10-items developed by Eisenberger et al. (1992) and Lynch et al. (1999). Participants responded on a 5-point Likert-type scale dictating to the extent which they agreed with each statement as it reflected their present work environment (1= strongly disagree, 5= strongly agree). The internal reliability estimated for this sample was 0.80. On the other hand, organizational citizenship behaviour was measured with 20 items 5-point Likert scale (1=strongly disagree, 5=strongly agree) developed by Podsakoff and MacKenzie (1989). The items were classified in terms of the five dimensions of altruism (helping other members of organization in their tasks), courtesy (preventing problems deriving from the work relationship), sportsmanship (accepting less than ideal circumstances), conscientiousness (dedication to the job and desire to exceed formal requirements in aspects such as punctuality or conservation of resources), and civic virtue (responsible and constructive involvement and participation in issues confronting the group and organization) (Dimitriades, 2007: 473; Konovsky and Organ, 1996: 257). Each subscale contained 4 items and Cronbach's alphas were as follows: 0.84 for altruism, 0.86 for courtesy, 0.68 for sportsmanship, 0.78 for conscientiousness and 0.88 for civic virtue.

RESULTS

Table 2 shows means, standard deviations, correlations among variables, and cronbach's alpha coefficients.

TABLE 2

As shown in Table 2, as a result of Pearson correlation analysis perceived organizational support had significant and positive relationships with conscientiousness ($r=.227$; $p<0.01$) and civic virtue ($r=.177$; $p<0.05$). According to these findings H_4 and H_5 were supported. This finding was similar to the study results of Liu (2009). No significant relationships were found between POS and other three variables such as altruism, courtesy, and sportsmanship. In this respect, H_1 , H_2 , and H_3 were not supported. Conscientiousness and civic virtue are related directly to the contributions of individuals to the organization while altruism, courtesy, and sportsmanship are concerned with the individuals' interaction with others. Hence, it is an expected result that there is positive relationship between POS and conscientiousness and civic virtue.

The following suggestions can be offered in order to get employees to have the perception of a supportive organization;

- Creative ideas, suggestions, and comments of the employees should be taken into consideration,
- An effective communication system should be provided,
- A participatory management approach should be adapted.

There are potential areas for future research. It is suggested that antecedents and consequences of POS and OCB should be investigated for different industries or organizations.

INFORMATION TECHNOLOGIES AND E-BUSINESS

THE IMPACT OF INFORMATION TECHNOLOGY INVESTMENTS ON FIRM PERFORMANCE IN NATIONAL AND MULTINATIONAL COMPANIES

Cemal Zehir

Büşra Müceldili

Bülent Akyüz

Ali Celep

Gebze Institute of Technology, Turkey

ABSTRACT

*The aim of this study is to research the relationship between information technology (IT) investment level, IT usage, IT perception, IT at decision process, future orientation, technology orientation and firm performance in the comprehensive competitive environment. According to this aim, we researched the related literature and after developing a research model and hypotheses, we made numerous analyses. The data of this study were obtained from a sample of different **National and Multinational Companies** in Turkey. 158 firms were given the questionnaire which traded on ISE(Istanbul Stock Exchange) and 94 have answered and returned it, we narrowed our sample with 81 firms which really answered correctly and carefully. In accordance with literature, the findings of this study showed that IT investments are vital component of firm performance. If firms manage IT investments successfully, they will enhance firm performance. Moreover, the study enlightens not only the practitioners but also the academicians for the future researches.*

Keywords: Firm performance, information technology, information technology investment, technology orientation, future orientation.

INTRODUCTION

Based on literature on management strategy, unique resources in a firm played role for competition (Huang, Ou, Chen, Lin, 2006). Information technology (IT) can be accepted as a unique resource in a firm in the ends of the 20th century and 21st century. According to Grant, IT- based resources can be classified as: tangible resources that comprising the physical IT infrastructure components, human IT resources that comprising the technical and managerial IT skills, and intangible IT resources, such as knowledge assets, customer orientation and synergy. The long term survival of firms is closely related to their ability to successfully managed information technologies (IT) in today's harsh and rapidly changing business environment. IT is the fastest growing sector in the economy, with 68 percent increase in output growth rate projected between 2002 and 2012 (Callahan, Gabriel and Smith, 2009). And corporations have invested billions of dollars in information technology (IT) over the last 20 years (Ta Byrd, Te Marshall; 1997). The reason of this growth is due to three factors. First, IT is no longer primarily confined to backroom operations. As Ceo of Wal-Mart says, "At Wal-Mart and at many other companies, technology has become integrated with every aspect of the business". Second, the role of Ceo has been elevated from the back office to the board room and companies now emphasize the ability of Ceo with his or her contribution beyond IT functionality. Third, the use and misuse of IT have become fertile ground for an ever increasing number of opportunities to either gaininig a competitive advantage or falling into a position of competitive disadvantage (Dehning, Richardson, Staratpoulo, 2005). So manufacturer and service organizations must follow IT trend. This trend is about investments to hardware and software and globalization to the information technology networks (Wen&Sylia, 1999).

Despite the substantial investments in IT by corporations, direct linkage between technology investment and increases in productivity and performance have been extremely elusive. Anticipated benefits from technology investments include reduced costs, improved quality, increased flexibility, improved customer satisfaction, higher productivity and ultimately, higher financial performance. Because of the enormous expenditures on IT at today's organizations, researchers and practitioners through investigation, are seeking to understand better the relationship between IT and performance. To determine this relationship, researchers must discover the relationship between IT and organizational performance (Ta Byrd, Te Marshall; 1997). Although, for over a decade, the researchers have studied the impact of IT investments on firm performance, studies are inconsistent (Yao, Sutton, Chan, 2009). While some studies have found positive relationship between IT

investments and performance, other studies found a negative relationship, and numerous other studies showed no relationship (Ta Byrd, Te Marshall; 1997).

To overcome this perplexing situation, many IT scholars have used more rigorous and scientific research framework; large sample datasets, including additional factors such as a time lag, the information intensity of the industry, new methodology and new theories (Kim, Xiang, Lee, 2009). Moreover, the relationship between IT and firm performance differs from developing countries to developed countries. Because, economic growth, regulation levels, labor costs, IT skills and availability, and heterogeneity, competition, complementary organizational innovations and culture can be different across countries (Kim, Xiang, Lee, 2009). Therefore, the primary purpose of this paper is to investigate the relationship between IT investments and organizational performance as technology orientation and future orientation concept in IT investments in Turkey.

LITERATURE REVIEW AND DEVELOPMENT OF THE HYPOTHESES

In this study, we investigated the relationship between firm performance and IT investments. The effect of IT can be seen at different levels of analysis including individuals, groups, organizations, industries and societies. The level of analysis in this study is at the organizational level. This research investigates the behaviours of employee and managers who establish the long term interaction between information technologies and firms.

According to this aim, the related literature was researched, the research model and hypotheses were developed, and numerous analyses were made.

Information Technology Investments

According to economical view, IT is an input in the production process and there is an interaction between IT and other inputs. Thus, IT provides benefit to the organizations more than capital and labour. IT's benefits can be evaluated at the organizational, industrial and nation level (Hu& Quan, 2004). For providing performance, organizations should invest and coordinate IT effectively (RMS,2008).

In this study, the factors affecting firm performance have been analyzed under four main topics. These are IT investment level, IT usage, IT perception and IT at decision making process. At the first stage, we made a study of the effects of these four factors on technology and the future orientation, whereas we studied the effects of technology and future orientation on firm performance at the second stage.

IT enables the transformation of organizations activating on different industrial branches to associated marketing firms, whilst universalizing the strategical unions among the enterprises (Iraz, R, 2008). IT investments have an impact on economical growth. In consequence of consistent innovation and the usage of technology, new processes can be developed and product outcomes can be increased (Artzeni&Carboni, 2001). Information technologies set up communication platforms on the world by connecting people and gaining access to precise information by means of World Wide Web (Kraut, 1998).

H1: There is a relationship between IT investment level and firm performance.

Firms make the description of the daily problems confronting in their activities by using IT. IT usage guides to formulize the policies which will stimulate the economical growth and development. It also provides very significant foresights for the rule regulators working on the field of specific sector development (Esselaar, 2006). Product quality standards continue to increase regularly with the usage of IT. The computer supported designing models increase the performance of machines and products by using advanced simulation technics. It also decreases the levels of tolerance during production process through effectively set up feedback mechanisms (Iraz, R, 2008).

H2: There is a relationship between IT usage and firm performance.

In context of technology, the perception of technology is different individual to individual. According to Technology Admit Model (TAM) while individuals decide to accept or refuse the new technology, they focus on facility usage and effectiveness. A person's degree of belief on using the system easily or difficultly can be defined as a facility usage (Davis, F.D, 1986).

H3: There is a relationship between IT perception and firm performance.

Decision-making process is the most important role of a manager in organizations, because survival of organizations depend on the managers' decisions. For example, a manager can acquire the information which is necessary for production process by complex ERP system or simple software matrix programme (Tanoğlu and Basoğlu, 2005).

H4: There is a relationship between IT at decision process and firm performance.

A future orientation firm gives particular importance to the potential customers and competitors beside the current customers and competitors. Future orientation firm considers both the future market and its customers, competitors and current customers' needs (Chandy and Thelis, 1998).

H5: There is a relationship between future orientation and firm performance.

H6: There is a relationship between IT at decision process and future orientation.

H7: There is a relationship between IT investment level and future orientation.

H8: There is a relationship between IT perception and future orientation.

H9: There is a relationship between IT usage and future orientation.

Technology can be conceptualized as a subunit strategy of sources used by a firm on present and future innovation efforts. High firm performance depends on the technological proficiency of the firms. Unless a firm predicts and follows the technological developments and use these developments for the improvement of its own product and process, high firm performance may not come true (Freeman and Soote, 1997; Meesuus and Oerlemans).

H10: There is a relationship between technology orientation and firm performance.

H11: There is a relationship between IT at decision process and technology orientation.

H12: There is a relationship between IT investment level and technology orientation.

H13: There is a relationship between IT perception and technology orientation.

H14: There is a relationship between IT usage and technology orientation.

Firm Performance

There are several definitions of firm performance in the literature but the simplest definition is to measure productivity (Zehir, Yılmaz, Velioğlu, 2008). Performance is generally stated as a doing business, implementing successfully. Performance, the main criteria of measuring success, could be defined as quite a wide concept that evaluates the ability to achieve the organization's targets successfully (Akal; 1994).

Performance can be evaluated with qualitative criteria such as job satisfaction, organizational commitment, perception of justice and quantitative criteria such as profitability, investment return ratio, sales growth in the studies. In this study, quantitative criteria such as financial, market and innovation performances are used. Financial performance measure the organization's basic economical targets, and these targets are important for practitioners and researchers; therefore in the studies, financial performance is used commonly. Profitability, revenue, investments' return ratio are used commonly in the studies and they are called financial performance evaluation criteria.

In addition to financial performance, market performance is important, too. Market growth and sales growth are important for practitioners and researchers, too. Customer satisfaction and commitment, change in market share, communication with customers in advertising or sales are used commonly in the studies as market performance criteria. Because of the rapid change in the demands and needs of customers, the product life get shorter. To handle this problem, firms must make radical innovations (Hunt, Morgan, 1996).

So, practitioners and academicians began to study about innovation concept. They made field study and developed appropriate measure criteria. The innovation performance criteria are about the R&D rate in the firm's budget, the new products, the new projects, the quality of the new projects and new products.

In our research, with the guidelines of literature review and previous empirical research, a research model has been developed to predict effects of IT investment level, IT usage, IT perception and IT at decision making process and future orientation and technology orientation on firm performance. The research model is presented below:

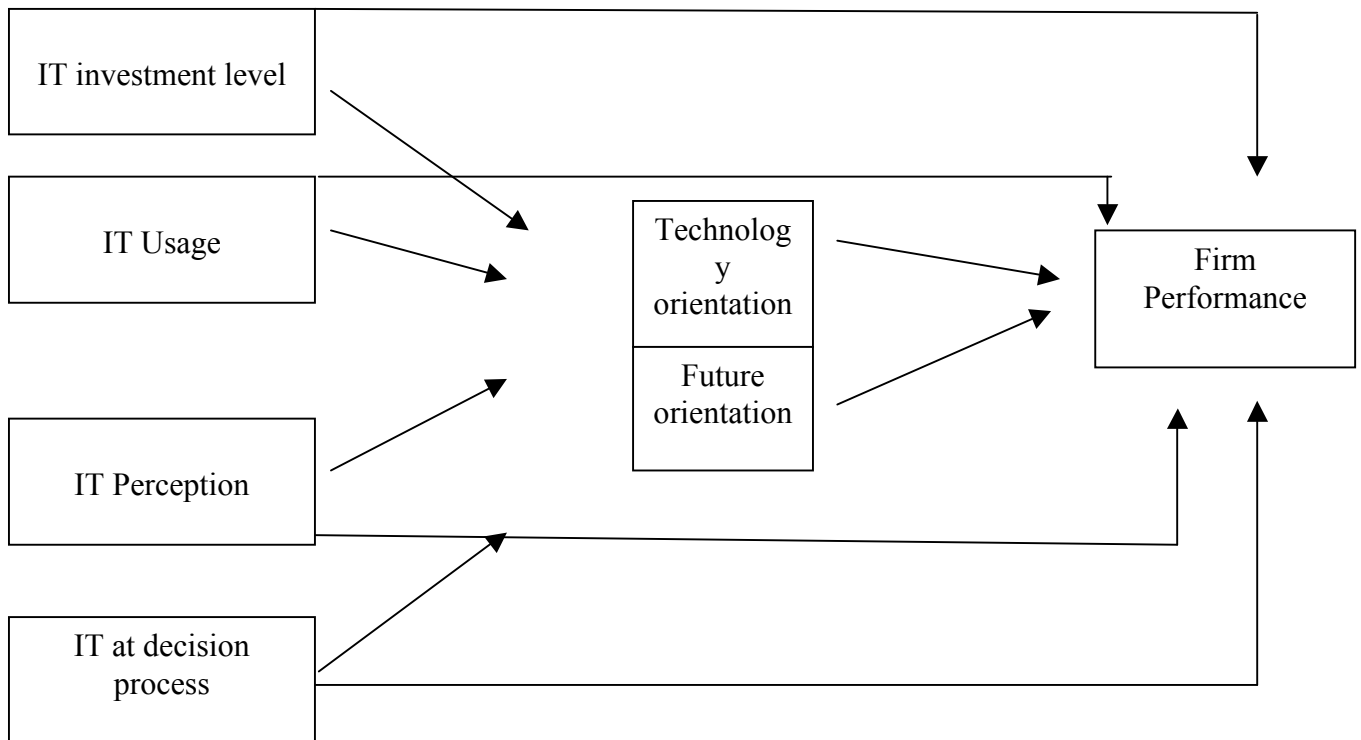

Figure 1: Research Model

METHODOLOGY AND RESULTS

Sample and Data Collection

In this study, we gathered data from a sample of different **National and Multinational Companies** in Turkey which traded on ISE (Istanbul Stock Exchange). Although firms' institution level in Turkey is lower than developed countries, the firms which traded on ISE are high. The main reason of choosing this sample is that, the institutional firms consider about IT investments at higher degrees.

Firstly, we phoned firms which traded on ISE and gave information about our research. Then, we sent the questionnaires to 158 firms which accepted answering by e-mail or mail, and 94 of them answered the questionnaires. After investigating the questionnaires; we narrowed our sample with 81 firms which really answered correctly and carefully. Ninety-two percent of the participants were young and middle-aged. Sixty-four percent of the participants were male. Sixty-one percent of the firms have 250 or above employer. We tested the data with the help of regression analysis and all items included in the questionnaire were measured on a 5-point Likert-type scale. The items that we used were mostly tested in previous research and were proven to be theoretically strong.

Measures

IT Investment Level: To assess actual IT investment level, we used Steve Esselar (2006) 6-item measurement.

IT Usage: To assess actual IT usage, we used Steve Esselar (2006) 6-item measurement.

IT Perception: To assess employees' perception of IT product service, we used İlda Tanoglu and Nuri Basoglu (2006) 7-item measurement.

IT at decision process: To assess employees' decision on the problems and utilize IT technology, we used İlda Tanoglu and Nuri Basoglu (2006) 7-item measurement. We searched for the level of firms' technology values and the level of firms' technology trend.

Technology orientation: We measured technology orientation with using the Barzack (1994) 7-item measure.

Future orientation: We measured future orientation by using the Barzack (1994) 3-item measure. We researched the level of future orientation and the level of future orientation behavior.

Firm Performance: To assess firm performance, we constructed measurement by combining Lumpkin&Dess (1996), Antoncic (2003), Zahra (1993), Alpkhan (2005).

Factor Analysis

We used SPSS software 16.00 for the evaluation of our data. Factor analysis, correlation, reliability tests, the means of the variable and regression analysis were used to analyze the relationship between variables of the research model.

Varimax rotational, exploratory factor analysis in SPSS software have been used to evaluate factor structure for the variables. We used the Cronbach's Alpha to estimate reliability for scales. These items and factor loadings are presented in Table 1 and Table 2.

KMO: ,855 Explained total variance: %72,243	IT at decision process(Cronbach α : 0,873)	IT level(Cronbach α : 0,702)	IT perception Cronbach α : 0,781)	IT usage (Cronbach α : 0,780)

Table 2: Dependent Variables Factor Analysis

Correlations between Variables of the Study

We calculated means and standard deviations for each variable and created a correlation matrix of all variables used in hypothesis testing. Means, standard deviations, reliabilities, and correlations among all scales used in the analyses are shown in Table 3. The means and standard deviations are within the expected ranges.

Correlation analysis is conducted to research the relationship between dependent variables (IT investment level, IT usage, IT perception and IT at making decision process) and independent variables (technology orientation, future orientation and firm performance).

According to correlation analysis; there is a medium relationship between dependent variable technology orientation and IT usage and IT at the making decision process ($p < 0,01$) and there is a weak relationship between technology orientation and IT investment level and IT perception. ($p < 0,01$). There is a medium relationship between dependent variable future orientation and IT usage, and IT at making decision process, IT investment level and IT perception ($p < 0,01$). There is a medium relationship between dependent variable firm performance and IT usage, IT at making decision process, IT perception and IT investment level and there is a strong relationship between technology orientation, future orientation and firm performance ($p < 0,01$).

According to correlation analysis, all hypotheses are supported.

Table 3: Mean, Standart Deviation and Correlation Coefficients

Test of the Hypotheses

The regression tables showed the effects of IT investment level, IT usage, IT at decision process and IT perception and future orientation and technology orientation on firm performance. The regression models examining the effects of IT investment level, IT usage, IT at decision stage and IT perception on future orientation. IT perception ($p < 0.1$; β : ,188), IT investment level ($p < 0.001$; β : ,316) IT at decision stage ($p < 0.001$; β : ,303) is statistically significant with future orientation, IT usage does not have a statistically significant effect on future orientation. So, H6, H7, H8 are supported and H9 is not supported. IT at decision stage is statistically significant effect on technology orientation ($p < 0.01$; β : ,376). So, while H11 is supported; H12, H13 and H14 are not supported. Future orientation is statistically positively significant with firm performance ($p < 0.01$; β : 405). So, H5 is supported. Technology orientation is not statistically significant with firm performance. So, H10 is not supported. IT usage (β : 236) and IT investment level (β : 347) is statistically positively significant with firm performance ($p < 0.01$). So, H1 and H2 are supported and H3 and H4 are not supported.

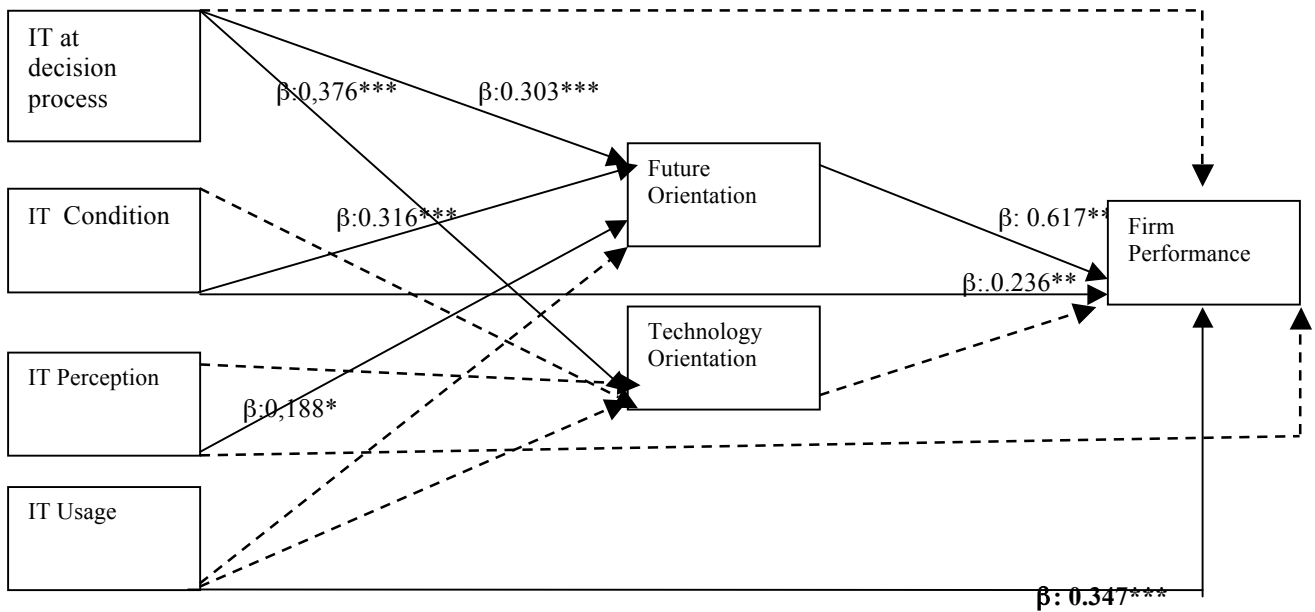

The mediating effects are investigated. The mediating effect of technology has dominated the IT usage and decreased the Beta value. Future orientation has shown intermediate variable effect and has dominated IT usage and IT investment level effect, so has caused the decrease of the Beta value.

Table 4: Regression Analysis Results

REGRESSION MODEL

Conclusion and Future Research

These results should be important to managers and practitioners beside IT researchers; because IT investments have a vital role in today's organizations. If the firms manage the investments correctly and carefully, they can manage the market and they can be market leader. The investment costs are important for organizations. Hence, IT's role in the organizations and maximizing the benefits of IT are very important for performance and success of the organizations in the future.

In this study, IT investment level, IT usage, IT at decision process and its concepts and their effects on technology orientation, future orientation and firm performance were investigated and a research model was developed.

For analyzing data, SPSS software was used. Firstly, factor analysis was done and questions that did not go with any factor were eliminated. The reliability analysis was done and all variables were reliable. After the reliability analysis, correlation analysis was made and all hypotheses were supported according to correlation analysis. There is a medium relationship between dependent variables and independent variables in the hypotheses. In the literature, there is not certain strong relationship between IT investments and firm performance. If IT investments are managed successfully, it can help to increase the firm performance. The relationship between IT investments and firm performance has been investigated at different aspects in the literature such as type of investments, industry company size, type, company location. (Rotzocki N, Weistroffer H.R; 2009) And Dos Sontos, Kim and Morris found positive relationship between firm performance and IT investments. Our research also found a positive relationship between IT usage and IT investment level between firm performance.

When we take future orientation while examining the effects of dependent variables on intermediate variables, the effect of IT usage has dominated the other dependent variables; whereas when we take technology orientation, IT at decision process has dominated the effect of all dependent variables.

The research was done in Turkey- developing country - and the results show that future orientation on IT investments have significant positive effect on firm performance. This study could be done in a developed country such as United States and the results could be compared. The questionnaire has been implemented only on firms trading at ISE (Istanbul Stock Exchange) , but could be applied on wider circles at further studies, and firm performance could be evaluated over firms' balance-sheet value. Firm performance could be measured by adding qualitative or quantitative criteria. Performance could be evaluated by business process performance such as customer satisfaction, flexibility of process and information sharing.

MEASUREMENT OF TRAVEL SUPPLIER'S WEBSITE QUALITY BY VIEW OF ITS INTERMEDIARIES' SALES AND OPERATION DIVISIONS

Can Deniz Köksal
Meltem Caber
Akdeniz University, Turkey

ABSTRACT

Extranet systems are one of the typical strategic networks of the multinational tour operators. In international travel industry, tour operators allow to use of their extranet systems online by the partner travel agencies in many inter-company processes. Staff who works in travel agencies at the intermediary-seller status, usually benefit from the web site interface of tour operators at the producer-supplier status for selling the products and services to the end-users. For this reason, the research model of this study had been generated according to the hypothesis which assumes that the quality of web site inter-face characteristics and customer services of a tour operator have direct effects on travel agency's personnel satisfaction and indirect effect on their trust towards tour operator. Besides, developing qualified web site accordance with wants and needs of users has been accepted as criteria of tour operator's concern and success at electronic customer relationship management. Herewith, the results of this study had been found contributory to understand the direct and indirect relationships among web site quality, customer services, user's satisfaction and trust concepts within inter-companies' e-CRM.

Keywords: *electronic commerce, website quality, structural equation modeling*

INTRODUCTION

The processes of benefiting from the structural advantages of the newly established information technologies in international trade relations have revealed a new understanding of the economy called as electronic commerce. In order to be existed in electronic commerce environment and to be able to respond to global competition, adaptation of businesses to technological developments has become a necessity. Tourism industry is located at the top of the industries which adapt themselves to the technological developments easily and rapidly. Therefore, tour operators as suppliers and travel agencies as intermediaries which constitute the traditional travel distribution system today, can be seen having the comprehensive information systems. These companies are followed a win-win strategy as well as by integrating their systems with each other and by sharing their customer data, too.

In this study, the tour operator's website evaluations by sales and operations staff of the travel agencies which work in cooperation with an international tour operator named "Tez Tour AS" in Bulgaria, Ukraine and Kazakhstan were examined. WebQualTM scale, tested through structural equation modeling, was reflected the most important functions in the perception of website quality of the system users. In this way, the quality measurement of website, which is one of the most important electronic commerce tools in the relationships of tour operators and travel agencies, has been made and the expectations of users from the system have been determined.

KNOWLEDGE- BASED THEORY IN STRATEGIC MANAGEMENT

Strategic management is defined as a process of assessing the corporation and its environment in order to meet the long-term objectives of the organization or the company (Alkhafaji, 2003). Strategic management enables managers to decide which tangible or intangible resources of the company can be enforced for obtaining performance improvement and competition advantage. Therefore, a fundamental question in strategy research is why companies differ in their performances (Dyer & Hatch, 2006).

Resource and knowledge-based theory in strategic management research argue that company-specific *knowledge* has the greatest potential to serve as a source of sustainable competitive advantage among the types of company-specific resources examined, and a company's knowledge base is the information inputs, know-how, and capabilities that organizational members draw on when searching for innovative solutions (Wang, He & Mahoney, 2009). Most of the intangible resources that a company can acquire or develop are

directly linked to its stakeholders. Knowledge acquisition and sharing as a part of innovation strategies enable companies to manage their interdependence with others, particularly in industries in which knowledge develops rapidly and sources of expertise are widely dispersed, like international travel industry (Soh, 2010). More recently, many scholars argue that a company's performance may be strongly influenced by its inter-company ties or its 'strategic networks' (Dyer & Hatch, 2006).

In international tourism and travel industry, travel agencies are the "mediaries" and "core stakeholders" of the tour operators who have strategic networks online with their suppliers (like extranet systems). In the related literature, strategic networks between travel agencies and tour operators in terms of strategic management have been widely ignored and very limited research can be obtained depending on the perspectives of researchers such as the importance of e-commerce for strategic management (Buhalis, 2003); the role of internet in travel distribution (Thompson, 2001); global alliances in the tourism industry (Crotts et al., 2000) and e-mediaries-competitive advantage relationships (Dale, 2003). In this study, authors aimed to contribute to the existing literature by examining a multinational tour operator's quality of extranet system and effectiveness of its features in the eye of system users for understanding the role of such systems in the content of strategic management.

THE ROLE OF EXTRANET SYSTEMS IN TRAVEL INDUSTRY

Extranet systems are one of the typical strategic networks of the multinational tour operators. In international travel industry, tour operators allow to use of their extranet systems online by the (partner) travel agencies in many inter-company processes (such as sales, marketing, contracting etc.) so that they can benefit both from the expertise of these agencies staff and to gain some performance advantages by time or cost efficiencies. On the other hand, travel agencies began to prefer to establish long-term partnerships with the proficient global tour operators that are also technologically advanced. In the perspective of strategic management, if knowledge resources of the both sides are shared mutually and spread into these extranet systems, it is going to be seen obviously that the system users begin to accomplish their duties much more easily and a great performance improvement in each operational process can be maintained.

B-TO-B ELECTRONIC COMMERCE IN TRAVEL INDUSTRY

Concept of electronic commerce which is firstly used by Kalkota and Whinston (1996) has been described as a tool to share business information, to provide commercial relations and to perform commercial changes via telecommunication networks (Tassabehji, 2003). Electronic commerce, as the scope of itself; uses telephone, fax, automated teller machines-ATM, electronic funds transfer-EFT and electronic data interchange-EDI systems (Henderson et al., 2003). However, instead of accepting electronic commerce as a particular application or a combination of several applications, it will be a more accurate approach to review it by taking into consideration with its support to the parties or businesses in their business process integration (Carter, 2002). Economic potential of information technology tools has the effect on all activities of the businesses, such as knowledge processing and communication strategies, etc. In information technology, application tools based on the ideas are created (Cohen et al, 2001). This basic set of tools provides many new opportunities from basic infrastructural constructions of enterprises to the scope of inter-industry activities.

Tourism industry has become one of the most active areas in which the internet network is used and the 33-50% of the operations of internet is carried out for the tourism associated issues (Werthner & Klein, 1999). In 2000, 7.3% of world's total travel reservations' is done online, and it is estimated that this figure increased to 16.3% in 2003. Therefore, in terms of tourism and travel industry, the importance of electronic commerce opportunities and commercial partnerships has become undeniable. Especially by the help of electronic commerce applications from customer to business and from business-to-business, industrial osmosis has gained a great impetus. In B-to-B electronic commerce environment since 1970s, special value added networks called information office systems (IOS) which put into businesses with customers and/or suppliers have been used (Archer & Yuan, 2000). Despite responsibility transfers in some cases, basic business-to-business commerce does not change the communication infrastructure between the business partners in trade channels. With the performance increase achieved with collaborative commerce, it is possible to develop all relational communication channels between businesses (Lee et al., 2003). At this stage, it will be in place to touch upon the concepts and their differences of e-business partnership and e-collaboration. E-business partnership is related to the organizational performance improvement provided by internet, ease of data transfer provided by e-commerce and ease of information sharing between e-partners. E-collaboration

contains more comprehensive structure than e-business partnerships. This concept is more concerned for supplier-vendor relationships (Zhao, 2005). The richness of digital platforms in which E-business partnership is realized, has led to significant different in the dynamic exchanges between business partners (Jarach, 2002).

WEBSITE QUALITY AND WEBQUAL™ SCALE

Website analysis, design, modeling and measurement have attracted the attention of many researchers. In general, to design a web site, is much more difficult than designing a usual kind of information system (Lowe & Henderson-Sellers, 2001). Subject of web site of modeling were examined with different purposes such as data structures and modeling, data relationships and hypermedia designs (Yen et al., 2007). Chaang- Iuan Ho (2007) pointed out to this situation in his studies and advised a four itemed e-travel service quality scale for the travel agents that operate in electronic commerce environment. The four dimensions of this scale were identified as: information quality, security, website functionality, customer relations and ability to answering. On the other hand, WebQual™ scale developed by Loiacono (2000) represents the web site users' quality perception of the systems in travel agencies sales and operations sections via extranet through their tour operator. This scale represents 5 primary (usefulness, entertainment, ease of use, response time, trust) and 12 secondary factors (information fit-to-task, tailored communication, online completeness, relative advantage, visual appeal, innovativeness, emotional appeal, consistent image, ease of understanding, intuitive operations, response time, trust) in order to discover the web site quality (Wolfinbarger & Gilly, 2003).

RESEARCH DESIGN

In the research phase of the study, authors collaborated with a multinational tour operator “Tez Tour AS.”, which was at the top in the First Major 500 Turkish Tourism Companies Index- 2008. The Quality Manager of the company has contacted with partner travel agencies in Bulgaria (92), Ukraine (80) and Kazakhstan (70) and sent to the questionnaires to the e-mail addresses of the sales staff in each agency. Data was collected by an online survey between October and December in 2009. It was determined that the average number of sales personnel per agency was approximately 2, and therefore the size of research space was calculated as 484. The useable number of the fully completed questionnaires was 336 (from Bulgaria 127; Ukraine 101 and Kazakhstan 108). The rate of response was quite sufficient (69 %) for an online questionnaire technique.

In the questionnaire, participants are firstly asked to answer some demographics and afterwards WebQual™ scale in 5 point type of Likert (1= totally disagree, 5= totally agree) and conceptual model was tested by structural equation modeling. Majority of the participants had university level of education (76.5 %); were between 26-33 years old (36.9 %) and using computer more than 5 years (92.6 %) and e-commerce programmes more than 3 years (66.7 %).

DATA ANALYSIS AND RESULTS

For testing the validity of the scale, confirmatory factor analysis was performed and at the first stage, below written factor loadings and goodness-of-fit indices have been obtained (Table I). As the X^2 value was 4090.92; degree of freedom (df) 594; RMSEA 0.133; AGFI 0.55; RMR 0.11 and SRMR 0.095, the first analysis results could not meet to the goodness-of-fit criterions.

When the items with factor loadings below than 0.45 and insignificant t-values has been eliminated (such as web19, web28, web33, web32 and rest item in one sub-dimension; web31), goodness-of-fit indices have improved and found acceptable. At the second run of Factor Analysis, RMSEA was found as 0.064; X^2 value and degree of freedom (df) values were found as 891.21 and 379, respectively (Table II).

According to the results given at Table-II, “The 11 First-order Model” is structured and is shown as at Figure 1. The “RESPONSE TIME” dimension with its 3 sub-dimensions was totally eliminated from the conceptual model and the rest of the study was conducted with 11 sub-dimensions named as “11 First-order Model WebQual™”.

Table I: Confirmatory Factor Analysis of WebQual™

trust	web36	0.87		

The discriminated validity of scale was also measured and analyses showed that all the unlimited model X^2 values were higher than limited model X^2 values. Accordingly, limited model X^2 values made out of unlimited model X^2 values and presented at Table V. Thus, the convergent validity of the scale has been supported too.

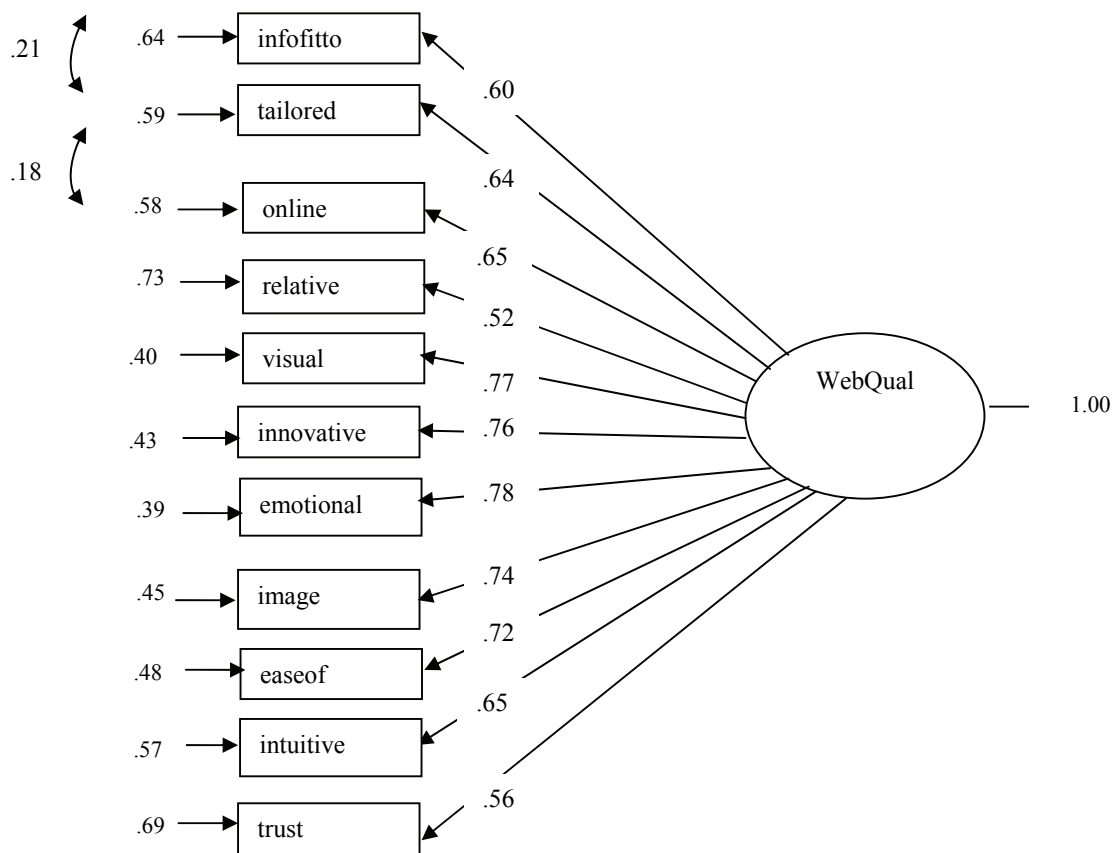

Figure 2: Single First-order Factor Model (WebQual™)

Table V: Goodness-of-fit Indices

Indices	Result	Cut-off Value
Degrees of Freedom (df)	42	
X^2	164.75	
X^2/df	3.92	≤ 5.00
Goodness of Fit Index (GFI)	0.92	≥ 0.80
Adjusted Goodness of Fit Index (AGFI)	0.87	≥ 0.80
Comparative Fit Index (CFI)	0.97	≥ 0.90
Non-Normed Fit Index (NNFI)	0.96	≥ 0.90
Root Mean Square Error of Approximation (RMSEA)	0.093	≤ 0.10
Standardized RMR (SRMR)	0.049	≤ 0.10

The single first-order factor model for WebQual™ shows that some features (or sub-dimensions) of the extranet system have more influence than others on the overall quality evaluations of the users. This research results point out that the 11 sub-dimensions of the WebQual™ and the scale itself can be accepted as an indicator of the website quality of the tour operator, and the most important features of the extranet system in the eye of users can be identified in terms of strategic management efforts.

At the last phase of the research, statistical differences among the participants according to their genders and nationalities have been analyzed. The results indicated that the system users in Kazakhstan have more positive perceptions about the system than other countries. In general, female users are more satisfied (means

3.96) with the system features than males (means 3.84). Female users are happier for using the system, for finding the effective information and for getting the confirmation of their transactions on time.

FINDINGS AND CONCLUSION

In this research, a multinational tour operator's extranet system which is one of the most vital communication and network element between the operators and their partner agencies investigated in the content of strategic management. Research results supported to the dimensionality of the WebQual™ scale, however instead of 12 sub-dimensions, in this study, 11 sub-dimensions have been obtained while "response time" dimension was found insignificant according to confirmatory factor analysis. In the future studies, researchers can analyze and compare to the divisional or functional performances among various companies and countries in other industries.

As a result, it can be said that extensive work processes, expertise necessities and high-tech infrastructure made it much more difficult for the companies in travel industry to maintain long-term partnerships and to response global competition in the last five decades. Therefore, if the system supplier knows the most important and vital features for its partner companies and system users; considerable amount of performance increases may be achieved in the long term.

APPENDIX:

Items of the WebQual™ Survey

(Five point scale, 1= strongly disagree and 5= strongly agree)

Informational Fit-to-Task (infofitto)

- The information on the Web site is pretty much what I need to carry out my tasks.
- The Web site adequately meets my information needs.
- The information on the Web site is effective.

Tailored Communication (tailored)

- The Web site allows me to interact with it to receive tailored information.
- The Web site has interactive features, which help me accomplish my task.
- I can interact with the Web site in order to get information tailored to my specific needs.

Trust (trust)

- I feel safe in my transactions with the Web site.
- I trust the Web site to keep my personal information safe.
- I trust the Web site administrators will not misuse my personal information.

Response Time (response)

- When I use the Web site there is very little waiting time between my actions and the Web site's response.
- The Web site loads quickly.
- The Web site takes long to load.

Ease of Understanding (easeof)

- The display pages within the Web site are easy to read.
- The text on the Web site is easy to read.
- The Web site labels are easy to understand.

Intuitiveness (innovative)

- Learning to operate the Web site is easy for me.
- It would be easy for me to become skillful at using the Web site.
- I find the Web site easy to use.

Visual Appeal (visual)

- The Web site is visually pleasing.
- The Web site displays visually pleasing design.
- The Web site is visually appealing.

Innovativeness (innovative)

- The Web site is innovative.
- The Web site design is innovative.
- The Web site is creative.

Emotional Appeal (emotional)

- I feel happy when I use the Web site.
- I feel cheerful when I use the Web site.
- I feel sociable when I use the Web site.

Consistent Image (image)

- The Web site projects an image consistent with the company's image.
- The Web site fits with my image of the company.
- The Web site's image matches that of the company.

On-Line Completeness (online)

- The Web site allows transactions online.

- All my business with the company can be completed via the Web site.
- Most all business processes can be completed via the Web site.

Relative Advantage (relative)

- It is easier to use the Web site to complete my business with the company than it is to telephone, fax, or mail a representative.
- The Web site is easier to use then calling an organizational representative agent on the phone.
- The Web site is an alternative to calling customer service or sales.

WORKPLACE INTERNET LEISURE BROWSING

Brent Coker
University of Melbourne, Australia

ABSTRACT

This study finds evidence showing that employees who use the Internet for non-work related tasks during work hours are more productive than employees who do not. We speculated that Workplace Internet Leisure Browsing (WILB) is an unobtrusive interruption which enables a restoration of mental capacity, and fosters feelings of autonomy that lead to happier workers. Freedom to surf as opposed to blocking internet access is thought to evoke motivations to perform through self-determination. The findings of this research have implications for internet monitoring policies in organizations.

Keywords: workplace internet leisure browsing, WILB, internet addiction.

INTRODUCTION

There is a common belief amongst employers that workers who use the internet for personal reasons during work hours are ‘goofing off’. It is not uncommon for workers to be punished or even fired for personal web usage at work. Young and Case (2004) found 34% of fifty-two companies surveyed had disciplined or fired employees for workplace internet leisure browsing (WILB). More strikingly, a study by Greenfield and Davis (2002) found that more than 60% of companies had disciplined—and over 30% had terminated—employees for WILB. But what is the basis for this belief that personal web usage during work hours is necessarily bad? Can it be argued that moderate bursts of personal web browsing during work hours are actually beneficial to a worker’s performance?

It is intuitive to believe that too much WILB will negatively affect productivity by eating into time that would otherwise be used to complete organization set tasks. However, in the present research we argue that moderate WILB is not necessarily bad, and for reasons elaborated below may be positively correlated with employee productivity. Our prediction is supported by prior literature that has made similar predictions. Seymour and Nadasen (2007) noted that higher levels of internet access in the workplace were correlated with perceptions of information literacy and information access. Lim et al. (2002) found that almost half of those surveyed believed their usage was justified in some way. Oravec (2002) argued that “Allowing for reasonable and humane amounts of online recreation [during work hours] can indeed have considerable advantages, both for the individuals involved and the organization as a whole” (p. 63). Anandarajan et al. (2006) argued that those who held a positive attitude towards personal web usage in the workplace “deserves to be given positive encouragement for appropriate and beneficial usage than total restriction of usage.” (p. 332). In their book, Anandarajan and Simmers (2003) argued that WILB may aid employees in achieving a balance between work and personal life, with added benefits including better time management, a way to reduce stress, and a method of informal learning.

The positions of these authors are consistent with more general theories of motivation which lend support to the prediction that WILB might have a positive effect on worker performance. Deci and Ryan’s (2004) self-determination theory proposes that a degree of autonomy in the workplace should have a positive effect on worker motivation, suggesting attempts at restricting or monitoring internet access may have a deleterious effect on work motivation. Research lending support to this assumption has found that greater autonomy in the workplace leads to greater job satisfaction (Baard et al. 2006), more loyalty (Deci et al. 1989), and higher quality of work performance (Breugh 1985). An alternative stream of research suggests that little unobtrusive breaks during the workday, such as may be obtained from bursts of WILB, may also have a positive effect on worker productivity, including task performance (Zijlstra et al. 1999), ability to make effective decisions (Speier et al. 1999), and as an important variable in ability to control stress (Uleman and Bargh 1989).

In this article we concur with the views of Oravec (2002) Anandarajan et al. (2003; 2006), and argue that WILB can have a positive effect on worker productivity. We define worker productivity as the degree to which an individual performs in the workplace with respect to attendance, quality of work, performance

capacity, and person factors. Framed in self determination theory, and drawing from studies that have examined the effects of interruptions and breaks on task performance in the workplace, we predict that an important byproduct of WILB behavior for those who are not obsessive-compulsive in their internet surfing behavior is an increase in motivation and net concentration over the work day, which ultimately has a positive effect on productivity.

The remainder of this article is set out as follows. In the next section we provide theoretical reasoning for our hypotheses. We then describe and present the results of survey data collected from 259 randomly selected office workers to test our predictions. Finally, we offer a discussion of our findings, limitations, and areas for future research to further understand this phenomenon.

THEORETICAL BACKGROUND

Research suggests that blocking or controlling internet access in the workplace is viewed by many employees as a restraint impinging on their sense of control. Specifically, several studies have reported that although participants were aware that WILBing was wrong, they did not agree that it was devious behavior. For example, Lim et al (2002) found in a survey of 188 working adults that the majority felt WILB was acceptable, despite experiencing feelings of guilt. Similarly, Anandarajan et al. (2006) categorized one group of respondents who viewed WILB as a way to improve performance, and another group who believed that WILB was necessary to balance working and living. Lee et al. (2007) suggested employees who WILBed felt justified doing so because they could not understand any harm was actually being done. Lim and Teo (2005) suggested one way employees rationalize their WILB behavior is by justifying personal time spent on the internet at work against time spent doing work related tasks while at home. Lee et al. (2007) also described a “Robin Hood” effect where employees differentiated harm done against the organization from WILBing against the positive micro-effects of WILB such as relationship building with work colleagues. Thus, not only did many participants feel that WILB was not harmful or immoral, many felt it was in some way beneficial to their ability to perform their job.

The incongruence between employers and employees views on the acceptance of WILB creates a conflict of interest in the workplace. While workers believe they should be allowed to WILB, management believes they should not be allowed. Efforts by employers to control employees misuse of the internet in these conditions results in resentment and feelings of being over-controlled. Having a sense of being in control is necessary for an individual to feel they have autonomy in their actions. According to self determination theory (SDT), people have a psychological need to feel that their activities are self-chosen and self-endorsed. They also have a need to feel competent and effective in their activities, and have a sense of relatedness or a feeling of having mutual respect and reliance with others (Deci and Ryan 2004).

SDT makes a distinction between autonomous motivation, and controlled motivation. Autonomous motivation occurs when one has an interest in performing an activity. Controlled motivation is evoked from external stimuli such as coercion or seduction. Of particular importance is autonomy, which has been found in prior empirical studies to be one of the strongest needs associated with high-positive and low-negative emotion. Interestingly, in a study of 10 psychological needs, Sheldon et al. (2001) found that only autonomy was negatively associated with affect. In two experiments, Sheldon and colleagues produced evidence suggesting that when people are asked to recollect deeply satisfying experiences, they recalled experiences in which they felt strongly autonomous, competent, or related to others.

Studies have found that support for autonomy by management has a positive effect on work outcomes. For example, Deci et al. (1989) found that autonomy given to employees to carry out tasks under their own volition in the workplace, and encouraging initiative rather than control, led to greater job satisfaction and loyalty. Baard et al. (2006) found support for their hypothesis that employees given more autonomy would find their employers more supportive and experience greater job satisfaction. Breugh (1985) reported a positive relationship between feelings of autonomy in the workplace and quality of work performance. Further research has found that when people feel they have more control over their actions, they are more creative (Koestner et al. 1984), and experience a strong positive outlook on the clarity of their work and perception of overall total life satisfaction (Haworth 1997).

From the other perspective, feelings of not being in control can have detrimental effect on motivations to engage in activities. For example, an early study involving pre-school children by Lepper and Greene (1975) found that those who were told they were under surveillance during an activity expressed less subsequent interest in performing the behavior again than those who were not monitored. In the medical literature feelings of not being in control have also been found to be associated with health problems (Wallerstein 1992). As a serious consequence, Marmot et al. (2000) reported an association between feelings

of not being in control and having no freedom over one's actions in the workplace with higher incidences of coronary heart disease.

These studies provide strong evidence in support of the benefits of providing autonomy to employees in the workplace. Given that many employees believe that WILB should be acceptable behavior, attempts at blocking or over-controlling internet access in the workplace could be detrimental to feelings of autonomy, eroding job satisfaction, loyalty, and motives to perform.

Another potential reason why WILB might be beneficial to employee performance is that it provides a way for employees to have a short unobtrusive break which enables concentration to restore. Not all breaks, intrusions, distractions, or discrepancies in the workplace have necessarily negative effects on the person being interrupted. For example, an interruption by a co-worker presents the possibility of experiencing feedback and information that would not have been learned otherwise (Jett and George 2003). Csikszentmihalyi (1975) noted that leisure activities were essential for emotional wellbeing and creative output. Csikszentmihalyi and Fevre (1989) argued that breaks at work enable employees to subconsciously reflect on ideas and project task elements, and found that this type of thoughtful reflection occurred more often in the workplace than during periods outside of the workplace. Uleman and Bargh (1989) argued for the physical benefits of breaks, suggesting that unintended thought occurred as a subconscious process during idle time, and that it was important to an individual's ability to control stress.

Anecdotally, the positive benefits of breaks on concentration are well known. If we do not have regular breaks when driving long distances we risk having a car accident, and if we do not give our students a break during a three hour lecture they will struggle to learn in the last two hours. In the workplace, empirical evidence suggests that breaks can have a positive effect on productivity. Zijlstra et al. (1999) found that experimentally manipulated interruptions in a simulated work environment resulted in tasks being completed quicker, and finished to the same quality as the control group who were not given breaks. They proposed this was because the interruptions caused the participants to overcompensate for perceived performance lost. Thus, the participants appeared to be conscious that the interruptions were in some way having a negative impact on their ability to perform their job, and therefore expended more effort and assiduousness in between each interruption than if there were no interruptions. Their result is consistent with an experiment conducted by Speier et al. (1999), who found support for their prediction that the decision performance of those exposed to interruptions would be higher than the control group with no interruptions. They predicted that an interruption would elevate stress, resulting in the decision maker completing the task faster while filtering irrelevant information (see also Baron 1986).

Framework

Based on the review of existing theory in the preceding section, it is not unreasonable to believe that WILB might enable a restoration of concentration during a workday, which once restored has a positive effect on subsequent task performance. Moderate amounts of WILB may be construed as an enjoyable volitional activity, much like visiting a café for a coffee with friends after work, or taking a walk, though less effortful requiring just a few clicks of the mouse. The preceding discussion on the effects of control in the workplace further suggest that freedom to surf at work fosters a sense of autonomy, which research suggests may have a positive effect on workplace loyalty, and willingness to perform. In light of this reasoning, we offer the following hypothesis.

H₁. Those who WILB will have higher workplace productivity than those who do not, or cannot, WILB

If we make this prediction, the question of frequency and duration of WILB arises. As pointed out at the beginning of this article, common sense suggests that there must be a point where too much WILB would simply eat into time that would otherwise be spent on organizationally set tasks. Assuming a positive relationship between WILB and productivity, it is logical that the relationship will be an inverted u, with WILB eventually having a negative impact on productivity after a certain period of time. Formally:

H₂. The relationship between WILB and productivity will be curvilinear such that WILB will eventually have a negative effect on productivity

Past research has found that the frequency of breaks may have a positive impact on net productivity. Specifically, research suggests short breaks are more optimal at increasing worker productivity than a few longer breaks. For example, Doerr (1986) found that those who were given more idle time on a production line (working under a pull policy) had higher productivity than those with less idle time working under a

push policy. It was concluded that more idle time enabled the workers to have “mini-breaks”, which allowed workers to maintain an overall higher level of effort. In a comparison of massed practice and spaced practice, Kanfer (1994) found that participants with a task goal with frequent breaks had higher task performance than those in a massed practice condition with no breaks. In a similar finding, Henning et al. (1997) found that short breaks were beneficial to productivity when integrated with task demands.

Collectively, the results of these studies suggest that that short breaks spaced during the workday will have a more positive effect on employee productivity than one or two relatively longer breaks. Put in the perspective of WILBing, this suggests that short episodes of WILB throughout the day should be expected to have greater effect on net workplace productivity than one or few episodes. Assuming hypothesis one, we further predict:

H₃. While controlling for duration and overall amount of time spent WILBing, frequency of WILB breaks should have a positive effect on worker performance.

Lastly, we believe moderate WILB behavior will positively affect productivity despite income, age, education, type of industry, organization size, or gender.

These hypotheses are illustrated in the following diagram (figure 1).

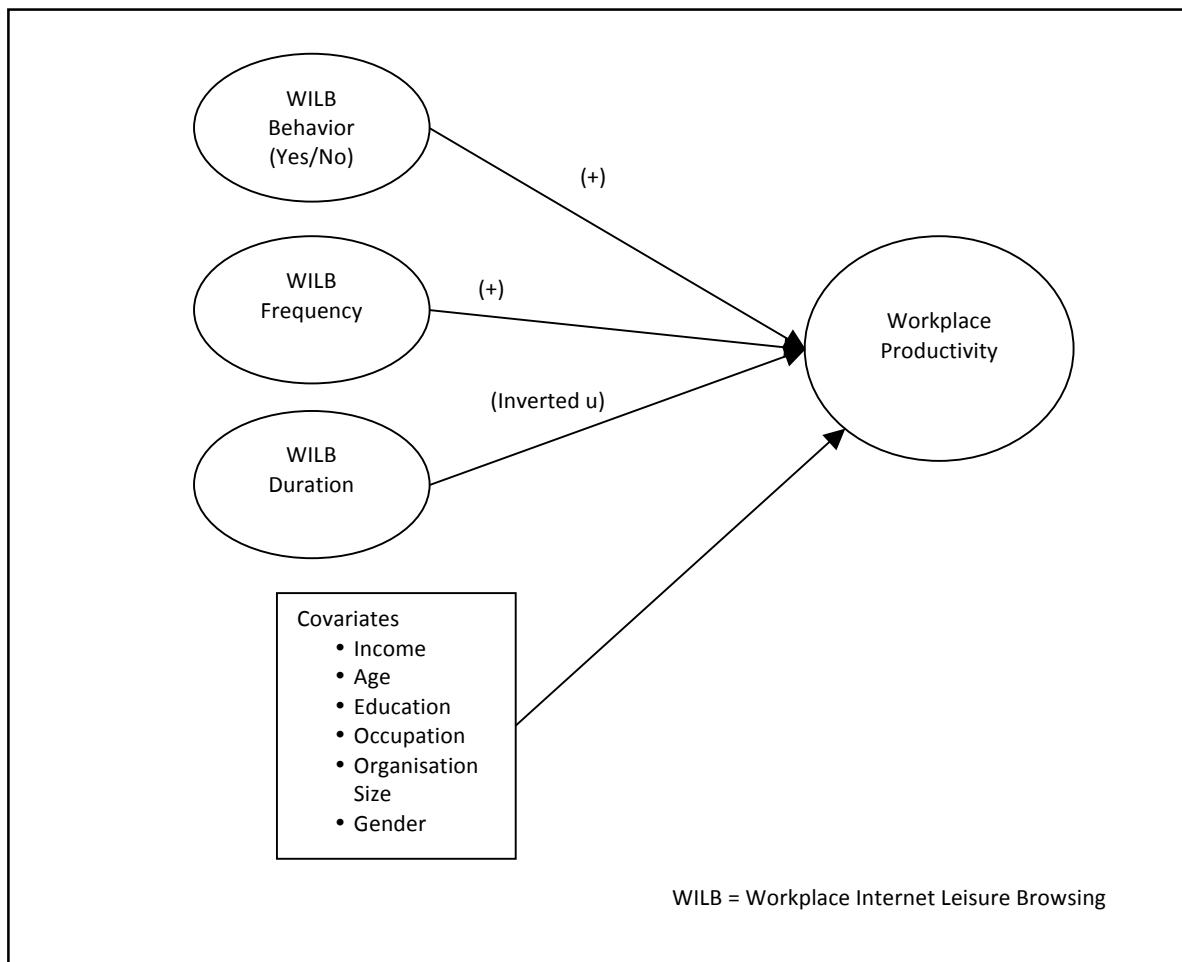

Figure 1: WILB Framework

PARTICIPANTS, DESIGN AND PROCEDURE

Data were collected using an online survey. Two-thousand and seven-hundred office workers were randomly selected from a commercial database of market research panelists. An email with a unique key and link to the survey was sent to each panelist. On clicking the link, each panelist was directed to a page which listed the instructions of the survey. The first page of the survey after the instructions page asked two dichotomous questions of whether the panelist worked behind a computer at work, and was currently employed. In total, 268 surveys were completed, of which 74% were female, and the average age was 33 years old, with 40% holding a university degree or higher in education. Twenty-three percent were a manager or administrator,

23% were a professional, 26% were clerical, sales, or service worker. The remainder (28%) indicated they were in another type of profession not listed. Average income was between 40-50k (the national average is 49k).

Independent Variables

WILB was calculated as a percentage of work time using the Internet for personal reasons while at work. A preliminary study was conducted to determine what types of WILB activities were conducted in the workplace. A random selection of participants from a commercial market research database were contacted by email to answer open ended questions about the incidences of personal and collegial WILBing they had experienced or witnessed in the workplace. Responses were recorded into a database from a web survey. Existing information on the panelists made it possible to exclude certain occupational groups unlikely to use a computer at work. Only those who were a manager or administrator, professional (e.g., scientist, doctor, lawyer), or clerical, sales, or service worker were contacted. Coding of the responses suggested 17 types of WILB activities (Table 1).

Table 1 Workplace Internet Leisure Browsing activities experienced in during work hours

Workplace Internet Leisure Activity

1. Reading online news websites
 2. Checking online sports results
 3. Checking lottery results
 4. Reading non-work blogs (including Twitter/Facebook)
 5. Writing personal blogs (including Twitter/Facebook)
 6. Reading/Writing newsgroup/discussion forum messages
 7. Shopping (browsing with an intention to purchase products and services)
 8. Browsing online shopping catalogues
 9. Browsing or participating in online auction websites
 10. Organizing personal financial affairs (e.g., online banking, stock trading)
 11. Watching online media (e.g., uTube)
 12. Playing online games
 13. Checking/writing personal emails from a non-work related email account
 14. Searching for information about hobbies
 15. Browsing websites for products or services of interest (no goal of specific purchase)
 16. Participating in online gambling activities
 17. Viewing adult websites
-

To estimate how much WILB each respondent was doing in the workplace, respondents in the main study were asked to indicate incidence, frequency and duration of each activity. Specifically, on the first page respondents were given the list of WILB activities (Table 1) and asked to indicate which of the activities they performed while at work during work hours. The activities they selected determined the questions which followed (question piping). For each activity they selected, they were then asked on a new page how often in a day, and the average duration of time for an episode they spent doing the activity. They were also given the option of choosing “less than once a day” for each WILB activity. If they chose less than once a day, they were directed to a new page, set out in the same way, but asking to indicate frequency and duration in a week. Again, respondents were given the option of “less than one a week”. If this option was chosen, respondents were directed to a new page asking frequency and duration in a month.

Respondents were also asked to indicate how many hours they usually work or would usually be expected to work per week, and how many hours they worked the previous week. This information was used to estimate the percentage of time each respondent usually spent WILBing.

An estimate of total WILB time in minutes per day was calculated by multiplying the WILB per minute duration by frequency of each WILB activity. The sum was divided by 60 to give an approximation of hours per day. To convert WILB per week into a percentage, WILB per week was divided by the number of hours usually worked in a week, and multiplied by 100.

$$WILB_h = \frac{\sum_1^{17} (wildeur_n \times wilbfreq_n)}{60}$$

Where $WILB_h$ is total time in hours spent WILBing per week, $wildeur_n$ is the average duration of each WILB activity, and $wilbfreq_n$ is the frequency of each WILB activity per week.

The following equation explains the conversion of $WILB_h$ to percentage of time spent WILBing, where $WILB_h$ is hours spent WILBing per week (equation 1), and $WORK_h$ is average hours spent working in a week.

$$\%WILB = \left(\frac{WILB_h}{WORK_h} \right) 100$$

Dependent Variable

Work productivity was measured on the Endicott Work Productivity Scale (EWPS), a 25 item scale which was designed to assess attitudes and behaviors that affect work performance and efficiency ($\alpha = .78$). The instrument evaluates worker performance in the areas of: Attendance, work quality, performance capacity, and social/mental, physical, and emotional person factors.

Covariates

Several additional variables were included in the questionnaire to determine if other variables were influencing the results. The covariates included: income, age, education, type of industry, occupation category, organization size, and gender. Those who indicated they were self-employed were excluded from the analysis ($n = 9$).

RESULTS

None of the covariates had any interaction with the WILB-productivity relationship. Hypothesis 1 predicted that those who WILB would have higher productivity than those who did not (or could not) WILB. The results found that those who WILBed had significantly higher productivity ($M = 70.30$; $SD = 11.90$) than those who did not WILB ($M = 64.66$; $SD = 15.14$) $F(1,258) = 12.23$, $p < .01$. Thus, hypothesis 1 is supported.

A quadratic equation was calculated to determine a point at which WILB would eventually negatively impact productivity. The results suggested a significant quadratic relationship between WILB and productivity $F(2,249) = 9.00$, $p < .0001$, implying the expected threshold where WILB began to have a negative relationship on productivity. The point of inflection was at approximately 12% (Figure 1). We interpreted this result as meaning that too much WILBing may begin to consume time needed to complete organizationally set tasks, thus supporting hypothesis 2.

Hypothesis 3 predicted that it is the frequency of WILB that affects worker performance, with shorter WILB breaks having a more positive effect on productivity than less longer breaks. To test this hypothesis, a dummy variable was created with zero representing cases who had an average WILB duration less than 40 minutes per day, and a frequency of WILB more than 8 times per day. A one way ANOVA was estimated using the dummy variable to compare productivity scores between those who WILBed for shorter periods and more frequently against those who WILBed for longer periods of time but less often. The results suggested that those who WILBed for shorter periods and more frequently had higher productivity scores ($M = 72.57$, $SD = 7.31$) than those who WILBed for longer periods less often ($M = 68.92$, $SD = 11.93$), $F(1,249) = 3.86$, $p < .05$. This result provided support for hypothesis 3.

DISCUSSION

In this research, we sought to understand how WILB affected worker productivity. The results suggest that WILB can have a positive effect on worker productivity, provided percentage of WILB does not exceed more than around 12% of work time. In a comparison of worker productivity scores, the results suggest that those who do WILB scored 9% higher than those who do not WILB. In addition, the results suggest that smaller, frequent episodes WILBing have a more positive effect on productivity than less frequent longer episodes.

This research challenges the prevailing assumption that all WILB is a negative workplace behavior. Intuitively, it is easy to envisage employees WILBing excessively at the expense of completing work related tasks, or using up expensive bandwidth. However, the results suggest that within limits, the negative effects of WILB are conditional on the extent of usage, the presence of addictive tendencies, and the degree to which a company is willing to forgo the added expense of WILB in terms of resources used at the expense of possible benefits. The results in this study are consistent with several studies that have found that short breaks can have a positive impact on task performance (Doerr 1986; Kanfer et al. 1994; Henning et al. 1997; Speier et al. 1999; Zijlstra et al. 1999). Moreover, the results complement applications of self-determination theory to organizational settings (Deci et al. 1989). In the past, SDT theory has been difficult to apply to work environments because of the simplistic dichotomous distinction between internal and external motivation (Gagné and Deci 2005). The results of this study suggest autonomy in the workplace may not only act as a powerful motivator, but may also have a positive flow-on effect to improving performance.

We note the following limitations of our research, which we believe provide a platform for future investigations of this phenomenon. We assumed in our study that episodes of WILB were not negatively distracting, taking the view that not all distractions are negative. However, as Jett & George (2003) point out, conceptually, breaks and distractions may have both negative and positive effects. We suspect that WILB could have a negative impact on task performance if it intrudes on an individual's concentration or flow state when working on a task requiring a high amount of cognitive resources (Csikszentmihalyi 1975). Thus, timed wrongly, an episode of WILB in-between a cognitively challenging task may be counter-productive if it requires the person to get "back into the groove" of concentration when finished. It could be possible that WILB is optimal when timed in between what Beal et al. (2005) refer to as "performance episodes," rather than performed mid-way during a task. This may in part explain why those with obsessive-compulsive urges to surf the internet do not show a positive correlation between WILB and productivity; their urge and timings to WILB may act as an interruption on performance rather than as a restorative break. An experimental design could add more depth of understanding into the mechanisms affecting WILB's impact on productivity.

ABSTRACT

The harsh competition conditions of globalization that organizations must face and rapid developments arising in communication technologies have been identified as the primary reasons driving organizations to operate online. Through e-commerce, the organizations manage to sell their goods and services to a variety of spots worldwide by making use of communication technologies. The organizations that must consider customer satisfaction in online environment just as they must in offline environment are expected to focus on ensuring customer satisfaction in e-commerce via e-crm policies they follow. In present study, the objective is to determine the factors (system quality, service quality and word-of-mouth communication) that have an influence over the purchase decision of customers in this rapidly growing e-commerce market. In this study it is aimed to find an answer to the question "In shopping, what the motives are driving consumers to select the organizations that offer electronic commerce?" Data employed in the research have been obtained via questionnaire method. To summarize statistical findings in digital representation, descriptive analysis and to measure the validity and reliability of the prepared scale, factor analysis has been used. Subsequently in order to detect whether the factors that have an influence over the decision of internet customers vary with respect to demographic variables, variance analyses have been conducted. It is aimed that with present study, some findings and suggestions may be developed to lead the organizations engaged in internet shopping to use their resources in the most rational way for aiding their efforts to meet the needs and demands of consumers.

Keywords: *E-commerce, E-CRM, Consumer perception in E-Commerce.*

INTRODUCTION

In today's world where there is a fierce competition in online environment as well as offline environment, the organizations engaged in electronic commerce are by all accounts expected to practice e-crm applications in order to preserve their web-site customer portfolio and turn them into prolific/loyal customers in time. Otherwise they will end up as one of the ordinary shopping companies amongst the thousands. As for the enterprises, to maintain a continuous interaction with customers, to obtain information related to customer expectations, choices and tastes from the first hand and to improve themselves in line with these feedback can only be achieved via properly functioning Electronic Customer Relationship Management (e-crm) applications. That is the reason why the organizations are by all means required to initiate crm and e-crm applications in both offline and online environments.

DEFINING E-CRM CONCEPT

The worldwide pervading effect of globalization and the copycat production of goods and services accelerated the efforts of organizations to reach the customers. Regardless of the sector it belongs to, any organization is expected to distinguish itself and maintain this differentiation throughout years. However since the differences organizations create thanks to their technological advancements are not permanent, the only field organizations can keep their differences intact remains to be their relations with customers. With the aid of the long term communication organizations establish with their customers, the enterprises seize an opportunity to transform them into loyal customers to ensure longevity. Electronic customer relationship management (e-crm) not only assists in organizations to gain maximum profit from their investment in online environment but it also helps them to forge relationship with customers through customization (Mahdavi et

al., 2008:1). Throughout their e-crm applications, organizations conduct their market briefing about the brands and products by employing information technologies. With the assistance of communication technologies, they keep updated about the shifts in customer behaviors hence acquire significant advantages in both mass and personal marketing (Güleş, 2004:236; Deniz, 2002:95). Just as the organizations which operate in offline environment need desperately crm concept so do the organizations functioning in online environment. Considering the fact that customers in online environment are -compared to the ones in offline environment- less attached to brands and products, it emerges as a necessity for the firms engaged in electronic commerce to initiate e-crm applications. Furthermore, provided that modern organizations operating in offline environment supported their customer relationship applications via e-crm applications on their web sites, they would be one step ahead of their competitors. Alongside the opportunities, the Internet also presents great obstacles for their users. Today thanks to the communication technologies, the customers are much stronger, smarter and much more well-informed than they were in the past. The customers expect the organization to satisfy them more at each time which in turn transforms customer satisfaction into the greatest performance measurement for any organization. In today's world where a product or service fails to preserve its advantageous status forever, the long-term relations with customers appear as the key for stability in the growing competition and dynamic markets (Wu and Hung, 2009:2). Consequently the organizations operating in both online and offline environments must -without fail- practice crm/e-crm applications. Customer relationship management is described as a management strategy covering customer-centered strategies, sales and marketing activities that can back up those strategies, new functions such as accounting, manufacturing and logistics and the rearrangement of all business processes for everyone to get influenced by these new functions (Tolon et al., 2009:2). After grasping this definition, it is now feasible to study e-crm concept or in other words customer relations in electronic environment. Parallel to Crm, in e-crm too the basic objective is to gain new customers for the organizations, to preserve them and turn them into prolific customers (Horn et al., 2005:101). Nonetheless it is rather hard to create an e-crm and solve the problems by ensuring its continuous development in coordination with customers (Harrigan, 2009:458).

THE FACTORS INFLUENTIAL ON THE WEB SITE SELECTIONS OF CONSUMERS IN ELECTRONIC COMMERCE

It is definitely not easy for customers to select just one amongst the numerous websites in online environment. While making a selection amidst these shopping websites, the customers pay attention to certain criteria. The foremost criteria are safe and easy shopping provided by the web site, the sufficient visibility, content of the web site and finally the other customers' selection of the particular website. In one of the researches related to e-crm applications of the web site, service and information quality of the web site has been emphasized. In the research, under service quality title credibility, responsiveness, trust, empathy and some tangible factors are stated. Similarly as a part of information quality title, access quality of the web site, content quality, presentation quality and the credibility of the information on web site are given (Web and Web, 2004:431). Another study focusing on the required qualities of a web site brings up the expression 7C which are: Context, Content, Community, Customization, Communication, Connection and Commerce (Clark and Das, 2009:4). Additionally e-crm applications require the emergence of certain divergences in taking decisions about marketing-related product, price, distribution and popularity. In online environment marketing, mixed factors are required to be interactive (Odabaşı and Oyman, 2007:323, Kotler 2007, Kotorov, 2002). The factors influential on the selection of the certain e-commerce organizations' websites by the customers are given as the service quality of the web site, system quality of the web site and word-of-mouth communication concerning the web site. The factors influential on the web site selection of the customers are in general terms:

System Quality of the Web Site

In modern age witnessing the rapid development of electronic commerce, the foremost obstacle preventing customers' internet shopping is surely the security problem of the websites despite all the technological innovations achieved so far (Aksoy, 2006: 80). A good deal of customers make use of the web sites only to check the goods and services they want to purchase and prefer to shop in regular department stores. That is the reason why, e-crm practitioners should first of all pay utmost attention to web site security. The term web site quality means offering the technical qualities expected from a web site in the best way to the user. In this quality dimension which is the most important characteristics of the web site, there must be privacy of information of web site visitors or web site shoppers, easy access to the web site, quick responsiveness to the demands/problems of web site visitors or shoppers are the primary issues in the system quality dimension (Başaran and Çelik, 2008: 51). Besides, the comprehensibility of the information on web site, writing quality,

complementary feature of each other and the presence of information/expressions of the web site visitors are also related to the system quality of the web site (Web and Web, 2004: 432). The alternatives for customer expectations, quick responsiveness of the web site even in the busiest periods of the day, easy access to web site administrator, easiness in customer support information, quick access to temporary information, easy order of products and services, alternative payment methods in purchases and on-line follow up of the order are amongst the other crucial aspects of the system quality of any web site (Rodgers et al., 2005:321).

Service Quality of the Web Site

On the web site, information related to the products and campaigns need to be updated regularly and outdated campaigns should be deleted from the web site. The main page of the web site must be for sure combined with eye-catching animations and colors to enable a positive first impression on the visitors. A system quick to respond to the questions of web site visitors should be established that is why a frequently asked questions page is a must on the website. The organizations volunteering to apply e-crm in electronic commerce are expected to perform all the activities or processes by focusing on the customer (Akar, 2004: 70). The credibility of the answers given to web site customers, timely and quick implementation of the provided services, selling insured goods at all times on the web site, the use of a reliable interface on the web site, customers' feeling of trust while shopping online, 7/24 web site service are also some of the factors ensuring customer satisfaction. Both service and system quality of the web sites greatly influence web site satisfaction of the customers. The satisfaction of the customers from online shopping considerably affects their loyalty to the web sites (Rodgers et al., 2005:321). Within the framework of web site's service quality, pre-purchase attitudes of the web site customers, easy use of the web site, advantage of the web site and the richness of the media technologies on web site are some of the factors (Lawler and Vandeputte,2008:397). In virtual environment, the equivalent of the physical environment where service process takes place is design quality of the web site. In that sense, easy use of the web site, comprehensibility, interaction, site contents and site image are within this scope. To ensure an easy comprehension of the web site, legibility of typefaces, comprehensibility of texts and the options on the menu need to be meaningful. Web site should be able to interact with the customer, offer the communication means with the firm to the customer and lead the customer in the proper way (Başaran and Çelik 2008:50). The leading factors affecting service quality are as below (Yeygel, 2009:28).

- Arrangement as per needs: Adaptation of the goods/services and processes according to customers,
- Interactive contact: Supporting access and interaction with customers via full-duplex tools and channels,
- Processing/deepening: Providing stimulating and meaningful information to activate the customers,
- Interest: Solving the order-related problems, rendering information about the status of the order, focusing on the details about the purchase of customer,
- Community: Customer comment links provided by the web site, purchase circle and via online chat rooms, providing the buyers the opportunity to share views about the goods, services or brands they have bought,
- Selection: Providing the opportunity to make a comparison and selection amidst various brands and products,

Online and Offline Word-of-Mouth Communication about the Web Site

Organizations engaged in electronic commerce can protect their web sites with high technology security software and design their websites in quite a modern and attractive form but they are not on their own sufficient enough to motivate the customers to shop from a particular web site. Nowadays customers prefer to shop from web sites which have been tested and approved by others. That is why the organizations should pay attention to the communication among customers in addition to their own advertisement campaigns. In both online and offline shopping, word-of-mouth communication is a determinant in the purchase decisions of customers (Okazaki, 2009:443). Aside from advertisement which has functions such as creating awareness, establishing communication with customers and leading the customers to test and purchase goods and services, the organizations should also allot a budget for the communication amongst customers (Bodkin and Perry, 2004:20). Presently thanks to discussion forums with millions of members, customers can acquire any comment/information on shopping sites, brands, goods, services through online word-of-mouth communication. With the assistance of online word-of-mouth communication people from a variety of lifestyles and sectors can convey their opinions to one another. The fact that internet contains an abundance of information as a data store satisfies the customers. The kinds of web sites which make it possible for customers to have an exchange of ideas are perceived as quality web sites by the customers (Cheung et al.,

2007:11-12). Provided that customers are satisfied with their online and offline shopping, they reflect their contentment around which in turn becomes the most significant advertisement for the organizations. Conversely, if the customers are dissatisfied they transfer negative word-of-mouth communication. While shopping on the web site, customers are uncomfortable if the product variety of the web site is limited, the web site has restricted visual images, insufficient customer relations, difficulty to find the searched product and most significantly doubts about web site security. Order delays after the purchase, qualitative and physical differences between the actual product and ordered one, failure to follow the order or regarding itself as the representative of all customers and several other reasons may be effective in the emergence of a negative word-of-mouth communication about the particular web site (Ward and Ostrom, 2006:222). The organizations are required to pay particular attention to such factors and enable the customers to inform the complaint lines about their discontentment. By this means, certain defects and negations of the web site shall be learned and besides customer satisfaction shall be guaranteed by solving the particular problem. In the following parts of the research hypotheses have been created after literature review. In order to test the hypotheses, a data gathering tool has been developed and by giving information about the cosmos and sampling of research data gathering and analysis processes have been discussed. The analyses have put forward that 3 factors are influential on the web site selections of customers in electronic commerce. It has been detected that there is statistically meaningful difference between the demographic features of the customers and these factors and the demographic features of customers are influential on their web site selections.

METHOD

In present study, the objective has been to detect the factors that affect the customers while shopping on the internet. In line with these detections certain findings and suggestions have been attempted to develop for assisting in the most rational way the organizations in managing their resources which compose e-commerce web site. Data employed in the study have been gathered by the free surveyors checking the questionnaire form during their face-to-face interviews with the online shoppers. In the research, a questionnaire form with close-ended questions has been used as data gathering tool. Before starting the questionnaire, a screening question and “do you shop on the web?” question have been directed and only the ones answering affirmatively have been included in the research. Obtained data after the questionnaire have been coded in the objective-specific file which has been structured in SPSS (Statistical Packet for Social Science) statistic program. The cosmos of the research consists of 2.379.502 residents of Western Black Sea Region- 2009 year address-based census records- (Turkish Statistical Institute, 2010) at the age of 18 and above. The population distribution of the cities in Western Black Sea Region is as below (including city/district centers and town/village populations – 2009);

City	Population	City	Population
Zonguldak	619.812	Karabük	218.564
Kastamonu	359.823	Sinop	201.134
Düzce	335.156	Bartın	188.449
Bolu	271.545	Çankırı	185.019

On 95% significance level for the main mass of 2,5 million people; with $\pm 0,05$ sampling error ($p=0,5$; $q=0,5$) minimum level of sample size has been found to be 385 people. In determining the number of individuals in target group (Kaya, 2008:35);

$n = [N \times t^2 \times p \times q] / [d^2 \times (N-1) + t^2 \times p \times q]$ formula has been used (Baş, 2001:45). Data used in the formula:

N: Number of individuals in the target group	: 2.379.502
p: Accrual frequency or probability of the case under research	: 0.5
q: Probability of the non-accrual of the case under research	: 0.5
t: On a definite significance level, theoretical value detected from t table (for $\alpha = 0,05$)	: 1.96
d: Sampling error \pm accepted according to accrual frequency of the case	: 0.05

$$n = 2.379.502 \times (1.96)^2 \times 0.5 \times 0.5 / 0.05^2 \times (2.379.502 - 1) + (1.96)^2 \times 0.5 \times 0.5$$

$$n = 2.285.237,72 / 5.949,71$$

$$n = 384,08$$

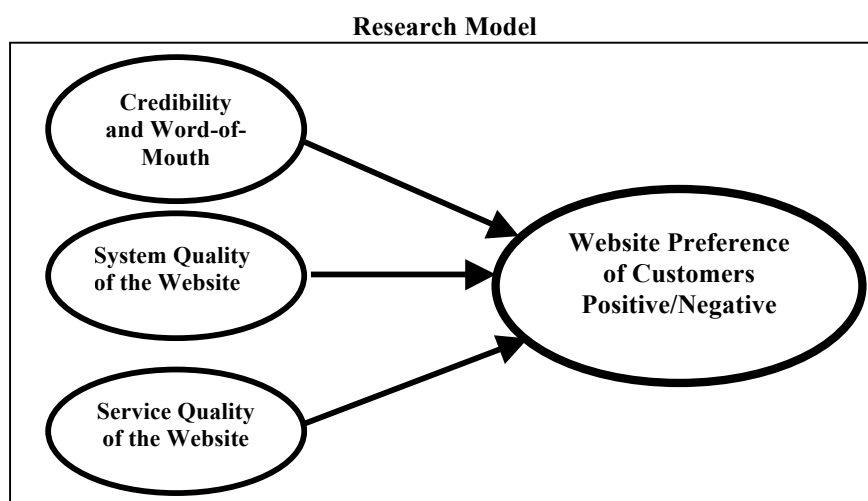

n = 385 people have been included in the sampling.

During February and March 2010 in cities within the scope of research- Zonguldak, Kastamonu, Düzce, Bolu, Karabük, Sinop, Bartın and Çankırı- the questionnaire has been completed with 425 web site customers

above-18 age who were selected via random sampling method. In order to improve the validity and credibility of research, questionnaires have been analyzed at once and skipped questions have been re-asked. As a part of the research, since during pre-review phase of the 35 data obtained via questionnaire from the sample mass were suspected of integrity they were not included in the research thus not taken into evaluation. Following the pre-review, 390 of the remaining questionnaires were found to be appropriate for analysis.

Criteria Variables, Model and Hypothesis of the Research

Parallel to the research objectives the variables influential on the variables which affect the e-commerce choices of customers have been categorized under two groups namely dependent and independent variables. The first group consists of variables related to the demographic features of customers shopping on the web while the second group is composed of behavioral variables. In the second group, 22 judgments about the preferred organization's marketing decisions have been prepared according to five Likert type scale (1=Not significant indeed, 5=Substantially significant). In this group, the customers of whose demographic features are known were asked to answer five levels of questions regarding the detection of factors influential on their shopping decisions.

The hypothesis developed to test if demographic features of customers have a meaningful influence over the e-commerce organization preferences of customers is as below:

H1: Demographic features of customers have a meaningful effect on the web site preference of customers in electronic commerce.

Web Site Preference Of Customers In Electronic Commerce

In data analysis, to summarize sampling qualities in digits and arrange the data, frequency distribution is needed. In order to detect customer attitudes on the significance of judgment influential on shopping preferences of customers the average and standard deviations of the scale have been analyzed. ANOVA test has been applied for the statistical hypotheses which have been formed whether or not customers' e-crm preferences amongst e-commerce organizations show a meaningful differentiation according to demographic features.

DATA ANALYSIS AND HYPOTHESES TEST RESULTS

Descriptive Analysis

Within the scope of research, the frequency and percentage distributions of the demographic features belonging to the web site users being questioned are shown in Table 1.

Table 1. Demographic Features of Customers (n:390)

Gender		Frequency	%
	Male	184	47,2
	Female	206	52,8
Marital Status		Frequency	%
	Married	239	61,3
	Single	151	38,7
Age		Frequency	%
	18–25	64	16,4
	26–35	153	39,2
	36–45	139	35,6
	46–55	30	7,7
	56 and above	4	1
Education Level		Frequency	%
	Primary School	8	2,1
	Secondary School	22	5,6
	High School	81	20,8
	Associate degree	119	30,5
	Bachelor's degree	109	27,8
	Post Graduate	51	13,1
Monthly Income (TL)		Frequency	%
	0–500	19	4,9
	501–1000	59	15,1
	1001–1500	96	24,6
	1501–2500	130	33,3
	2501 and above	86	22,1
Profession			Frekans
	Public Sector	103	26,4
	Private Sector	147	37,7
	Artisan/ Self-employed	102	26,2
	Student / Not employed	31	7,9
	Retired	7	1,8
Household		Frequency	%
	Living alone	53	13,6
	2–4 people	251	64,4
	5–7 people	85	21,8
	Eight people and above	1	0,3
Frequency of using Web Sites for Shopping		Frequency	%
	Less than 1 year	87	22,3
	Between 2–3 years	151	38,7
	Between 4–6 years	117	30,0
	Between 7–10 years	32	8,2
	11 years and above	3	0,8
Are you happy to shop from the Web Sites?		Frequency	%
	Yes	211	54,1
	No	26	6,7
	Sometimes	153	39,2
Monthly Average Spending Amount from Web Sites		Frequency	%
	Less than 100 TL	176	45,1
	Between 101-250 TL	131	33,6
	Between 251–500 TL	66	16,9
	Between 501-1000 TL	16	4,1
	1.000 TL and above	1	0,3
	Total	390	100,0

Factor Analysis

Before testing the hypothesis claimed to exist amidst variables with variance analyses, in order to detect structure validity of the factor scale affecting web site selections of customers and factor structures of the items, principal component analysis method and verimax conversion have been applied in factor analysis (Kaya, 2009:8-9). In the first stage of this two-stage factor analysis, 5 factors of which eigenvalue are 1 and explaining %55,798 of total variance have been detected. However amongst scale items, the judgments of which factor load remained to be lower than 0,50 (number 11, 16, 19, 20, and 21 judgments) since certain items were -in high ratios- ($>0,50$) loaded to more than one factor, were kept outside the scope of analysis. With the second factor analysis made on the remaining judgments 3 meaningful dimensions (factors) explaining 51,03% of the total variance of which items' eigenvalue is above 1 have been obtained. Prior to conducting factor analysis, internal consistency [Cronbach alpha (x)] of the questionnaire used in research has been calculated as 0,838. Since Cronbach alpha value is higher than 0,70, 22-judgment questionnaire used to detect the factors influential over web site selections of customers has been accepted as reliable.

The results of Barlett's Test of Sphericity and KMO (Kaiser-Mayer-Olkin) relevance scale are indicated in Table 2.

Table 2. KMO and Bartlett's Test

Bartlett's Test of Sphericity;	
Approx. Chi-Square	2220,123
Df	136
Sig.	,000
<i>KMO Relevance Scale</i>	0,886

Barlett's Test of Sphericity obtained results have been rejected even in zero hypotheses % 1 significance level. KMO relevance scale 0.886, Barlett and KMO test results confirm the compatibility of data with factor analysis (Sipahi, Yurtkoru and Çinko, 2006:80). The questions which have been grouped in line with verimax conversion results have been combined according to the answers and tested by reliability analysis. Factor loads of obtained factors, eigenvalues, variance percentages and Cronbach's Alpha coefficients are given in Table 3.

Table 3. The Loads of the Factors Influential on Web Site Preferences

Factors	Factor Loads	Eigen value	% of Variance	Alpha Coefficient
Factor 1: Credibility and Promotion of the Web Site (Word of Mouth Communication)				
Securing customer information privacy on the web site affects my purchase decision on the internet.	,845			
Credibility of the web site affects my purchase decision on the internet.	,833			
Smooth ordering and payment on the web site affects my purchase decision on the internet.	,798			
Continuous access to the web site affects my purchase decision on the internet.	,735			
Expert recommendations about the web site affect my purchase decision on the internet.	,724			
Comprehensibility of the information on the web site affects my purchase decision on the internet	,661			
The recommendations of the people who shopped from the web site before affect my purchase decision on the internet.	,650			
Installment possibilities provided by the web sites increase the frequency of my visits for shopping.	,627			
My friends' recommendations about the web site affect my purchase decision on the internet.	,484			
Factor 2: Service Quality				
The availability of the frequent user advantages on the web site affects my purchase decision on the internet.	,727	1,899	11,169	0,539
Enquiring customer demands/expectations on the web site affects my purchase decision on the internet.	,670			
The availability of animations on the web site affects my purchase decision on the internet.	,591			
Money points provided by the web sites affect the amount of shopping.	,524			
Factor 3: System Quality				
Easy use of the web site affects my purchase decision on the internet.	,651	1,630	9,587	0,474
The variety of the services provided on the web site affects my purchase decision on the internet.	,649			
The attractiveness of the design of web site affects my purchase decision on the internet.	,534			
The abundance of the information about the products on the web site affects my purchase decision on the internet.	,456			
Total Variance Displayed			51,053	

KMO Measure of Sampling Adequacy. 0,886. Bartlett's Test of Sphericity Approx. Chi-Square: 2220,123, df: 136, Sig.: 0,000

Once the dimensions emerging after factor analysis and the sub-variables they contain are examined it is observed that more or less 3 factors are influential on the selection of a specific website for the customers' product and service purchase decisions. The first factor is credibility and promotion of the web site (word of mouth communication). This factor that has a 0,888 internal consistency is composed of nine variables accounting for the 30,297% of total variance. The biggest contribution to the factor is provided by the variable "Securing customer information privacy on the web site affects my purchase decision on the internet". The second factor is service quality. This factor that has a 0,539 internal consistency is composed of four variables accounting for the 11,169% of total variance. The biggest contribution to the factor is provided by the variable "The availability of the frequent user advantages on the web site affects my purchase decision on the internet". The third factor is system quality. This factor which consists of four variables with 0,474 internal consistency accounts for the 9,587% of total variance. The biggest contribution to the factor is provided by the variable "Easy use of the web site affects my purchase decision on the internet".

Average and Standard Deviations of the Web Site Preference Related Attitudes of Customers

In the evaluation of the significance level attached to the given independent variables in the web site preferences of the participator customers, 5 Likert type scale has been used. Average and standard deviations of the web site preference related attitudes of customers are shown in Table 4.

Table 4. Average and Standard Deviations of the Web Site Preference Related Attitudes of Participator Customers

Variables	Mean	Std. Deviation	t Sig. (2-tailed)
Easy use of the web site affects my purchase decision on the internet.	2,8769	1,23164	(46,129)**
Comprehensibility of the information on the web site affects my purchase decision on the internet	2,8744	1,20714	(47,024)**
The abundance of the information about the products on the web site affects my purchase decision on the internet.	2,6795	1,13479	(46,630)**
The variety of the services provided on the web site affects my purchase decision on the internet.	2,3744	1,03082	(45,488)**
The attractiveness of the design of web site affects my purchase decision on the internet.	2,6282	1,17503	(44,172)**
Credibility of the web site affects my purchase decision on the internet.	3,3513	1,47723	(44,802)**
Securing customer information privacy on the web site affects my purchase decision on the internet.	3,4333	1,49873	(45,240)**
Continuous access to the web site affects my purchase decision on the internet.	2,9923	1,28565	(45,964)**
Installment possibilities provided by the web sites increases the frequency of my visits for shopping.	2,9846	1,24391	(47,384)**
Smooth ordering and payment on the web site affects my purchase decision on the internet.	3,2256	1,33775	(47,618)**
Personalized sales on the web site have an effect on my purchase decision on the internet	2,4077	1,07337	(44,298)**
The availability of the frequent user advantages on the web site affects my purchase decision on the internet.	2,3385	,96643	(47,785)**
Enquiring customer demands/expectations on the web site affects my purchase decision on the internet.	2,5103	1,14889	(43,149)**
The availability of animations on the web site affects my purchase decision on the internet.	3,2154	1,15386	(55,032)**
My friends' recommendations about the web site affect my purchase decision on the internet.	3,1641	1,12176	(55,703)**
The information available on the web site forums have an effect on my purchase decision on the internet	2,4154	1,03996	(45,867)**
Expert recommendations about the web site affect my purchase decision on the internet.	3,2333	1,17139	(54,511)**
The recommendations of the people who shopped from the web site before affect my purchase decision on the internet.	3,1026	1,19327	(51,347)**
Advertisement activities of the web sites have an effect on my purchase behavior on the internet	3,3205	1,07905	(60,771)**
Installment possibilities provided by the web sites increase the frequency of my visits for shopping.	3,3436	1,25835	(52,474)**
The campaigns I hear around encourage me to shop on the internet.	2,9949	1,21895	(48,521)**
Money points provided by the web sites affect the amount of shopping.	2,5718	1,07733	(47,143)**
Test Value	2,9108		

**,* respectively indicates 1% and 5% level of meaningfulness. (n:390)

In order to detect if the arithmetical average in Table 4 illustrating the factors influential on the web site preferences of customers is statistically different than group average 2,9108, t-test has been used.

Accordingly 22 out of 22 judgments (according to $\alpha=0,05$) have been meaningful. If an evaluation based on the order of these meaningful judgments is conducted it surfaces that; “Securing customer information privacy on the web site affects my purchase decision on the internet.” (3,4333), “Credibility of the web site affects my purchase decision on the internet.” (3,3513), “Installment possibilities provided by the web sites increase the frequency of my visits for shopping.” (3,3436), judgments have had a strong effect on the web site preferences of the participant customers whereas “The availability of the frequent user advantages on the web site affects my purchase decision on the internet.” (2,3385), “The variety of the services provided on the web site affects my purchase decision on the internet.” (2,3744) and “Personalized sales on the web site have an effect on my purchase decision on the internet” (2,4077) judgments have had a low effect.

The macroeconomic factors that grow parallel to the increasing and varying demands and needs of customers push their organizations to improve the web site services. Turning the websites into most preferred ones gained has significance. The reasons accounting for the high effects of the variables “Securing customer information privacy on the web site affects my purchase decision on the internet” and “Credibility of the web site affects my purchase decision on the internet” may be several problems such as fraud and forgery that have risen up recently. Due to such problems, customers might be in need of feeling trust towards the web site they shop in. “Installment possibilities provided by the web sites increase the frequency of my visits for shopping” variable could have been graded with a low effect due to the shortage of cash customers face; hence they are inclined to meet their future needs with the incomes they receive.

The Effects of Customers’ Demographic Features on their Web Site Selections

In this part, the findings of the hypotheses tested by one-way analysis of variance (ANOVA) which has been developed in line with research objectives are given. ANOVA test assists in analyzing the specific and general effects of independent variables on dependent variables. This test makes a calculation based on the arithmetical averages of dependent variable on factor level. In variance analysis, the groups are examined as a unity and a general conclusion regarding if or not there is a difference amidst them is arrived (Baş, 2001:142). H_0 hypothesis tested via this method indicates that group averages are equal to each other or in other terms there is not a meaningful difference in terms of the effects of factor levels. H_1 hypothesis on the other shall be regarded that there is no equality and there is a meaningful difference in terms of the effects of factor levels (Nakip, 2003:352). To detect whether demographic features of customers have a meaningful effect on their web site selections, variance analysis has been applied on research findings which then have been statistically compared. The results of the test conducted via one-way variance analysis aiming to detect the shifts in the factors influential on web site selections of customers with respect to their demographic features are given in Table 5.

Table 5: The Effects of the Demographic Features of Customers on Their Website Selections

Demographic Features	Gender		Age		Education		Income		Profession		Marital Status		Employment Status of the Household Spouse		Duration of Web Use			
	f-value	p	f-value	p	f-value	p	f-value	p	f-value	p	f-value	p	f-value	p	f-value	p		
1 Credibility and Promotion of the Website (Word of Mouth Communication)	5,723	,017*	2,217	,067	,483	,789	21,861	,000**	8,336	,000**	7,188	,008**	11,489	,001**	1,349	,258	2,384	,051
2 Service Quality	0,030	,862	1,008	,403	1,784	,115	,676	1,137	,339	,086	,605	,437	,549	,459	2,069	,104	3,576	,007**
3 System Quality	0,854	,356	1,192	,314	,921	,467	,929	,447	1,704	,148	,809	,369	,199	,656	3,075	,028*	,191	,943

** , * respectively indicates 1% and 5% level of meaningfulness. (n:390)

Occupational status of customers has been classified as public sector, private sector, artisan/self employed, student/not employed and retired. In website selection, in “Credibility and Promotion of Web Site (Word of Mouth Communication)” factor, a statistically meaningful difference has been detected as per profession. Income levels of customers have been grouped as; 0–500, 501–1000, 1001–1500, 1501–2500, 2501 and above. In website selection, in “Credibility and Promotion of Web Site (Word of Mouth Communication)” factor, a statistically meaningful difference has been detected as per income level. By considering the findings about income levels, the organizations offering web site service may reach high-income customers through distance communication methods such as e-mails. Gender of customers has been classified as male and female. In website selection, in “Credibility and Promotion of Web Site (Word of Mouth Communication)” factor, a statistically meaningful difference has been detected as per gender. It has been

concluded that female participants graded these factors higher. Parallel to the variables constituting this factor, females in particular should be informed about the credibility of the web site. Marital status of customers has been classified as married and single. In website selection, in “Credibility and Promotion of Web Site (Word of Mouth Communication)” factor, a statistically meaningful difference has been detected as per marital status. By benefiting from distance communication tools, single customers may be informed about the products and campaigns. Single customers have graded higher points hence while organizing campaigns with gifts, popularity tools ensuring the participation of single consumers should be used. In the light of research findings, organizations aiming to increase web site user number and use frequency are required to group the demands and needs of customers parallel to their demographic features because once the functions of websites are shaped in line with the demographic features, the preferences of customers to use this particular web site also increase. For the purpose of loyalty structuring in line with customer satisfaction, an above-expectation and customer-specific service based on demographic features of customers and following a customer-oriented marketing approach should be provided. Bonding strong ties between customer and organizations providing web service will be influential in selecting the products offered by such web sites. Awarding the customers who have throughout long years cooperated with web servers shall positively affect satisfaction level and such satisfaction shall be determining in web site preference. In the target market, instead of presenting the same product or service to everyone in the same way, the attempt should be to structure the messages and offers sent to customers in line with the specific demands and needs of customers. A rich data store can be formed concerning purchase preferences, demographic features of customers and the profits they provide. In this data store, different customer groups can be detected though data mining about their own products and services and for each group they can offer a different product or service.

CONCLUSION

In present research the aim has been to determine the factors influential on the web site preferences of customers and to detect if demographic features of customers have any impact while customers make their web site selection. The obtained findings from the 390 questionnaire forms employed in sampling cosmos Zonguldak, Kastamonu, Düzce, Bolu, Karabük, Sinop, Bartın and Çankırı cities amidst the customers shopping on the web sites are summarized below. It has been observed that while making a web site selection, the customers are influenced by 3 factors. In those 3 dimensions determined via factor analysis, ANOVA test has been conducted for the statistical hypotheses developed to test if customers’ web site selections varied meaningfully with respect to their demographic features. According to the findings, it has been concluded that demographic features of consumers are influential on their web site selections. A statistically meaningful difference has been detected between “Credibility and Promotion of the Web Site (word of mouth communication)”, “Service Quality” and “System Quality” factors and demographic features of customers. As the services provided by web site are structured with respect to demographic features of customers, the inclination of the customers to use specific web site also shows a rise. Therefore the hypothesis stating that demographic features of customers have a meaningful effect over the web site selection of customers has been taken as valid. Obtained findings of present research are parallel to the results of earlier studies but still in order to better detect the factors influential on web site preferences, similar studies may be conducted in different times and places and their results may be compared. Recently, web sites of enterprises have evolved into significant communication channels in finding solutions to certain needs and customer interactions. Use of web sites as communication tools shall increase the efficiency of an organizations as well (Jalkala and Salminen, 2007:826). The organizations are expected to provide first class service on their web sites by improving the relationship with customers through web chats, order follow-ups, e-mail, auto reply and personalized pages to implement their e-crm services (Hamid, 2005:51, Yayla and Altundağ 2005, Luck and Lancaster, 2003:215). In online environment, the word-of-mouth communication between not only their relatives or friends but the close community about the department stores is a vital source of information for customers hence web site administrators are required to construct a sub-structure where the customers can communicate with each other on the website (Gauri et al., 2008:3). Word-of-mouth communication (womm) intentionally affects the communication amidst customers through traditional marketing techniques. The administrators in an organization can make use of word-of-mouth communication campaigns as an elevator in both online and offline contexts (Kozinets et al., 2010:71). To sum up, due to the rising similarities between the functional features of websites, web servers face a harsh time in the competition through web-site functions. In order to succeed in this competition, before taking decisions web site servers should base their web site marketing strategies on operational methods of the market, hypotheses and facts instead of distance intuitions or multi-facet, poor data.

STRATEGIC MANAGEMENT IN PUBLIC SECTOR

LEADERSHIP STYLE IN PUBLIC SERVICES SECTOR, EMPLOYEE SILENCE AND ORGANISATIONAL COMMITMENT RELATIONSHIP: A STUDY IN THE PROVINCE OF ORDU

M. Turan Çuhadar,
Deputy Governor of Ordu, Turkey

ABSTRACT

Human is the main and most important input resource of the organizations in the fierce competition environment of information age. The organizations attach more importance to the resource of human being because of the facts that both human creates the products and services and he himself is the final beneficiary. Extraordinary advances in information technology have turned the sphere we live on into a village. This communication and intimacy also heavily influence the public sector that has no competitors in delivering services, refrain the governments from being closed systems, expose to effects of external environment. This situation forces the public organizations to think as if they are the government and behave like private sector organizations.

Research activities were done on public institutions which are operating in public sector and on private organizations of similar services. This study on the fields such as municipality, security, education, healthcare, financial services, environment in a competition-free environment in public institutions, is a unique one in its own sphere.

It is aimed to find the relationship between organizational silence, leadership style and organizational commitment- which is a new investigational study in our country-in the study. It has been tried to analyse how this behaviour of silence of workers' willingly or unwillingly, made a consequence for the organizations, with which leaders their effects have been changed. In the end of the research it is found that there is a negative correlation between organisational silence and transformational leadership, organisational commitment, a positive significant relationship with interactionist and Laissez-Faire leadership.

Keywords: leader, leadership, organisational silence, organisational commitment.

INTRODUCTION

Strong people namely the leaders are supposed to ensure maximum efficiency in enterprises, public institutions and even in countries where individual efficiency has difficulty in rapidly changing competitive conditions; increasing complexity and group success are needed. Human is the main and most important input resource of the organizations in the fierce competition environment of information age. As a result of globalization in organizations' gaining competitive advantage "human resource" regarded as the most effective source, employees' silence especially in the context of organisational commitment and redirection of these negative aspects for organisational purposes, leadership styles and approaches are of clear importance.

Within the general culture of the organization and organisational culture is one of the most important factor affecting and triggering silence. The cultural reflections such as "silence is due to acknowledgement", "Speech is silver, but silence is gold", "The snake that doesn't touch me can live a thousand years for all I care" which preserve their validity in the Turkish public organizations are said to affect the silence. Workers' fear for losing their jobs due to the economic crisis, changing of the places they work, their anxiety about being perceived as nuisance, gossipy, and complaintive lead to silence even if they are not pleased. Civil servants appointed as an Employee until his retirement, working in the public sector except rarely exported, without touching anybody, without frightening the mules continuing his life silently might be one of the reasons of the silence.

It is a good idea to address literature studies for better understanding of the issues. In this context each concept; leadership, leadership style, silence of workers and organisational commitment subjects will be tried to make clear.

In spite of numerous researches made about the definition of leadership phenomenon which has an important place in people's organisational, social and political lives a certain consensus has not been achieved yet. The leader is someone who leads the others to behave in a certain purpose, who influence. The leadership is defined as; one's influencing the activities of others and leading process under certain conditions, to perform certain personal and group goals. According to Koçel, the leadership process is a complex process formed between the relationship of leader, audiences and circumstances and formulated as; Leadership = f (leader, audience, circumstances) (Koçel 2005).

Many researches have been made about leadership. Leadership theories may be classified in many ways. According to a classification the leadership theories may be classified as Universalistic Leadership Theories-Contingency Theories (Koçel 2005). Apart from the classifications made about leadership and their contents a summary info will be given about three leadership styles used in the study. Transformation leader is someone who changes the needs, beliefs and value judgement of the audiences. Transformation leader increases the level of the commitment of the audiences (Koçel, 2005). Transformational – Innovative leadership style has a characteristic open to future, innovation, change and reform (Eren, 1998:368). Leader is someone who changes the needs, beliefs and value judgement of the audiences, makes the organisations reach the superior performance by achieving innovation (Luthans, 1995:357). Transformational leaders has a personality that develop relationships between people and enhance the communication between them (Şoşik vd, 2004:5). Interactionist leadership depends on to which extent leader could meet the changing needs of the (Eraslan, 2004, p.4). This leadership has some characteristics such as pragmatic, present-oriented, coordinating the organization by the roles and regulations, vertical communication, egocentric, hard-featured, responsive, having its power from its present positions, centralized (Eren, 1998: 369-70; Çelik, 1998:151). The leader who has a leadership style of Laissez-Faire or Free Rein Leaders gets out of power and responsibility. The group members train and motivate themselves. If the leader does not show his authority there can be nuisance in the group (Şahin vd, 2004:659).

The construct of silence, which is also called as "silence", close communication, communication anxiety, *avoidance*, not enough or no information / lack of information, reluctance to share information, culture of silence, a climate of silence (Clair, 1997; Freire, 1970; Neuwirth, Frederick, & Mayo, 2007;) is named organisational silence by Morrison & Milliken (2000). About the reasons and basis of organisational silence studies have been made by various authors for nearly 20 years (Argyris, 1977; Redding, 1985; Nemeth, 1997). In terms of well being of the organization when the importance of the information is increased, the workers' effectively referring to the method of silence increases the importance of the issue more (Argyris & Schon, 1978; Deming, 1986; Glauser, 1984). In brief; people communicate or not. "Silence" is simply a concept that expresses the situation of not communicating. But in literature there is a little confusion in the use and scope of this term. Because this term is used in cases both related and not related with communication. Communicative silence is a silence status of people for a while during dissatisfaction. Silence could become a desirable situation if a person wants to deceive the others because of information incompatibility, wants to create an environment for them to lie (Grover, 1993, 05, Sims, 2002). As a result of organisational silence, hindering of feedbacks reduces the ability to control the mistakes of organization and fix them (Miller, 1972).

Although many studies have been done on organisational commitment subject, we see that there is not a common definition. The reason is; there are different perceptions about the structure of the relationship between workers and organisation and how it is developed (Mathieu ve Zajac, 1990:171-172). It will be useful to bear on several definitions in this part to lead to an idea about organisational commitment. Organisational commitment has a quite basic and a wider definition. The first one is 'the strength of one's commitment to the organisation' (Wahn, 1998:256) and the second one is workers' highly believing and adopting of the goals and values of the organisation, the willingness to act enthusiastically for the goals of the organisation and a strong desire to stay in the organisation and to sustain the membership status (Mowday vd., 1979, 311). According to another opinion, 'organisational commitment is behavioural acts happening as a result of the devotional attitudes of human beings' (Reichers, 1985: 468). In a one another definition 'organisational commitment has been stated as a function of harmony perceived between the person and organization' (Bateman and Strasser, 1984: 95). However all the definitions come together at a joint point that the commitment is based on a behavioural and manner like basis. In other words, workers sustain their memberships by creating a behavioural or manner like reason (Çöl, 2005). On account of this fact, while the scientist's studying on the field of organisational behaviours concentrate on behavioural commitment, social psychologists concentrate on manner like commitment (Mowday, Porter and Streers, 1982). Consequently, the term of organisational commitment can be addressed as emotional, continuance and normative commitment. It has been referred that emotional devotion is workers' own emotional desire to stay in the organisation (Huselid and Day, 1991:381; Balay 2000:21); continuance commitment is perceiving to work because of the costs and negative effects to the organisation when leaving it as an obligation (Obeng and

Ugboro,2003:84;Yalçın and İplik.2005:398;Balay,2000:21) ; normative commitment is the belief of workers that they have responsibilities towards the organisation and the belief of commitment is a must in working life (Yalçın and İplik, 2005:398;Wasti,2002:526; Obeng and Ugboro, 2003:84;)

A great many researchers have emphasized on the factors that affect the organisational commitment rather than describing it. One of the factors effecting the organisational commitment is the value of demographic and personality features (Hrebiniac and Alutto, 1972, p.557; Buchanan, 1974, p.535; Dubin vd., 1975, p.412) and the other is the value of awards system and the ordinary working in the organisation (Oliver, 1990, p.26)

Similar to researches on the factors effecting organisational commitment, there have been a lot of researches on the outputs of organisational commitment. Being highly devoted to the organisation has a positive effect on the organisation like a decisive and reliable work force (Balay, 2000, p.90). On the other hand high level organisational commitment results in consequences such as efficiency increase, product quality advance, effective communication in the organisation (Randall, 1987, p.464). Although a high level organisational commitment has positive sides such as increased client contentment(Üner, Karatepe and Halıcı, 1998), decreased absenteeism, being late to work and quitting the job (Mathieu and Zajac 1990) it also has some negative results on the organisation such as ignoring the family and other obligations, getting into stress because he/she cannot be socially developed(Mowday vd., 1982, p.140) causing decline in organisational flexibility, appearance of highly relying on the applications and as a result of this situation stabilizing traditional techniques (Balay, 2000. p.92). It is not possible to see the positive outputs gained as a result of high level commitment, in a low level kind. It has been observed that a low level commitment leads to circulation of workers in large numbers, absenteeism and being late to work, the perception of workers that they do not feel themselves as a part of the organisation, the tendency of quitting the job, decreasing the commitment levels of workers as their leaving time come closer (Clugston, 2000, p. 477)

METHODOLOGY AND FINDINGS

This study started with the impact of the personal experiences of the researcher by doing a literature scan in the second half of the year 2009. After the literature scan there have been interviews with some secondary administrators who are the experts of the subject and who can be on the centre of the study. Determining the hypothesis of the problem to be solved, some certain survey questions are set by deciding the variables of the study suitable with it. Previous studies that are valid and reliable are used in preparing the surveys. In this study in preparing questions related to the leadership styles the questionnaire form has been used developed by Bass and Stogdill (1990), in preparing the questions related to organisational silence the question format developed by Çakıcı & Çakıcı (2007) based on the literature has been used in preparing questions about organisational commitment the form of ‘ commitment focuses’ which has been developed by Meyer, Barak and Vandenberghe and translated into Turkish by Wasti and Can (2007) has been used. Question format has been organised according to the five hold Linkert scale. The answer part of each question is in the shape of 1=never 2=rarely 3=sometimes 4=usually and 5= always . The survey forms were sent to the test subjects by post and they were asked to return them back two weeks later. By loading the mathematical results of the surveys, this result has been analysed by the help of SPSS 16.0. The analysis has been mentioned within the study and its results and assessment have been involved at the end of the study.

The Hypothesis of the Study

H1: There is a relation between leadership forms and the organisational silence.

H1a: There is a relationship between leadership forms and keeping silence in the organisation because of directory and organisational reasons.

H1b: There is a relationship between leadership forms and keeping silence in the organisation because of the subjects related to the job.

H1c: There is a relationship between leadership forms and keeping silence in the organisation because of lacking experience

H2: There is a relationship between leadership forms and organisational commitment.

H2a: There is a relationship between the leadership forms and a normative commitment in the organisation.

H2b: There is a relationship between the leadership forms and emotional commitment in the organisation.

H3: There is a relationship between the organisational silence and organisational commitment.

H3a: There is a relationship between the organisational silence and emotional commitment to the organisation.

H3b: There is a relationship between the organisational silence and normative commitment.

Table 1: The Model of Research Hypothesis to Be Tested

Sampling and Data

This study includes the staff that is in decision making positions, working in 25 different public corporations and organisations in Ordu such as education, health, security and order, municipality, environment and special management. The organisations in the select scope of implementation were asked to fill in the survey forms for the year 2010. The organisations answered the forms sent in the given time period and 393 working staff out of 450 gave their answers to the survey questions. A reliable organisation data has been derived from 356 answered forms out of the total to take into consideration in the evaluation process. The answering ratio of the survey is 79.1%.

Findings

Initially a factor analysis was done and the questions of which factor verification was under 0, 50 were put out of the analysis.

Table 2: Sectoral Distribution

	Frequency	Percentage	Valid ratio	Total ratio
General management	126	35,4	35,4	35,5
Education	91	25,6	25,6	61,0
Finance	40	11,2	11,2	72,2
Security-Order	29	8,1	8,1	80,3
Religious services	27	7,6	7,6	87,9
Agriculture-livestock	25	7,0	7,0	94,9
Municipality	18	5,1	5,1	100
Total	356	100,0	100,0	

Reliability value is the degree of the same results in repeated measurements of an evaluation instrument. To be able to say that a result of an analysis is correct, it supposed to have bigger Alfa number than the amount 0,70 (Eymen, 2007) the reliability levels are given in the table below separately. The direction and intensity of relationship between two variables are accounted in the correlation analysis (Eymen, 2007)

Table 3: correlation analyze

factors	1	2	3	4	5	6	7	8

Normative commitment	,098	,071	-,006	-,032	-,031	-,009	,492**	$\alpha=,939$

** . Correlation is significant at the 0.01 level (2-tailed).

According to the correlation analysis ,it has been understood that There is an adverse relation between Transformation leadership and the directive and organisational reasons effecting silence (-,617**), issues related to the job (-,551**) lack of experience (-,241**).Considering the data derived from the study it can be said that in the organisations having a Transformation leaders .workers do not keep silence and they can talk to their superiors about their duties and problems. It has been understood that in these organisations there is a

positive relationship with emotional devotion (.316**) namely the emotional commitment is high in the organizations having a transformist leader and there is not any kind of relation with the normative commitment. There is a negative relationship between the interaction leadership and the directive and organisational reasons (-,719) effecting the organisational silence issues related to the job (-619**) lacking experience (-337**). Although there is a positive relation with normative commitment (.273) there is no relation between emotional commitment(.071) and the interactivist leadership. There is a positive relation between the Laissez-Faire leadership and the directive and organisational reasons (.,643**), the issues related to the job(.556**), lacking of experience (.,323**) and there is a negative relation with emotional commitment (-,209**) there is no relation with normative commitment.

Regression analysis is the one that gives us opportunity to find cause and affect relationship between the variables. (Eymen 2007)

The Relation of Directory and Organisational Facts One of the Reasons of Silence of Workers between the Leadership Styles

H1a.: There is a relationship between directory and organisational reasons of organisational silence and leadership.

Table 4. Regression Analysis of Leadership styles and directory and organisational reason

INDEPENDENT VARIABLES	β	t	Sig.	Result
Transformation Leadership	-,150	-3,106	,002	approval
Interactivist Leadership	-,459	-9,549	,000	approval
Laissez-Faire Leadership	,379	6,952	,000	approval

Dependent Variable: factors related to the directory and the organisation

R ²	F	Sig.
,636	170,867	,000a

P < 0,01

The data in the table 7 shows that our model is substernal. (F=170,867, p=, 000). It has been accounted that the ratio of R² the independent variables' explaining dependent variables is 636. The leadership styles effects the organisational silence caused by directory and organisational reasons with the percentage of 63,6. It has been understood that the most important reasons of workers' silence are directory and organisational ones.

According to the results of regression analysis three of each leadership styles affect the silence caused by the directory and organisational reasons. Transformation leadership ($\beta = -,150$, p=,000) effects the silence in a negative percentage of 15,0, interactivist leadership ($\beta = -,459$, p=,000) effects the silence in a negative percentage of 45,9 and Laissez-Faire leadership ($\beta = ,379$, p=,000) effects the explaining of silence in a negative percentage of 31,4

The subordinates working with the Transformation leaders having good relationships with the workers, making his/her workers feel special, letting them to learn by making mistakes, are able to share their problems and their ideas about the job without fear and freely. So it can be thought that the silence of the workers who work with the employers providing changes to make them progress may decrease. The beliefs of workers who do not trust his/her manager, such as 'there will be no change when I speak openly because the 'I know the best' attitudes of the managers and I will be exposed to unfairness and bad treatment, may increase the keeping silence of workers in the organisation.

The Relation of Issues of Work One of the Reasons of Silence of Workers between the Leadership Styles

H1b: There is a relationship with the reasons of workers' silence and the leadership styles

Table 5: Regression analysis of the issues related to the work and Leadership styles

INDEPENDENT VARIABLES	β	t	Sig.	Result
Transformation Leadership	-,168	-2,898	,004	approved
Interactivist leadership	-,395	-6,787	,000	approved
Laissez-Faire leadership	,223	4,086	,000	approved

Dependent Variable: Factors related to the work and the working environment

R ²	F	Sig.
,464	86,924	,000a

P < 0, 01

The data in the table 8 shows that our model is substernal.(F=86,924, p= ,000). It has been accounted that the ratio of R² the independent variables' explaining dependent variables is 464.The leadership styles effects the organisational silence caused by issues related to the job with the percentage of 46,4.

According to the results of regression analysis three of each leadership styles affect the silence caused by the issues related to the job. Transformation leadership ($\beta = -,168$, p= ,000) effects the silence in a negative percentage of 16,8,interactivist leadership ($\beta = -,395$, p=,000) effects the silence in a negative percentage of 39,5 and Laissez-Faire leadership ($\beta = ,223$, p=,000) effects the explaining of silence in a negative percentage of 22,5.

The workers thinking that the people talking about problem are not welcomed; talking would cause the change of his/her position oar even the work place; when talking openly the directors and colleagues would have negative attitude towards him/her, may choose to keep silence in the organisation considering the negative effects they may get. They may worry about having extra responsibilities not only when talking about the problems but also when giving advice.

The Effect of Lack of Experience One of the Reasons of Silence of Workers between the Leadership Styles

H1c: There is a relationship between the leadership styles and the keeping silence in the organisation because of the lack of knowledge

Table 6.Leadership styles –Regression Analysis of Lack of Experience

BAĞIMSIZ DEĞİŞKENLER	β	t	Sig.	Result
Transformation Leadership	,024	,322	,747	Objection
Interactivist Leadership	-,256	-3,510	,001	Approval
Laissez-Faire Leadership	,186	2,717	,007	Approval

Dependent Variable: Lack of Experience

R ²	F	Sig.
,142	16,776	,000a

P < 0,01

The data in the table 9 shows that our model is substernal.(F=16,776 p= ,000). It has been accounted that the ratio of R² the independent variables' explaining dependent variables is 142.The leadership styles effects the organisational silence caused by the lack of experience with the percentage of 14,2.

According to the results of regression analysis there is no relation between the Transformation leadership and experience, interactivist leadership ($\beta = -.256, p = .001$) effects the silence in a negative percentage of 25,6 and Laissez-Faire leadership ($\beta = .186, p = .007$) effects the explaining of silence in a negative percentage of 18,6

The dilemma that the workers have been through is both related to the self confidence and courage and the director. The thoughts like “I do not have enough experience to advice or talk about the problem that I will discuss about may reveal my lack of knowledge because my position is a lower one there will not be any importance of my talking of ideas” may cause the worker keep silence about the issues related to his/her job.

The Relationship between Normative Commitment and Leadership Styles

H2a: There is relationship between the normative commitment and the leadership styles.

Table 7: Regression Analysis of leadership styles and normative commitment

INDEPENDENT VARIABLES	β	t	Sig.	Result
Transformation leadership	,107	1,342	,181	Objection
Interactivist leadership	-,011	-,132	,895	Objection
Laissez-Faire leadership	,051	,687	,493	Objection

Dependent Variable: normative commitment

R ²	F	Sig.
,007	,713	,545a

P < 0,01

The data in the table 10 shows that our model is not substernal. ($F = .713, p = .545a$) The defining rate of independent variables of dependent variables is R^2 at 0,,007 value. The leadership styles effect the normative commitment at a pretty low percentage of 0,07.

According to the regression analysis there is no relation between the leadership styles and the normative commitment. It has no effect to define normative commitment comparing transformation leadership to normative commitment ($\beta = .107, p = .181$); interactivist leadership to normative commitment ($\beta = -.011, p = .895$); Laissez-Faire leadership to normative commitment ($\beta = .051, p = .493$) The worker do not consider leaving the working environment where there are good relationships, appreciative directors and where he/she has the opportunity to improve him/herself.

The Relationship between Emotional Commitment and Leadership Styles

H2b: There is a relationship between the leadership styles and the emotional commitment

Table 8: Regression analysis of the leadership styles with emotional commitment

INDEPENDENT VARIABLES	β	t	Sig.	Result
Transformation leadership	-,101	-1,069	,286	Objection
Interactivist leadership	-,224	-2,306	,022	Approval
Laissez-Faire leadership	-,056	-,888	,375	Objection

Dependent Variable: emotional commitment

R ²	F	Sig.
,118	12,968	,000a

P < 0,01

The data in the table 11 shows that our model is substernal. ($F=12,968$ $p=,000$). It has been accounted that the ratio of R^2 the independent variables' explaining dependent variables is 0,118. The leadership styles effects the emotional commitment with the percentage of 14,2.

According to the results of regression analysis there is no relation between the Transformation leadership and the Laissez-Faire leadership, interactivist leadership ($\beta= -,224$, $p=,022$) effects the emotional commitment in a negative percentage of 22,4. As regards to the results in the study there is an emotional commitment to the organisation where there are joint relationships under the directory of a Transformation leader.

The Relationship between Emotional Commitment and Organisational Silence

H3a: There is a relationship between emotional commitment and organisational silence.

Table 9: Organisational Silence – Regression Analysis of emotional commitment

INDEPENDENT VARIABLES	β	t	Sig.	Result
Factors related to the directory and the organisation	-,101	-1,069	,286	Objection
Factors related to the job and the working environment	-,224	-2,306	,022	Objection
Lack of experience	-,056	-,888	,375	Objection

Dependent Variable: emotional commitment

R^2	F	Sig.
,118	12,968	,000a

$P < 0,01$

The data in the table 11 shows that our model is substernal. ($F=12,968$ $p=,000$). It has been accounted that the ratio of R^2 the independent variables' explaining dependent variables is 0,118. Organisational silence effects the emotional commitment with the percentage of 11,8

According to the regression analysis results there is not any relation in keeping silence between emotional commitment and factors about directory and organisation and lack of experience. The factors related to the job and the working environment ($\beta= -,224$, $p=,022$) has a 22,4 % effect on explaining the commitment

The Relationship between Organisational Silence and Normative Dependency

H3b: There is a relationship between organisational silence and normative dependency

Table 10: Organisational Silence –Regression Analysis of normative dependency

INDEPENDENT VARIABLES	β	t	Sig.	Result
Factors related to the directory and the organisation	-,020	-,212	,832	Objection
Factors about the job and the working environment	-,014	-,144	,886	Objection
Lack of experience	-,015	-,228	,820	Objection

Dependent Variable: normative dependency

R^2	F	Sig.
,002	,180	,910a

$P < 0,01$

Table 13 ($F= 20,101, p= ,000$) shows that it is impossible to explain the dependent variables with the independent variables. The value of R^2 has been calculated as 0,008. The amount of 0,2 % of normative dependency can be explained by the organisational silence variable.

According to the results of the regression analysis there is no relationship in keeping silence between normative dependency and the factors related to the directory and the organisation, the factors related to the job and the working environments and the lack of experience.

Table 11: The Model Developed As a Result Of the Study

LEADERSHIP STYLE	RELATIONSHIP TYPE	REASON OF SILENCE	RELATIONSHIP TYPE	COMMITMENT TYPE	RELATIONSHIP TYPE	COMMITMENT TYPE
Transformation Leadership→	Factors related to the directory and the organisation	↔	Emotional	↔	Normative
→	Factors related to the job and the working environment→	Emotional	↔	Normative
	↔	Lack of experience	↔	Emotional	↔	Normative
Interactivist Leadership→	Factors about the directory and the organisation	↔	Emotional	↔	Normative
→	Factors related to the job and the working environment→	Emotional	↔	Normative
→	Lack of experience	↔	Emotional	↔	Normative
Complete freedom providing Leadership	→	Factors about the directory and the organisation	↔	Emotional	↔	Normative
	→	Factors related to→	Emotional	↔	Normative

		working environment				
	→	Lack of experience	⊕	Emotional	⊕	Normative

→	Pozitive relationship
⊕	No relationship
⋯→	Negative relationship

RESULT AND ASSESSMENT

As can be understood from the title of the subject this study has been done on the workers of public services of public organisations. It is known that the factors that might have oppressive effects on workers such as working formalities and Fundamentals of working in public services, employing, dismissing are in the frames of law and especially dismissing a worker is of tough conditions. The general situation is that a staff working in public sector stays in his/her position until retirement except extraordinary situations. This fact reduces the efficiency of directors or leaders on workers. So there has been a decrease on the organisational behaviours like organisational commitment, being directed by the leaders when the workers guarantee his/her life. As can be understood from the study in the three types of leadership there is not an effect or support of keeping silence except the job and working environment related silence factors. In the same way from the point of effecting organisational commitment, only the factors related to the job and working environment effect the emotional commitment in a negative way.

According to the verifications derived from the study it has been sensed that the situation is rather different in public or business. In a research (BİLDİK, 2009) the leadership styles in businesses, organisational silence and organisational commitment were examined and the data proved that there are considerable differences between public and private sectors. It has been found out that there is a positive relationship between the Transformation leadership and normative commitment and a negative relationship with other factors except lacking knowledge that leads silence. It has been tracked down a positive relationship between interactivist and complete freedom providing leadership along with both organisational constancy and all facts of silence.

As it is for any kind of study this is the one which have also had a lot of constraints. Taken into consideration the fact that these constraints may have influence on the obvious differences between the studies, it can be referred that this field is an intact one and needed to be explored. The fact that there are serious differences between the two studies leads us to the conclusion that there should be much more researches on both fields. It has been advised to study giving a chance to compare the public and private sectors and to choose more specific fields with the researches to be done on the workers of public services sectors.

STRATEGIC PLANNING FOR LOCAL GOVERNMENT: A CASE STUDY

**Seher Arslankaya
Tülay Korkusuz Polat
Sakarya University, Turkey**

ABSTRACT

Institutions, whether they are public or private, work in order to accomplish their primary goals in accordance with the reasons for their existence. Recent developments bring along changes in the structure of the societies as well as changes in the structures and administrative mentalities of the institutions. In this context “Strategic Management” is one of the approaches that is widely accepted. Especially with European Union harmonization process strategic management model has been started to be applied in public enterprises. This process can work better if strategic planning is made obligatory for public enterprises. This study tells about the strategic goals that have to be obeyed by City of Sakarya Special Provincial Administration to improve their quality of service and to keep up with the changes, the targets/sub targets identified to accomplish these strategic goals, measurable performance indicators defined for targets/sub targets and the preparation process of strategic plan of 2010-2014 involving target values.

Keywords: Strategy, Strategic Management, Strategic Planning, Public Management

INTRODUCTION

Strategy is one of the critical factors of continuing one’s existence and improving in personal, institutional and organizational structuring.

A strategy addresses simultaneously which goals the organization wants to achieve and how it can achieve them. It is a description of ambitions, together with work programs, actions and practical alternatives to reach these ambitions (Bryson, 2004). In Turkish “strategy” means “dispatching, directing, sending and guiding” (Eren, 1997).

Strategic Management is a long-term and forward-looking understanding which defines the way between the current situation of the institution and the situation to be achieved. The main objective of the strategic management is to strategize, to apply these strategies and to make improvements by evaluating the results. Strategic management always strives towards betterment and quality, embodies the activities of budgeting, source planning, program evaluation, performance, review, improvement and reporting.

Strategic management is “concerned with determining the future direction of an organisation and implementing decisions aimed at achieving the organisation's long and short-term objectives”. Hence, the entire strategic management process can be said to comprise two major dimensions that are interlinked: strategic planning and strategy implementation and control. In strategic planning, strategic decisions are made concerning the organisation's mission and vision, its objectives and targets, as well as methods for achieving the objectives and targets. Strategic planning and corporate planning are sometimes used interchangeably in the literature to refer to an extensive organisation-wide resource allocation process. On the other hand, strategy implementation and control is about translating strategic decisions into concrete actions necessary to achieve desired levels of performance (Mugabi et al, 2007).

In this study, concepts of strategy, strategic management and strategic planning are discussed and as an example strategic plan of City of Sakarya Special Provincial Administration is given.

STRATEGIC PLANNING

Strategic planning is one of the primary objects of an institution. It involves the identification, implementation and monitoring of strategies of the institution which define the behavior of the institution

under changing and indefinite environmental conditions. In this concept executives should define institution's mission, vision and basic values and set strategies which help institutions reach their goals in the light of these.

In literature there are several definitions on strategic planning. Strategic planning is management of the decisions and activities which define a company's long-run performance (Wheelen and Hunger, 2003). McNamara (2006) defines strategic planning as determining where the company will be next year or the following years, how they will go there and whether it will go there or not.

Strategic planning is described as generating the future mission and vision of the institution in a dynamic environment and changing surroundings, determining strategic objectives and measurable targets, measuring the performances by predetermined indicators and monitoring and evaluating this process. It is a participative approach which enables the budget of an institution to be in accordance with the aims and targets in the strategic plan from a forward looking point of view and give priority to resource allocations.

Strategic planning can be used to explain the instructions, to define a wide vision, to solve the problems and/or accomplish the objectives. A strategic plan clearly portrays the objective of the organization and builds realistic objectives and targets which are consistent with the mission within the implementation capacity in a defined period. Strategic plan enables institutions to use their sources as efficient and effective as possible by focusing on the sources in key priorities. Gill et. al., (2005) explain the main objective of a strategic planning study as follows:

- Defining the goals of the organization,
- Creating key capabilities,
- Ownership,
- Priorities,
- Measuring and assessment,
- Leadership,
- Creating strong teams,
- Providing satisfaction,
- Increasing productivity,
- Solving great problem,
- Organisational focus.

Strategic planning practices are very beneficial for organizations. These benefits can be listed like this (KorkusuzPolat, 2007). During implementation it builds realistic objectives and targets which are consistent with the defined mission of the organization. Therefore, it necessitates these objectives and targets to be delivered to whole organization. It defines the behavior of the organization against uncertain events and minimizes the risks. It helps managers understand each other and simplify focusing on the same objectives. It gathers the workers of an organization around a vision and presents the necessary reasons for prioritization in the institution. It makes the sources of the organization to be used effectively and efficiently. It allows measurable progresses and builds appropriate infrastructures which can make required changes whenever necessary. It lets the organization focus towards its own objectives and therefore leads a more efficient production. It enables the executives to have a healthy communication among each other and other employees. It supports a management based on targets and performance.

Strategic Planning Process

In order to make a strategic planning in an institution different processes are suggested by different authors (ISNAR (2006), Wheelen and Hunger (2003)). Öztemel (2004) defines Strategic Planning Process Map as it is illustrated in Figure 1.

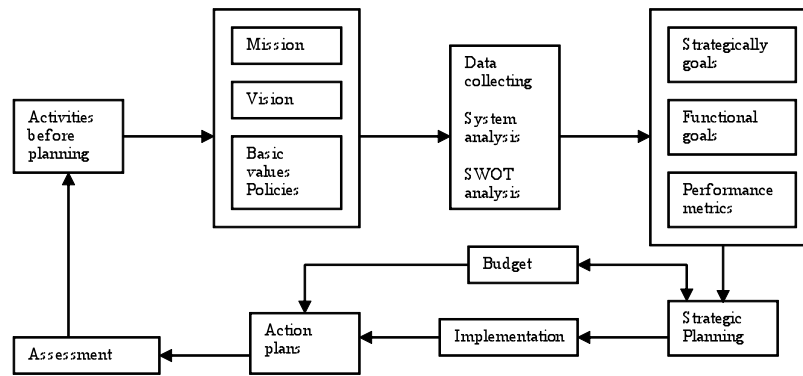

Figure 1. Strategic planning process map (Öztemel, 2004)

Strategic Planning Process Map, which was suggested by Öztemel (2004) and is illustrated in Figure 1, shows this interrelationship of the activities of the process. Being aware of these relationships among the processes while the activities of making, implementing and reconsideration of the strategic plan are accrued facilitates related operation and required changes. Basic functions of the strategic planning process are explained as follows.

A **mission statement** is a general expression of the overriding purpose of an organization that, ideally, is in line with the values and expectations of major stakeholders. Mission statements are often regarded as “enduring statements of purpose that distinguish one business firm from others” (Kemp and Dwyer, 2003).

While improving its mission statements, an institution has to be careful about accepting the objective of the organization unanimously, assigning standards in allocating sources, generating corporate culture and organizational climate, facilitating accomplishing the objectives in the work structure that involves defining the positions of the employees, determining organizational objectives, turn the objectives into targets and finally choosing valuable and manageable performance parameters (time, cost etc.) for these objectives.

Most of the strategic management implementers and researchers think that an efficient mission statement should have 9 characteristics. Taking all this components into consideration and involve all of them in determination of the mission is crucial. (David, 2003).

Vision, which expresses common goals and beliefs, is a critical factor which defines what an institution ought to do in order to accomplish its objectives and where it wants to be in the future and which is a consolidative function among the different units of an institution. Vision should be taken into consideration as the objectives which define the prospective position of the institution and which enable the institution to be in the desired position in the future in the direction of predetermined criterion.

After the mission and vision of the institution is determined the basic values which have to be obeyed in the light of this mission and vision should be clearly and openly designated. These principles are significant factors in determining the mission and vision. Core values must express the corporate culture and policy.

One of the most crucial steps of Strategic Planning is SWOT (Strength, Weakness, Opportunities, Threat) Analysis. The main philosophy of this analysis is to evaluate the current position of the institution considering the environment of the institution and other institutions and determining the “strong and weak” points. Strong sides include any element which increases the chances of competitiveness of the organization in the market and influences the corporate improvement in a positive way. Weak sides include any elements which diminish productivity such as lack of qualified employee and which cause losing competitive advantage and financial sources. In planning process it is important to supply information in order to supplement weak sides with the strong ones. Similarly to bring out the “threads” which are beyond the control of the institution but which at the same time hinder improvement of the institution such as legal reforms and increase of the efficiency of the rivals in the market and to get rid of the problems by utilizing the possible “opportunities” which support the growth of the institution and which solve the problems (like taking advantage of new technologies) are other objectives of this analysis.

SWOT analysis is a strategic management technique which enables companies not only to estimate their own situation but also to analyze the structure of the market and the situations of the rivals (Aktan, 2006). (For detailed information on SWOT Analysis look Paliwal, 2006, Kajanus et. al., 2004, David, 2003, Bryson, 2004). SWOT matrix (David, 2003) is a widely used approach which shows the results of SWOT analysis in a matrix. With this approach Strong side – Opportunity Strategies which uses the strong sides in order to obtain opportunity advantages; Weak Side – Opportunity Strategies which overcome the weak sides by obtaining opportunity advantages; Strong side – Threat Strategies which utilizes strong sides in order to avoid threats; Weak side – Threat Strategies which avoid threats and minimize the weak sides are determined.

When the strategy of the institution is determined the current situation of the institution has to be analyzed in detail. The sector of the institution, technology, competition conditions, environmental factors, sources of the institution are some of the constituents that have to be taken into consideration in determining the strategy.

Objective of the strategy assessment should be finding out the strategies which contribute to the success of the company. With this objective it is inevitable to evaluate the strategic alternatives in the light of particular criterion. When the strategy of the institution is established, consistence of the strategy with the vision and the mission of the institution, appropriateness of the strategy with trade circle and processes, validity checking of the data and the information, determination of the risks an institution faces or can face which can be overcome whenever necessary, reasons for strategy implementation reasons and evidences proving the relationship between the expected and what is available must be taken into consideration. (Öztemel, 2004).

Functional objectives are the final results of the planned activities. Since it is impossible to control whether immeasurable objectives are met or not, during the setting process their being measurable is strictly recommended. Another significant theme is that when the objectives are set companies have to pay attention to the source facilities of the institution. After the functional objectives are set these objectives should reduce to unit/process base. In order to determine in what percentage the functional objectives are accomplished i.e. whether they are met or not, a single performance indicator should be assigned for each functional objective.

With determined strategic objectives and targets strategic plan of the institution is generated and it is evaluated and reviewed periodically.

STRATEGIC PLANNING IN PUBLIC ENTERPRISES

When the problems of the public enterprises are thought activities being fulfilled schemingly gains importance increasingly. With strategic planning studies the goal congruence of the organization is provided by disciplining during the process of budget preparation and implementation, allocating the sources according to the strategic plan, periodically monitoring whether the objectives are accomplished and making necessary improvements. Therefore, in public enterprises “strategic planning” is adopted as a basic tool just like the private ones. Besides bringing efficiency/productivity to public finance management strategic planning also supports definition of the goals of the institution, feeling of ownership and corporate culture, employee and consumer satisfaction.

Strategic plans to be prepared by public administrations within the frame of the national development plans and strategies increase the effectiveness of the implementation and planning process including programs, sectoral master plans, regional plans and urban development plans and contribute to the rational usage of the sources. According to the 9th article of Public Financial Management and Control Law No. 5018 strategic plan is defined as “a plan including medium and short-term goals of public administrations, basic principles and policies, objectives and priorities, performance measures, methods to be followed in order to achieve these and resource allocations of public administrations.” The same law states that “in order to form missions and visions for future within the framework of development plans, programs, relevant legislation and basic principles adopted; to determine strategic goals and measurable objectives; to measure their performances according to predetermined indicators, and to monitor and evaluate this overall process, public administrations shall prepare strategic plans in a cooperative manner.” Besides Law No. 5018 with Municipality Law No: 5393 and Metropolitan Municipality Law No: 5216 all the municipalities with population over 50.000 are liable to prepare their own strategic plans. Moreover, with Special Provincial Administration Law No: 5302 special provincial administrations have to prepare their strategic plans as well. (DPT, 2006).

Duties of The Special Provincial Administration

According to the 6th article of Special Provincial Administration Law No: 5302 the duties of Special Provincial Administration are listed as follows:

- With the a subsection of the 6th article of Law No: 5302 the services within the province border are listed as: “Youth and Sports, health, agriculture, industry and trade; provincial development plan, public works and settlement, preservation of soil, prevention of erosion, culture, art, tourism, social services and assistances, granting micro loans to the poor, nursery schools and orphanages, procurement of plots of lands for primary and secondary education schools, and construction, maintenance and repairs of the school buildings.”
- With the b subsection of the same Law the services out of the municipal border are identified as: “Reconstruction, road, water, sewage, solid waste, environment, emergency aid and rescue, culture, tourism, youth and sport; support to Forestry villages, Forestation, building park and garden”
- It involves the local and common qualified services of the city.

CASE STUDY

According to the 9th article of Public Financial Management and Control Law No. 5018 and 31st article of Special Provincial Administration Law No: 5302, special provincial administrations are obliged to prepare the strategic plan and annual performance plan of the city. This study tells about the strategic goals that have to be obeyed by City of Sakarya Special Provincial Administration to improve their quality of service and to keep up with the changes, the targets/sub targets identified to accomplish these strategic goals, measurable performance indicators defined for targets/sub targets and the preparation process of strategic plan of 2010 – 2014 involving target values.

This plan is prepared to form and guide the activities of City of Sakarya Special Provincial Administration between years of 2010 – 2014. This very strategic plan presents the strategic objectives consistent with the mission and vision of Special Provincial Administration and the targets of the Special Provincial Administration to accomplish these strategic objectives to the attention of those concerned.

The strategic objectives and targets presented in this plan contain the related duties and responsibilities of Special Provincial Administration. Under the leadership of City of Sakarya Special Provincial Administration that adopt a corporate management mentality for the future of Sakarya, with the participation of Presidency Council of Sakarya Provincial Assembly, Group Deputy Chairmen, Presidents of the Specialization Commissions, Delegates of Provincial Directorates, Delegates of the Municipalities, Non-governmental Organizations, Delegates of the Voluntary Organizations and Academic Members of University of Sakarya team of provincial strategic planning was generated. Studies of strategic planning are conducted by strategic plan preparation group with the approval of Provincial Assembly. Strategic objectives include the working areas of Special Provincial Administration and the priority issues of Agriculture – Trade – Tourism – Education – Health (A – 2T – E – H) which were determined in the previous studies. For each strategic objective with the participation of Directorates of Special Provincial Administration and Delegates of Provincial Directorate targets and sub targets, performance indicators and target values were designated.

Strategic Planning Studies started with the training of “Strategic Planning” to the related commission. With the commission, mission, vision and basic principles have been updated and SWOT analysis studies have been started. SWOT analysis results were requested from Special Provincial Administration and Provincial Directorate and after the obtained results were evaluated by Commission of Preparing Strategic Plan, necessary corrections were made. SWOT Analysis results and A – 2T – E – H were evaluated by requesting strategy suggestions from Special Provincial Administration and Delegates of Provincial Directorate and necessary changes were made. To accomplish the defined strategies target and sub target suggestions from Special Provincial Administration and Delegates of Provincial Directorate were taken, suggestions were discussed by the commission and then allowable corrections were made. Commission determined the targets and sub targets, performance indicators and target values and based on these the budget was determined as well. After many meetings to review the prepared strategic plan draft it was introduced to the commission.

After the approval by the commission the draft was presented to Secretary General and to the Head of Departments; after their approval it was presented to Provincial Council and finally to Provincial Assembly; The Strategic Plan of City of Sakarya Special Provincial Administration for 2010 – 2014 was accepted unanimously.

CONCLUSIONS

Prepared strategic plan should contain what is desired to be done with the targets and at which level and how it will be done. If strategic plan is prepared after determining the performance indicators to measure the applicability of the targets which accomplish the strategic objectives, then its factualness can be discussed. Applicability of the plan is based on the correct selection of the targets, their having no obstacles, adequate sources and finally consistency among the targets.

For the implementation of the plan, required sources should be compensated from the resources of public and private sectors, from foreign capital, from the enterprises in other districts or from credits; also cooperation with University, Metropolitan Municipality, Provincial Municipalities, Non-governmental Organizations, Delegates of the Voluntary Organizations and with State Planning Organization. In this context there are 16 strategies, in the strategic plan of City of Sakarya Special Provincial Administration and the strategic plan of 2010 – 2014 has been started to be applied.

ADOPTION OF PERFORMANCE MEASUREMENT AMONG PUBLIC SECTORS IN MALAYSIA: AN EXPLORATORY STUDY

**Ruzita Jusoh, Rudyanto Azhar, Haslida Abu Hassan,
University of Malaya, Malaysia**

ABSTRACT

This paper focuses on the adoption of performance measurement in public sectors in Malaysia. The objectives of the study are to examine the extent to which performance measurement is designed and linked to the strategy and the extent of performance measures being used in a balanced manner in accordance to the balanced scorecard (BSC) approach. A survey was conducted to senior civil servants and the results reveal that the design of public sector performance measurement system is moderately well developed. In examining the balanced nature of performance measurement, this study reveals that there is an overall lack of balanced indicators except for indicators on financial and non-financial such as input, activity and output indicators.

INTRODUCTION

There is an increasing interest on the performance measurement in government since late 1980s encouraged by the new public management movement (Osbourne and Gaebler, 1992). Many governments have adopted some sort of performance measurement initiatives to enhance their services and promote transparent and accountable government. However, implementations and practice of performance measurement has been recognized as much less than comprehensive (Niven, 2002). Much has been written in theory about performance measurements. However, less is known in practice about their operation, especially in the public sector and in Malaysian context. Therefore this paper reports an attempt to investigate the perception of senior civil servants of Malaysian public sector on the performance measurement design and implementation. A study was conducted to examine the extent to which performance measurement is designed in line with the strategy, how it has been implemented and the extent to which it has been used. This study resembles partly the research done by Hoque and Adams (2008) in the Australian government.

There were several reasons for undertaking this study. The first reason is to date, the design and choice of the performance management systems within government departments received minimum attention from researchers and least explored especially in Malaysia. The most recent study was conducted by Hoque and Adams (2008) in Australia. A quite similar study was done much earlier on state and local governments by the Government Accounting Standards Board and National Academy of Public Administration in the USA in 1997. Both studies looked into the performance measurement practices in the public sectors. Therefore, this study adopting a survey approach using questionnaires developed partly based on these earlier studies by Hoque. Within Malaysia, recent studies in regard to performance measurement were done on the private sector by Othman et al. (2004) on the limitations faced by a Malaysian telecommunication company in implementing balanced scorecard (BSC) and Jusoh et al. (2006, 2008a, 2008b) on performance measurements and balanced scorecard usage in Malaysian manufacturing firms. It is hoped that this short exploratory study will promote researchers' interest to investigate further into the issues of adapting and sustaining performance in the Malaysian public sector.

The second motivation for conducting this study is due to increasing efforts taken by the Government of Malaysia in adopting outcome-based performance monitoring and evaluation method on the governments' projects and programs. These efforts emphasizes on outcome/impact instead of processes. In line with this new development, the Malaysian government has also introduced the use of key performance indicators (KPIs) to all ministers which has resulted in the creation of a new unit called 'Unity and Performance Unit' under the Prime Minister's Department. It is therefore timely to examine if the BSC or its distinguishing characteristics can be used as an effective performance measurement and management tool for the government sector especially its application in the government of Malaysia.

Hence, focusing on the Malaysian public sectors, this paper attempts to answer the following questions related to the design, implementation, uses, and benefits as well as shortcomings of performance measurement system:

1. How is the performance measurement being designed?
2. How is the performance measurement being implemented and used?
3. What are the benefits and important aspects of successful implementation of performance measurement system?

LITERATURE REVIEW

Evolution of Performance Measurement

The concept of performance management has been going through a gradual change over the years. Performance measurement is defined as management and control systems that produce information to be shared with internal and external users (Henri, 2004). Furthermore, as it encompasses all aspects of the business management cycle, performance measurement constitutes a process for developing and deploying performance direction (Nanni et al., 1992). Neely et al. (1995) view performance measurement as the process of quantifying the efficiency and effectiveness of action while the performance measure represents the metric used to quantify the efficiency and/or effectiveness of this action. Performance measurement based on traditional cost or management accounting system that was introduced in early 1900s is more for fulfilling the requirement of external reporting and government (Johnson & Kaplan, 1987). Johnson and Kaplan (1987) argued that traditional performance measurement systems focus too heavily on the accounting or financial based measures and tend to ignore the non-financial measures. In other words, no or less emphasis is given on long-term value creation, particularly for the intangible and intellectual assets, that generate future growth to the organization. This is because these intangible assets could not be easily quantified in terms of financial or monetary values. Managing organization's intangible assets such as customer relationships, innovative products and services, high-quality and responsive operating processes, and employee capabilities and skills can only be done through the use of non-financial measures.

Accordingly, during the last two decades, an increasing number of companies have implemented performance management systems (PMS) that are based on critical success factors (CSF) and key performance indicators (KPI). Organisations, especially those in the private sector, have implemented a number of broader performance measurement and management system (PMS) tools such as Activity-Based Costing/Management (ABC/M), Benchmarking, Total Quality Management (TQM), Business Process Reengineering (BPR) and arguably the so-called best tool, the Balanced Scorecard (BSC). In a recent survey, Rigby (2003) reported that the BSC is one of the key "compass setting" tools used by managers. Lingle and Schiemann (1996) describe the results of a study that confirms that companies who balance financial and non-financial measurements, but also link strategic measures to operational ones, update their strategic scorecard regularly and clearly communicate measures and progress to all employees, are better performers. Surveys among corporate executives conducted by the consulting firm Bain and Company revealed that by 2004, 64 percent of their respondents in North America and 57 percent of the respondents worldwide were using BSCs in their companies (Rigby and Bilodeau, 2005).

Increasingly, managers have found value in monitoring indicators other than the financial measures. A recent survey of senior executives reveals that short-term financial measures rank fifth behind four non-financial measures in terms of perceived importance (Ittner and Larcker 2001). Atkinson et al. (1997, 25) also conclude that "performance measurement systems based primarily on financial performance measures lack the focus and robustness needed for internal management and control". This is because the information developed using traditional performance measurement framework for external users is inadequate and insufficient for internal users. The perceived restrictions of traditional accounting-based measures are

numerous of which Ittner and Larcker (1998a) listed eight most common limitations, namely, too historical and “backward-looking”, lack of timely signals, lack of predictive ability to explain future performance, reward short-term or incorrect behaviour, lack of actionability, too aggregated and summarized to guide managerial action, reflect functions instead of cross-functional processes, and give inadequate guidance to evaluate intangible assets.

Traditional financial ratios have worked as important tools of measuring organisational performance in the past. Kaplan and Norton (1992, 71) suggest that they “worked well for the industrial era, but they are out of step with the skills and competencies companies are trying to master today”. Their relevance in the information age where the market has no boundary and organisations are competing for talents is questionable. The situation may worsen when the firm is compelled to pursue short-term goals at the cost of the organisation’s long term objectives (Anand, Sahay, & Saha, 2005). Eccles, (1991) felt that the leading indicators of business performance cannot be found in the financial data alone.

Performance Measurement in Public Sector Organisations

‘New public management’ discussion surrounds only one key word, which is ‘performance’ (OECD, 1993: p.7). Performance has been the agenda for new way of doing business in the public sector and that involves paradigm shift towards entrepreneurial government (Osbourne and Gaebler, 1993). Thus, public sector nowadays needs to be managed like their business counterpart. However, the design of performance indicators in both private and public sectors are very difficult to match because performance is a broad concept which has various meanings for different audience in a different context (Carter, 1991). Nevertheless, managers of public sector have to face a number of performance measurement-related challenges resulting from the new public management initiative. Public agencies are becoming more aware of their necessity to develop and implement practices and procedures that will make them more business-like (Dixon, Kouzmin and Korac-Kakabadse, 1998). Governments around the world are under pressure to control their costs and improve their services. They are expected to be responsive and accountable not only to their departmental secretary, minister and parliament but also to client groups in the marketplace, even when their respective interests are in conflict (Dixon, Kouzmin and Korac-Kakabadse, 1996).

US Comptroller General David M. Walker, in testimony to a US Senate subcommittee on how to improve the federal government's approach to managing its people, noted that the landmark federal management reforms of the 1990s signaled the arrival of a new era of accountability for results (Walker, 2000). The US federal government will have to go beyond a zero tolerance for waste, fraud and abuse and create a government that is better equipped to deliver efficiently, economically and effectively on its promises to the US people. Randor and Lovell (2003) believe that there is a need to reinforce accountability, so that they are clearly held accountable for the resources they use and the outcomes they achieve. In response, government administrators have begun introducing changes and implementing modern private sector management tools in their organisations to deal with the financial constraints and increasing demand in terms of accountability to stakeholders (Ho & Chan, 2002).

According to the World Bank’s Independent Evaluation Group’s report, growing number of governments are working to improve their performance by creating systems to measure and help them understand their performance (Mackay, 2007). These monitoring and evaluation (M&E) systems are used to measure the quantity and quality of the goods and services (i.e. the outputs) that the state provides and to measure the outcomes and impacts resulting from these outputs. The M&E systems are also a medium to facilitate understanding of the causes of good and poor performance. The report highlights the various whole-of-government M&E initiatives around the world (some which are named differently) such as in the Australia, Chile, Colombia, United States (Program Assessment Rating Tool, PART), the United Kingdom (Public Sector Agreement), South Africa, Uganda (National Integrated M&E System) etc. Niven (2002) among others has been actively working with a number of local authorities in balanced scorecard implementation such as the City of Charlotte and Transport Department of Michigan, USA. In European countries such as the United Kingdom, Finland, the Netherlands and Sweden, performance measurement has been implemented rather pervasively as reported by Pollit (2005). Pollit emphasizes that the UK’s public sector has had the

strongest history on performance measurement and that performance measurement has become almost universal in the northwestern European governments and it goes well beyond rhetoric and into practice.

However, there are underlying differences between the private sector and the government sector. Private sector and government sector organisations organize functions differently, because their budgeting processes, regulatory and accountability regimes are different (Dixon, Kouzmin and Korac-Kakabadse, 1998). Consequently, priority objective would have been different too as the “financial” perspective (which is understandably the most important aspect of a profit oriented organisation) cannot be a bottom-line objective for government organisations, but rather may provide a constraint by limiting spending to budgeted amounts (Kaplan & Norton 1996: pp.179-80). Two important features of the public sector are:

- i) bureaucrats often serve several masters which include services’ users, services’ payers, politicians and professional organizations;
- ii) the consequence of serving different masters resulting in the bureaucrats often have several ends to achieve, i.e. they are often expected to increase both efficiency and equity when delivering services to the public (Dixon, 2002).

Steven Van de Walle (2007) highlights that the main problem of measuring public sector performance lying on a conceptual instead of measurement. It is a conceptual problem because in order to measure government and government performance, you first have to define government and agree on its objectives. Failure to define those areas would render the measuring effort as technically correct, but at the same time meaningless. Objectives, as in most cases of governments in the world, may not be revealed – objectives may be contradictory, or policy makers may just not know what exactly their objectives are. When conflicting and/or vague objectives is an essential feature of governing, measuring government performance will be merely a political exercise at best.

Balanced Scorecard (BSC) in Public Sectors

Kaplan and Norton (1992) define the "balanced scorecard" (BSC) as a set of measures that gives top managers a fast but comprehensive view of the business. The BSC includes financial measures that tell the results of actions already taken which is then complemented by the operational measures on customer satisfaction, internal processes, and the organisation's innovation and improvement activities. They identified the operational measures as the drivers of future financial result. Basically, a scorecard can be considered “balanced” if it contains financial and non-financial measures, driver and outcome measures, tangible and intangible measure and internal and external constituents.

Niven (2003) describes a BSC as a carefully selected set of quantifiable measures derived from an organisation’s strategy. Strategy is an integral element of a BSC framework which suggests that the foundation of measuring organisational performance should be derived from its vision and strategy. Therefore, any measurements chosen within the four perspectives (financial, customer, internal processes, and learning and growth) should be able to explain the level or extent of achievement of the strategy. In linking strategy to balanced scorecard, it is important to translate strategy into measurable achievement so that it can help to guide the organisation in explaining those typically mouthful words into simple and achievable adverbs and nouns (Kaplan and Norton, 1996). Hence, this study attempts to explore the extent to which performance measurement in the public sector is being developed based on their strategy.

Despite some underlying differences between the private and the government sector, government organisations are increasingly recognizing the BSC as an important performance measurement and management tool. They are also looking for appropriate performance measurement systems to ensure employees are rewarded for good performance. Effective performance management requires fact-based decision making and one of the first requirements is relevant and reliable data. With multiple perspectives (one of the important elements of the current version of the BSC) data at hand, government agencies can show the outcomes and effects of their efforts as real as possible, and taxpayers can judge the agencies'

accomplishments across a range of measures and decide whether they are getting the best possible service value for their tax dollars.

Apparently, there has been very little research done on how a standard BSC (originally developed for the private sector), can be effectively applied in the public sector. The effective use of the BSC in the public sector as a performance measurement and management tool represents a gap in the literature (Chan, 2002). Major concern would be on the potential adjustment to the BSC should it be adopted in a public sector. Potential adjustment to the structure of the BSC and the use of composite measures in evaluating an organization is worth to be discussed further.

Structure of BSC

There are some obvious weaknesses of the current version of the BSC when it is applied in the government sector especially with regard to its design and structure. The differing objectives of the government sector indicate some problems of the application of the current version of the BSC in government organisations. Government organisations often place their customers or constituents (not the financials) at the top of their strategy maps (Kaplan & Norton 1995, p.79). But the current version of the BSC fails to provide a blueprint as to how other perspectives (learning and growth, internal business process and financial) may ultimately influence and affect customers.

A clear distinction between the private and the public sector is that in the private sector, it is the customer who pays for the service and receives the service (Kaplan & Norton 2001, p.134). In the public sector, however, the customers or citizens do not necessarily pay for the service they receive (or perhaps pay only proportionately). In other words, the citizens do not receive service in direct proportion to their tax payments and any form of fiscal contribution. Therefore, unlike the private sector, the “financial” perspective is not the bottom-line objective for government organisations (Kaplan & Norton 1996, pp.179-80), but customer perspective is. Hence, in a causal relationship manner, it is very important that a BSC translates all relationships into customer satisfaction but not necessarily into financial success. In fact, in the government sector, it is most often that financial success leads to customer satisfaction (as contrasted with the private sector, where customer satisfaction usually leads to increased revenue).

This has been clearly experienced by the City of Charlotte, USA as highlighted by Kaplan & Norton (2001, p.138) where they placed the customer perspective at the top of their corporate scorecard. They experienced that financial objectives became the enablers for helping the city to achieve its customer objectives by ensuring that the city’s services such as sewage treatment, garbage collection, city cleanliness etc are delivered at a reasonable price. They also have seek competitive funding from external partners while maintaining a solid and sustainable tax base and credit ranking in order to fund high-priority projects towards providing better service delivery. All these financial objectives led them to a higher customer satisfaction. The BSC can be effective in the government sector, if and only if, the current perspectives are rearranged as shown in Figure1.

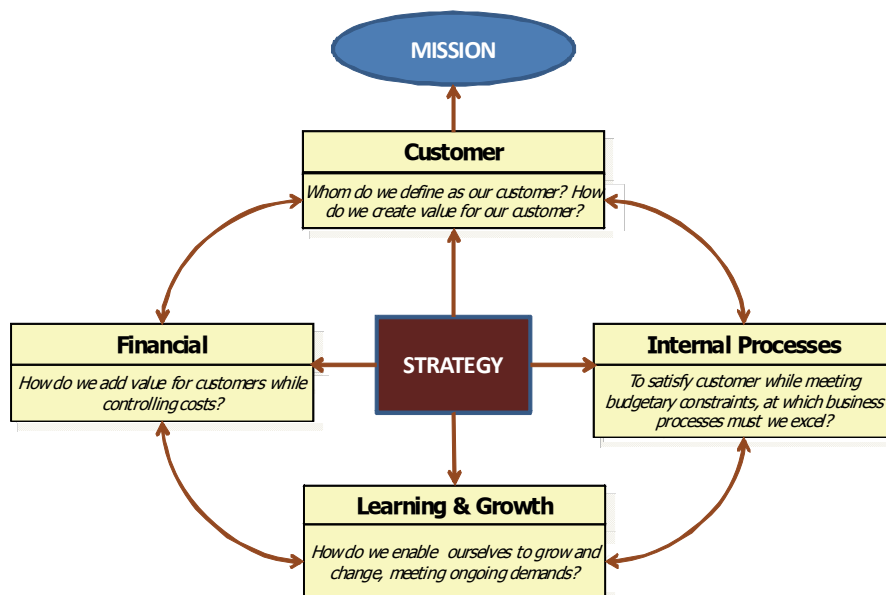

Figure 1: Rearrangements of balance scorecard for public sector

According to Niven (2003), the four perspectives of the current version of the BSC can still be applied in public sector as long as they are rearranged according to governmental priorities. The primary intention of a government agency is to serve the people; hence its main reason for existence or its mission would be at the top of every other objective. The strategy still remains at the focal point of the perspectives however, meeting the people's or customers' expectations is now considered to be the most critical perspective among the four in determining whether the agency has accomplished its mission or otherwise. Another consideration as suggested by the revised framework above is on the rephrasing of the strategic questions to suit the public sector environment. These considerations, if positively dealt with, may contribute to employee satisfaction, superior employee performance, sound internal business process and in turn, may lead to efficient stewardship of taxpayers' dollars which may eventually lead to achieving the main objective - absolute customer satisfaction. In conclusion, in the light of the above observations, it is clear that some modifications are needed to the current version of the BSC albeit having a similar set of performance perspectives for it to be used in the public sector. This study attempts to investigate the design and structure of performance measurement in the public sector in terms of its strategic alignment and balanced characteristics.

RESEARCH METHODS

Sample and Survey Procedure

There are more than 900 federal and state government agencies throughout Malaysia. According to listings by federal government ministries and agencies in the website, there are approximately 77 ministries and federal government agencies having headquarters in Putrajaya. The scope of this study was limited to the government agencies having their head offices at Putrajaya in view of the vast locations and respondents which may include many groups and sub-groupings. This would be more practical and achievable given the time and resource constraints of the study. Furthermore, the questionnaire designed demands responses from the senior executives and most senior executives normally are positioned at the head offices in Putrajaya. Concurrent with time constraint and position of the participants, the questionnaires were administered personally to respondents' offices in Putrajaya. All respondents were assured that their responses will be treated confidential; the cover letter states that 'only aggregates will be used for the research and that no individual organisation will be linked to specific responses'. The cover letter also states that filling up of personal information at the end of the questionnaire is optional. Out of 73 questionnaires sent out, only 51 were returned (70 percent), seven via fax and the rest were personally collected.

Respondents' Profile

Demographic information of the respondents is presented in Table 1. Majority responses obtained were from the divisional level (38 respondents, 74.5 percent), followed by sectoral (12 respondents, 23.5 percent) and organisational level (1 respondent, 2 percent). The respondents were divided into three position groupings: Senior Management, Middle Management, and others. There are 28 males respondents as compared to 20 females, while 3 respondents' data were missing. Forty seven respondents (92.2 percent) have been in the government service for 12 years and above and among them, 24 (47.1 percent) respondents have been with the same unit between 2 to 4 years. Twenty four of the respondents (47.1 percent) have a university degree while 21 of them graduated with a master's degree.

Table 1: Respondents' Profile

	Frequency	Percentage
Levels in organization		
Entire organization	1	2
Sector	12	23.5
Division	38	74.5
Total	51	100.0
Post		
Senior Management	6	11.8

Ph.D.	2	3.9
Professional qualification	1	2.0
Missing	3	5.9
Total	51	100.0

Questionnaire Design

The questions in the questionnaire were formulated after a lengthy review of the literature in performance measurement and balanced scorecard. A total of 35 questions derived selectively from various previous researches such as Hoque and Adams (2008), Kald and Nilsson (1999), and Marr (2005). Majority of the questions were adapted from Hoque and Adams (2008). The questionnaire is broadly divided into three sections, namely: Strategy, Performance Measurement, and Respondent's Background. Strategy section gives the respondents an opportunity to present his/her understanding of his/her unit's strategy and its

possible relationship with performance measurement system. Performance measurement section deals with questions related to the design, implementation, and use of the PMS in his/her organisation, sector or division. Majority of the questions were being rated on a 5-point Likert Scale where 1= “To a little or no extent”, 2= “To some extent”, 3= “To a moderate extent”, 4= “To a large extent” and 5= “To a very large extent”.

RESULTS

Survey data of this study was analyzed using descriptive statistics to answer the three research questions posed earlier. As the study was an exploratory in nature, analysis using descriptive statistics deems to be sufficient in order to give a general idea about the current state of nature of performance measurement systems practiced in the Malaysian public sector. Therefore, results are presented according to the three research questions.

How is the Performance Measurement Being Designed?

Before the respondents were asked on the specific questions relating to the design of performance measurement, two questions were asked regarding the business performance measurement (BPM) approaches. Out of 44 responded (7 were missing), 41 of them (93.2 percent) said that they had heard and are aware of the balanced scorecard (BSC) approach. In another question asking them whether their performance measurement system is a balanced scorecard, only 7 out of 51 who responded (13.7 percent) say that their performance measurement system is to a large and very large extent resembles a BSC whilst 27 respondents (52.9 percent) reply that their performance measurement systems least likely to resemble a BSC. Among 51 who responded (see Table 2), only five respondents’ organisations (9.8 percent) have actually implemented BSC whilst 28 organisations (54.9 percent) are still in the consideration stage, while 12 have rejected the idea and six have not considered it at all.

Table 2: Business Performance Management (BPM) Approaches

	Percentages				
	Not considered	Considering	Considered then rejected	Implemented	Implemented then abandoned
ISO	3.9	21.6	9.8	62.7	2.0
Six Sigma	26.0	38.0	28.0	6.0	2.0
Activity Based Costing	44.9	12.2	24.5	16.3	2.0
Balanced Scorecard	11.8	54.9	23.5	9.8	
Customised KPIs	2.0	15.7	19.6	62.7	

This study also attempts to find out if the unit is using any other performance measurement approaches than the balanced scorecard. This is because in Marr’s (2005) study, out of 276 respondents, 167 (61.0 percent) are using BSC together with other quality-based approaches such as total quality management, Baldrige, Six Sigma and economic value added (EVA). The results of this study (see Table 2) show that 32 organizations (62.7 percent) have implemented ISO and some sort of a customized KPI system. Eight organizations (15.7 percent) have implemented activity based costing and only 3 (5.9 percent) have implemented six sigma. What is interesting to note is that there is one respondent from each of those who had implemented ISO, Six Sigma and activity based costing had eventually abandoned the approach.

By using cross tab analysis (see Table 3), the result shows that 43.1 and 39.2 percent of those who have implemented ISO and a customized KPI system respectively are also considering implementing BSC. With a

move towards outcome-based performance measurement and in increasing awareness towards employing a balanced set of KPIs, there is a high probability that the public sectors will increasingly adopt the BSC approach.

Table 3: BSC with other BPM approaches

	Percentages			
	ISO	Six Sigma	Activity Based Costing	Customised KPIs
Considering BSC	43.1	2.0	4.1	39.2
Considered then rejected BSC	7.8	2.0	8.2	9.8
Implemented BSC	2.0	2.0	4.1	5.9

On the specific questions concerning the design of performance measurement system, questions relating to the extent of performance measures being derived from the organisational strategy and the extent to which performance measures are used in a balanced manner in accordance to the BSC approach were asked (see Table 4 and Table 5).

Table 4: Performance measurement design – Derived from strategy

Performance measurement design – Derived from strategy	Percentages			
	Little or no extent	Moderate Extent	Large and Very large extent	Mean
Our unit's strategy is officially documented	11.8	37.3	51.0	3.45
Our unit's organisational strategy is well understood by employees	25.5	49	25.5	2.98
Our unit's operational strategy is influenced by organisational strategy	13.7	23.5	62.7	3.90
Our unit's Key Performance Indicators (KPIs) are derived from the unit's organisational strategy	13.7	47.1	39.2	3.25
We review and reassesses the KPIs used by our performance measurement system whenever our unit's strategy changes	33.3	37.3	29.4	2.98

As shown in Table 4, there are five questions relating to performance measurement design-derived from strategy. Results show that 51 percent of respondents declare that their unit's strategy is officially documented, while 62.7 percent of respondents feel that their operational strategy is to a large and very large extent influenced by the organisational strategy. The overall mean for performance measurement deriving from strategy is 3.31, hence, it can be deduced that the performance measurement of Malaysian public sectors is to a moderate extent being developed based on organisational strategy. This result somewhat disagrees with the findings by Kald and Nilsson (1999) on 800 business units in the Nordic countries where there is a relatively strong connection between strategic plan and the measures used. This could be perhaps due to the difficulties in translating the strategy into operational and measureable terms within a public sector as strategy is often nebulous and visionary as Kaplan (1996) suggests that strategy can be a foreign concept to a public sector organisation.

Table 5 shows the scores for questions relating to the extent of performance measures being used in a balanced manner in accordance to the approach of the BSC. The evaluations of balanced indicators are in terms financial vs. non-financial, input vs. output, driver vs. outcome measures as well as internal vs. external constituents. In addition, balanced indicators should reflect the multidimensional nature of performance measurement.

Table 5: Performance measurement structure – Balanced

Performance measurement dimension – Balanced	Percentages			
	Little or no extent	Moderate Extent	Large and Very large extent	Mean
Output	29.4	11.8	58.8	2.29
Cost & processes efficiency & quality measures	33.3	41.2	25.5	1.92
Activity/process	11.8	27.5	60.8	2.49
Customer satisfaction	13.7	49	37.3	2.24
Outcomes	47.1	37.3	15.7	1.69
Financial	9.8	54.9	35.3	2.25
Inputs	19.6	35.3	45.1	2.25
Learning and growth	41.2	45.1	13.7	1.73
Socially and environmentally related measures	60.8	31.4	7.8	1.47
Innovation	58.8	29.4	11.8	1.53

As shown in Table 5, all the ten performance measurement dimensions are used only to some extent by the Malaysian public sectors (mean scores are below 3.0). However, among the 10 dimensions, activity/process measures are used most extensively (mean= 2.49), followed by output measures (mean= 2.29), financial measures (mean= 2.25), inputs measures (mean = 2.25), and customer satisfaction measures (mean = 2.24). Majority of the respondents reported that they use activity/process measures (60.8 percent) and output measures (58.8 percent) to a large and very large extent. The findings on output and activity/process measures are quite similar to the findings reported by Hoque and Adams (2008) in the Australian government. As expected, socially and environmentally related measures (mean = 1.47) and innovation related measures are used least by the Malaysian public sectors. The former is reported to have been used to a little or no extent by 60.8 percent of respondents and the latter by 58.8 percent. The mean score for all 10 dimensions is 2.94, and therefore, it can be concluded that Malaysian public sectors use balanced performance measures only to some extent. It seems that the measurements are to some extent being balanced between financial and non-financial indicators because the financial measurements are being used to some extent (mean= 2.25), while other non-financial performance measurement dimensions such as customer satisfaction and process efficiency and quality are being used to some extent too.

In addition, from the mean scores, the results also indicate that there seems to be a somewhat balanced set of performance measurements between input and output indicators as both types of measurements are being used to large and very large extent by 45.1 percent and 58.8 percent of respondents, respectively. This could be due to the current Malaysian government initiative of implementing Annual Work Target which was enhanced in 2002 (JPA, 2002) that requires every public servant to plan and document all core and non-core activities and deliverables to be accomplished for that particular year which include planned budgets, manpower, activities and trainings. However, with regard to input measures, this finding is quite different from Hoque and Adams's (2008) study whereby inputs and learning and growth measures were the least used in the Australian government.

Not surprisingly, the least used performance measurement dimensions are socially and environmentally related measures (mean= 1.47), measures on innovation (mean= 1.53) and outcomes measures (mean= 1.69). An outcomes measure is defined as the measure that tracks the benefit received by stakeholders as a result of the organisation's operations (Niven, 2002). Outcome measure relates to the achievement of the organisation's overall goals such as reduced incidence of HIV, increased perception of public safety etc. The low percentage of usage of outcome measures among Malaysian public sector might not augur well with the aspiration of the Chief Secretary to the Government to institute outcome measurements in evaluating the achievement of the Ninth Malaysian Plan.

Another possible balanced set of indicators are between a driver and an outcome indicators. A driver indicator is a measure that leads to the achievement of outcome indicators and often includes the measurement of processes and activities (Niven, 2002). Since this study shows an extensive usage of inputs, activities as well as a moderate use of efficiency and quality measures as compared to outcome measures, therefore, we can fairly deduce that the public sector performance measurement system is seemingly lacking in terms of balanced driver-outcome indicators.

The last aspect of a balanced set of measurements is from the perspective of internal vs. external stakeholders (Kaplan and Norton 1992; 1996). From our results, internal related measurements such as inputs, financial, activity/process, as well as output, are being used to a larger extent as opposed to external related measures. Except for customer satisfaction that were reported to have been used to a moderate extent (49.0 percent), other external related measures such as outcomes (47.1 percent) and social and environmental (60.8 percent) related measures have been used to little or no extent. Therefore, it seems that the Malaysian public sector has been measuring their achievement based most on internal yardstick instead of taking the cues from the stakeholders, customers or the public.

To explore further on the use of socially and environmentally related measures, respondents were asked to rate on the extent of use of nine socially and environmentally related measures as shown in Table 6.

Table 6: Social and environmental related performance measures

Performance measurement structure – Social and Environmental related performance measures	Percentages			
	Little or no extent	Moderate Extent	Large and Very large extent	Mean
Employee diversity	86.3	9.8	3.9	1.18
Economic impacts	54.9	35.3	9.8	1.55
Occupational health and safety	62.7	21.6	15.7	1.53
Stakeholder involvement in community, social and environmental issues	54.9	19.6	25.5	1.71
Community relations	60.8	23.5	15.7	1.55
Employee satisfaction	9.8	74.5	15.7	2.06
Other community, ethical, social and environmental issues	60.8	19.6	19.6	1.59
Natural resource conservation and emission levels	70.6	19.6	9.8	1.39

The mean score of overall nine social and environmental related measures is 2.28 suggesting that the social and environmental related measures are only being used to a little or no extent by the Malaysian public sectors. Among the nine measures, employee satisfaction measures received the highest mean score (2.06) with 74.5 percent of the respondents used these measure to a moderate extent. Interestingly, employee diversity measures received the lowest mean score with 1.18 and were used to little or no extent by 86.3 percent of the respondents. This is particularly interesting given the racial composition in the public sector has been a hot and sensitive issues debated recently (Ahmad, 2007; Abdullah, 2008). Ahmad and Abdullah wrote that according to the Public Services Commission's (PSC) statistic, only 1.78 percent of Chinese and 2.5 percent of Indian had applied to join the public sector in 2006 out of 486,802 total applicants. This goes to show how unpopular the work in public sector is to the non-Malays. According to Tan Sri Ismail Adam, the Director General of Public Service Department (PSD), his department and the PSC have been relentlessly doing their level best to eliminate the racial gap in the public sector (Ahmad, 2007; Abdullah, 2008). This survey however, shows that employee diversity is not one of their key indicators.

Another interesting observation from the results shown in Table 6 is on the usage of natural resource

conservation and emission level measure. A mean score of 1.39 suggests that they have little or no extent of use of the said measure. As alarming as it might suggest, the study by Hoque and Adams (2008) also reveals similar pattern. As part of government's efforts to preserve the environment, the new Prime Minister has taken the lead in restructuring the Ministry of Energy, Water and Communication into Ministry of Energy, Green Technology and Water effective 9 April 2009 (Prime Minister's Office, 2009). With the new name, perhaps there will be more attention and importance given to the natural conservation measures.

Another social and environment related measure that is worth mentioning is the low attention given to the economic impact measures (mean = 1.55). Being one of the key tenets in the New Economic Policy as well as in the Ninth Malaysia Plan, one would expect quite a number of ministries, departments and agencies would be addressing the eradication of hard core poverty, reducing overall poverty, tackling the socio-economic inequalities and bridging the income gap between rural and urban area as well as among races.

How is the Performance Measurement Being Implemented and Used?

Several questions relating to performance measurement implementation and use were asked. The following sub-sections discuss the management/employee participation and communication channels involve in performance measurement system implementation as well as recording, updating and analysis of performance data involved. As part of performance measurement implementation and use, questions about the purposes and users of reports generated from the performance measurement system as well as its specific uses were also asked.

Participation and Communication Channels

Table 7 looks into the intricacies of deployment activities of performance management initiative that entails participation of various functional areas during performance measurement development and the communication channels employed. With regard to participation in the implementation process, the senior management team comprising those in the corporate planning, services & operations as well as the policy groups are to a large and very large extent involved in development of performance measurement (mean = 3.59). Results also indicate that 62.7 percent of the respondents have reported use of information sessions (mean, 3.86) and 60.8% have used memo (mean = 3.69) as their major communication channels to a large and very large extent.

Table 7: Participation and Communication Channels

	Little or no extent	Moderate Extent	Large and Very large extent	Mean	Valid N	Missing N
Participation in the development	Percentages					
Accounting / Finance	43.1	41.2	15.7	2.67	51	0
Policy	9.8	37.3	52.9	3.59	51	0
Human Resources	31.4	47.1	21.6	2.88	51	0
Corporate Planning	15.7	25.5	58.8	3.59	51	0
Services / Operations	9.8	31.4	58.8	3.59	51	0
Information Technology	41.2	43.1	15.7	2.76	51	0
Communication	Percentages					
Brochures	74.5	9.8	15.7	1.92	51	0
Newsletter	35.3	31.4	33.3	2.92	51	0
Memo	11.8	27.5	60.8	3.69	51	0
Information sessions	5.9	31.4	62.7	3.86	51	0
Organisation unit's website	64.7	25.5	9.8	2.02	51	0

Recording, Updating, and Collecting Performance Data

The survey also asked the respondents to indicate the extent of use of methods or system to track, record, and collect data for performance measurement. The results are as shown in Table 8. The results indicate that spreadsheet application is being used to a large and very large extent (47.1 percent; mean, 3.18) as compared to ERP and specialized packaged PMS which are the being used to a little or no extent. The dominant method of data collection is found to be through manual basis where 51.0 percent (mean = 3.33) have used it to a large and very large extent such as via hardcopy or email submission of spreadsheet and words document.

Table 8: Recording, Updating, and Collecting Data

Recording, updating and collecting data	Little or no extent	Moderate Extent	Large and Very large extent	Mean	Valid N	Missing N
Method / system	Percentages					
Spreadsheet applications	33.3	19.6	47.1	3.18	51	0
Enterprise Resource Planning (ERP) system	72.5	19.6	7.8	1.73	51	0
Specialised packaged performance measurement system	49	35.3	15.7	2.33	51	0
Custom-built applications environmental issues	39.2	45.1	15.7	2.51	51	0
Data collection method	Percentages					
Manual	23.5	25.5	51	3.33	51	0
Batch interface	45.1	41.2	13.7	2.57	51	0
Online	64.7	27.5	7.8	1.98	51	0

The highly use of spreadsheet applications and manual data collection indicates that the level of use of IT and information system sophistication (ISS) is still low among many Malaysian public agencies. Classe (1999), for example, noted that simple spreadsheet tools might be sufficient at the initial stage of implementing PMS, but to make the method an integral part of the strategic performance measurement and management, automation will usually be necessary. Bernard Marr (2005) reports in his study that even though 45 percent of respondents use spreadsheet applications, such as Microsoft Excel, as the prime tool for the business performance measurement and management (BPM) activities, the users are not satisfied with their spreadsheet applications as 18 percent felt that they worked poorly as tools to measure and manage performance.

The lack of suitable IT platform could be due to the cost of acquiring ERP that might run into millions of ringgit as according to Spathis and Constantinides (2003), the cost is not correlated to the sum of benefits of its implementation. This finding aggravates the concern stated earlier about the issue of changing or rotating the staff assigned to collecting, analysing and reporting performance measurement. Without a standard process supported by an established IT platform and dedicated staff, there could be a further challenge in monitoring and evaluating governance that could go undetected and might jeopardize the whole integrity and sustainability of the PMS initiative.

To make matters worse, online collection method for performance measurement data is still not prevalent among public sector as 64.7 percent (mean, 1.98) say that they use to a little or no extent of such method. Shaman and Kavan (1999) observe that paper-based measurement systems are too slow, cumbersome, labour intensive and unreliable. This might just compound the issue of governance as stated above.

Analysis Methods

The questions attempt to find out the extent of analysis done on the performance result. The analysis activity

is very crucial if the results are going to be used regularly by the executive leadership as well as to help staff monitor progress toward intended program or service results. The findings are presented in Table 9. Results show that majority (58.8%, mean = 3.55) of respondents use qualitative analysis to validate their data through interviews and personal observations. Knowing that there is a lack of technology enabler that is supporting the data collection and recording as found earlier, thus validation tool using interviews and observation is justifiable.

With regard to the role of performance data in benchmarking activities, the results reveal that performance data are often being benchmarked with the established targets (68.6 percent, mean = 4.06), the national standards or guidelines from federal agencies and/or professional groups (62.7 percent; mean, 3.60), prior periods (41.2 percent; mean, 3.26) and with established thresholds (41.2 percent; mean, 3.18). The overall mean for Analysis is 2.97 which imply that the performance measurement result analysis has only been done in a little extent. These findings are almost similar to Hoque and Adams' (2008) survey that the Australian government uses prior periods (75.0 percent; mean, 3.77) and established targets (60.0 percent; mean, 2.62) as their main benchmarks.

The qualitative analysis may not be suitable in most situations as empirical data need to be collected from district, state and departmental levels for purpose of analysis. This finding would reflect that many government agencies do not actually have a robust qualitative analytical tool, well-defined methodologies and IT platform to facilitate them in project measurement/evaluation especially those with multi-billion worth of projects.

Table 9: Analysis

Analysis	Little or no extent	Moderate Extent	Large and Very large extent	Mean	Valid N	Missing N
Validation tool	Percentages					
Statistical analysis (e.g. regression, correlation)	66.7	23.5	9.8	2.16	51	0
Qualitative analysis (e.g. interviews, personal observations)	11.8	29.4	58.8	3.55	51	0
Validation of relationships between measures are done	39.2	27.5	33.3	2.98	51	0
Benchmarking data	Percentages					
With prior periods	23.5	35.3	41.2	3.26	51	0
With established targets	5.9	25.5	68.6	4.06	51	0
With established thresholds	27.5	31.4	41.2	3.18	51	0
With national standards or guidelines from Federal agencies, and/or professional groups	15.7	21.6	62.7	3.60	51	0
With other programs/agencies of other governments	51	25.5	23.5	2.46	51	0
With other programs/agencies within your governments	60.8	19.6	19.6	2.42	51	0
With private sector organisations	60.8	23.5	15.7	2.10	51	0

The following sub-sections also discuss about the implementation and use of performance measurement system with respect to the users/recipients of the performance measurement reports, the reporting purpose and the specific uses of performance measurement system in the Malaysian public sector.

Users

From Table 10, majority of the respondents reveals that from large to the very large extent, the recipients of the performance measurement reports have been the Implementation Coordination Unit (ICU) (52.9 percent,

mean = 3.43) and followed by Economic Planning Unit (EPU) (49.0 percent, mean = 3.43). Other users are the operating managers (39.2 percent, mean = 3.10) and elected officials (37.3 percent, mean = 2.84). This result is understandable because ICU and EPU are two of the four central agencies under the Prime Minister's Office who are involved in planning the country's and policy direction as well as monitoring the physical development throughout the country. Hence, as a large percentage of measurements consist of input, activity/process and outputs, the results would have been useful for EPU and ICU.

Surprisingly, Ministry of Finance has had little to no extent of use of the performance report. This might be due to the availability of an automated finance systems like the Electronic Budget Planning and Control System (e-SPKB) and the Standard Accounting System for Government Agencies (SAGA) that link finance divisions of each ministry and agency to the Ministry of Finance and Auditor General's Office, hence reducing the need for additional finance related measures.

Table 10: Users

User	Percentages			Mean	Valid N	Missing N
	Little or no extent	Moderate Extent	Large and Very large extent			
Finance Ministry	49	27.5	23.5	2.71	51	0
Public service department	13.7	56.9	29.4	3.16	51	0
Economic Planning Unit	23.5	27.5	49	3.27	51	0
Implementation & Coordination Unit	15.7	31.4	52.9	3.43	51	0
Parliament	31.4	49	19.6	2.84	51	0
Program managers	7.8	52.9	39.2	3.33	51	0
Elected officials	31.4	31.4	37.3	2.84	51	0
Operating managers	21.6	39.2	39.2	3.10	51	0
Financial managers	17.6	56.9	25.5	3.12	51	0
Budget analysts	37.3	39.2	23.5	2.71	51	0
Citizens	58.8	19.6	21.6	2.47	51	0
Media	51.0	29.4	19.6	2.57	51	0
Human resource managers	45.1	41.2	13.7	2.65	51	0
Sustainability, environmental or social responsibility managers	60.8	27.5	11.8	2.02	51	0

There were 58.8 percent and 51 percent of the respondents respectively declare that the citizen and media have little use of the performance report. These results however are somewhat different from Hoque and Adam's findings on the Australian government whose 60 percent of respondents replied that the reporting outputs are for the citizens and media. Does this show that the Australian government practices a more open and transparent administration than the Malaysian government? Or does it mean that our citizens are less concern about our right? This study does not have the answer for either question but based on the results, the Malaysian public sector could have been more transparent in its performance reporting especially on issues related to environmental sustainability and social responsibility in order to prevent any environmental mishaps like landslides or cracked highways from happening. In a study conducted by Pollitt (2005) on the European governments, the respondents cited that the only regularly active external scrutiny seemed to occur when state agencies are engaged in commercial activities with private sector.

Reporting purpose

As shown in Table 11, the results indicate that the main purposes of reporting have been to a large and very large extent for internal managerial control (68.6 percent, mean = 3.92) and followed by budget execution (45.1 percent, mean = 3.37). This result substantiates the remark by Pollit (2005) that performance measurement and management system is carried out by and for managers.

Table 11: Reporting Purpose

Reporting purpose	Percentages			Mean	Valid N	Missing N
	Little or no extent	Moderate Extent	Large and Very large extent			
External financial reporting	51	25.5	23.5	2.71	51	0
Internal managerial control	5.9	25.5	68.6	3.92	51	0
Budget preparation	19.6	52.9	27.5	3.10	51	0
Budget execution	13.7	41.2	45.1	3.37	51	0
Legal requirements	68.6	19.6	11.8	1.94	51	0

Uses

On the question relating the uses of performance measurement system, 60.8 percent of respondents use from large to a very large extent the results of performance measures as a basis for taking actions (mean = 3.76), to manage activity or program (mean = 3.59) and for strategic planning (mean = 3.47), while 45.1 percent are using it to a large and very large extent for measuring program and project performance (mean = 3.10). The results also indicate that performance measures are used at a little or no extent to satisfy professional associations (64.7 percent, mean = 1.98), to follow others (62.7 percent, mean = 2.08), to measure goals in relation to community impacts (62.7 percent, mean = 2.33) and to measure environmental goals (60.8 percent, mean = 2.27).

Table 12: Uses

Uses	Percentages			Mean	Valid N	Missing N
	Little or no extent	Moderate Extent	Large and Very large extent			
Measure program and project performance	35.3	19.6	45.1	3.10	51	0
Satisfy legislative requirement(law, ordinance, policy)	47.1	25.5	27.5	2.59	51	0
Manage an activity or program	7.8	31.4	60.8	3.59	51	0
Budget formulation	27.5	49.0	23.5	2.98	51	0
Taking actions based on the results	9.8	29.4	60.8	3.76	51	0
Budget execution	13.7	47.1	39.2	3,31	51	0
Strategic planning	17.6	21.6	60.8	3.47	51	0
Satisfy community expectations	47.1	23.5	29.4	2.76	51	0
Social responsibility goals	47.1	25.5	27.5	2.67	51	0
Goals in relation to local community impacts	62.7	23.5	13.7	2.33	51	0
Environmental goals	60.8	25.5	13.7	2.27	51	0
Satisfy professional associations	64.7	23.5	11.8	1.98	51	0
Punish or reward staff	35.3	43.1	21.6	2.94	51	0
Follow others	62.7	21.6	15.7	2.08	51	0

What are the benefits and important aspects of successful implementation of performance measurement system?

Benefits

Performance measurement has promised many benefits since Argyris (1977) claims that performance measurement should contribute to a better understanding of how business works. In this survey, we attempt to identify the extent of benefit of the performance measures that are being used in various managerial

activities. Performance measurement system seems to provide benefit largely in improving programmes/service quality (56.9 percent; mean, 3.51), cross agency cooperation /coordination (56.9 percent; mean 3.41), increasing awareness of factors that affect performance results (54.9 percent; mean 3.71), increasing awareness of and focus on result (54.8 percent; mean 3.24) and improving effectiveness of agency programmes (52.9 percent; mean 3.41). The least benefits expected from the performance measurements are to reduce environmental effect (58.8 percent; mean 2.39), changing appropriation level (56.9 percent; mean 2.27), changing the questions the legislators ask government managers or executives (54.9 percent; mean 2.49) and communicating with the public about performance (52.9 percent; mean 2.57).

Table 13: Benefits

Benefit s	Percentages			Mean	Valid N	Missing N
	Little or no extent	Moderate Extent	Large & Very large extent			
Increasing awareness of and focus on results	31.4	13.7	54.9	3.24	51	0
Increasing awareness of factors that affect performance results	13.7	31.4	54.9	3.71	51	0
Improving responsiveness to customers	13.7	39.2	47.1	3.41	51	0
Improving programs/service quality	15.7	27.5	56.9	3.51	51	0
Communicating with the public about performance	52.9	27.5	19.6	2.57	51	0
Improving effectiveness of agency programs	17.6	29.4	52.9	3.41	51	0
Changing strategies to achieve desired results	11.8	45.1	43.1	3.37	51	0
Changing the substance or tone of discussion among legislators about agency budgets	17.6	41.2	41.2	3.20	51	0
Improving communication with the legislature and legislative staff	49.0	25.5	25.5	2.53	51	0
Changing the questions legislators or their staff ask government managers/executives	54.9	19.6	25.5	2.49	51	0
Reducing duplicating services	19.6	37.3	43.1	3.16	51	0
Changing the substance or tone of discussion among legislators about oversight of agency	43.1	25.5	31.4	2.65	51	0
Improving external government cooperation / coordination	21.6	45.1	33.3	3.12	51	0
Cost savings	15.7	51.0	33.3	3.16	51	0
Improving cross-agency cooperation /coordination	15.7	27.5	56.9	3.41	51	0
Changing appropriation levels	56.9	23.5	19.6	2.27	51	0
Reducing environmental impacts	58.8	9.8	31.4	2.39	51	0

On the question about the important aspects of successful implementation of performance measurement system, results shown in Table 14 indicate that respondents perceived that performance measures that help staff monitor progress toward intended program/ service results (mean=3.72), training for management and staff about performance measurement development and selection (mean=3.54) and communication of purpose (mean=3.52) are most important (see Table 7). They also consider that staff participation (mean=3.44), regular use by executive leadership (mean=3.40) and the adequacy of technology for collecting, analyzing and reporting performance measures (mean = 3.28) as critical to ensure successful

implementation of PMS initiative. These results are quite comparable to those of Hoque and Adam's (2008) study that reveals regular use of performance measures by executive leaderships is the most important, followed by performance measures that help staff monitor progress towards intended program/service results and the adequacy of technology. Consistent with Hoque and Adam's study, results also reveal that additional or changed staffing for collecting, analysing and reporting performance measures is the least important aspect of successful implementation of performance measurement system (mean= 2.42).

Table 14: Important aspects of successful implementation

Important aspect of successful implementation	Percentages			Mean
	Little or no extent	Moderate Extent	Large & Very large extent	
Regular use of performance measures by executive leadership	31.4	15.7	52.9	3.40
Performance measures that help staff monitor progress toward intended program/ service results	7.8	39.2	52.9	3.72
Adequacy of technology for collecting, analyzing and reporting performance measures	25.5	25.5	49.0	3.28
Communication of the purpose for using performance measurement to employees	11.8	33.3	54.9	3.52
Staff participation in the process of developing performance measures	13.7	33.3	52.9	3.44
Training for management and staff about performance measurement development and selection	7.8	37.3	54.9	3.54
A link of performance measures to budget decisions	21.6	41.2	37.3	3.22
Citizen, client/customer or stakeholder interest in government program performance	19.6	43.1	37.3	3.22
Additional or changed staffing for collecting, analysing and reporting the performance measures	56.9	31.4	11.8	2.42
Regular use of performance measures by elected officials	11.8	49.0	39.2	3.28

Shortcomings

The respondents were also asked to state their opinion on whether their current performance measurement system experiences any shortcomings or weaknesses. These shortcomings are expected to hinder the successful implementation of performance measurement system. Table 15 shows the results of shortcomings of performance measurement system as perceived by the respondents.

Table 15: Shortcomings

Shortcomings	Percentages			Mean	Valid N	Missing N
	Little or no extent	Moderate Extent	Large and Very large extent			
Overly focused on the past	70.6	11.8	17.6	2.31	51	0
Overly focused on the short run	21.6	49.0	29.4	3.06	51	0
Overly focused on financial performance	37.3	33.3	29.4	2.84	51	0

Overflow of information	35.3	27.5	37.3	2.86	51	0
Information not available in time	11.8	17.6	70.6	3.84	51	0
Easy to manipulate	35.3	27.5	37.3	3.10	51	0
Too aggregated	35.3	35.3	29.4	3.00	51	0
Imprecise, often provides erroneous information	5.9	25.5	68.5	3.76	51	0

The most obvious shortcomings of the performance measurement are that the information is to a large and very large extent, not available on time (70.6 percent; mean, 3, 84) and imprecise (68.5 percent; mean, 3.76). These results seem consistent with those found in Table regarding the data recording, updating, and collection methods. The overly use of spreadsheet applications and manual data collection indicates that the level of use of IT and information system sophistication (ISS) is still low, hence results in data being not available on time and imprecise. There are 37.3 percent of respondents who say that they have to a large and very large extent too much information and that the information is easy to manipulate.

The KPI results information are very crucial for the analysis activities, hence their absence and possible erroneous facts may impede or taint some critical decisions. Marr (2005) observes that even though excel has been primarily used as data collection and analysis tool, most organizations are not happy with the system. PAIB (2008) also concludes that respondents of their survey are much more satisfied with their performance measurement system if it has the capability for capturing, processing and reporting useful information on both financial and non-financial developments. Therefore, it can be concluded that the use of excel and manual data collection would result in major shortcomings as reported above.

CONCLUSION

The results of the study provide insights into the design of performance measurement system and would have drawn attention to its implementation and usage in the public sector. This study attempts to provide exploratory empirical evidence on how the Malaysian public sectors design their performance measurement system by specifically looking into two aspects: strategic alignment and balanced characteristics. This study found that the public sectors have been to a moderate extent designing their performance measurement system to align to the organisational strategy. Still, the KPIs are found to be less dynamic to reflect the changes in strategy. In examining the balanced nature of performance measurement, this study reveals that there is an overall lack of balanced indicators except for indicators on financial and non-financial such as input, activity and output indicators. Other indicators are not extensively being used such as outcomes, sustainability, innovation, environmental and social responsibility indicators.

As the top echelons of the civil servants are calling attention to outcomes-based evaluation of performance, this survey has established to some extent that they might not be quite ready for the push just yet. A successful adoption of performance measurement system is not just about giving the right training nor having the technology to support it; it is about holistic change which involves the people's readiness and their willingness to embrace and institutionalise a transparent and outcome oriented measurement goals and is accountable to it. The study indicates that there is a need for public sector to take into more serious consideration of the outcomes as well as socially and environmentally related measures and link all measurements up in a causal relationship manner.

The overall findings are nevertheless, subject to several limitations. As the questionnaire demands responses from senior executives in order to elicit the prevailing practice of performance measurement in public sector, this study is not able to claim with full certainty that the responses have been made by the senior executives per se. Perhaps due to higher and more critical work obligation, the task might have been delegated to a more junior officer. Other limitation includes the use of survey to capture perceived subjectivity of an issue. Use of survey will not likely be able to dig deeper into a subject matter and solicit better insights from the respondents. Perhaps, a case-study with face-to-face interviews with a number of senior civil servants at

various central, federal and state level agencies coupled with a time-series performance data would reveal a much more colour to the study.

Given the possible impact of the performance measurement results on the management and individual's reputation, it may also be deemed as sensitive to question the strategy. It may even be construed as questioning the management's capability because the senior management has been actively involved in determining the strategy and KPIs. In addition, since the cultural dimension of management style within the Malaysian Public Sector who are coincidentally, predominantly Malay, who according to Asma Abdullah (1996) have the main work values of "preserving face", hence, it is possible that the act of questioning other people's performance would have been deemed as obtrusive which would have been avoided at all cost and blame the data integrity for the poor performance.

The lack of questioning and analysis may be due to the inside-out practice of choosing performance measurement. This could potentially be detrimental to the implementation initiative as the integrity of the whole system may be questionable. As a result, everyone would be starting to lose faith and interest in the PMS and may decide to abandon the whole initiative, which in the end, would put the whole government machinery at risk.

STRATEGIC CHANGE IN PUBLIC SECTOR MANAGEMENT IN TURKEY: A BRIEF APPRAISAL

Sefa ÇETİN
Vice Governor of Çorum

ABSTRACT

Profound changes are taking place in governance structures and responsibilities of the countries across the world. Not only the changes occurring in political, economic, social and cultural fields stemming from the globalization process - and in parallel with this, challenges relevant to regionalization, transformation of the state and the localization - but also principles of good governance such as participatory democracy, transparency and accountability are accelerating these changes further. The new regulatory needs arising from the structure, responsibility and rights-sharing, human resources policies as well as communication strategies of public sector institutions generally lead to reforms spreading through time in preference to an overall reform process at one point in time.

Within the scope of these global changes, the reforms realized by several successive governments in Turkey, reflecting the implementation of liberal economic policies and reinforcement of ties with other societies around the world, sustained significant transformations in the public sector. In this context, privatization implementations, regulatory impact analysis, establishment of regional development agencies, resizing the local government structures, abolishing certain local bureaus of the central administration, Public Tender Law, Public Financial Control and Management Law, and the Europeanization process of Turkey which brought significant power to local governments are among the most significant changes.

*In this paper, in the light of these above mentioned strategic changes in public sector governance, the successes and failures of the process will be evaluated with a view to provide a practitioner's lens to the issues involved in order to advance future processes. First, **an overview of public sector governance** in Turkey will be presented to set the ground for evaluating further the current state of affairs. Second, **participation** as one of the most significant guiding principles of the public reforms process will be highlighted. Third, in line with the principle of participation, the introduction of **strategic management** and strategic planning into Turkish public sector governance will be explained. Next, the leading principles of **transparency and accountability** will be presented with reference to their significance for good governance in Turkish public sector. Then, an insight to how the reformers are also reforming themselves will be provided through the introduction of **regulatory impact analysis (RIA)** in Turkey. Sixth, **the decentralization process** in Turkey will be discussed as part of ongoing reforms in Turkey with a view to evaluate **its current strengths and weaknesses** in implementation. Finally, the rising trade-off between the **information technology internalization** and the public sector will be discussed in line with the current implementation phases in Turkey. The paper will be concluded with remarks as to the future of the ongoing process.*

1. INTRODUCTION

Profound changes are taking place in governance structures and responsibilities of the countries across the world. Not only the changes occurring in political, economic, social and cultural fields stemming from the globalization process - and in parallel with this, challenges relevant to regionalization, transformation of the state and the localization - but also principles of good governance such as participatory democracy, transparency and accountability are accelerating these changes further. The new regulatory needs arising from the structure, responsibility and rights-sharing, human resources policies as well as communication strategies of public sector institutions generally lead to reforms spreading through time in preference to an overall reform process at one point in time.

Within the scope of these global changes, the reforms realized by several successive governments in Turkey, reflecting the implementation of liberal economic policies and reinforcement of ties with other societies around the world, sustained significant transformations in the public sector. In this context, privatization

implementations, regulatory impact analysis, establishment of regional development agencies, resizing the local government structures, abolishing certain local bureaus of the central administration, Public Tender Law, Public Financial Control and Management Law, and the Europeanization process of Turkey which brought significant power to local governments are among the most significant changes.

In this paper, in the light of these above mentioned changes in public sector governance, the successes and failures of the process will be evaluated with a view to provide a practitioner's lens to the issues involved in order to advance future processes. First, an overview of public sector governance in Turkey will be presented to set the ground for evaluating further the current state of affairs. Second, participation as one of the most significant guiding principles of the public reforms process will be highlighted. Third, in line with the principle of participation, the introduction of strategic management and strategic planning into Turkish public sector governance will be explained. Next, the leading principles of transparency and accountability will be presented with reference to their significance for good governance in Turkish public sector. Then, an insight to how the reformers are also reforming themselves will be provided through the introduction of regulatory impact analysis (RIA) in Turkey. Sixth, the decentralization process in Turkey will be discussed as part of ongoing reforms in Turkey with a view to evaluate its current strengths and weaknesses in implementation. Finally, the rising trade-off between the information technology internalization and the public sector will be discussed in line with the current implementation phases in Turkey. The paper will be concluded with remarks as to the future of the ongoing process.

2. AN OVERVIEW OF PUBLIC SECTOR GOVERNANCE IN TURKEY

Throughout the history, as elsewhere around the world, Turkey has been transforming itself politically, economically, socially and culturally. This transformation has been at times very fast due to several international and national factors, and at times very slow. These transformation processes naturally also changed Turkish public sector governance through time. As a result of the Westernization efforts back in 19th century, Turkish public sector governance has been influenced by the French system to a significant degree. This has continued again primarily through developments in Europe and the current system has now a dual nature. In this context, the central and local government structures are introduced briefly to prepare the ground for further discussion in this section.

Turkish public sector is predominantly a centralized and democratic system of government and the local governance structures essentially function through the principle of extended jurisdiction. Accordingly, central administrations transfer their rights of jurisdiction in pre-defined and limited fields as well as reassign their decision making right to governors to implement.

The main responsibilities of central government are internal and external security, justice, population (birth registry), land registry, culture and tourism, social services, education, health, and so on. In several of these areas, local governance institutions are also authorized. The local governance branches of central ministries function through limited authority given to them by the central administration. Turkey is divided to provinces, provinces to districts /towns, towns to villages. Provinces are governed by the governors and the districts /towns are governed by the district governors. Governors and district governors are appointed by the central government. The local representations of the central government also function under these two authorities. Moreover, the special provincial administrations - also part of local government structures - are also under the authority of governors as representatives of central government.

Local governments are public organizations established through law, having an elected decision-making body and their functions are geared to meet common demands of the local people. These organizations have financial and managerial autonomy; they make their own investment programs, their own budgets and appoint their own staff. Local government system in Turkey has three pillars. The first pillar is special provincial administrations as a regional administration structure. Second pillar is municipality as an urban administration structure. Villages, the third pillar, are the rural administration structures. Although these three pillars have no managerial relation among themselves, their problems, especially infrastructure, are solved by special provincial administrations. The coordination of different units in a same region is left to various levels of offices under governorships. (Güler, 2006:269).

Special provincial administrations, whose responsibilities are limited to provinces, can also fulfil the functions of central government's local units. Their decision making body are the assemblies, established in 81 provinces, and they are public institutions administered by the governors. Their jurisdiction is defined by

Law No. 5302 on Special Provincial Administrations which has come into force in 2005. The decision making and implementation authority of relevant tasks are divided among provincial general assembly (1), provincial council (2) and governor (3). The members of the provincial general assembly are elected directly and the assembly is presided by an internally elected president.

There are 3225 municipalities all around Turkey covering the %82 per cent of the overall population, and they are all subject to scrutiny of central government. Municipalities implement the functions defined by the law. The mayor and the municipal assembly are directly elected by the people. The most populous 16 provinces of Turkey are organized as Metropol Municipalities.

Finally, villages are the smallest local governance units with limited budgets, without paid staff and they are administered by a headman and the council of elders. The number of villages governed according to an outdated law of 1924 is 35000.

3. AREAS OF CHANGE IN PUBLIC ADMINISTRATION REFORM

On the overall, Turkish public administration system reflects a system which is devoid of merit, and participation, as well as devoid of key principles of efficient and contemporary governance such as transparency, accountability, and strategic planning. In this context, several opinion polls conducted point to dissatisfaction on part of the citizens regarding the quality of public administration in general. For example according to results of a country-wide study conducted by TESEV, Turkish population is largely dissatisfied vis-à-vis the services of public institutions (TESEV, 2001:134). Moreover, again according to a study conducted by TUSIAD, similar results could be observed. Consequently, the citizens are not only dissatisfied with general living conditions individually but also with the socio-economic conditions and the quality of general public administration. What is even more striking in this study is that the general dissatisfaction on the quality of public administration and socio-economic conditions is even more that their individual dissatisfaction vis-à-vis the living conditions (TÜSIAD, 2002:12).

Turkish public administration system could not pursue the fast changes occurring in 1990s around the world. Thus the basis of unresolved various economic and social problems can be considered as the inert bureaucratic structure and the management philosophy accompanying that. As it is unlikely to resolve the current problems with the existing structures, it is inevitable to restructure the public administration system. In this way, both the trust of the society towards to state would increase and also public resources can be optimally and effectively used. (Bilgin, 2007:11).

It is possible to observe the theoretical base of the public administration reforms in Turkey through the lens of “New Public Management” approach. This approach foresees a non-bureaucratic structure with free market rationalization, replacing the former bureaucratic rationalization. (Eryılmaz, 2008:34,260). Next to this, based on principles such as participation, transparency, accountability, strategic planning, and decentralization, it creates its own institutions. In order to clearly explain these and the restructuring of Turkish public administration further, it is considered to be important to evaluate their repositioning in the process.

3.1. Participation as Guiding Principle of Reform

The reform of Turkish public administration takes as a managerial basis, the principle of participation. According to Eryılmaz, the future culture of public administration is not only to emphasize the expertise and impartiality but also, simultaneously, will underline the importance of participation (2008:240). In other words, public administration, consults its staff and the citizens more than ever. For example, in some countries civil servants are given union and collective bargaining rights, and these constitute important developments in the field (Rosenbloom, 1989:498). Again one of the four main components of the best value regime implemented in the UK is consultation, in the course of which the citizen is directly asked whether a certain service is necessary or not (Çetin, 2000:23).

What should we understand with the term participation? According to the EU Commission, participation points to the effective opening up of the process to a wide spectrum starting with conceptual formation towards final implementation. A similar regulation in line with this definition is introduced in Turkey within the scope of By-law on Ethical Behavioural Principles of Civil Servants dated 13 April 2005. Accordingly, Provision 19 and Section 3 of the By-law reads as:

“Civil servants show utmost attention to sustain the participation of those who will be directly or indirectly affected from a decision or a body of decisions aimed to improve and implement public services unless there are other competing legal provisions preventing or against them.”

As it can be seen from above legal provision, the administrative institutions have to sustain the participation of different segments of society to the decisions directly affecting them, and further they have to organize the necessary functional processes to sustain the participatory mechanisms. Citizens can also demand mechanisms that directly communicate their views regarding various regulations and activities or they can directly attempt to create these mechanisms themselves.

The principle of participation is an integral part of increased democracy in public management. This principle reads as “In decision making pertinent to public services, views and suggestions of professional organizations with the status of relevant public institutions and civil society organizations are taken into account”. However, it is not trouble-free to effectively implement this principle. For the success of such implementations, there should be an advanced democratic culture with specific reference to the significance of participation. According to statistical data, in Turkey civil society membership is 10% on the overall (Adaman et al., 2008:12). This is a striking fact describing partially the difficulties in implementation of the principle of participation.

A way of sustaining participation is the direct involvement of people to various committee meetings of local governments, and enable them to explain their views in these platforms. If this would be implemented thoroughly both the decisions taken will be more vigorous and the social sensitivity of the decisions made and the effectiveness of implementation will be higher. This process will also serve the unity of public administration with the citizens.

A further significant development in terms of participation is provincial councils. These councils bring together all the stakeholders covering the entire province, serving as a common awareness platform. In advanced democracies, when the local governments are taking decisions, the citizens are following different ways of direct participation in these decisions and try affecting them as much as they can.

In Turkey, according to Law No. 5393 on Municipalities, with reference to Provision 76, a provincial council / city council is foreseen apart from the municipal assembly. This Council is made up of representatives from professional organizations, unions, notaries, universities, NGOs, political parties, public sector institutions. The Council can discuss all the issues relevant to a province / city, and can make decisions. The Municipal Law sustains the fact that these decisions are taken to the agenda of the first municipal assembly meeting and are enforced.

These councils are unique governance mechanisms bringing together central administration, local government and civil society within the scope of a cooperation partnership. The effectiveness of such a model lies with working groups and participation of all sub-assemblies as well as volunteers. According to Municipal Law No. 3225, the establishment of these councils in municipalities are obligatory. But this regulatory obligation has its problems for internalization of the process. This should be regarded as a common platform of awareness instead of a hierarchical structure to be taken hold of (Öner, 2005: 84).

In the structuring of Provincial / City Council and its management, the missing points of implementation are a significant problem. The implementation based on voluntary participation covers those citizens who have the right to elect and to be elected. The sustainability of participation is based on the factors such as “having the culture of consensus”, “feeling responsible” and “cooperation based on trust” (Toprak, 2006:303). The significance of the participants in these Councils is not about strengthening their own position but to sustain support in decision making and implementation of these decisions for advancing the social and financial capacities of local governments through several working groups.

The 77th Provision of the Municipal Law points to a clear participatory implementation. Accordingly, municipalities are conferred with rights to implement programmes sustaining participation of volunteers for increased effectiveness, savings, and productivity as well as for increased participation and solidarity in health, education, sports, and environmental services. Both the sense of responsibility and the sense of belonging of citizens are advanced as such while the load of local governments is decreased.

If this method is further developed, also through usage of human resources in the city / province, not only cheap or free local services will be produced but also a positive psychological environment resulting from the “support” will further enhance the sense of belonging to governance structures among the citizens. This, in return, will create a role model for neighbouring people and will enhance the satisfaction of contributing to society, further leading to increased social welfare.

In order to implement the democratic local government approach and to advance the models of participation as well as to create result-oriented outcomes, meetings and events should be organized for enhanced awareness among high level management and the civil servants. Moreover, for internalization of the knowledge by the people, different tools such as meetings, brochures, etc should be developed with a view to enhance the role of stakeholders in the implementation of strategic plans.

Finally, one of the significant participatory mechanisms in Turkey is strategic plan implementations. The preparation and implementation of strategic plans are binding on public institutions and this process involves mechanism to sustain direct participation of citizens not only in preparation but also in implementation and audit phases. According to Law No. 5018 on Public Financial Control and Administration, the public institutions are foreseen to be governed by the strategic management approach while the participation of all stakeholders is made compulsory throughout the strategic planning process. The next section provides an overview of the strategic planning implementations in Turkey.

3.2.Strategic Planning: A Tool for Good Governance

As a result of the reforms introduced to Turkish public administration system a new step forward is the passage towards strategic planning in public sector institutions. This approach foresees to increase the performance of public institutions in a way that is more responsible and accountable towards the people. In strategic planning the managerial responsibility is evaluated through reaching performance targets rather than fulfilling the orders. It is both result and cost effectiveness oriented and not politically oriented

Strategic plan, the main instrument of strategic planning, is defined in Public Financial Control Law (Law No. 5018) as “the plan which contains the medium and long term aims of public administrations, their main principles and policies, their targets and priorities, their performance criteria as well as the methods to reach these and the resource distributions”. With this law, the public administrations are given the tasks of creation of vision and mission, within the framework of relevant regulations and main principles, preparing development plans, programmes; defining strategic aims and measurable targets; measuring their performance through predefined indicators; and to set up a participatory strategic plan preparation with a view to monitor and evaluate as well as to implement these.

In addition to Law 5018, Law 5393 on Municipalities and Law 5216 on Metropol Municipalities, all municipalities having a population exceeding 50000 people are obliged to prepare strategic plans. In this way, for example, a municipality is to plan its usage of resources in the next five years, and will define the type of aims and targets as well as the relevant strategies and activities to fulfill them. It follows that the municipality will pass this through its own decision making structure and make it an obligatory regulation to be also shared with the general public. At the end of this five year term, for every year, the performance results will be shared with the public through performance plans or activity reports, thus will be accountable to the electorate.

Consequently, with long term decisions and implementations, a more effective and efficient management approach will be set forth and through more economical usage of local resources the overall welfare of the public will be increased. Moreover, with Law 5302 on Special Provincial Administrations, these administrations are also assigned with strategic planning responsibility. In this way, all the institutions are geared towards a new managerial approach. The coordination of strategic planning is entrusted to strategy development units in public institutions. With Law 5436, dated 2005, all the Research, Planning and Coordination Committee Directorates are turned into Strategy Development Directorates.

For central governance institutions a transition plan has been foreseen, but the local governance institutions are directly requested preparation of strategic plans and their implementation regardless of a transition phase. Facing the obligation to prepare a strategic plan in a given period of time, local governments focused on timely preparation rather than the quality of the plan itself. The strategic plans thus turned out to be superficial and they were highly affected from one another. This in return is an obstacle before transformation of the institution in question as well as focusing on strategic areas (Erkan, 2008:68).

In Turkey, the general coordination of strategic planning is entrusted to State Planning Organization and the performance based budgeting has been entrusted to Ministry of Finance. As these are the result of a few years of development and work, it can be said to be premature to evaluate the implementation outcomes of such a process as yet.

3.3. Towards Transparency and Accountability

Today, advancement of democratic thinking, preventing corruption, avoiding bad governance, and the need to restore trust of people towards public administration paved the way for demands for increased transparency. As competition and democratic public opinion requires freedom and transparency, the bureaucratic information and its usage also needs to be brought openly before public. (Eryılmaz, 2008:219).

Transparency can be defined as accessible, open and understandable management processes and decisions. The clarity, fairness, and impartiality of actions and operations of an administration are best guaranteed when the administration is transparent. Accordingly, an inconsistent and clientalist administration cannot be transparent. New laws in Turkey require public institutions to be transparent. For example, the Law on Municipalities orders decisions, actions and various reports of the municipalities to be publicly accessible. These regulations are about informing the citizens and they are a component of transparency.

Another component of transparency is brought about with the Law on Right to Information. With this right, people have the right to ask for various types of information from all public institutions. The Law on Right to Information has made the accessible information a rule and the restrictions an exception. The responsibility of the citizens is to apply to relevant institutions and claim the information. The institution in question has to answer within 15 days after receiving the request. The existence of the Right to Information Law, in a way, provides the citizen with the role of a volunteer supervisor and the bureaucracy is audited through people themselves. In this way, the decision making processes are known and civil servants cannot easily evade the rules. This law made it difficult to cover the possible mistakes and arbitrariness.

In Turkey, one of the most frequent areas where the right to information is used is information regarding the performance evaluation results of individuals which can serve as a double edged sword. It can be positive when a civil servant is able to see his or her own performance evaluation, on the other hand, this can negatively affect the relations between an officer and the supervisor leading to conflicts, and thus it should be implemented carefully. Particularly, in an environment where a merit system is not completely institutionalized, tensions tend to accumulate and can even lead to a decrease in institutional productivity.

Another implementation regarding transparency relates to the Financial Management and Control Law, due to which all the ministries publicly present their annual activity reports on their websites. In this way the income and expenditure of state is shared through internet in a detailed way.

It is claimed that the approaches based on New Public Sector Management (i.e. performance based management, participatory management, citizen orientedness, subsidiarity, better regulation, public – private sector rapprochement) will erode conventional ethical values. (OECD,1996). Consequently, simultaneously decreasing public expenditure and increasing performance, coupled with the pressure build upon civil servants, can lead to decreased quality in services and trigger unethical behaviour. It is possible to observe difficulties in providing services when the public sector managers and officers are squeezed between announced service standards of the government and the budgetary limitations.

Transparency in management is a prerequisite of accountability. The optimal implementation of this principle increases awareness on part of the citizens and it needs to be sustained. Otherwise, like other similar regulations, these are doomed to stay on paper, unimplemented. In Turkey, for being optimistic in this context, there is a need for further enforcement. According to a study conducted in Turkey, for example, 60% of the public is unaware of the right to information and 70% do not feel the need to use or demand such information (Adaman et al., 2008:35)

3.4. Regulatory Impact Analysis (RIA): Reforming the Reformers

Regulatory Impact Analysis (RIA) has been in use worldwide as a regulatory reform tool for over twenty-five years, both by the governments and the private sector. For example, RIA processes began in the USA in 1974, in Canada in 1967, in Australia in 1985, in Denmark in 1993, in Finland in 1970, in France in 1996, in Germany in 1984, in Japan in 1987, in the European Union and World Trade Organization in 1990. Although studies on the use of RIA in reform processes were started within the OECD in 1974, its effective usage began in 1995. Within this scope, the OECD Regulatory Quality Council established RIA standards with a 10-article checklist in an advisory decision as guidance for optimum implementation, principles regarding best practices in RIA were determined in 1997 and these were last updated in 2007. Currently, OECD and the EU are conducting joint initiatives on RIA. In all of the developed countries, RIA has become the norm in democratic and good governance, and in the face of ever increasing competition, the developing countries are also internalizing RIA more and more. RIA is also used in corporate governance.

In Turkey, one of the important components of reform and better regulation is also RIA which reshapes the political and administrative decision making as well as regulatory design competence of the state. Turkey joined the EU and OCED countries using RIA, especially within the framework of practices carried out in OECD, at the beginning of 2006. The general fundamentals of the implementation of RIA were established with the “By-law on the Procedures and Principles for Preparing Legislation” published in the Official Gazette No.26083 on 17 February 2006 and the details of implementation were determined with the Prime Ministry Circular No 2007/6 dated 2 April 2007 and its appendix, the RIA Guidebook.

According to the above mentioned Prime Ministry Circular, public institutions within the scope of the By-law on Procedures and Principles for Preparing Legislation are charged with creating administrative capacity within their own structures for RIA, establishing the quality, defining a unit to ensure cooperation with the “Better Regulation Group” formed at the Prime Ministry, and acting according to the Guidebook while carrying out their duties. According to this Circular and on the request of Prime Ministry, RIA coordination units and liason persons have been assigned to all public institutions. RIA is both a tool and a decision making process which will be used effectively for regulatory reform by the state in the coming years and it is getting institutionalized more and more. Since the consultation component of RIA sets forth direct participation of civil society and business world into policy making processes, it is a significant step for better governance in public sector as well as for strengthening democracy.

3.5.Decentralization in Turkey

The formulas of the World Bank and the UN which cover decentralization are defined as subsidiarity by the EU. The World Bank and the UN take decentralization into consideration in four different ways. First, deconcentration which means to move authority from centre to local public administration. Second is the devolution, meaning passing authority to local governments. Third is the delegation meaning the authority is passed to one step down authority in the hierarchy, and finally, the fourth one is privatization (Güler, 2005:23).

The decentralization system in Turkey covers the spectrum somewhere between deconcentration and devolution. Only through such a model, it seems possible to assign the rights of the centre to local governance institutions. In order to establish a strong local governance system, there is a need to strengthen governorships, district governorships and provincial organizations. This will enable enhancement of on site service quality that is to be followed by a transfer of further rights to the local governance structures. It is important because the citizens still assign great importance to provincial organizations. For example, the governorship as an institution is still much respected. Governors are among the most trusted civil servants according to the opinion polls.

The centre has a significant number of responsibilities in terms of enhancement of administrative capacity; mobilizing civil society; and creating participatory mechanisms. This would accelerate the implementation of the public reforms at local scale where the governors are convinced in the merit of them. Governors and district governors are individuals whose professional maturity in public administration process is sustained through a special evolutionary process in time both theoretically and through direct implementation. In the implementation of public reforms, the services of these individuals should be employed at a maximum scale (TEPAV, 2005:40).

While with new laws new governance mechanisms are created, and while local governments are given new rights and responsibilities, there is a need to give special weight for increasing the administrative and financial capacity of provincial organizations. However, the conflict between central and local governance organizations need to be reconciled where possible in order to prevent the difficulties in implementation of services. For example, there are conflicts in provision of health, culture, tourism, and social services. In terms of social services there are social services provincial directorates, special provincial administrations, social solidarity foundations that serve the same goals. This leads to difficulties in accurate distribution of social services.

Meanwhile, increasing the rights and responsibilities of local governance structures without increasing their capacity would make these organizations inept and inadequate. When the reforms are realized, the adequacy of service provision scale of local governance structures in human resources, technical and administrative capacity should be evaluated against the principles of public interest, public service, neutrality, savings, service outreach, equality, and equity (TEPAV, 2005:49).

Although subsidiarity (transfer of rights) as part of New Public Management approach is perceived to be necessary for efficiency and needs conformity, there are signs that it erodes the values of conventional public services. Subsidiarity affects the conventional accountability and distribution of responsibilities (Al, 2006:246). While there are efforts to sustain autonomous working of the institutions through subsidiarity, the area of discretion widens further. The managers using this right can be observed in being irregular conduct. Moreover, it is claimed that an absolute decentralization process can lead to local authoritarianism (Kalaycıoğlu, 2000:34).

In developing countries, there are already difficulties in fulfilling the responsibilities with existing capacities of local governments, and a further widening of rights and responsibilities could possibly lead to decrease in service quality. Therefore, implementation of decentralization strategies should go parallel with capacity empowerment or even prior to that.

In Turkey, in 81 provinces there are 81 special provincial administrations; 3215 municipalities; and 35000 villages, which, on the overall, constitute the local governance realm. Special provincial administrations are newly recognized as service providers in the system in the recent years; however, municipalities constitute the backbone of the system. In the recent reform endeavours the centre of gravity shifts towards the special provincial administrations. In the same province, how the relations among two different local governance and central governance institutions will be shaped is still an unknown parameter. The conflict of mandate and mission among these institutions is becoming a frequent phenomenon. For example, how will the municipalities accept the right of provincial planning entrusted to special provincial administrations? (Güler, 2005:19). It remains to be seen how these ambiguities are going to be resolved in the coming years.

If the local government reform in Turkey is to be evaluated against the EU criteria, it is possible to say that Turkey is in conformity with European Charter of Local Self-Government and the general EU regulations in terms of legal framework. However, if it is to be emphasized once again, the trade off between the rights and responsibilities of special provincial administrations and the future character of the relations between central government and special provincial administrations could create a significant interest for following up the contribution of this unique model in Turkey to general public administration literature in the future. The problem in this context stems from the internalization and implementation of this new governance approach /culture. This will be a considerably time consuming process.

3.6 Information Technology and the State: E-State Implementations

E-State is a structure which enables outreach of public services to citizens through usage of information technology (Çevikbaş, 2009:76). In this way, faster, cheaper and efficient provision of services has been aimed at, and it is named as electronic state or briefly as e-state. With the implementation of e-state:

- Red-tape will be decreased and efficient use of time will be sustained
- Service costs will go down
- Individual participation will increase thus will lead to enhancement of democratic culture
- Overlap of communications among public institutions will be avoided, while resources will not be exhausted,
- The possible clashes or conflicts between the service provider and receiver will be eliminated.

The most significant step towards e-state has been through Law 5070 dated 2004 on Electronic Signature. With this law, official correspondence has been facilitated in electronic environment. Among the examples of e-state implementations in Turkey; MERNIS (registration of birth services), SAY 2000i (Minsitry of Finance Audit Offices Information Flow), UYAP (National Justice Network), POL-NET (Police Services) can be indicated as examples.

In E-State implementations, it is hardly possible to say that the original targets have been reached due to a number of reasons such as; the lack of information on part of the citizens, the insufficient usage of internet by the citizens, problems related to lack of relevant legal basis; and limited financial resources. In terms of utilization of information technologies, Turkey is listed among the very last countries across Europe (Balcı ve Kırılmaz, 2009:66). This in return means that even if the state passes to electronic environment, a significant number of the citizens do not have access to these types of services.

It would only be optimistic to think of effective public administration through buying computers to public institutions and creating web sites. The e-state implementations thus should go beyond these technical issues and be considered in a holistic manner. For example, continuous training of the staff in public institutions, informing the citizens at various levels should be among the priority areas in this context. Consequently, there would be maximum utilization of information technology usage as the catalyzer of change in public administration.

4. CONCLUDING REMARKS

The meaning of public administration reform for the citizens is to make straightforward usage of public services, reducing red tape, democracy, human rights and enhancement of the rule of law; briefly, it is citizen oriented governance. For civil servants it means increase in salary and in authority, promotion options, and optimization of social security rights.

In the last twenty years, it is possible to observe remarkable transformation in Turkish public administration. The starting point of the regulatory reforms is the New Public Management approach that is already in use in various developed countries. The principles evolved as a result of economic, political and social developments in these countries through time, also needs to be tested through a time span in order to conclude how these will be reconciled with the evolution of relevant processes as well as the socio-economic and cultural values prevalent in Turkey. The harmonization within the context of EU integration and its institutional requirements simultaneously reflect the implementation of a strategy, and its indicators towards catching up with global standards.

Consequently, the possible roadside accidents towards reaching these reform goals might occur as momentous parameters to balance between the gains and losses to be resulting from these processes. In other words, will the burden of change be carried by the whole society equally or by a certain part of the society? Are the reforms to be realized in a holistic way or are they to be carried out step by step or in patches? For example, is it important to make institutional changes in central government or to make new structuring in both central and local governance while changing also functioning of legislative and judicial institutions? Is it the society to be changed through altering regulations or is it the regulations complying with the changing society? These questions need to be discussed and answered by the society as a whole, and it should be the decisional priority of Turkey as a democratic republic.

In today's environment, it is hardly possible to say that reform climate is continuous. Different political and social changes are simultaneously occurring in Turkey, and public sector reform is not a key priority any more. Both in central and local governance institutions, there are no signs to indicate that initial enthusiasm is continuing. It is also hardly possible to say that the reforms are implemented thoroughly. This is because reform is a dynamic process and for it to succeed the societal dynamics and relevant responsibilities need to be taken into account. The changes in regulations and their implementation through public administration system will not create change radically. The conventions coming into existence through time, as well as the existing institutional culture might lead the civil servants to seek ways to keep the status quo. However contemporary concepts and demands along with these will undoubtedly commence a role to sustain the continuity of public sector reform process eventually.

AN APPLICATION OF STRATEGIC MANAGEMENT TO THE PUBLIC SECTOR: WHAT ACCOUNTS FOR ADOPTION OF REINVENTING GOVERNMENT STRATEGIES ACROSS THE STATES OF THE UNITED STATES

Murat ÖNDER
Cumhuriyet University, Turkey

ABSTRACT

In 1990's, a new wave of reform movements with result oriented, strategic human resource planning, cost effective philosophy has been launched with the name of reinventing government in the USA to provide better service but cost less. However, some argue that reinventing government strategies did not produce expected results and the adoption of reinvention reform strategies varies across states, cities, and agencies. This paper analyzes the reasons for the differences in the adoption of reinventing government reforms as strategic management application in public sector since most of the basic assumptions come from strategic management. I revisited and evaluated the early applications with the regression model, and discussed the findings and their implications with strategic management framework for academicians and practitioners for today's and future public sector management.

Keywords: *Strategic management, public sector application, reinventing government.*

INTRODUCTION

The history is a full of reform movements as a continual search for an ideal governmental form that can deliver services in an efficient, cost effective, accountable, and responsive manner. In 1990's, a new wave of reform movements with result oriented (Moynihan, 2006: 77), strategic human resource planning, cost effective philosophy has been launched with the name of reinventing government in the USA to serve better.

Reinventing government reform movement has achieved some strategic notable results, and we still see some countries across the world trying to adopt reinventing government strategies (Sulle, 2009:7). However, some argue that reinventing government strategies did not produce expected impact and ended up with disappointment (Moynihan, 2006:84). The research also indicates that the adoption of reinvention reform strategies varies across states, cities, and agencies. Therefore, this paper analyzes the reasons for the differences in the adoption of reinventing government reforms across states. Reinventing government can be considered as strategic management application in public sector since most of the basic assumptions come from strategic management.

This paper aims to see why strategic management applications in public sector works or fails in a certain extent. I formed several hypotheses driven from the literature and combined different perspectives from political science, public administration management and economics in the regression model, which includes one dependent and nine explanatory variables. I revisited and evaluated the past applications to provide the findings and discuss their implications for academicians and practitioners for today and future.

REINVENTING GOVERNMENT

Strategic management requires comprehensive analysis of an organization's strength and weakness internally and externally before making a strategic plan and implementing it (Eren, 2005: 15; Dinçer, 1998:167-9).

Employing extensive research and analyses, Vice President Al Gore had a report prepared for US Public Sector Organizations, later known as Al Gore Report. They offered dynamic, catalyst, customer-market oriented, competitive government. Their philosophy changed from government strategy with closed perspective to strategic management including many stakeholders during preparation and adoption of these strategies (Steurer 2007:204) as in embeddedness within networks. Strategic management is to convert policy by including all stakeholders in the design and implementation of the policy (Köse, 2008:63).

Strategic processes in the public sector may have many similarities to those in the private sector. Public sector managers can gain various benefits from writing strategic documents, including mission statements, vision statements and strategic plans (Joyce, 2004: 107). Public sector managers can become more successful in, and more accountable for, performance, by using strategic goals to develop annual performance targets just like in the private sector. Having developed framework strategic management influenced public sector management to adopt similar philosophy.

The Clinton Administration designed the reinventing government (REGO) campaign with goals that would favor a transformation of administrative machinery to produce “a government that works better and costs less. Reinventing government movement has gained great momentum in the United States by the National Performance Review and the introduction of Government Performance and Results Act (GPRA) of 1993, which is a reflection of contemporary management ideas in government (Çorbacıoğlu, 2005:2). GPRA attempts to contribute to cultural and organizational change by reinventing American federal government through strategic planning, annual performance planning and reporting, as well performance based budgeting.

There is no single intellectual source for the reinventing government movement. It seems to have been improved largely among practitioners of private sector and public administration in different places in the world such as United Kingdom and New Zealand. Contrary to public sector organizations, private sector organizations recognized that they have to change their cultures and processes to survive in a rapidly changing world to be able to compete in the market and meet the needs of their customers (Kamensky, 1996:247).

The proponents of reinventing government argue that administrative institutions in the United States were established based on the bureaucratic model of command-and-control and have not changed significantly in their design and operation during the twentieth century. They claim that the onset of modern information age has rendered this bureaucratic form of government as ineffective, static, and obsolete. Their justifications of reinventing government rest on several assumptions. These are (Schachter, 1997):

- Federal agencies of the premodern era were designed and operated according to the Weberian bureaucratic model of command, control, and strict hierarchy.

- Agencies of the premodern era did not operate entrepreneurially. The entrepreneurial characteristics within the reinventing government model are the keys to effectiveness for agencies of the modern information age.

- The design and operation of agencies has not changed significantly to adapt environment during the twentieth century.

- Federal agencies with designs based on the bureaucratic model performed effectively during the premodern era, when problems were tractable, goals were congruent, and information was bounded.

- With the advance of the information age, the performance of modern era bureaucratic agencies has increasingly worsened.

Gaebler and Osborne, pioneers of REGO, translated the principles of new public management into United States contexts (Kamensky, 1996:248 and Çorbacıoğlu, 2005:3). New public management as an eclectic approach uses many concepts suggested by public choice, principal-agent theory, transaction-cost analysis, strategic management, and total quality of management, organization development, and benchmarking (Moynihan, 2006:78). While bureaucratic government has the characteristics such as formalization, hierarchy, monopoly, political autonomy, and specialization; entrepreneurial government, suggested by reinventing government, maintains adaptability, capacity building, client-responsiveness, competition, delegation of operational decision-making authority, measured outcomes, sense of mission and so forth (Meier et al, 2006: 357-9; Wolf, 1997:354).

United States should be more entrepreneurial, primarily through a process of reforming administrative institutions. Osborne and Gaebler (1993:16) argue that complex entrepreneurial paradigm including

principles of markets and public service should be a model for bureaucracy now and future. This entrepreneurial government which later used as basic tenets of REGO possesses these characteristics (Osborne and Gaebler, 1993:321-331) which one can easily tell that most of them were borrowed from strategic management philosophy:

- Continuous training programs to improve client or customer service;
- Quality improvement programs to encourage team problem solving and to empower employees;
- Benchmarks for measuring program outcomes or results;
- Strategic planning that produces clear agency mission statements;
- Systems for measuring client or customer satisfaction;
- Simplification and relaxation of human resource rules; be more innovative and flexible;
- Privatization of major programs;
- Reduction in the number of levels in the agency hierarchy;
- Delegate decision making authority to lower organizational levels;
- Greater discretion in procurement of goods and supplies.
- Empower employee and citizens;
- Focus on catalyzing various organizations and stakeholders into action to solve problems.

FACTORS AFFECTING ADOPTION OF REINVENTING GOVERNMENT STRATEGIES

The researches indicate that **the adoption of reinventing government reform** strategies (REGO) vary across states, cities, and agencies. REGO occurs for a number of reasons. It is not a mere neutral, technical one, but is the result of political actors and involves complex stream of processes and participants. REGO is influenced by external socioeconomic factors as well as internal organizational factors. Additionally, institutional environment also influences REGO across states. Most of all, REGO occurs by the interactions among different factors.

Successful reinvention efforts are frequently reported in the media. Ketl (1998:37) states that media also played important as motivator factor in adoption stage. Schneider et al. (1995) emphasizes the importance of entrepreneurship in the institutional change. Some scholars examined the importance of local government and human resources management in the adoption process (Ruhil et al. 1999: 434). They reduced reforms into three main categories and tested their extent of implementation. They found that leadership, commitment and fiscal concerns are important in the success of adoption.

Durst and Newell (1999:62) in their research on adoption of reinventing government found that reasons and actors of adoption play very important factor for successful implementation. While actors are high-level administrators, midlevel managers, employees, governing board, customers/clients, and some other persons and groups; general reasons for implementations are revenue problems, competition, complaints, media criticism, and encouraging leaders. The economic decline and financial problems are most important factors for reform demand (Chackerian, 1996:25). Fiscal stress often forces to change in the organizational structures, functioning and choices to increase the efficiency and effectiveness (Ruhil et al. 1999: 435; Durst and Newel, 1999:65). Using resources efficiently and finding new resources is a major concern for strategic management.

Hypothesis 1: REGO is more likely when the states have revenue problems and fiscal stress.

Reinvention makes assumptions about the nature of public administration that cannot be sustained. The role of politics in administration processes is essentially ignored. The politics/administration dichotomy goes back to the early reform movements. The dichotomy referred primarily to the belief that “politics” in terms of partisanship should be kept out of administration of government programs. It became clear today that it would be very difficult to remove politics from administrative activity. Kellough (1998:6) argues that the reinventors appear to assume that legislative, judicial power, and role of politics in public administration is negligible. Multiple goals that, at times, are conflict with each other, not solving major incentive problems, neglecting political dynamics and constitutional system.

Political institutions may either facilitate or block the expression of external interests. Success of strategic management is to convert policy by including all stakeholders in the design and implementation of the policy (Skok, 1989:134). Lack of political will and support seems one of the most important factor in REGO implementation (Steurer, 2007:202). Pursuing policies that have widespread stakeholders’ acceptance is a good way to reduce policy adoption costs. The probability of policy adoption might decline as the party competition approaches to the balance (Chackerian, 1996:26-28) means high competition.

Hypothesis 2: REGO is more likely when there is less legislative party competitiveness.

Ruhil et al (1999:434) found that city manager is the single actor most likely exerts influence on the extent of the reform activities in his community. Central to his analysis is the role of leadership, known as necessary if a governmental unit is to innovate successfully. Within the structure of local politics, two factors are central: the mayor and city manager. Although a number of important institutional constraints inhibit reform activity, city manager leadership appears to be critical for overcoming the impediments to efficient governance. City managers may pursue reform not only to improve existing governance structure but also to earn reputational gains that translate into a move up to larger communities with larger staff and larger budgets (Ruhil et al. 1999:435-438). Managers stand to benefit in terms of their reputation by successfully introducing reforms. Reputational gains can translate into more tangible rewards since managers are mobile and participate in a competitive national labor market.

Schneider et al (1995) emphasizes the importance of entrepreneurship in the institutional change. The adoption of innovative policies of local governments depends on both public entrepreneurs, and the presence of certain conditions and institutions that stimulate entrepreneurial activity. Strategic management provides vehicle that skilled leader can use to involve stakeholders in creating visions for the agency, building commitment to strategic objective (Poister and Streib, 1999; Barzelay & Jacobsen, 2009: 327). In the state level, governors with concentrated executive authority in their hands are expected to act as entrepreneurs.

Hypothesis 3: REGO is more likely in the states where governors have more power.

Elected officials will do anything to give the public the impression that the great and wonderful things are being done (Clingermayer and Feiock, 1999). The public demands for less government will have impact upon elected officials to adopt REGO (Durst and Newel, 1999:69). The people who vote and have higher education are expected to have more sensitive and accountable to the public affairs (Hughes and Conway, 1997:191), and try to influence the policy makers in various ways for persuasion.

Hypothesis 4: REGO is more likely in the states where citizens are more sensitive to the public affairs.

Some researches compare the South with the North arguing that the South is relatively more affected by religion, and more conservative in many issues (Mezey, 1983). Ruhil et al (1999:438) tested whether there is a difference between the North and South in the adoption of REGO in local government level and found differences across regions.

Hypothesis 5: REGO is less likely in the southern states.

Clingermayer and Feiock (1999) state that homogeneity and/or diversity have effects on local policy choices since homogeneous societies/groups might protect their interests more powerfully, and also may have considerable influence on policy makers.

Hypothesis 6: REGO is more likely in the states where there are more homogeneous societies and groups.

In the urban areas, people have more chance to get education and other opportunities, change their traditional values, increase their revenues, and come together to establish certain groups so that they can protect their common interests by influencing policy makers. Residents of the urban areas are more likely to institutionalize the change and ready to accept the change.

Hypothesis 7: REGO is more likely in the states where the urbanization is high.

RESEARCH DESIGN

My research question is “What accounts for the difference in the adoption of reinventing government reforms strategies (REGO) across states of the United States?” To answer this question, I combined several perspectives into our model that has several hypotheses, which includes several causative relationships between our independent variables and the adoption of REGO in state level as a dependent variable. Units of analysis of this paper are the states of United States. The model has one dependent and nine explanatory variables.

The dependent variable

The dependent variable is the adoption of REGO in the agencies across states. The data for the dependent variable were drawn from the American State Administrators Project, a mailed survey of heads of state agencies completed by 1229 respondents in late 1994 and early 1995. Survey questions distributed to heads or directors of 93 types of agencies in the 50 states. Since 'reinvention' incorporates numerous specific

proposals, the survey included a set of 11 items devised from the major reinvention literature. Each item was constructed to tap a principal reinvention theme and, as a group, to represent this paradigm. Each administrator was asked to report the actual level of change in his or her own agency on each reform proposal (Brudney, Hebbert, and Wright, 1999).

From time to time, state agencies undertake to change the way they do things. Please indicate the extent to which your agency has implemented each of the following over the last four years:

- ___ no changes considered; ___ considered, no action yet;
 ___ action/s planned; ___ partially implemented;
 ___ fully implemented.

- 1- Training programs to improve client or customer service;
- 2- Quality improvement programs to encourage team problem solving and to empower employees.
- 3- Benchmarks for measuring program outcomes or results;
- 4- Strategic planning that produces clear agency mission statements;
- 5- Simplification and relaxation of human resource (personnel) rules;
- 6- Increasing manager's discretion to transfer funds or carry over year end funds;
- 7- Reduction in the number of levels in the agency hierarchy;
- 8-Decentralization of decision making to lower organizational levels;
- 9- Systems for measuring client or customer satisfaction;
- 10- Privatization of major programs;
- 11- Greater discretion in procurement of goods and supplies.

Table I: The Descriptions of the Variables

Variables	Descriptions	Mean	SD
REINVENT ^a	Reinvention implementation (1992-1996)	22.735762	2.697588
REVENUE ^b	Per capita state government revenue in 1994	\$3,341.96	\$1,425.74
COMPETIV ^b	Legislative party competitiveness as 1994	29.8416	23.3461
BUDGETPO ^b	Budget making power (Full responsibility=1, Shared=0)	.80	.40
ITEMPOW ^b	Item power of governors (Yes=1. No=0)	.82	.39
VOTING ^c	% of eligible population reported voting in 1994	47.1800	7.8652
EDUCATE ^c	% of population graduated from high school as of 1995 (age 25 and older)	82.8680	4.8372
SOUTH ^c	South/non-south (Southern=1, Non-southern=0)	.32	.47
MINORITY ^c	% of minority population in 1995	14.8410	11.0555
URBAN ^c	% of urban population in 1990	68.1800	14.6714

^a Brudney, Hebert & Wright (1999)
^b The Book of the States 1994
^c State Rankings 1996

The response to each reform was assigned a score ranging from 0 for "no change considered" to 4 for "fully implemented." The dependent variable used in the analysis is an additive scale based on summing responses across the 11 items.

The Independent Variables

Nine independent explanatory variables test the hypotheses. The data regarding our independent variables were driven from the Book of the States, and State Rankings. To measure the fiscal stress and revenue problems the states have, I used per capita state government revenue (REVENUE).

Legislative party competitiveness was operationalized by using the following formula: The party competitiveness increases as the numbers approach to the balance (zero).

Competitiveness in the Senate = (% of Democrat Party members out of total members) - (% of Republic Party members out of total members), \Rightarrow Competitiveness in the House = (% of Democrat Party members out of total members) - (% of Republic Party members out of total members), \Rightarrow

Party Competitiveness (COMPETIV) = [(Competitiveness in the House | + Competitiveness in the Senate)] / 2.

Entrepreneurship and/or commitment of governor was measured by governor budget making and item veto power. Two variables were used to measure the power/authority of governors. The budget making power (BUDGETPO) of governors was illustrated by using a dummy variable that equals to "1" if governor has full responsibility over budget making, "0" if s/he shares responsibility with other agents. The item veto power of governor (ITEMPOW) was illustrated with again a dummy variable that equals "1" if the governor has the item veto power, "0" if not.

The sensitivity of citizens to the public affairs was measured by using voter turnout and the education level, % of population which graduated from high school. The sensitivity of citizens to the public affairs was measured by using voter turnout (VOTING) in 1994 Elections, % of eligible population reported voting, and the education level (EDUCATE), % of population which graduated from high school as of 1995 (age over 25).

SOUTH denotes the regional differences. It is a dummy variable that equals to "1" if the state in the South Region, "0" otherwise. MINORITY was included to specify the degree of society's heterogeneity. If the percent of minority population increase, the society will be more heterogeneous.

URBAN illustrates the urbanization level of the states. Some of the authors (Ruhil et al.1999; Feldman, Kearney, and Scavo, 1999) use population density instead of urbanization since they concentrated on the implementation of REGO in more local and city level. However, in state level, using population density may misguide us for example if we think about some states which have specific characteristics such as deserts, mounts, long winters so forth even though they may be urbanized.

FINDINGS AND DISCUSSIONS

The ordinary least squared (OLS) multiple regression method was employed to analyze the data. The model with one dependent and nine explanatory variables was found statistically significant ($p < .01$). There is a moderate relationship between the explanatory variables and the dependent variable, reinvention implementation ($R^2 = .412$). Consistent with Moynihan (2006:82) findings, partial adoption of REGO have been observed. Although most of the variables verify our hypotheses, a few of them are not statistically significant. Let's evaluate the correlation of each variable in the model separately.

The hypothesis 1 about fiscal stress and REGO was supported by the findings that there is inverse relationship between per capita state government revenue and the implementation of REGO ($p < .10$). One can say that the states that have fiscal/revenue problems are more likely to adopt the REGO. Findings support the arguments that reinvention is a set of proposed reforms aimed at solving persistent financial problems in government by promising that we can do more with less. However, this too much emphasis on businesslike approach was criticized since there are numerous legal and other distinctions that can be drawn between government and businesses and there are important values in government that sometimes take precedence over economy and efficiency (Kellough, 1998:7-8).

Table II: The Adoption of Reinventing Government Reform Across States

Variables	B	Std. Error	T Value	Significance
CONSTANT	2.913	8.773	.332	.742
REVENUE	-4.827E-04	.000	-1.781	.083
COMPETIV	-2.670E-02	.016	-1.717	.094
BUDGETPO	-2.505	1.010	-2.480	.017
ITEMPOW	1.449	.908	1.595	.119
VOTING	.126	.060	2.096	.042

EDUCATE	.151	.109	1.386	.173
SOUTH	2.277	1.175	1.938	.060
MINORITY	-4.775E-02	.041	-1.158	.254
URBAN	6.693E-02	.029	2.344	.024

N = 50, R² = .412, F = 3.119, Significance of F = .006

Durbin-Watson = 2.041

Dependent Variable: Adoption of REGO Strategies

While previous research proved the importance of environmental factors on the performance of strategic management in private sector, they argue that there is little evidence on whether strategic planning was effective in public sector (Hendrick, 2003:496-7). They argue that the attentiveness of stakeholder, ambiguity, openness, and nature of colatitions create obstacle in strategic management applications. The hypothesis 2 regarding legislative party competitiveness has been supported ($p < .10$). Pursuing new ideas and expressing them in a competitive legislative body increase the transaction cost of decision making, which prevent the emergence and development of new ideas. One can argue that if the legislative party competitiveness increases the adoption of REGO decreases.

The hypothesis 3 regarding power of governors seems to be questionable since the statistical results indicates that the relationship is opposite of arguments. It appears that there is inverse relation between budget making power governor and the adoption of REGO ($p < .05$). With 99 % confidence, we can argue that the REGO is more likely in the states where governors share their budget making responsibility with the other agents. However, this situation is compatible with the philosophy of REGO in terms of participation. Other variable regarding item veto power of governors does not have statistically relationship with the adoption of REGO. However, very close value of .11 significance level leads us to think that the item veto power of governors has some influence on the adoption of REGO. Strategic leadership is seen as a key element in effective strategic management.

Both variable regarding powers of governors do not support our hypothesis 3. Both of these variables indicate the structural (statutory) regulations about the power governors have. But in reality, we do not know how the governors acted, whether they used their power or not. Our operationalization of commitment/entrepreneurship of governors in terms of power is questionable. Different governors may use their power differently. Our units of analysis are the states not the governors, which might be weak in measuring entrepreneurship of governors. Enthusiasm is not enough for successful implementation of new practices. It is important to have support from higher levels in the hierarchy and from the political level (Barzelay & Jacopsen, 2009: 327).

The public demand/pressure for the government that costs less from more accountable and sensitive people to public affairs in terms of political participation is an influential factor in the adoption of REGO. It appears that there is positive correlation between voter turnout and the implementation of REGO ($p < .05$). In other words, the adoption of REGO is more likely in the states that have higher political participation in terms of voter turnout. The political participation is one of the most important factors that indicate sensitivity/accountability to the public/political affairs. The concept of consumers/taxpayers/receiver of public service or citizens is in the focus of REGO. Citizens should act, and have right to ask and learn what is going on. Customer orientation, one of the most important principles of reinventing government, has been evaluated as a problematic since identifying customers in the public sector can be sometimes very difficult unlike in private sector. However, the relation between education level and the reinvention implementation is not statistically significant. The measurement of education level needs to be improved.

It appears that there is statistically significant relation between regions and the adoption of REGO ($p < .10$). However, the results are contradictory with our hypothesis, which argues that in the Southern states being more conservative, REGO is less likely to be adopted than non-southern states. But according to our findings the southern states are more likely to adopt REGO. The similar results regarding adoption of REGO according to regional differences were found by Feldman, Kearney, and Scavo (1999).

There is an inverse relation between minority and the adoption of REGO, but it is not statistically significant. Our operationalization of the hypothesis 6 needs to be rechecked and find alternative way to measure the heterogeneity of society/groups in given states. It appears that there is positive linear relationship between urbanization level and the adoption of REGO ($p < .05$). We can argue that as the urbanization level increases the adoption of REGO increases.

CONCLUSION

The reform movements can be viewed as a continual search for an ideal governmental form that can deliver services in an efficient, cost effective, accountable, and responsive manner. Together with 1990's, a new wave of reform movements has been launched with the name of reinventing government in the USA regarding this reason.

The proponents of reinventing government argue that administrative institutions in the United States were established based on the bureaucratic model of command-and-control and have not changed significantly in their design and operation during the twentieth century. It has been claimed that the onset of modern information age has rendered this bureaucratic form of government as ineffective and obsolete. So the government and its philosophy should change, and should be more entrepreneurial, including principles of markets and public service, as a model for bureaucracy now and future.

Despite many criticisms on reinventing government regarding its implementation and philosophy, this reform movement has achieved some notable and impressive results. And learning successful reinvention efforts from frequent reports in the media diffused implementation to other agencies and states. However, the researches indicate that the adoption of reinvention reforms varies across states, cities, and agencies.

This paper partially answered the question of "What accounts for the difference in the adoption of REGO reforms across states?" The model explains variation with macro/external variables rather than micro/internal variables such as attitudes of implementers, administrators or other staff, organizational considerations, and individual contributions. It has been found that there is statistically significant relation between the adoption of REGO and fiscal stress, legislative party competitiveness, powers of governors, voter turnout regional differences, and urbanization. Nonetheless, it only explains very little about complete adoption. There is no significant relationship between the adoption of REGO and heterogeneity and social capital of society.

This study has given the story of partial implementation of strategic management in the public sector with the REGO. Findings will help us to understand why public sector fails in adoption of strategic management in macro level. After the many years of public-sector reforms in today's public administration, a concept of strategic management for the delivery of public services proved its significance. However, it must take into account the specific features of the public sector and the implications of the rule of law. It has been found out that there are some critical application problems in the public sector. The paradox is that strategic management is most needed in public sector where it is less likely to work, and it is most likely to work where it is least needed. That is, strategic management will be successful where organizations have capacity. If they do not have the capacity, they have to adopt strategic management to increase the capacity.

Political leaders and Public managers need to have more commitment and get more serious about long term strategies which will bring the success. Al Gore lost the elections; Bush came into power, and together with the September 11 attacks, reinventing left behind the shadow of homeland security policies. Once more it underlines the significance of leadership and commitment in strategic management application. Therefore, according to them, reinventing did not create expected results. However, it should not be forgotten that US public organizations still are the ones that run and look like successful firms.

Political leaders and managers should be more strategic in public sector application; they cannot just directly copy normative strategic management from the book, their commitment to long term strategies will bring the success. It will look perfect on the book but not in real life application, if you do not consider critical issues in the public sector. Some of the critical reasons why it may be difficult to adopt strategic management in public sectors might be given as it follows; shared power within different levels of government, political environment muddies definitions of performance, and public managers have less autonomy and control. Hopefully this study makes contributions to public strategic management theory and practice, and questions raised in this paper stimulates critical thoughts and further the research for future applications.

ENERGY AND DEVELOPMENT STRATEGIES

FINANCIAL POLICIES ON RURAL DEVELOPMENT: EU FUNDS AND THE EXAMPLE OF TURKEY

Cem KOLUKIRIK, H.Selçuk ETİ
Namık Kemal University, Turkey

ABSTRACT

The low level of added values of economic activities in rural areas, regional inequities in income distribution, increase in unemployment due to the technological improvements and mechanization, and the inadequate infrastructure in those regions are causing life conditions to decrease in rural areas. This leads to a great volume of immigration from rural to urban areas and consequently, social and structural problems in cities. So, in general, it is not possible for any government to ignore the problems in rural areas in a development period. Governments should supply not only direct financial aid for people living in rural areas, but also financing of sustainable and participative approaches that will help those people to earn an income. The projects and programmes about rural areas in Turkey which applied in the past could not get enough success. This is because, local problems were tried to solve in central, the inadequate participation of local actors during the preparation period of projects and programmes and defining the problems and determining the priorities. In the period 2007 – 2013, European Union will send some financial aids to a candidate country Turkey, under the title of “rural development”. Thus, Turkey, which could not perform rural development by his own policies, will have some opportunities with the help of its position as a candidate.

In this study, the importance of European Union’s pre-membership financial funds on performing the rural development in Turkey was analysed, current situation of rural areas in Turkey was defined and the possible results of applying the funds coming from EU was discussed.

Keywords: The funding policies, rural development, Turkey, European Union, IPARD

INTRODUCTION

Rural development is contextually a significant political issue such as market efficiency in rural areas, improvement of quality and sanitary standards and creating new employment and alternative job opportunities. Therefore, it is fundamentally a multi-dimensional concept that is to be interpreted with an integrated approach with the political issues like health, education, employment, transportation, accommodation, telecommunication, regional development and small and medium sized enterprises. A systematic rural development policy has not been able to establish in spite of the early initiation of rural development activities applied since the foundation of Turkish Republic. Political decision making in former rural development projects, the selection of geographical areas to be funded in a non-objective way, agriculture-oriented concept, failing to encourage the participation of the non-governmental organizations and public in the process and the difficulties experienced in the manufacturing and efficiency are among the primary reasons for the current situation. European Commission shall fund Turkey through IPARD, one of its political and funding instrument for agriculture and structural development, including the period 2007-2013 and with this step Turkey will enter a new process in which she can have new opportunities and take funds under the title of rural development for the very first time.

FINANCIAL POLICIES ON RURAL DEVELOPMENT

The concept of “Rural Development” frequently comes to the agenda in different fields for variety of purposes. In the fulfillment of the rural development activities having a multi-dimensional structure and necessary for the economical and social development, the policies focused only on the agriculture are not sufficient. Because of the division of the agricultural fields avoids their use for income generating purposes, high agricultural population, aggressive use of the natural resources and the low VAT (value added tax) value

of the agricultural production in the developing countries; the rural residents incline to other income-generating activities or tend to immigrate to the big cities. At this point, states should provide financial aids such as credits or direct income support for the farmers and they should finance the multiplication of the other economical activities besides agriculture. At this point, in order to develop proper policies the rural areas in Turkey should be classified and analyzed.

To build the rural development, first of all these areas should be determined. Once the rural areas in Turkey are classified in line with OECD criteria, we can see that “completely rural areas” are generally located in disadvantaged eastern cities. However rural areas can also be seen in both eastern and even the most developed western regions of the country. In terms of production, “Rural areas” are considered as the areas composing alternative production resources besides the province and district centers (DPT 2006). The related statistics has shown that almost 35% of the population resides in the rural areas. But taking into consideration the so-called province and district centers having a city status although where the employment and economy depend on the agriculture, living conditions of rural areas are observed and the industrial development is really slow, we can easily say that almost more than half of the population is currently living in rural areas in the country. These areas cover a large geographical surface and they have different physical characteristics and a variable economical structures. Therefore a different policy should be developed for each region.

Figure 1. Classification of the Rural Areas in Turkey in line with OECD criteria

Reference: TKİB, IPARD Programme, 2008

It is an undeniable fact that there are both structural, social and political deficiencies to be worked on in rural areas. These deficiencies can be mentioned as in the following:

- Deficiency and lack of proficiency of the institutions analyzing the requirements,
- The lack of monitoring councils that can evaluate the influence and quality of the application of rural development programs,
- Profound regional inequalities observed in the agricultural production of the developing areas and the quality of manufactured products,
- Fragile social and economical structure in the rural areas,
- The consumption of clear water resources due to the excessive use of water in agriculture,
- Weak formations of public and non-governmental institutions

The rural development has been identified as a driving force for the economy since the foundation of the Republic in Turkey where most of its population lives in rural areas. The other characteristics of the country and lots of complicated problems in these areas have inevitably carried the rural development among the

most crucial political issues. However, theoretically efficient policies can not get the expected achievement in practice. There will be significant changes in the approaches and applications in the aspect of rural development beginning from the negotiations of Turkey's Accession to EU on September 3, 2005 (Can 2007). The opportunities emerging from these changes should be evaluated quite well. Turkey will be able to benefit from the financial support supplied by means of Rural Development Component (IPARD) of Pre-Accession Assistance Instrument (IPA) for candidate countries by EU between 2007 and 2013. IPA has been designated in order to improve the efficiency of the planning and distribution process of EU financial aids (Tan and Dellal,2003). IPA will support the adaptation studies of the candidates and potential candidate countries to the EU standards, policies and union acquis within the membership perspective as it is applied within the financial aid programs beforehand. With these financial instruments EU aims to decrease the differentiation between the members to the minimum level while ensuring the readiness of the candidates-to-be for the full membership in order to fulfill the economical integration for its basic political objective.

Taking into consideration the financial dimension of the supports to be given to Turkey before the accession within the scope of the IPA fund, it can be observed that the approximately 600 million Euros financial supports will be granted per each year over a 5-year period in 2007-2011 for 5 basic components (Table 1). In addition to this, most of 3 billion Euros (39%) has been assigned to the Transitional Process Aid and Organizational Structure components; Regional Development Component follows that with a ratio of 35% and then the Rural Development component with a ratio of 15%(Bakırcı 2008). Thus the least allowance is reserved for the Cooperation in the Borderline (%1.5). The candidates should meet some administrative and legal requirements in order to benefit from the financial support of IPA fund. While there is flexibility about the support from the first 4 components of IPA, the 5th component of Rural Development (IPARD) has a different nature. IPARD requires a different practice and programming mechanism for the projects to be funded within this component(Dıraor,2008). In other words, it is necessary to complete all administrative and legal requirements in order to obtain the support from this component aiming the development of agriculture and rural areas and the fulfillment of EU standards.

Table: 1 Turkey's Multi-Annual Indicative Financial Frame Budget (Million Euro)

Component	2007	2008	2009	2010
1. Transitional Aid and Institutional Capacity	252.2	250.2	233.2	211.3
2. Cross-border Cooperation	6.6	8.8	9.4	9.6
3. Regional Development	167.5	173.8	182.7	238.1
4. Human Resources Development	50.2	52.9	55.6	63.4
5. Rural Development	20.7	53.0	85.5	131.3
TOTAL	497.2	538.7	566.4	653.7
Regional and Horizontal Programs	100.7	140.7	160.0	157.7

Reference: EU Commission, 2006: IPA 2008-2010 multi-annual indicative financial frame budget

Appropriate financial support shall be granted for the farmers and enterprises through the projects to be developed by means of the Rural Development Component. Although the financial supports are given by the EU within IPARD program, an equal contribution system works to cover expenses arising from the project. A triple system is used for funding the projects. This structure is composed of EU, National Contribution and the beneficiaries. The beneficiaries should meet %50 of these expenses. %25 of the remaining amount is stemming from the national resources. Therefore while constructing the administrative structures regarding the monitoring, supervising and payment processes, the transparency and accountability should be given the utmost importance. The beneficiaries should provide the share assigned for themselves within the project and they should make sure to have the financial structure to be able to meet all the expenses at the beginning with the awareness of that the EU support is completed. Analyses of the former EU countries benefited from the SAPARD program that has the similar structure with IPARD program indicated that the is granted after the project nonfunctional agricultural credit system and the difficulties confronted by the agricultural

manufacturers in taking credits from the banks have created bottlenecks for the countries in question (Nikolova,2005). Furthermore, the problems are caused by the incapability of the Commission in planning. This comment is significant because it points out that the Commission could not manage to give sufficient information about SAPARD program (Kasprzak 2005). In order to share the experiences gained by Central and Eastern Europe Countries (MDA) in the management of the rural development funds, we need to study carefully the contents of adopted measures and projects as well as the relations between activity fields and the budget applied in SAPARD programs by the said countries. Selection of the most primary measures and secondary ones in accordance with the requirements from the fields defined as fundable within the scope of SAPARD plan can be observed as the first step determining the capacities of rural development funds of the countries (Diraor 2008). As indicated in Table 2, the resources allocated from the Commission's budget between 2000 and 2006 was 529 million Euro. Within the scope of the program, 10 MDA countries have been donated totally 3.640 million Euro as resources. According to this, Poland and Romania have been granted the highest allotment while Slovenia, Estonia and Slovakia have been given the lowest.

Table 2. Annual EU Allotments Granted to MDA Countries between 2000 and 2006 (Euro, According to the prices of 2000)

Beneficiaries	Total	The Allotment donated in accordance with the measures in SAPARD Plan	Item 7 (Commission Aid up to 2%)
BULGARIA	53.026.146	52.033.785	992.361
CZECH REPUBLIC	22.444.860	22.024.814	420.046
ESTONIA	12.347.063	12.115.993	231.070
HUNGARY	38.712.627	37.988.137	724.490
LETONIA	30.345.271	29.777.373	567.898
LITHUANIA	22.226.138	21.810.186	415.952
POLAND	171.062.514	168.391.050	3.211.464
ROMANIA	153.243.162	150.375.284	2.867.878
SLOVENIA	6.446.679	6.326.032	120.647
SLOVAKIA	18.605.540	18.257.346	348.194
TOTAL	529.000.000	519.100.000	9.900.000

Reference:EC(2000)

At this point the experiences of the MDA countries will be a guidance for Turkey before the membership. We can assume that the problems confronted by Bulgaria during the process is similar to the problems of Turkey. Therefore, it will ease the realization of the required regulations and organizations through these experiences for Turkey.

The SAPARD Experience of Bulgaria

It is notable that Bulgaria has 81% rural areas in total and 42% of the population is rural residents. Studying the example of Bulgaria, approximately 53 million Euro for SAPARD Program is assigned from Commission Budget annually. Annual average budget of the program together with the national contributions is 115 million Euro. The basic objectives in the SAPARD program of Bulgaria are :

- To improve an efficient and sustainable agricultural production and to promote the food processing standards to the EU standardizations by means of the latest technology, better market facilities and strategical investments,
- To ensure rural development depending on alternative employment opportunities and the best enviromental methods.

Within the frame of these objectives, the following fields and activity types have been given priority in Project selection:

Priority 1: The improvement of the production, processing and marketing of agricultural, forestry and aquacultural resources and the encouragement of eco-friendly farms and environmental conservation

Priority 2: Integrated rural development aiming the protection and reinforcement of rural economy and rural areas

Priority 3: Investment in the human resources

Priority 4: Technical Assistance

According to the EU requirements Bulgaria throughout the process had severe problems in insufficient information transfer of the beneficiaries about the applications, low quality of risk analyses, use of second-hand materials and their registration as brandnew materials. At this point, Bulgaria has achieved its priorities and progressed to the Project level by taking into consideration the recommendations of EU for the solution of the problems on the necessity of the writing all the procedures in details, the meticulous duty assignment, the use of four-eye principle in each Project, ensuring the independency at the work of internal inspection unit, monitoring and reporting data's covering not only the numbers but also the detailed information on the subject, close cooperation with EU Commission and the cooperative work between the ministries and local institutions.(Kaşıkçı 2009).

1909 projects with total amount of 768.878.208 Euro was accepted according to the figures of the year 2005. 1.324 projects on "Investment on Agricultural Enterprises", 291 projects on "Diversification of Economical Activities" and 238 projects on "Improvement of Processing and Marketing the Agricultural and Aquacultural Products" were accepted in line with the related measures (Miroslava 2005).

Figure 2. The number of Projects of Bulgaria Within the Frame of SAPARD Measures

Kaynak: Bulgaristan Tarım ve Orman Bakanlığı, Proje Veri Tabanı, Nisan 2005.

The investments that are quite difficult for Bulgaria without the assistance of SAPARD had great roles in its adaptation to the EU standards in terms of animal welfare, hygienic conditions, environmental conservation and phytosanitary of the sector. These investments made an increase in the interest of the investors to the agricultural products. Moreover, establishing management mechanisms regarding the funds had great significance to acquire information and experience for the country about the structural fund management before and after the membership to EU programs. The management approach based on the partnership established on the course of the program is one of primary factor in the efficient and successful application of the program. The most important problem of the program during the first two years is the insufficient number of project applications. However, comparing with the other countries Bulgaria can be mentioned among the countries that applied the program in the most proficient way. In general, the rural development policies applied in the country are quite successful examples.

Turkey IPARD Programme

In Turkey, capital accumulation is generally not high at the rural areas since the early years. Thus, beneficiaries may have difficulties because of the equal funding principles within the scope of IPARD. Therefore these projects and their locations are offered to the international financial institutions in accordance with the principles determined for the “development priority regions” in the development plans and in line with the preferences and priorities of these institutions (Gülçubuk 2006). The achievement of the rural development projects are confined due to the funding and organization problems. Besides, the state should make contributions for spreading the program in larger areas by supporting the farmers having the designated criteria but failing to apply because of the lack of the necessary capital. It is important that reasonable credit opportunities should be provided by especially the state banks in order to get over with this problem.

Currently, it is certain that 290 million Euros will be assigned for the agricultural rural areas as a donation source from EU funds between 2007 and 2011. Moreover the amount will be nearly 600 million Euros including the state and beneficiary contribution for the said period. This source is significant for the rural enterprises having capital difficulties. Analyses of the IPARD program within the scope of precautions indicates that the investments in this field will have possible results such as the VAT provision for the agricultural products, modernization of the agricultural enterprises, variation of the economical activities, priority to the non-agricultural activities and encouragement of the micro enterprises.

Turkey has been changing its political path which was applied since 1963 to be able to use an EU fund with an amount of approximately 150 million Euro within IPARD and in this concept Turkey is expected to act according to the EU policies under the body of an administration completely determined by EU. Therefore it is necessary for Turkey to meet a lot of requirements in order to benefit from the IPARD funds between 2007 and 2013. Within the scope of the assigned resources in our country, the sectors will be supported in line with the conditions specified in IPARD plan. Thus, the sectors having priority are milk and dairy, meat sector, aquacultural products, fruit and vegetable sectors.

Fruit and vegetable sector is a strategical sector for Turkey. Since it is a labor oriented sector and it provides four times more value addition than the other agricultural sectors per each hectare. For that reason in Turkey the main resource of rural employment comes from the fruit and vegetable sector. This why other problems arise such as the great number of small enterprises, the increasing amount of losses in harvest and the assurance of quality, hygiene and food. Hence the measures for the solution of the problems in fruit and vegetable sector within the frame of IPARD program should be taken to promote these enterprises to the required economical size. Thus strong modern enterprises having the quality standards of the time will be able to be built.

Turkey has managed herself with her own resources without any significant exchange with the other countries in the dairy sector. The profound changes in the dairy product sectors in EU countries observed in the last decade have no effects on Turkey. As a result of this, there is no mutual understanding. Turkey is having difficulties to imagine what kinds of changes should be made. Today's member of EU Poland and Portugal experienced the same circumstances before their accession. However, these two countries have also restructured and modernized their own dairy products in a relatively very short time. Studying the procedures these countries have been through will be rather useful for the specialist of the field. The success of a dairy farming enterprises depends on enough and cheap feed, highly efficient cattle, skillful and well-informed managers and the existence of a regular raw milk market (Turhan 2005).

In dairy sector the latest improvements such as emerging of a dynamic and modern dairy industry allowing qualified production, introduction and marketing new dairy products in urban sites, encouragements for qualified dairy production and the inspection of the manufacturing and marketing processes have influenced the sector positively. However, we should not forget that there are still a great deal of small farms hardly holding in the business and the incompliance of the dairy houses to the required standards. Turkey having lower milk production and consumption level than EU average can not ignore the small farms and dairy houses. Therefore, these farms and dairy houses will be able to keep up with the required economical size and designated standards through the projects to be conducted under IPARD program as well as state encouragements and cooperatives.

In the policies regarding fishery the following issues will be taken into consideration in line with the EU acquis to be able to realize the followings: to establish a balance on the use of resources in hunting production through the studies on the inventory, to ensure the environmental sustainability of cultivating activities that are growing rapidly due to the provided supports and increasing demand and to make necessary

administrative changes in accordance with the specified objectives. Besides the legislation on “Organization of the Manufacturers” will be re-evaluated and so an organizational structure that will allow an increase in the efficiency and competitive power in marketing according to various goals of the manufacturers will be arranged. A new approach is set in order to benefit from the recent progresses in human resources and the funds on transportation and regional development: “To open “growing centers” towards a balanced regional development.” (DPT 2006). If it achieves, an appropriate model will be formed for fishery in the open sea projecting definite fishery ports where all the enterprises and entrepreneurs will come together in one place. Although Turkey is surrounded by seas from three sides and has 26.2 hectar water areas with its rivers, natural and artificial lakes, the share of the fishery sector in gross national product is just 40% and 3.5% in total agricultural production. Therefore, the sector having a high production potential and that has not been benefited enough so far should be immediately put in good use. Especially the high meat prices stemming from the high expenses should be turned into advantages for the sector. Turkey is far behind EU averages because of the insufficient production, the limited network of distribution and insufficient marketing activities.

In order to overcome these problems in the meat sector, 8 sustainable agricultural and rural development measures regarding the four aspects indicated in EU 2007-13 rural development policy within the scope of 2007-13 IPARD will be applied (ABGS 2009). The most significant problem of Turkey in the meat sector is the low consumption due to the economical expenses as well as the limitations on the import. Because, unlike the other sectors, the pressure of the competitive retail markets on the incomes of administrators and manufacturers, the number of the small enterprises decreases. This encourages the big and medium sized production facilities though it gives difficulties to the small enterprises. Thus, measures taking into consideration the small manufacturers during the changes in subvention programs should be in IPARD program to decrease high feed expenses and to avoid unregistered activities.

The contribution of poultry sector to the 2007-13 IPARD Plan has been developed kobion the negative factors and difficulties detected in the poultry sector as well as the current condition of rural areas in Turkey. The past activities and lessons learned by the government and the donaters have contributed to designate a strategical formulation. Thus the consumption of the chicken products has increased immensely due to the decrease in the meat products, increasing population and relatively low price of the chicken products. The domestic and foreign demands for the chicken products are still rising. The hygenic conditions at the small slaughterhouses and processing facilities, the instability in the regional production, the lack of manufacturer’s organizations, the immigration of the population from the traditional livestock areas are the weak points of the sector. Within Ipard prgram, we can gain the upper hand in the competition with the exporting countries by focusing on these sectors especially when the export ratio is going higher in these recent days.

RESEARCH DESIGN

The scanning of the litarature, researching, assesment of the related EU legislation and analyzing the examples from the past funding procedures of the member countries, statistical evaluation on fund collection and use, past rural development studies of Turkey and analyses on IPARD program have been used as the main methods of the study. Necessary structural and legal regulations for Turkey to solve the problem of rural development and then benefit from EU funds have been surveyed. Within this context the following methods have been used such as analyzing, synthesizing, interrelating the acquired data and interpreting the pursued policies and procedures as well as their social, economical and institutional outcomes. The examples of MDA countries where SAPARD has been applied and their post effects have been examined through this study. The experiences regarding EU rural development funds of Bulgaria which has the similar structure as in Turkey has been analyzed in detail. The primary sectors and regions, where these funds are going to be used, have been studied within the frame of IPARD program of the Ministry of Agriculture and Rural Affairs. Within this context the following methods have been used such as analyzing, synthesizing, interrelating the acquired data and interpreting the pursued policies and procedures as well as their social, economical and institutional outcomes.

CONCLUSION

IPARD program will ensure a stable and transparant political atmosphere focused on common objectives that are clearly explained to Turkish farmers and consumers. While establishing a rural development policy and high food safety, animal health and environmental standards on the one hand, on the other hand the competitive power between Turkish farmers and agricultural enterprises will be increased. Turkey will be able to be a part of a common market where half million consumers are and Turkish agriculture will

contribute to the improvement of the successful export sectors. Particularly the fruit and vegetable manufacturers will benefit from the free access to EU markets. The increasing competition will help decreasing the prices of the cereal and meat products, and this is expected to cause higher consumption ratio in domestic markets. Animal product consumption ratio per person in Turkey right now is 25. This ratio is only 40% or 60% of EU countries. In order to reach the required standards and increase the competitive power, Turkey will be granted a financial assistance in these sectors as in the same way applied in EU countries.

In conclusion, the pre-accession support funds have quite significant roles in the rural development and the adaptation process of Turkey to EU. However the amount of the fund which Turkey can benefit from is approximately 1/20 of the resources required for the rural development. Thus, it will be misleading to suppose these funds alone will solve all the problems in rural areas. Turkey has no experience in the use of the funds. Thus, the funds and procedures conducted by the recently member countries before their accession process shall guide Turkey about the situation. Taking into consideration all these aspects, our rural development policy should ensure the necessary amount of fund from our own budget while including EU rural development policies and having a structure allowing problem solving in line with the realism of the country. The performance conducted by Turkey shall be essential for the definition of the changes in a positive or negative way.

FORECASTING TURKEY'S NATURAL GAS CONSUMPTION BY USING TIME SERIES METHODS

Mustafa Akkurt
Turkish Airlines, Turkey

Omer F. Demirel and Selim Zaim
Fatih University, Turkey

ABSTRACT

Strategic energy planning processes, which include natural gas demand, are commonly used as a tool to design the regional and local energy system and encourage renewable energy development. The oil and natural gas market plays a very important role in the strategic energy planning process in a country. In recent years, natural gas consumption has become the fastest growing primary energy source in Turkey. In this study, natural gas consumptions of Turkey in different time periods are forecasted by using various time series methods such as exponential smoothing, winters' forecasting and Box-Jenkins methods. These methods are compared with each other in terms of the superiority in forecasting performance. The findings reveal that in the yearly data set, double exponential smoothing model outperforms the other alternative forecasting models. On the other hand, in term of monthly data set, SARIMA model provides the better results than the others.

1. INTRODUCTION

Energy is one of the most important inputs required to maintain social and economical improvement in a country. It is necessary that energy demand should be performed at the right time economically, and be of good quality and respectful of increasing environmental consciousness in order to preserve national development and a high standard of living. Natural gas is an alternative energy source that has cleanliness, burning easiness, high thermal value and resource availability (Aras and Aras, 2003). All over the world, the use of natural gas is projected to nearly double between 1999 and 2020, providing a relatively clean fuel for efficient new gas turbine power plants. The largest increases in gas use are expected in Central and South America and in developing Asia, and the developing countries as a whole are expected to add a larger increment to gas use by 2020 than are the industrialized countries.

Turkey is located at a strategic place between the Middle and Near East, where rich oil and natural gas reserves prevail, and the Western world, where the main energy consumption takes place. Turkey is also situated near the Caspian Sea, where natural gas and oil production are expected to increase substantially. Turkey has made a remarkable contribution to the stability of the region and still continues to maintain this policy. It is accepted that creating a balanced international cooperation setting is an important factor for acquiring more reliable energy supply (Ozturk and Hepbasli, 2003).

Turkey is an important candidate to be the "energy corridor" in the transmission of the abundant oil and natural gas resources of the Middle East and Middle Asia countries to the Western market. Furthermore, Turkey is planning to increase its oil and gas pipeline infrastructure to accommodate its increased energy consumption. Naturally, Turkish natural gas usage is projected to increase remarkably in coming years, with the prime consumers, expected to be industry and power plants (Kilic, 2006). Turkish energy consumption has risen dramatically over the past 20 years due to the combined demands of industrialization and urbanization.

The usage of the natural gas can be classified into 3 groups; the residential users, the industrial users and the commercial users. The demand characteristics of these three categories differ significantly. The residential customer demands are typically temperature sensitive, increasing on weekends. The commercial customers are also typically temperature sensitive, but decreasing on weekends. Industrial customer demand is much less temperature sensitive, decreasing significantly on weekends. Historically, many methods have been used to predict daily demand. Gas controllers have used methods such as looking at use patterns on similar historical days and scatter plots of use versus temperature.

Forecasting the natural gas demand is important for planning gas production and transmission. The challenges of this forecasting are the volatility of consumer profile, the strong dependency on weather conditions and the lack of historical data (Viet and Mandziuk, 2000).

2. FORECASTING NATURAL GAS CONSUMPTION

There is wide range of studies about forecasting natural gas consumption in the literature. Liu and Lin (1991) estimated the residential consumption of natural gas in Taiwan by using linear transfer function method. Khotanzad et al. (2000) has used the artificial neural network (ANN) forecasters with application the prediction of daily natural gas consumption needed by gas utilities. Gumrah et al. (2001) analyzed the factors and their relationships that influencing the gas consumption in Ankara, and they suggested a model based on degree-day concept including annual number of customers, average degree days, and the usage per customer. Sarak and Satman (2003) forecast the residential heating natural gas consumption in Turkey by using degree-day method. Aras and Aras (2003) have described an approach to obtain appropriate models for forecasting residential monthly natural gas consumption in terms of time series analyses and degree-day method. Viet and Mandziuk (2003) analyzed and tested the several approaches to prediction of natural gas consumption with neural and fuzzy neural systems for natural gas load in two different regions of Poland. Siemek et al. (2003) implemented the Hubbert model based upon Starzman modification to describe the possible scenario of the development of the Poland gas sector. Liu et al. (2004) used the support vector regression (SVM) technique for natural gas load forecasting of Xi'an city, and they compared the result with the 7-lead day forecasting of neural network based model. Gil and Deferrari (2004) presented a generalized model which predicts mainly the residential and commercial natural gas consumption in urban areas of Argentina, for the short and intermediate ranges of time. Brown et al. (2005) presented the mathematical models for gas forecasting in their study. Al-Fattah (2006) presents a methodology for developing forecasting models for predicting U.S. natural gas production, proved reserves, and annual depletion to year 2025 using time series modeling approach. Ivezic (2006) showed the results of investigation of an artificial neural network (ANN) model for short term natural gas consumption forecasting. This methodology uses multilayer artificial neural networks to incorporate historical weather and consumption data. Wong-Parodi et al. (2006) compared the accuracy of the forecasts for the natural gas prices of Energy Information Administration's short term energy outlook and the futures market for the period from 1999 to 2004. Potocnik et al. (2007) proposed a strategy to estimate forecasting risk of natural gas consumption in Slovenia. This strategy combines an energy demand forecasting model, an economic incentive model and a risk model. Sanchez-Ubeda and Berzosa (2007) presented a model based on decomposition approach to capture demand patterns in a very large number of different historical profiles. Ediger and Akar (2007) used ARIMA and SARIMA methods to estimate the future primary energy demand of Turkey from 2005 to 2020. Kızılaslan and Karlık (2009) used seven neural networks algorithms as forecasting models they tried to find the best solution on forecasting of monthly natural gas consumption

3. THE RESEARCH STUDY

The analyses used in this study are conducted in two stages. First stage involves monthly forecasting analysis based on a various time series models. In the second stage, yearly data set has been considered to forecast the natural gas consumption in Turkey. Finally, these time series methods are compared with each other in terms of the superiority in forecasting performance. Data set was collected from the state-owned Turkish Pipeline Corporation (BOTAS) and International Energy Agency (IEA). All these stages are explained in the following subsections.

3.1 Monthly Natural Gas Consumption of Turkey

In this part of study monthly natural gas consumption data of Turkey are taken into account. The consumption values were provided by International Energy Agency (IEA) from 1999 to 2008. In total 120 data points are observed. When we plot the monthly natural gas consumption of Turkey, it exhibits seasonality and increasing trend as clearly seen in Figure 1. Like other natural gas consumption data sets, the consumption values are increasing in winter months and decreasing in summer months. As Turkey's total natural consumption is growing the data has an increasing trend.

Figure 2 Monthly natural gas consumption of Turkey from 1999 to 2008 (IEA)

3.1.1 Forecasting Monthly Natural Gas Consumption with Exponential Smoothing Type Methods

SmartForecasts software is utilized for a search on forecasting methods. The data values from years 1999 to 2007 were used. The consumption values of 2008 were used for testing the selected forecasting method. The results obtained from SmartForecasts are given below in Table 1.

Table 1 SmartForecasts results

Rank	% Worse	Avg Error	Forecasting Method
1	(winner)	160.10	Winters' Multiplicative, weights = 26% 26% 26%
2	33.8%	214.21	Winters' Additive, weights = 54% 54% 54%
3	37.1%	219.49	Simple Moving Average of 1 periods
4	37.4%	219.93	Single Exponential Smoothing, weight = 97%
5	76.2%	282.05	Double Exponential Smoothing, weight = 69%
6	82.4%	292.01	Linear Moving Average of 12 periods

Winters' multiplicative method with weights 0,26; 0,26; 0,26 is suggested by SmartForecasts for monthly data. The forecasts for 2008 are presented in Table 2.

Table 2 Winters' multiplicative method forecasts

2008	Real	Winters	Lower Limit	Upper Limit	Error
January	3647	3,831	3,480	4,182	184
February	3680	3,622	3,261	3,982	-58
March	3685	3,574	3,202	3,945	-111
April	3001	2,874	2,491	3,258	-127
May	3000	2,579	2,182	2,975	-421
June	2753	2,442	2,031	2,852	-311

				MAD	234

3.1.2 Forecasting Monthly Natural Gas Consumption with Seasonal Autoregressive Integrated Moving Average (SARIMA) Model

We have generated Box-Jenkins SARIMA model for forecasting monthly natural gas consumption of Turkey in 2008. We have also used the consumption values from 1999 to 2007 to form the SARIMA model. SPSS time series function module is utilized.

SPSS Time Series function recommends SARIMA (0,0,2)(1,1,0) model. The model constant is estimated as 263,224 where as MA(1) parameter estimate is -0,473 and MA(2) is -0,471. Seasonal AR(1) parameter estimate is -0,425. The forecasts obtained from SARIMA model are given in Table 3. SARIMA has slightly better MAD value than Winters' multiplicative method and unlike Winters all the real values are in forecasted limits. (The consumption value of May was out of the Winters forecasted limit.) SARIMA should be selected for forecasting method to predict monthly natural gas consumption of Turkey.

Table 3 Forecasts of SARIMA Model.

2008	Real	SARIMA	Lower Limit	Upper Limit	Error
January	3647	3,364	2,889	3,839	-283
February	3680	3,323	2,746	3,900	-357
March	3685	3,332	2,683	3,982	-353
April	3001	2,971	2,321	3,621	-30
May	3000	2,715	2,065	3,365	-285
June	2753	2,625	1,975	3,274	-128
July	2368	2,553	1,904	3,203	185
August	2882	2,586	1,936	3,236	-296
September	2880	2,701	2,051	3,351	-179
October	2947	2,916	2,266	3,565	-31
November	3121	3,357	2,707	4,006	236
December	3164	3,604	2,954	4,254	440
				MAD	233.64

3.2 Annual Natural Gas Consumption

Turkey's need for energy sources is growing fastly therefore total natural gas consumption has risen rapidly in the last 20 years. Annual natural gas consumption values from 1987 to 2008 are provided by BOTAS (Turkey's petroleum and natural gas pipeline corporation).

The plot of annual natural gas consumption data shows an obvious increasing trend and no seasonality in Figure 2. Trend analysis would be meaningful to explore future expectations about annual natural gas consumption of Turkey.

Figure 2 Annual natural gas consumption of Turkey from 1987 to 2008 (BOTAS)

3.2.1 Forecasting the Annual Natural Gas Consumption of Turkey with Trend Analysis

Trend analysis can be done with different ways in time series models. Commonly used models are linear trend model and quadratic trend model. Linear trend model accounts for linearity in the trend. Quadratic trend model accounts for curvature in the trend. In this research also double exponential smoothing is investigated for forecasting annual natural gas consumption of Turkey. More over double exponential smoothing's level and trend parameters were optimized in MINITAB software. The error values of all three models are listed in the Table 4.

Table 4 Error values of different models

Methods	MAPE	MAD
Regression	57	2.042
Quadratic Trend	25	676
Double Exponential Smoothing with 0,23 and 3,43 weights	13	676

The mean absolute percentage error (MAPE) and the mean absolute deviation (MAD) values of quadratic trend and double exponential smoothing are lower than linear regression in Table 4 therefore, quadratic trend and double exponential smoothing are appropriate models for forecasting.

We use consumptions from 1987 to 2006 for forming the model and forecast 2007, 2008 consumptions for testing the model. The SmartForecasts software is used to forecast the annual consumptions of 2007 and 2008. SmartForecasts runs automatic search to select forecasting method with minimum error and proposed double exponential smoothing method with both 0,71 weights as the best method. Forecasts of double exponential smoothing and quadratic trend for 2007 and 2008 are shown below in Table 5. Note that LL is lower limit and UL is upper limit of forecasts.

Table 5 Forecasts for 2007 and 2008

Years	Real	Quadratic Trend	Error	DES (0,71; 0,71)	UL	LL	Error
2007	35,064	31,842	-3,222	34,031	36,440	31,623	-1,033
2008	37,128	34,928	-2,200	37,864	40,922	34,805	736

MAD 2,711

MAD 884

The forecast values demonstrated that double exponential smoothing method has minimum MAD value and acceptable lower and upper limits. We suggest double exponential smoothing model to make long term forecasts.

For further improvement, we made a parameter search on double exponential smoothing. For level and trend constants we have tried parameters values of 0,2; 0,4 and 0,6. The results in Table 6 have shown that parameter values of (0,6; 0,6) combination has a lower MAD value than others.

Table 6 Parameter search on double exponential smoothing

DES		MAD
Level	Trend	
0.2	0.2	7811
0.2	0.4	5826
0.2	0.6	3635
0.4	0.2	4482
0.4	0.4	2754
0.4	0.6	2001
0.6	0.2	3019
0.6	0.4	1671
0.6	0.6	866

In Table 7 the limits and MAD value of (0,6; 0,6) parametered model is compared with double exponential smoothing with (0,71; 0,71) parameters. Here also Double exponential smoothing with 0.6 and 0.6 parameters has better MAD value. So we can take that model as our forecasting model.

Table 7 Comparison of double exponential smoothing models

DES (0.6; 0.6)						DES (0.71; 0.71)				
Year	Real	Forecast	LLr	UL	Error	Forecast	LLr	UL	Error	
2007	35,064	33,437	30,870	36,004	(1,627)	34,031	36,440	31,623	(1,033)	
2008	37,128	37,023	33,961	40,086	(105)	37,864	40,922	34,805	736	
					MAD				MAD	884

3.2.2 Forecasting the Annual Natural Gas Consumption with Autoregressive Integrated Moving Average (ARIMA) Model

As clearly seen in Figure 3, annual natural gas consumption of Turkey has an increasing trend. That makes the data non-stationary one. This kind of series must be transformed into stationary form in order to make time series analysis according to Box-Jenkins procedure.

Differencing is one of the transformation methods to make the data stationary. It is particularly useful for removing a trend. For non-seasonal data, first-order differencing is usually sufficient to attain apparent stationarity, so that the new series is formed from the original series by first-order differencing. Occasionally second-order differencing might be required (Chatfield, 1996).

Firstly, we take the first differences of the data series check whether the trend is removed by time plot and autocorrelation function (ACF). The slow decline of the ACF and the increase in time plot of first differences of data suggest that second differencing is required. Second difference of the data is plotted in Figure 3. The trend is removed and the stationarity is obtained. Its autocorrelation and partial autocorrelation function plots are also shown in Figure 4 and Figure 5 respectively.

Figure 3 Time series plot after second difference of annual natural gas consumption of Turkey

Figure 4 Autocorrelation function plot of second difference of annual natural gas consumption of Turkey

Figure 5 Partial autocorrelation function plot of second difference of annual natural gas consumption of Turkey

Order of autoregressive process of the ARIMA model is determined by the number of partial autocorrelation function coefficients. Similarly, order of moving average of the ARIMA model is decided by the number of autocorrelation function coefficients. The peak points of these functions show the order of models (Goktas, 2005). This approach is employed to find out the orders of annual natural gas consumption of ARIMA model. Autocorrelation function plot of the second difference in Figure 4 has the peak point at the first lag. Moving average order should be first order. Partial correlation function plot of second difference in Figure 5 has the peak at the first lag. So autoregressive process order should be first order for the model. As a result of that analysis, ARIMA (1,2,1) is decided to make annual natural gas consumption forecasts of Turkey. In order to check our findings we also run SPSS software. SPSS made an automatic search on the orders of ARIMA and suggested the ARIMA(1,2,0) model for annual gas consumption data of Turkey. Coefficients of both ARIMA models are listed in Table 8. We have compared forecasting performance of both models in Table 9. ARIMA(1,2,1) model is performing better than ARIMA(1,2,0) model in forecasting 2007 and 2008.

Table 8 Coefficients of ARIMA models

Model	Coefficients	
	AR(1)	MA(1)
ARIMA(1,2,0)	-0,708	
ARIMA(1,2,1)	-0,642	0,194

Table 9 Results of ARIMA models

Years	Real	ARIMA(1,2,0)	UL	LL	Error	ARIMA(1,2,1)	UL	LL	Error	
2007	35,064	34,920	37,080	32,760	-144	34,872	37,103	32,642	-192	
2008	37,128	38,782	42,311	35,253	1,654	38,725	42,331	35,119	1,597	
					MAD	899			MAD	894

Table 10 Comparison between ARIMA model and double exponential smoothing

Years	Real	DES (0.6; 0.6)	UL	LL	Error	ARIMA(1,2,1)	UL	LL	Error	
2007	35,064	33,437	36,004	30,870	-1,627	34,872	37,103	32,642	-192	
2008	37,128	37,023	40,086	33,961	-105	38,725	42,331	35,119	1,597	
					MAD	866			MAD	894

The ARIMA(1,2,1) model compared with double exponential smoothing in terms of forecast and limit values in Table 10. Double exponential smoothing with 0,60 and 0,60 parameters error value is lower than ARIMA(1,2,1). As a result, double exponential smoothing produces better long term forecasts than ARIMA for annual natural gas consumption of Turkey.

3.2.3 Forecasting the Last Four Years of Annual Natural Gas Consumption of Turkey and Comparing with Literature.

Ediger and Akar (2007) made a study about forecasting of primary energy demand by fuel in Turkey. They have used autoregressive integrated moving average (ARIMA) method to predict future primary energy demand of Turkey from 2005 to 2020.

One of the findings of Ediger and Akar is that natural gas will continue to be a key element of the Turkish energy system in the future. In order to understand the future changes, they forecasted the consumption values of natural gas period between 2005 and 2020.

This section of our study provides the comparison of forecast values between our study and the Ediger and Akar's study. Annual natural gas consumption data of Turkey from 1987 to 2004 is used. As our previous findings recommend double exponential smoothing we have used the same data and make forecasting with double exponential smoothing. Table 11 represents the comparison table of forecasts related to applied methods. Our double exponential smoothing forecasts were performed better than Ediger and Akar's ARIMA model for forecasting 2005 to 2008.

Table 11 Comparison table of methods

Methods	2005	2006	2007	2008	MAD
Ediger and Akar's Study Forecast	22,319	24,155	26,569	28,378	7,032
Double Exponential Smoothing Forecast	24,623	26,919	29,216	31,512	4,320
Real Values	26,865	30,493	35,064	37,128	

Double exponential smoothing with 0,41 and 1,37 parameters should be considered for forecasting years of 2005, 2006, 2007 and 2008.

4 CONCLUSION

Recently, considerable attention has been focused on the energy resources and energy policies in Turkey. Energy is one of Turkey's most important development priorities. Natural gas consumption is the fastest growing primary energy source in Turkey. Turkish natural gas is projected to increase dramatically in coming years. Energy planning is not possible without a reasonable knowledge of past and present natural gas consumption and likely future natural gas demand. Overestimating the natural gas demand may cause redundancy in resources, while underestimating may cause series energy crises. Therefore forecasting the gas demand became very important aspect to manage the energy policy with respect to gas consumption and use in Turkey.

Time series forecasting is one of the most important quantitative model that has received considerable amount of attention in the literature. The accuracy of time series forecasting is fundamental to many decision processes and hence the research for improving the effectiveness of forecasting models has never stopped. With the efforts of Box and Jenkins, the ARIMA, exponential smoothing and SARIMA models have become one of the most popular and traditional methods in the forecasting research and practice.

In this study, natural gas consumptions of Turkey are forecasted by using various time series methods such as exponential smoothing, Winters' forecasting and Box-Jenkins methods in a monthly and yearly base. These methods are compared with each other in terms of the superiority in forecasting performance. The findings reveal that in the yearly data set, double exponential smoothing model gives the better results than the other alternative forecasting models. On the other hand, in term of monthly data set, SARIMA model provides the better results than the others. However, this study does not claim that double exponential smoothing and SARIMA models are superior to other alternative forecasting methods.

In future study, more sophisticated analytical techniques such as genetic algorithms, neural networks, and fuzzy models must be utilized to forecast the natural gas consumption in Turkey. In addition that it will be very valuable to add some other variables such as price and weather temperature when developing and improving the forecasting model. This study can be extended by measuring the relationship between gas consumption of Turkey and gas price and weather temperature and their influence on gas consumption.

CURRENT ENERGY STRATEGY OF TURKEY AND EASTERN EUROPEAN COUNTRIES AND NUCLEAR ENERGY

Sudi Apak and Güngör Tuncer
Beykent University, Turkey

Erhan Atay
Trakya University, Turkey

ABSTRACT

Nuclear energy has historically played a significant role in the development of raw materials, techniques and skills. Nuclear energy has been used to produce electricity for more than half a century. Eastern European Countries experienced remarkable changes along with the collapse of the centralized socialist regimes in 1989. In this article, our aim is to examine the future of nuclear energy in Eastern Europe and Turkey by taking into consideration of the consumption patterns, price fluctuations and environmental pressures as their significance has been increasing constantly due to the rising energy demand.

Turkey's energy strategy concentrates mainly on ensuring a supply of reliable, sufficient, economic and clean energy in due course of time and in a way to support the targets of growth and social development. Increasing world energy demand requires serious decision-making on whether or not to build new nuclear power plants. Considering this fact, Turkey is planning to erect 2–3 nuclear plants (10,000 – 15,000 MW) because the expected energy consumption patterns are likely to impose unbearable economic burdens and environmental problems. Consequently, this paper elaborates on the economic initiatives and capabilities of Eastern European countries in terms of nuclear energy.

Key Words: nuclear economics, Eastern Europe, technological innovation, Turkey

INTRODUCTION

Nuclear energy is a strategic choice that takes shape according to the governments' quality and quantity targets. Technological progress plays a central role in the modern economy. Innovation is the process of introducing new scientific as well as engineering knowledge to serve a market demand in new and better ways.

Although from time to time advocates deplore the inattention of government to one's favorite technology, it is a fact that energy has produced some impressive innovations and this means that energy innovations must make economic sense.

Nuclear energy is one of the major sources of energy supply in the world constituting about one-sixth of total electricity generation. Theoretically, the performance associated with any aspect of constructing or operating a nuclear power plant affords some degree of economic consequence. Therefore, one could conclude that any measure of nuclear performance, in one way or another, can be construed as being economic.

World energy consumption is expected to increase to 22G toe per year in 2050, from the current 10G toe per year. Fossil fuels provide 70% of this total (coal and oil 26% each, natural gas 18%) and non-fossil sources 30% are shared almost equally between renewables and nuclear energy.

The required technology to build nuclear power plants was mastered in sixties and seventies in the world. Nuclear power plants which were built or licensed to be built in that period but were completed later, are operating today and produce electricity at comparable cost to coal, natural gas or hydroelectric power.

Due to the technological advances, the new generation of nuclear power plants are cheaper to build, the electricity generated is cheaper than that generated through many other methods, safer to operate and creates no carbon-dioxide emissions.

As regards energy sources, the situation differs from country to country. For example, the development of nuclear energy in the Eastern Europe region cannot be understood without taking into consideration the role of the former Soviet Union. Globally, if the capital cost were around US\$1000/kW or less, then the financial burden would be much less than current nuclear technologies, and this would ease the launching of nuclear power programs, especially in developing countries. The innovative nuclear reactor technologies should focus on decreasing capital cost, without compromising safety.

TECHNOLOGICAL INNOVATIONS AND NUCLEAR ENERGY

Developing innovative energy technologies and approaches through science and technology R&D is widely seen as a key to reducing the role of energy sector as a driver of climate change.

Technological innovation is a process that extends from the R&D stage to full commercialization. A finance continuum demonstrates the stages of technological innovation, the types of finance required at those stages and the areas where financing gaps exist. Innovative public financing approaches can close the financing gaps for technological innovation throughout the entire continuum.

Technological innovation will continue to be essential in the energy system for both economic and public policy reasons. The process of innovation is typically incremental, cumulative, and assimilative. Innovation may produce revolutionary outcomes through the accumulation of small steps, or because it introduces new performance characteristics that the market values.

Experience with energy innovation suggests that government intervention works best when it is carefully targeted on specific obstacles. Technological innovation has long been a central characteristic of the energy system. Widespread diffusion of nuclear energy technologies depends on a successful chain of R&D, demonstration, deployment, and cost reduction before a technology becomes commercially viable.

There is a great need for technological innovation for energy efficiency, renewables, and the cleaner use of fossil fuels in the developing countries. Technological operating environments in these countries are often distinctly different from those of industrialized countries. For example; most developing countries are in the early stages of infrastructure development. They have enormous demands for basic materials and need innovative technologies that will facilitate infrastructure development (Turkenburg, 2002: 154).

On the other hand, in industrialized countries, by contrast, the demand for basic materials is reaching the saturation point, and there is little need for fundamentally new technologies for basic materials processing.

Despite the challenges it faces, nuclear energy technology is an important opportunity for the world economy to meet the future energy needs without emitting carbon dioxide (CO₂) and other atmospheric pollutants. Nuclear energy is a significant contributor to the world's energy supply, which represents approximately %6 of ultimate amount of energy utilized and %16 of the world electricity capacity. Nuclear power is projected to be expanded in the future, but this expansion could be hampered due to the public perception, policy and economy.

At the same time, world energy demand is expected to rise sharply in the next 50 years, presenting all countries in the world with a real challenge: how to provide energy needed to stimulate the economic growth and improve social development, while simultaneously addressing the environmental protection issues.

Nuclear energy can therefore become an important "sustainable" source of hydrogen. R&D into the use of nuclear energy to produce hydrogen is being conducted in a number of countries and through several international agencies.

EXPERIMENTAL

Nuclear energy in Turkey

Turkey's energy strategy concentrates mainly on ensuring a supply of reliable, sufficient, economic and clean energy in due course of time and in a way to support the targets of growth and social development. Although almost all conventional resources exist in Turkey, these resources are not sufficient to meet the energy demand, except for lignite and hydro. More than half of the energy demand is met through imports to Turkey and in the future energy demand will increase in parallel with the country's development and industrialization.

According to the IEA's 2001 report, Turkey's primary energy consumption has increased 5,6% over the last thirty years, which is approximately four times of European countries' 1–1,5% increase in primary energy consumption for the same period.

Diversification of energy mix is essential in order to meet the electricity demand in a secure manner. In this regard, to increase energy resources together with the nuclear energy in overall electricity production, Law No: 5346, dated 2005 on the use of Electricity Production was revised in 2007 to create a more conducive climate for the use of those resources and to include nuclear energy into the electricity supply mix. Draft Law on "Building and Operation of Nuclear Power Plants and Sale of Energy" was transmitted to the parliament and was accepted (S.P.O. Energy Report, 2008: 116).

In other words, after the Electricity Market Law, the private sector will lead in new investments coupled with the privatization of the electricity generation plants. The range of capital cost per kW will play an important role in the selection of technology in the future, and reductions in the capital costs of nuclear power plants would favor investment in nuclear energy by private investors.

In Turkey, where past investment in electricity had been insufficient, attracting private investment has been the most important factor in privatization and restructuring of electricity sector. Both the privatization and deregulation efforts in 1980s and 1990s and the restructuring efforts in 2001 have remained in background requirement of ensuring funds urgently for needed investments in the electricity sector. However, it is very early to assess the performance of the new structure of the Turkish electricity sector (Özkıvrak, 2005: 1350). Turkey is planning to erect 2-3 nuclear plants (10,000 – 15,000 MW) because the expected energy consumption patterns are likely to impose unbearable economic burdens and environmental problems. Therefore, late in 2004 Turkish Government announced plans to build three plants totaling 4500 MW by 2011. Early in 2006 the province of the port city of Sinop on the Black Sea was chosen to host a commercial nuclear power plant. This has the advantage of cooling water temperatures around five degrees below those at Akkuyu (Mersin), allowing about 1% greater power output from any thermal unit.

New nuclear plants can be deployed in Turkey within a decade with sufficient timely public/private collaboration. Turkey should give priority to its local energy resources, especially new nuclear plants, for completing projects related to electricity production.

This is why we believe that a network of nuclear power plants would help Turkey in diversifying energy sources, reducing its vulnerability to supply shocks and ensuring environmental sustainability.

Turkey's Primary Energy Consumption during the period 2000-2010 is given at the Table 2 below:

	Electricity(Mtoe)	Gas(Mtoe)	Coal(Mtoe)	Oil(Mt)	Total
2000	8.4	12.7	25.5	31.1	77.7
2001	8.3	14.4	21.8	29.9	74.4
2002	8.8	15.6	21.2	30.6	76.2
2003	9.6	18.8	21.8	31.2	81.4
2004	10.5	19.9	23.0	32.0	85.4
2005	10.9	21.5	27.7	32.7	92.8
2006	11.6	23.8	28.8	33.4	97.6
2007	12.3	26.2	29.9	34.2	102.6
2008	13.0	28.7	31.1	34.9	107.7
2009	13.7	31.5	32.3	35.6	113.1
2010	14.5	34.4	33.6	36.3	118.8

Source: Çermikli and Gökçe, 2006

Therefore, forecasts of Turkey's energy market in 2010 reveal that while previously oil was the major source of energy consumption, the weights of coal, natural gas, and oil will come closer to each other. As it can be seen in Table 2, in 2010 30% of energy consumption will be met by oil, and the shares of natural gas and coal will approximately be 28% each (Çermikli and Gökçe, 2006: 265).

In other words, Turkey's energy import dependency has been increasing constantly. As a solution to this problem, nuclear energy would lessen oil dependence and ensure environmental sustainability. Given that renewables provide a limited supply of energy, nuclear power is a worthwhile alternative that could improve self-sufficiency in energy generation as well as reduce greenhouse gas emissions.

Eastern Europe and nuclear energy

After the collapse of the centralized socialist regimes in 1989, many of the Eastern Europe Countries experienced significant changes. They faced high inflation as a consequence of price liberalization, as well as slow growth, due to the process of restructuring the economy.

Eastern European countries, among which are Hungary, Czech Republic, Poland and the Russian Federation, must have cheap and abundant energy to advance the welfare of their citizens through their economic developments. In this regard, Russia seeks support to modernize its energy sector and keep it to itself. For example, in July 2008 Russia announced plans to allocate \$40 million from the state budget over the next 7 years for the development of the nuclear energy sector and the nuclear industry. This will allow the construction of 26 major generating units in Russia by 2020 – about as many as those which were built in the entire Soviet period.

There are strong technical, safety-related, and economic grounds for nuclear cooperation between Russia and the former allies of Soviet Union in Eastern and Central Europe (Fisher, 1994: 59). The nuclear programs of CEE countries have obviously been seriously affected by the transition to market economies and its consequences on the decision-making framework within the context of overall economic conditions (Semenov et al, 1993:5).

On the other hand, Russia still has proven oil reserves of 6% of the world total reserves. However, there are concerns that oil production might have reached another peak. There are two factors at play in this situation which involves an increase in production costs: First, the brown fields in W. Siberia and the Volga-Urals are maturing, and while they still have many years of productive life, the process of extracting further oil is becoming more difficult and, as a result, more expensive. Second, green fields in frontier regions such as East Siberia and the Continental Shelf in the Arctic Sea remain relatively underdeveloped. (Goldsworthy, 2010: 6)

Countries that once belonged to the Eastern European bloc, which had a rather rigid and centrally planned economic system, have developed nuclear power on a considerable scale as a source for electricity generation (Semenov et al, 1993: 1). For example, at the end of the 1992, Russia had 28 nuclear power plants with a total capacity of 18.9 gigawatts electric.

Table 1: Nuclear Energy and Electricity Consumption Projections in Selected Former Soviet Union Countries

(2000-2050)						
	Total Population (Million)		Total Electricity Consumption (Billion Whr)		Nuclear Production (GWe)	
	2000	2050	2000	2050	2000	2050
Country						
Russian Federation	145	104	767.1	904	115	271
Czech Republic	10	8	54.7	74	10	22
Hungary	10	7	35.1	43	14	22
Ukraine	50	30	151.7	120	12	22
Poland	39	33	119.3	133	13	27

Source: MIT, 2003.

When we consider the Russia and Europe relationship, on the one hand, the EU's concentration has been on rising energy provisions from Russia and on the other hand, this leaves fairly free hands for the member states to follow their own agenda with Russia on a bilateral level including the interconnection of electricity grids and improved cooperation in the nuclear energy field (Genç, 2009: 21).

If the Czech Republic builds new nuclear power plants, as it plans to do, it is also likely to obtain them from Western suppliers. (Fisher, 1994: 55) Nowadays, most of the Czech public supports further expansion of nuclear power use (60% in 2007) seeing it as the only realistic chance to deal with the future energy crisis. However, each country provides its own data on cost levels and these vary considerably from country to country. Base construction costs for nuclear power plants range from \$ 1000 per kW installed in the Czech Republic to \$ 2500 per kW in Japan; coal-fired plants were in the range \$1000 to \$1500 per kW but gas-fired plants are significantly lower, ranging from \$ 500 to \$1000 per kW. O&M and fuel costs (and their escalation) also vary considerably by country. The lowest costs for nuclear production were recorded in S.Korea, the Czech Republic, Canada and France, and the highest in Japan (Ritch, 2005: 24-25).

RESULTS AND DISCUSSION

The finance of nuclear power

Traditionally, nuclear, coal and run of river hydro facilities usually run as base load, while gas/oil plants and hydro with storage ponds are more flexible and therefore dispatched mid-merit and to meet peak demand (Hooper and Medvedev, 2008: 12).

Financing costs per kW for nuclear plants have fallen considerably due to standardized design, shorter construction times and more efficient generating technologies. Further gains are expected as nuclear technology becomes even more standardized around a few globally accepted designs. Meanwhile, recent new-build experience has demonstrated that new plants can be built on time and on budget (Ritch, 2006: 8).

Financing costs for new nuclear plants, a critical component of nuclear economics, are expected to fall as new approaches are developed and tested to increase certainty and to lower investors' risk. Meanwhile, in many countries, license procedures are being streamlined - a development facilitated by the nuclear industry's strong worldwide safety performance (Gale, 2005: 8).

In a balance sheet financing, therefore, the sponsor absorbs the full risks of cost overruns, revenue shortfalls, and changes in regulation, changes in circumstances, and all other "ups and downs" in the project lifespan. These are "full recourse" financings, where a creditworthy entity - such as a substantial power utility, a sovereign entity or group of creditworthy end-users - would assume 100% liability for all debt service payments under the financing (Troy, 2007: 8).

Examples of "balance sheet" financings for a nuclear power station include the construction of the nuclear station by a regulated power utility, which develops the facility under traditional "cost of service" rate regulations and finances it as part of the utility's ongoing regulated operations. Lenders would rely on the general credit of such entity for repayment of the loans and would price the loans in line with its general creditworthiness.

Another nuclear power plant financing is the construction of the nuclear station by a group of creditworthy end-users who are looking for a stable, low-cost supply of energy and finances it through equity injections or other recourse financing.

Investments in commercial nuclear generating facilities will only be forthcoming if investors expect that the cost of producing electricity using nuclear power will be lower than the risk-adjusted costs associated with alternative electric generation technologies. Since nuclear power plants have relatively high capital costs and very low marginal operating costs, nuclear energy will compete with alternative electricity generation sources for base load operation.

If fossil fuel use is significantly penalized by carbon taxes or emissions trading regimes, the competitiveness of new nuclear plants improves further. Nuclear power represents a large capital investment in the range of US\$ 1500-2000/kW. The financing plan for the procurement of the plant will probably involve a number of

sources, the sum of which needs careful management since long term commitments, in some cases extending up to 20–25 years, are involved (Rastas, 2006: 20).

Investments in nuclear power plant financing are not a function of global capital availability. In 2006, some \$4.2 trillion were raised in the global capital markets, 5% or \$230 billion of which was invested in the energy sector. So, nuclear power financing is not related to capital availability per se. But rather is subject to the political, economic, commercial and operational factors and other investment opportunities that offer “better” returns.

In fact, if the public sector wishes to invest in nuclear power as part of its socioeconomic development priorities, finance problem is not a real obstacle. It becomes an issue in the presence of other equally important development needs and private sector participation is sought.

Determinants of nuclear energy economics

Macro-economics has increasingly led the financial community to assess the economic competitiveness of nuclear energy. Once a power plant is built, there is no risk premium at all associated with its operation; but investors’ perception of the risk for a new nuclear project is still relatively high. Thus, there is still a significant risk premium associated with the initial investment.

The bottom line is a “risk-reward” analysis, which translates for most potential investors into a request for a high return on investment. To make things happen, we need to tackle each side of the problem: the risk and the reward (Lauvergeon, 2005: 2). In the past, debates on nuclear economy have been dominated by the estimates of construction costs. However, the much poorer reliability of nuclear plants than expected in some countries as well as the increasing focus on the economic risk of building a nuclear power plant; indicate the other two factors that deserve comparable attention. Other significant elements in the economics of nuclear power are the operating cost, including the cost of fuel and the expected lifetime (Schneider et al, 2009: 44).

From an economic perspective, the operation of a nuclear power enterprise embodies a series of major processes that include several distinct, but strongly interrelated phases.

This economic life cycle begins with extensive planning, engineering and construction, extends throughout the operational phase (including life extension) and concludes with decommissioning.

There are five different roles for the government in promoting nuclear energy as stated in a MIT publication (Joskow, 2003: 83). These are respectively:

- i) assuring that nuclear energy is considered on the same basis as other technologies that reduce carbon emissions,
- ii) taking steps to reduce regulatory uncertainty,
- iii) providing partial support for industry projects that demonstrate the economic competitiveness of nuclear energy,
- (iv) nuclear technology R&D, and
- (v) reauthorizing (Price Andersen) nuclear accident insurance.

Nuclear energy costs versus fuel and coal

The comparative economics of nuclear power plants depends on local conditions, discount rates and the cost of other fuels like coal and gas. The issues to be addressed in a comparative techno-economic analysis include the location of coal mines close to load centers, coal transportation, the availability of railroads for transportation, the ash content of the fuel and the associated environment impacts.

In this regard, the competitiveness of nuclear power compared to coal-fired power varies depending on how far away the coal-fired plant is from the mine that supplies its coal. If the coal fired plant can be located close enough to the pit-head, it will be cheaper than the nuclear power. But if, in order to be close to the load centre it serves, the coal fired plant were more than 1200 km away from the coal pit-head, then nuclear power is more competitive.

Expressed in a different way, one may say that economics of a coal fired power plant is location dependent, while that of a nuclear power plant is location independent. This depends on capital cost, Operation and Maintenance (O&M) cost and the fuel cost. For a nuclear power plant, capital cost is higher than a conventional coal-fired power plant.

Capital costs are incurred while the generating plant is under construction and include expenditure on the necessary equipment, engineering and labor. These are often quoted as “Overnight” costs which are exclusive of interest accruing during the construction period. They include engineer-procure-construct (EPC) costs, owners’ costs and various contingencies. Once the plant is completed and electricity sales begin, the plant owner begins to repay the sum of the overnight and accrued interest charges. The price charged must cover not only these costs, but also annual fuel costs and expenditure on operation and O&M of the plant (Gale: 2005: 18). Nuclear plants have relatively high capital costs but low marginal operating costs. They run most economically at very high load factors, supplying the demand for “base load” electricity.

On the other hand, energy cost of a kW of electric generating capacity depends on the number of hours it is used. For instance, a generator of 1kW that is producing for a year of 8760 h, provides $1 \times 8760 = 8760$ kWh. If it uses a fuel that costs \$0.2 kWh, then the total fuel cost will be $1 \times 0.2 \times 8760 = \1752 . This can be considered a component of the total variable cost. There are of course other costs which we called fixed costs. Call this F, and for this example make it equal to \$10,000. Then the total cost for 8760h of operation becomes \$ 1,752.

As already indicated, this fixed cost (F) can be designated as the capital cost (Banks, 2007: 324). Non-fuel operating expenses also can be broken down into fixed and variable cost components and are generally assumed to increase at the rate of inflation, though in some cases a real escalation rate is included (MIT Study: 2003: 143). Nuclear power is cost competitive with other forms of electricity generation, except where there is direct access to low-cost fossil fuels. Fuel costs for nuclear plants are a minor proportion of total generating costs, though capital costs are greater than those for coal-fired plants. In assessing the cost competitiveness of nuclear energy, decommissioning and waste disposal costs are taken into account. In other words, the decision making process of selecting a decommissioning option, typically made during the operating phase of a nuclear power, may have serious implications with regard to the total cost of electricity production (IEAE, 2006: 15).

Nuclear plant revenues and operating expenses

The real levelized cost of electricity production is used to assess the economic competitiveness of alternative generating technologies. A project’s real levelized cost can be computed using discounted cash flow analysis, as described below. (It can be seen in the Tables 3 and 4 below)

Revenues and expenses are projected over the life of the project and discounted at rates sufficient to satisfy the interest and principal repayment obligations to debt investors and the minimum hurdle rate (cost of equity capital) required by equity investors. The sole source of revenue for the power plant is the sale of electricity. Annual revenue is the product of the quantity of electricity produced and its price. The plant’s net capacity and capacity factor determine the annual electric generation.

An alternate method, based on traditional regulated utility revenue requirement calculations is often used to calculate levelized costs for generating technologies. This approach has two problems: first, it fails to account properly for inflation and yield levelized nominal cost numbers that cannot easily be compared across technologies with different capital intensities. Second, it imposes a particular capital cost repayment profile that, while consistent with the way regulated investments were treated, is not consistent with the merchant generation investment environment that now characterizes the US, Western Europe and a growing number of other countries (MIT Study, 2003: 141).

Table 3: Combined Cycle Gas Turbine (CCGT) Base Case Cash Flows (Nominal Dollars)

YEAR	1	2	3	5	10	20	30	40
Elec. price(cents/kWh)	4.25	4.28	4.51	4.78	5.54	7.45	10.01	13.45
Revenue(\$ million)	317	326	336	356	413	555	746	1,003
Operating Expenses (\$ million)								
- Fuel Cost	196	205	215	234	293	457	712	1,111
- Waste Fee	-	-	-	-	-	-	-	-
- Fixed O&M	16	17	18	19	23	34	51	76
- Variable O&M	4	4	4	5	6	9	13	19
- Decommissioning	-	-	-	-	-	-	-	-
- Incremental cap.	6	6	7	7	8	11	15	20

Operating Income	94	93	93	91	83	45	-45a	-223a
Depreciation (tax)	24	45	41	33	28	0	0	0
Interest Payments	26	24	22	18	4	0	0	0
Dept Principal Repaymt.	22	24	26	30	44	0	0	0
Taxable Income	44	24	30	40	51	45	0	0
Net Profit	29	36	33	28	16	28	-45a	-223a

(a) For the purpose of comparing energy supply options, plant operation is not terminated when operating costs exceed revenues.

Source: MIT Study, 2003

Waste and Decommissioning costs, which are included in the operational costs of nuclear plants, represent a tiny fraction of the lifetime costs of a reactor's operation. Nuclear plant economics are thus largely insensitive to these costs and will become even less so as fuel efficiency continues to increase and as waste and decommissioning costs are spread over reactor lifetimes that are becoming even longer (Gale, 2005: 8).

If the resultant operating income (revenues less operating expenses) is insufficient to cover the entire debt payment in any year, the electricity price is raised until all debt payments can be made. If the debt service constraint is binding, the realized return on equity will then exceed the minimum required return specified.

Table 4: Nuclear Base Case Cash Flows (Nominal dollars)

YEAR	1	2	3	5	10	20	30	40
Elec. price(cents/kWh)	6.91	7.12	7.33	7.78	9.02	12.12	16.28	21.88
Revenue(\$ million)	515	530	546	579	672	903	1,213	16.31
Operating Expenses (\$ million)								
- Fuel Cost	38	39	40	43	51	73	103	145
- Waste Fee	8	8	8	9	10	13	18	24
- Fixed O&M	66	68	71	77	94	139	206	306
Decommissioning	9	9	9	9	9	9	9	9
- Incremental cap.	21	21	22	23	27	36	49	65
Operating Income	370	381	391	414	475	625	817	1,063
Depreciation (Tax)	92	174	157	127	108	0	0	0
Interest Payments	92	86	79	64	13	0	0	0
Debt Principal Repaymt.	80	86	93	108	159	0	0	0
Taxable Income	186	121	156	223	354	625	817	1,063
Income tax paym.	71	46	59	85	135	237	310	404
Net Profit	127	163	160	157	169	387	506	659

Source: MIT Study, 2003

Investment returns, interest on debt accrues during construction and is repaid with the principal in equal annual payments over the specified term of the debt. Equity holders invest funds during construction and receive profits net of taxes and debt obligations during plant operation (MIT Study, 2003: 144).

Owing to the capital intensive nature of the nuclear power business, as well as to the relatively high operating expenditures, the economic consequence of any one phase may have serious, far reaching implications for the economic success or failure of the others.

Consequently, if we take two different alternatives into account in the Tables 3 and 4, it is clear that, after the 40 years of nuclear activities, "Nuclear Base Cash Flows" can make 659 million \$ net profit, while alternative Combined Cycle Gas Turbine base cash flows make a-223 million loss.

CONCLUSION

Technological innovation is crucial to the re-shaping of energy systems in ways that encourage sustainable development. The innovation process requires investment not only in R&D but also starting up the market diffusion of nuclear energy technologies. In this regard, there is a need for international institutional

mechanism to channel private-sector resources and both bilateral and multilateral public-sector resources from around the world to the developing countries for technological innovation activities of nuclear energy.

Turkey is seeking to cover an imminent shortfall in electricity as well as cut its dependence on foreign energy resources. The government's plan is to designate nuclear energy an essential source of energy, meeting at least one-fifth of Turkey's power needs within the next two decades.

Some of the Eastern Europe countries' natural resources of energy are running dry, which is increasing their reliance on energy imports except Russia. The basic solution to reduce this dependence is to develop nuclear energy. Reliable and sustainable energy sources, especially nuclear ones, are needed to preserve the living standards in the Eastern Europe region.

Energy policy as a major economic performance indicator will significantly influence management decisions and strategy development concerning the timing and duration of planned nuclear outages and risk management associated with the sale of nuclear generation by power purchase agreements, bilateral contracts or spot market bidding arrangements.

In this regard, first effort must be focusing on developing a comprehensive energy strategy that includes a clearly stated investment and macroeconomic policy direction and addresses all the key issues - production, trade, consumption, research and investment in nuclear energy.

It is clear that if the present rate of growth of energy demand continues for another two or three decades, the need for more nuclear-based power will be indispensable. Nuclear power is a part of the energy policy promoted by the Eastern Europe Countries to develop the nuclear energy as part of the European policy, considering sustainable development, security of energy supply and competitiveness.

Government's support is a pre-requisite to any Nuclear Power Plant project and financing in the developing countries. We believe that the governments should step in and increase the likelihood of practical demonstration of nuclear power by providing financial incentive to the first movers in Turkey and the Eastern Europe region.

The global energy demand will be mainly identified by the developments in the developing countries and in emerging economies such as China and India. Eastern Europe Countries, except Russia, will have the chance to benefit from nuclear energy if they built economically competitive smaller reactors to match the grid sizes of many countries.

RECOMPUTATION OF UNDP'S HDI RANKINGS BY DATA ENVELOPMENT ANALYSIS

**Mehmet Tolga Taner
Bülent Sezen
Lütfihak Alpkın
Selim Aren
Gebze Institute of Technology, Turkey**

ABSTRACT

The HDI has played an influential role in the debate on human development. No index is perfect and so is the Human Development Index of United Nations Development Program. This paper aims to measure the performance of 182 countries in terms of performance by means of non-parametric input oriented CRS employed Data Envelopment Analysis. In addition, it elaborates on the cut-off values assigned by UNDP to categorize the countries. By means of this research, countries will be able to choose those elements by benchmarking from other countries that are applicable and most likely to develop strategy formulation processes for human development and international growth.

INTRODUCTION

Today, normalised measures of life expectancy, literacy, educational attainment, and GDP per capita are considered to be the main indicators of development for countries worldwide. These three indicators are unified to give a measure of development, namely the Human Development Index (HDI). HDI has been first used in the United Nations Development Program's (UNDP) World Development Report. Since the first publication of this annual report in 1990, UNDP has been seeking to explore the concept and measurement of global human development.

The Human Development Index (HDI) computes and assigns a single, scalar value to each country of the world based on three components of human development. This simple measure has changed the global debate on development and influenced public policy around the world. Criticism and proposed alternatives abound, yet the index has managed to maintain its popularity and simplicity with only minor modifications over the years of 1991, 1994, 1995, 1999 and 2005. The HDI was developed to measure "the basic concept of human development to enlarge people's choices" (Ul Haq, 1995). It was also designed as an alternative to the use of GDP per capita alone as a measure of human development. To these ends, it must be concluded that the HDI has achieved overwhelming success. However, it is still prone to criticisms as it lacks the means to correctly measure and analyse the annual performance of countries.

Ul Haq stated that the purpose of the HDI was to measure at least a few more choices besides income and to reflect them in a methodologically sound composite index. Indeed, the HDI has included only a limited number of indicators to keep it simple and manageable. This simple HDI algorithm is still being used today and calculated from regularly available data to produce a meaningful number that can be used to compare and rank countries across the world.

Up-to-date, critics on HDI have claimed that it uses very few or the wrong indicators. Others allege that it presents an oversimplified view of human development and added that a pure economic model focusing on growth alone should set the tone on discourse regarding human development. In fact, some of these critics have developed their own novel indices or have resulted in the modification of HDI. But, collecting reliable data continues to be the major obstacle in the poorest countries (Harkness, 2004). Regarding health and longevity, Harkness notes that mortality data are most likely to be missing in countries where mortality is the highest. According to another critic, both the resources allocated throughout a country and the levels of inequality that may exist across the country are not taken into account in the HDI index (Foster, 2005; Ul Haq, 1995). In recent years, most critics have taken issue with the equal weights assigned to each of the

respective indicators of the index (Mahlberg and Obersteiner, 2001; Chowdhury and Squire, 2006) but assigning differing weights have been proven to be unnecessary (Stapleton and Garrod, 2007). And yet, the HDI has been extensively criticised for its lack of desirable statistical properties.

To overcome the deficiencies of previous traditional parametric approaches and weighing problems, Data Envelopment Analysis can be employed. To measure the HDI, this analysis has been firstly used by Mahlberg and Obersteiner in 2001. The following year, Lozano and Gutierrez proposed a new DEA model that computes a range-adjusted measure (RAM) of efficiency for HDI and Lee et al. (2006) made use of a fuzzy multiple objective DEA for the HDI. In 2005, the HDI of the Asian and Pacific countries were calculated by Despotis (2005). Having automatically overcome the subjectivity difficulties in weighing the component indices, this technique analyses the inherent properties of the data by a different approach.

METHOD

Data Envelopment Analysis (DEA) is a data-oriented technique which has been proven to be an effective tool in evaluating relative efficiency. It is a nonparametric method of measuring the efficiency of a decision-making unit (DMU) such as a country, first introduced into Operations Research literature by Charnes, Cooper and Rhodes in 1978. Recent years have seen a great variety of applications of DEA for use in evaluating the performances of many different kinds of entities engaged in many different activities in many different contexts in many different countries such as sports, logistics, hospitals, universities, cities, business firms etc. Because it requires very few assumptions, DEA has opened up possibilities for use in cases which have been resistant to other approaches because of the complex and often unknown nature of relations between the multiple inputs and multiple outputs involved in the DMUs.

Throughout the paper, we use decision making units (DMUs) to represent countries. Each DMU is assumed to have a constant input and represented by three outputs, i.e. HDI component indicators (life expectancy index (LEI), education index (EI) and GDP per capita index (GDPI)). The DEA model used assumes an input oriented radial CRS technology.

The main advantages of DEA are: (1) Multiple inputs and outputs can be used effectively, while ascertaining efficiency, and a specific production function is not required; (2) The decision maker does not need prior information about weights of inputs and outputs; and (3) For each DMU, efficiency is compared to that of an ideal operating unit, rather than to the average performance.

The HDI is based on three indicators: longevity, as measured by life expectancy at birth; educational attainment, as measured by a combination of adult literacy (two-thirds weight) and combined primary, secondary and tertiary enrolment ratios; and standard of living, as measured by real GDPI (Purchasing Power Parity in US\$). To calculate the dimension indices, UNDP has assigned minimum and maximum values (goalposts) for each underlying indicators. Performance in each dimension is then calculated and expressed as a value between 0% and 100%. Then, the HDI is calculated as a simple average of the dimension indices by basic algebra. In UNDP's approach, this was followed by assigning (equal) weights to each dimension index given as follows:

$$\text{HDI} = x. (\text{LEI}) + y. (\text{EI}) + z. (\text{GDPI}) \quad (\text{where } x = y = z = 1/3).$$

whereas, in our approach, the indices are analyzed by the use of linear programming methods to construct a non-parametric piece-wise surface over the data. The CRS surface is presented by a straight line that starts at the origin and passes through the first DMU that it meets as it approaches the observed population. The models with CRS envelopment surface assume that an increase in inputs will result in a proportional increase in outputs. Efficiency measures are then calculated relative to this surface. For the purpose of analyzing the data, Efficiency Measurement System (EMS) is used. The inherent weights for the inputs and outputs are assigned by the model itself.

The essence of the CRS model is the ratio of maximization of the ratio of weighted multiple outputs to weighted multiple inputs. Any country compared to others should have an efficiency score of 100% or less. The efficiency score in the presence of multiple input and output indicators is defined as:

$$\text{Efficiency} = \text{Weighted sum of outputs} / \text{Weighted sum of inputs}$$

Assuming that there are n DMUs, each of with i inputs and j outputs, the relative efficiency score of a test DMU m is obtained by solving the following model proposed by [Charnes et. al., 1978]:

$$Max \frac{\sum_{j=1}^J v_{mj} y_{mj}}{\sum_{i=1}^I u_{mi} x_{mi}}$$

$$0 \leq \frac{\sum_{j=1}^J v_{mj} y_{nj}}{\sum_{i=1}^I u_{mi} x_{ni}} \leq 1; n = 1, 2, \dots, N$$

$$v_{mj}, u_{mi} \geq 0; i = 1, 2, \dots, I; j = 1, 2, \dots, J$$

y_{mj} = amount of output j produced by DMU m .
 v_{mj} = weight given to output j

x_{mi} = amount of input i utilised by DMU m .
 u_{mi} = weight given to input i

The above model is run n times in identifying the relative efficiency scores of all DMUs. Each DMU selects input and output weights that maximize its efficiency score. In general, a DMU is considered to be efficient if it obtains an efficiency score of 100% and a score of less than 100% implies that it is inefficient.

ANALYSIS

Unlike the HDI, the DEA scores on Table 1 are relative measures. Each country is compared with the best practice countries when it assesses its composite performance on the human development indicators. As shown in Table 1, the EMS analysis has yielded differences in country rankings between the UNDP and DEA approaches. The DEA approach identified a group of 20 optimally performing countries that are defined as efficient and assigns them an efficiency score of 100%. These efficient countries are then used to create an “efficiency frontier” or “data envelope” against which all other countries are compared. In sum, countries that require relatively more weighted inputs to produce weighted outputs, or, alternatively, produce less weighted output per weighted inputs than do countries on the efficient frontier, are considered technically inefficient. They are given efficiency scores of less than 100%, but greater than 0%.

Table 1 HDR 2009 Data and DEA Rankings

UNDP ranking	DMU	HDI	Efficiency Score	GDP per capita index	Education Index	Life Expectancy Index	DEA ranking
1	Norway	0,971	100,00%	1,000	0,989	0,925	1

182	Niger	0,340	44,80%	0,307	0,282	0,431	178

We compared the DEA efficiency scores with HDI values. Pearson correlation coefficient of 0.958 shows that the two indices are highly correlated. Despite this strong correlation, there are also some notable differences between the two measurements.

DISCUSSION

Benchmarks

DEA analysis shows that Australia is the country that is the most frequently used as a reference by the inefficient countries (115 times or by the 63% of the inefficient countries). The corresponding frequencies for Denmark and Japan are 94 (52%) and 58 (32%), respectively. Therefore, both Australia and Denmark can be regarded as role model countries.

Cluster Analysis

The basis of UNDP's classification of 182 countries into 4 groups (shown in Table 2) is based on a simple leveling structure. A better method for determining the real cut-offs between countries is the cluster analysis. In a previous research, Wolff et al. (2009) have examined the consequences of data error in data series used to construct aggregate indicators and found that up to 45% of developing countries were misclassified in HDR 2008. Our analysis of corrected HDI and DEA-based cutoffs are given in Table 3. Grouping of countries by means of cluster analysis is given in Table 4. In addition, the ranking results of DEA have also been examined by cluster analysis. The countries have again been classified in four groups. However, there are substantial differences between the groupings of HDI and DEA.

Table 2 Classification of countries according to HDR, 2009

	No. of countries	UNDP's lower cut-off (HDI)	UNDP's upper cut-off (HDI)
Very High Human Development $0.900 \leq \text{HDI} < 1.000$	38	0.902	0.971
High Human Development $0.800 \leq \text{HDI} < 0.900$	45	0.803	0.895
Medium Human Development $0.500 \leq \text{HDI} < 0.800$	75	0.511	0.798
Low Human Development $\text{HDI} < 0.500$	24	0.340	0.499

Table 3 Corrected and DEA cutoffs classifying the 182 countries

	Group no.	No. of countries	Lower cut-off	Upper cut-off
Corrected HDI	1	66	0.829	0.971
	2	63	0.683	0.826
	3	30	0.499	0.654
	4	23	0.340	0.493
DEA	1	84	90.00%	100.00%
	2	57	70.53%	89.49%
	3	33	52.64%	70.29%
	4	8	39.31%	48.17%

Corrected groups of HDI has differed from the former one in many terms. Firstly, Group 1 now includes many of the recently EC-integrated countries such as Estonia, Poland, Slovakia, Hungary, Lithuania, Latvia, Bulgaria and Romania. Secondly, South and Central American countries has appeared in Group 1 for the first time. These countries include Chile, Argentina, Uruguay, Costa Rica, Venezuela, Panama and Trinidad Tobago. It should be noted that Argentina, Uruguay and Venezuela are full members of Mercosur. Thirdly, none of the African countries are categorized in Group 1. Next, Group 2 now includes the majority of Asian, Turkic and North African countries. Last, whereas Group 4 includes mostly the Central African countries.

According to the classification by DEA, all ex-USSR countries except Azerbaijan and Uzbekistan have moved to Group 1 from Group 2 due to their high adult literacy rate. In return, Bahamas and Malaysia have moved to Group 2 from Group 1 due to their relatively low EI. Equatorial Guinea have moved to Group 1 from Group 2 due to its high GDP per capita of 30.627 USD. In return, Panama has moved from Group 1 to Group 2 due to its relatively low GDP per capita.

Moving from Group 3 to Group 2 has required countries to have superiority over other countries in any of the two indicators. For instance, Pakistan has higher GDP per capita (0.537 versus 0.526) and life expectancy (0.687 versus 0.624) indices than Yemen. Therefore, Pakistan has moved to the upper group whereas the group of Yemen has remained the same.

It should be noted that high education index is proven to be the most important criterion while grouping the countries by DEA. All countries moving from Group 4 to Group 3 such as Malawi, Zambia and Rwanda have enjoyed relatively higher adult literacy rates. It is also observed that countries with the lowest efficiency scores are mainly from the Central African countries.

Table 4 Classification of countries by Cluster Analysis

-----	---	---	---	--

CONCLUSIONS

It is true that the HDI has brought the global community closer and inspired a united effort in the common cause of improving the human condition for those dwelling in the darkest corners of the world. It is also true that HDI is a simple and universal index. However, this index has been very subjective and not been scientifically successful in correctly categorizing the countries. To overcome this problem, cluster analysis has been used.

The proposed approach in this paper differs from the previous HDI assessments since it does not need to assign any subjective weights to EI, LEI and GDPI. It also differs from the previous DEA applications on HDI assessment by clustering countries by means of DEA-based cutoff points.

ABSTRACT

The main object of this paper is the food safety of the Russian Federation – it is such a state of the country's economy when food independence of the Russian Federation is provided, physical and economic availability of food stuffs, corresponding to the requirements of Russian Federation legislation in safety and quality, is guaranteed for the population of the country. Realization of Russia's national interests in this field is a key problem.

Regional peculiarity is considered to be one of the most important aspects in methodology of managing economy in agrarian sector. Regional support system becomes dominant amongst the other sources of state support system in agro business.

Key Words: *food safety of the Russian Federation, agro-industrial complex of the Russia, regional aspect of the agroindustrial complex*

I. INTRODUCTION

Food safety of the Russian Federation – it is such a state of the country's economy when food independence of the Russian Federation is provided, physical and economic availability of food stuffs, corresponding to the requirements of Russian Federation legislation in safety and quality, is guaranteed for the population of the country.

Realization of Russia's national interests in this field is a key problem.

Regional peculiarity is considered to be one of the most important aspects in methodology of managing economy in agrarian sector. Regional support system becomes dominant amongst the other sources of state support system in agro business. Effectiveness of regional policy shows itself in flexibility, high opportunities in controlling the usage of budgetary means. Absence of prerequisites on a federal level, rapidly decreases the effectiveness of budgetary means regulation. “Russia is striving to be a part of world trade system, it also hopes to strengthen and to bring the relations with all its partners to a higher level”¹, said D. Medvedev.

II. RESEARCH QUESTION, DISCUSSION AND SHORT LITERATURE REVIEW

Despite steps taken, the potential of agro-industrial complex of the country is used not fully, and the state of food safety causes serious apprehension.

Problems of provisions safety become more and more important in the regulation of world agricultural trade. Russian economists Arhipov,ⁱⁱ Altukhovⁱⁱⁱ, Vermel^{iv}, Gordeyev^v, Shmelev^{vi} and others state that “food safety” is as “food independence” because of the significant economic dependence of Russia on import of food and raw material.

The food independence according to them is an ability of a country's agricultural sector to provide manufacture, storage, processing and supply of the country population with the basic kinds of the foodstuffs in the quantity and assortment necessary for an active healthy life. Ushachev^{vii} has the same approach to the definition and uses the term “Reliable food maintenance”. According to the opinions of Glazyev, Gordeyev, Zeldner^{viii}, Illarionov^{ix}, Ivanchenko^x, Miloserdov, Semchagov, Gorddev^{xi} a country's food safety is not provided if manufacture of the vital food stuffs meets less than 80-75% basic needs of the population according to physiological norms.

High import dependence of the country in separate kinds of agricultural produce and food stuff is preserved. It forms nowadays 36% of goods resources at food market. The problem of import dependence is quite acute at the market of live-stock produce. The share of import in goods resource of meat is estimated in 41%, milk – in 27%.

The tendency to the growth of sufficient share of import is preserved, and in live-stock produce it is increased. Import of pork has increased by 29% from the beginning of 2009, and dry milk – almost in 2 times. All this increases the dependence of food market and seriously infringes upon Russian agriculture interests.

By the forecasts of international organizations the world food stuff situation in the nearest decade will sharpen. Highly developed states apply two principal approaches for providing food safety: the first – the priority in support of national agricultural manufacturer (EC countries)^{xii}, the second – equal support of agricultural manufacturers and food consumers (USA). It is proposed in Russia to use the support of both consumers and commodity manufacturers.

At present the average volume of budget support of agricultural manufacturers in Russia (slide 1) is less than in the USA in 2,7 times, in EC countries – in 5,4 times. Natural-climatic conditions for the production of agricultural output is considerably more complicated in Russia.

Table 1

Government policy in the sphere of food safety guarantee shall consider **risks and threats** which may weaken it sufficiently. They include such factors as deficit of qualified personnel, price disproportion, modern systems of supervision over the state of production market.

Food safety in Russia may be considered as guaranteed^{xiii}, if, with the flow of food stuff from abroad terminated, food stuff crisis does not occur at the expense of high share in consumption of home-made agricultural raw and food: potato – 95%, grain, milk and milk products – 90%; edible salt – 85%; meat and meat products – 85%, fish and fish products, sugar, oil – 80%.

To compare these figures with those we are having today, the balance is broken considerably in providing the population with meat and milk produce.

To get closer to the level of developed countries we are to solve simultaneously several interconnected and capital-intensive tasks:

1. technological upgrading of agriculture and food industry, spheres of industrial service of AIC;
2. forming of personnel potential of the branch capable to master innovations;
3. carrying out works for restoration abandoned land;
4. creation of modern social infrastructure of farm territories (housing, roads, etc.)

To provide financial-economic stability of agricultural output it is necessary to conduct constant monitoring of price parity between agricultural sector and other sectors of economics, to use indicative prices for taking steps in providing efficient output of meat, milk, grain, sugar and other vital food stuff timely.

III. THERE ARE THE FOLLOWING PROBLEMS IN THE EFFICIENCY OF AGRICULTURAL FOOD SECTOR

1. There is a high difference in population's earnings. It is enormous in town and in the countryside, i. e. it is the result of considerable quantity and quality differences in nourishment. The average consumption of fiber of animal origin per capita by socially unprotected population is particular low.

2. The main internal factors defining the condition of agro-industrial and fishery complexes are imperfection of micro-economic terms, backlog in the development of innovation activity and social sphere, deficit of qualified personnel.

3. Such external factors as considerable growth of solvent demand in developing countries, intensive development of bio-energetic in developed countries, reduction of world reserves in food stuff, the development of world financial and fund crisis increase the influence on the security of food safety. The food more and more becomes one of the major key factors of political and economic pressure in international relations.

4. Entering World Trade Organization (WTO) for meeting national interests of the Russian Federation, will also advance in strengthening food safety of the country.

Guarantee of food safety is linked with risks which may weaken it. Such risks include:

1. macroeconomic risks caused by sharp fluctuations of world prices for some goods of Russian export and the food stuff imported from foreign countries;
2. natural and technogenic risks;
3. technological risks;
4. agro-ecological risks;
5. social risks;
6. trade-economic risks;
7. political risks.

Guarantee of food safety is connected with the overcoming of negative factors which have a complex character and are caused by the following:

1. considerable increase of threshold value of the criteria of domestic market saturation by import output, for example, - meat;
2. low level of paying capacity of the population for food stuff;
3. price disproportion at the markets of agricultural, fish output and food stuff on one side and material-technical resources on the other;
4. disturbance of stability of financial-credit system;
5. insufficient level of development of domestic market infrastructure;
6. moral and physical aging of material-technical basis of agro-industrial and fishery complexes;
7. insufficient level of innovation and investment activities;
8. reduction of national genetic resources;
9. probable expansion of bio-fuel output from agricultural products and raw;
10. lack of qualified personnel.

This paper will consider one more complex aspect of the country's integration to world community – entering of the country, Rostov region to WTO.

VI. METHODOLOGY

The main methodological principle of research is institutionalism. Methods used in the paper: statistical methods, graphic methods and etc. All the data used from Reference Materials on social-economic complex of Russia, Rostov-on-Don region, from various foreign resources during last years.

CONCLUSION

Set of official opinions in connection with targets, tasks and principal trends of government policy for the provision of food safety of the country, formation of such economy of the country when food independence of the Russian Federation is provided, physical and economic availability for the country's population of food stuff, meeting the requirements of Russian Federation legislation, is guaranteed.

Realization of expressed proposals and their justified reasoning in the paper will allow to provide food safety of the Russian Federation and Rostov region as an important component of the country's economic safety.

Effectiveness of regional policy shows itself in flexibility, high opportunities in controlling the usage of budgetary means. Absence of prerequisites on a federal level, rapidly decreases the effectiveness of budgetary means regulation. The leading role at solving the problem of food safety shall be given to regional management, in this project to the Rostov region, in the following aspects:

to provide the region with food stuff in quantity, quality and assortment equal to population size;

to guarantee food stuff quality to the population;

to provide economic availability of food stuff.
