PREFACE

Dear Colleagues, Ladies and Gentlemen,

Welcome to the Sixth International Strategic Management Conference in St. Petersburg, Russia. On behalf of the Organizing Committee, I would like to extend my heartfelt greetings to all of you and wish you a successful conference that yields many productive academic collaborations and reinforces the already established ties, as with previous meetings of our conference.

The Sixth International Strategic Management Conference is organized jointly by Beykent University, Çanakkale Onsekiz Mart University, and Gebze Institute of Technology, of Turkey. This year we have also enjoyed the academic and financial support of Turkey's State Planning Organization. As Conference Chairman, I deem it a great pleasure to extend my deep appreciation to my colleagues, the presidents of Çanakkale Onsekiz Mart University and of Gebze Institute of Technology, and the distinguished Undersecretary of the State Planning Organization, all of whom also act as the Honorary Presidents of our conference.

This year's conference has received a total of 262 papers from 33 different countries. Some of these papers were submitted as full papers from the start. Unfortunately, some of the extended abstracts were not received as full papers by the deadline given for submission of full papers. In the Proceedings Book and CD that you have, 145 papers are included. These were selected after careful screening.

I am happy to announce that in this year's conference a much wider geography is represented than in previous years. The number of different countries is more than double that in past conferences, and this indicates that we are reaching an ever wider audience of academicians. These 33 countries are: Albania, Australia, Belgium, Bosnia and Herzegovina, Brazil, China, the Czech Republic, Finland, France, Germany, Greece, Hungary, Indonesia, Iran, Israel, Italy, Malaysia, Mexico, New Zealand, Nigeria, Pakistan, Poland, Portugal, Russia, Singapore, Slovenia, South Africa, Spain, Thailand, Tunisia, the UK, the USA, and Turkey. Also, some academicians have been unable to attend the conference due to visa problems, which have caused us all much concern. This year two keynote speakers will address you on the strategies out of the global recession.

Ladies and Gentlemen, on behalf of the Organizing Committee, I would once again like to welcome you to the Sixth International Management Conference.

*Prof. Dr.Erol Eren
Conference Chair*

PREFACE

We are pleased to welcome you to the 6th International Strategic Management Conference in St. Petersburg. This year, the theme is “Searching for Strategies out of the Global Recession”.

Participants coming from different parts of the world aim to discuss and explore for strategic management issues and approaches to managing global crises. We are going to debate on different topics including industry analysis, innovation, entrepreneurship, marketing and financial aspects of strategies addressing mainly problems and issues in turbulent environments.

Academicians from different countries submitted original papers for conference presentation and for publication in this Proceedings Book. All competitive papers have been subject to a peer review. The results of the evaluation efforts produced 145 empirical, conceptual and methodological papers submitted from 26 different countries involving all functional areas of strategic management with a specific focus on strategies for the global recession. I would like to express our appreciation to the reviewers for reviewing the papers that were submitted to this conference. We also thank to all those who submitted their work to be considered for presentation at the conference.

I would like to thank to the Rectors of Universities for their continuing cooperation. My special thanks go to Alinur Büyükaksoy, Rector of Gebze Institute of Technology for his valuable support and encouragement.

Many people worked very hard for the realization of this organization. The Conference could not have been held without the diligent work of Professor Erol Eren, Faculty Dean and Chairman of the Conference. He made great effort to organize and perfect all arrangements. Special thanks to him for his leadership and execution of 2010 Conference. I want to extend special appreciation to Mehtap Özşahin for her hard work and commitment to the Conference development. She carefully worked in coordination with us during the all phases of the organization.

We hope that you all will enjoy and benefit from the conference and enjoy your stay in this great and historic city, St.Petersburg.

*Oya Erdil, PhD
Co-Chair*

PREFACE

Strategic management is a term that is acknowledged in areas of individualism to institutionalism, urban government to regional planning and administration of nation to international relations and organizations.

While it was first identified and regarded as a subject of multi-company corporations, today strategic management has gained a strategic identity for every individual, every institution and every nation. Indeed, strategic management that can be defined as decision of long term behavior pattern has become a reality that is required in every field.

Design of strategy in every phase also mediates in planned development. Indeed, definition of vision and mission is a requirement where strategies of objectives and goals are put forward. This requirement cause individuals work for long years and as a result resources are used rationally and performance levels of managers increase.

Six years ago we have decided to organize international strategic management conference at an institutional level and led by Prof. Erol EREN in order to expand the concept of strategic management perception in this way and context in Turkey. First conference was organized in Çanakkale by Çanakkale Onsekiz Mart University, Gebze Institute Technology and İstanbul Ticaret University. Conference has developed its international feature and gained an internationally institutionalized identity.

The theme of the conference which will be held for the sixth time this year also has significance. "Searching For Strategies Out Of The Global Recession" is quite a significant theme in today's conjuncture since the crisis itself is a natural possible result and expectation of the globalization. Therefore it is not a conjectural happening but a structural phenomenon.

Yet, a strategic approach to global crisis and crisis in general is a requirement as a structural phenomenon. Design of strategies in getting over from crisis and reaction to crisis both in macro level and institutional level is another requirement. In this regard we will have the opportunity to see significant crisis strategies proposals in the 6th International Strategic Management Conference.

I wish a successful organization of 6th International Strategic Management Conference and thank everyone for their efforts in the event.

*Prof. Ali AKDEMİR
Co-Chairman of the Conference
Rector
Canakkale Onsekiz Mart University*

FOREWARD

Dear Colleagues,

On behalf of Beykent University, I would like to express my pleasure at holding the Sixth International Strategic Management Conference at the historic city of St. Petersburg. Ever since its establishment our conference has enjoyed the generous support of two important institutions: Gebze Institute of Technology and Çanakkale Onsekiz Mart University. Both institutions have displayed an extraordinary effort in collaborating with Beykent University in the preparation of this conference over the years. I would like to express my deep gratitude to my colleagues, Professor Alinur Büyükaksoy, the President of Gebze Institute of Technology, and Professor Ali Akdemir, the President of Çanakkale Onsekiz Mart University.

In addition, this year the Conference has benefited from the academic and financial support of the State Planning Organization, an institution that plays a critical role in the long-term economic planning for Turkey. I would like to extend my sincere appreciation to the State Planning Organization in the person of the Undersecretary, Mr. Kemal Madenoğlu. I would also like to thank all of the institutions and the individuals who have contributed to the organization of this conference.

The Sixth International Strategic Management Conference enjoys the participation of academicians from 33 different countries. Represented are nearly all of the countries of Europe, and also countries from the continents of Asia, Oceania, Africa, and America. The number of countries has more than doubled compared to previous years. I would like to express my appreciation and respect to all of the distinguished academicians who have contributed their academic endeavors from all around the world.

Putting together a truly international conference requires a lot of organizing and the synergy of a harmonious team. In the person of the Conference Chair, Professor Erol Eren, I congratulate all of the members of the Organizing Committee and the Advisory Board and Peer Review Committee.

It is my sincere wish that the Conference is productive and successful for all of the participants.

*Professor Ahmet Yüksel
President
Beykent University*

FOREWORD

Dear Colleagues,

On behalf of my university and staff members I would like to welcome the delegates of the 6th International Strategic Management Conference with the theme “Searching for strategies out of the global recession” organized jointly by Beykent University of İstanbul, Turkey, the Gebze Institute of Technology of Kocaeli, Turkey, and the Çanakkale Onsekiz Mart University of Çanakkale, Turkey.

As Gebze Institute of Technology, we are extremely pleased to have participated in the organization and realization of this series of conference and many of others which contributes our aim of concentrating on scientific events. This year, we provide our support for the success of the 6th International Strategic Management Conference which will be held in historic city of Saint Petersburg, Russia.

My special thanks go to Professor Ahmet Yüksel, Rector of Beykent University, and Professor Ali Akdemir, Rector of Çanakkale Onsekiz Mart University who give the excellent example of cooperation to realize this successful event. I would like to express my sincere hope that this cooperation will continue in the coming years.

Professor Dr. Erol Eren, Dean, and the President of the Organizing Committee, successfully lead the organization the last five years. I would like to thank to Dr. Eren for his valuable efforts. I also would like to thank to colleagues and staff of our Faculty of Business Administration for their hard work.

It is our sincere hope that you will enjoy both the academic discussions and social events of the Congress and your stay in St. Petersburg.

*Alinur Büyükkaksoy (Ph.D.)
Rector
Gebze Institute of Technology*

STRATEGIES FOR THE GLOBAL CRISIS

MANAGING LARGE CORPORATE CRISIS IN ITALY. AN EMPIRICAL SURVEY ON EXTRAORDINARY ADMINISTRATION

Alessandro Danovi
Bergamo University, Italy

ABSTRACT

This paper aims at presenting some initial empirical evidence regarding Extraordinary Administration (amministrazione straordinaria), a sort of Italian Chapter 11. This procedure was introduced into Italian bankruptcy legislation in 1979, in order to manage large corporate crises. It was reformed afterwards in 1999 and amended in 2003 and 2008 to deal with two of the biggest Italian crises, the Parmalat and Alitalia cases.

While there is an ample theoretical framework on the legal aspects (for a general overview in English see Panzani, 2009), economic issues have not been thoroughly addressed. Among the few we refer to Floreani, 1997; Leogrande, 2003; Danovi, 2003; Falini 2008.

The paper investigates, how the procedure was put into effect between 1999 and 2008. Sources of information are documents available from the Ministry of Industry, which sets out the procedure and has to approve the restructuring plan and the Court Houses that are empowered to accept filing for EA, in cases of insolvency. The data collected, regarding almost all cases ruled by Act 270/1999 refer to 57 groups composed by 183 companies.

Specifically the empirical survey discusses: i) the economic relevance and size of the phenomenon; ii) the characteristics and assets of the companies involved; iii) timeframes and management aspects; iv) safeguarding of the work force.

The main conclusion is that the new law is more concentrated on recovering entrepreneurial activities through the sale of companies and not on true restructuring. This seems correlated to the short timespan for carrying out the process, as well as the excessive indebtedness of companies which file for EA.

Under a strictly economic profile, the results of administrator management show operative inefficiency which is difficult to overcome in the time period available for the process.

The author is aware that because of the statistical limits the analysis can be considered an initial survey, but it is worth presenting as the basis for future studies and to create the conditions for proper discussion for a procedure whose real effect is often merely imagined, rather than known.

Key words: Corporate restructuring; bankruptcy procedures in Italy; Extraordinary Administration

Jel classification: G33 - Bankruptcy; Liquidation; K35 - Personal Bankruptcy Law

INTRODUCTION

Extraordinary Administration (amministrazione straordinaria), a sort of Italian Chapter 11, was introduced in Italian bankruptcy legislation in 1979, by Act 270/1999, in order to manage large corporate crises. It was reformed afterwards in 1999 according to EU recommendations and amended in 2003 and 2008 to deal with two of the biggest Italian crises, the Parmalat and Alitalia cases.

Differently from other Italian bankruptcy procedures, Extraordinary Administration is a sort of hybrid since it is under the jurisdiction of both the administrative authority (Ministry of Industry) as well as the Court. Currently there are two distinct phases. During the initial “observation” phase, an extraordinary administrator manages the company and also has to verify whether there is a real possibility for recovery. During the second phase (“recovery phase”), the restructuring program prepared by the administrator follows a going concern logic, and the company can either be sold to other investors or guided towards a stand alone recovery. If according to the program only some divisions of the company are sold, after the sale, the rest has to be liquidated (“liquidation phase”).

As often happens with bankruptcy laws, there is ample theoretical framework and many studies have been carried out, focused on the legal aspects (Alessi, 2000; Costa, 2008; Ponti & Spadetto, 2006, Stanghellini, 2007 for a general overview in English see Panzani, 2009), while economic issues have not been thoroughly

investigated. Among the few we refer to Floreani,1997; Bertoli, 2000; Leogrande, 2003; Danovi, 2003, Lacchini et Al. 2005; Falini, 2008a and b.

In such a context, this paper aims at presenting some initial empirical evidence regarding how the procedure was put into effect between 1999 (the year of the reform) and 2008. The research follows the ideal framework of the most complete empirical study in Italian literature (Floreani, 1997) which studied the phenomenon before the reform, analysing almost all cases up to 1996. It is a useful tool for comparing the effect of the new law on corporate reorganization in Italy.

Information sources utilized to carry out the study were documents available from the Ministry of Industry, which sets out the procedure and has to approve the restructuring plan, and the Courts, that are empowered to accept filing for EA, in case of insolvency. The data collected, regarding all cases filed under Act 270/1999 (“Legge Prodi bis”), refer to 57 groups composed of 183 companies. The analysis was carried out on the EA cases under Act 270/1999 as it was more widely used than the revised version ruled by Act 39/2004.

The paper is divided into the following sections: §2. Characteristics of group involved. - § 3. Causes of the Crisis and the situation at filing. -§ 4. Management and Liquidation Phase. – § 5. Conclusions.

The main conclusions are as follows:

- The new legislation widened the sphere of application: the regulations introduced by the Act of 1999 notably increased the area of application, extending the intervention of the administrative authority to protect industry and national employment levels;
- The analysis of sectorial distribution illustrates how the phenomenon especially effects industrial sectors, like engineering and textiles, as well as commerce and wholesale, the same sectors especially hit by the crisis in Italy;
- Filing for EA often happens too late and this delay has negative effects on the possibility for recovery. The principle of “merit” introduced by the new legislation, based on the observation phase, is an important filter for singling out companies which are effectively salvageable;
- The economic rebalancing of the companies seems to have been pursued almost exclusively through the sale of the whole company or at least some divisions to other competitors. There are only three cases of stand-alone restructuring. This suggests that the new legal tools serve to foster sales rather than carry out real internal recovery.
- The aim to protect the workers seems to be reached in the majority of cases through the transfer of a significant number of employees (about 51%) with the company still functioning. EA seems to be useful in safeguarding the work force in most cases.
- The deadlines fixed for the execution of the program have produced tangible benefits on the duration of the procedure, at least as far as regards the recovery phase.
- The liquidation phase is the most complex of the entire procedure. In fact, for those still in progress (87%), the total timeframe is more than 6 years, similar to Italian bankruptcy procedures.
- In conclusion, while EA has proven to be generally efficient, effects on creditor’s rights are variable: in some cases there are significant recovery ratios, in others the percentages are not far from the ones creditors could have had if the company had gone bankrupt.

The author is aware that because of the statistical limits, this analysis can be considered as an initial survey. From a methodological point of view, it is necessarily more descriptive than analytical. The size of the sample, in fact, while often representing the whole population, is too small to find statistically significant correlations. It is meant as the basis for future studies, to create the conditions for proper discussion for a procedure whose real weight is often merely imagined, rather than known.

CHARACTERISCS OF GROUPS INVOLVED

After Act 270/1999 was approved and up to November 2008, 57 groups for a total of 183 companies filed for EA.

Table 1- EA Admission Over Time

A- Year by year

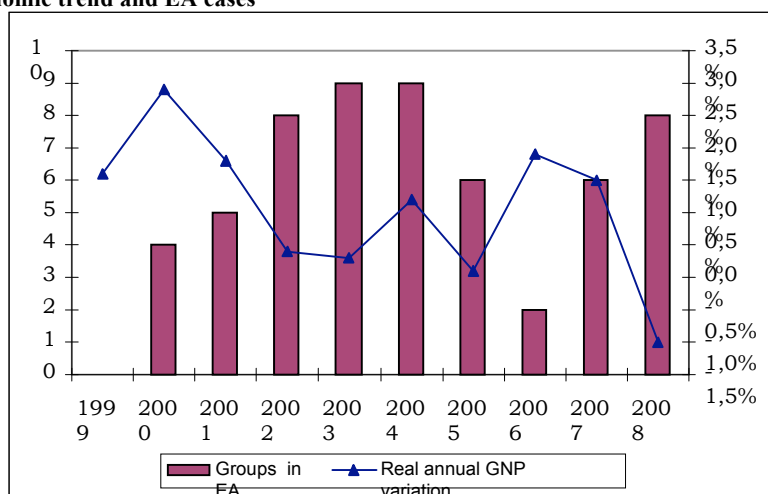

Year	Groups	Companies		Groups	Companies
1999	0	0	2004	9	29
2000	4	20	2005	6	11

2001	5	18	2006	2	13
2002	8	13	2007	6	17
2003	9	40	2008 (up to Novembre)	8	22
Total	57	183			

Source: Ministry of Industry data

Most admissions took place between 2003-2005 (42% for groups and 44% for single companies).. The frequency appears linked to the general economic trend: the increase in the number of cases filed followed the downturn of the economy, with the usual delay as illustrated below. Vice versa, there were just a few cases during the expansive phase of the cycle. Figure 1 illustrates the existing relationship between the dynamic of the real GNP and the number of cases filed. In light of the present significant crisis, a great increase in the phenomenon in the near future is expected.

Figure 1: The economic trend and EA cases

Source: Ministry of Finance and Ministry of Industry data

Following the national economic trends, a larger number of groups filed for EA during the last decade. Fewer companies filed between 1999-2008 (183 against 229), but more groups were involved (57 against 25). This can be explained in light of the following elements introduced by the new law (Danovi, 2003, 71):

- lowering the dimension required to file for EA led to filing by smaller groups;
- greater access selectivity, i.e. only for recoverable companies as well as the removal of automatic extension to all other distressed companies within the group.

Analysis of the sectorial distribution shows how the phenomenon affects the engineering, textile, commercial and distribution sectors. The high incidence of significant difficulties in the engineering field is due to the stagnation of 2007-2008. The textile sector also made widespread use of EA, particularly in 2006-2008. There is a correlation between the incidence and the economic sector trends, which experienced severe structural crises in the last years.

The entity of the crisis that has hit the industrial sector and the importance of EA is also illustrated in the Report on the State of Industry (Ministry of Industry & IPI 2003), which discusses crisis situations between 2002 and 2003. EA seems to be a solution to company crises, especially in industrial sectors.

Table 2 - Sectorial subdivision of the groups in EA

Sector	Total 2000-2008		2000-2002		2003-2005		2006-2008	
	Count	%	Count	%	Count	%	Count	%
Food	2	3.51%	1	5.88%	1	4.17%	0	0.00%
Textiles and clothing	9	15.79%	2	11.76%	3	12.50%	4	25.00%
Paper and Publishing	3	5.26%	2	11.76%	1	4.17%	0	0.00%
Chemical	1	1.75%	1	5.88%	0	0.00%	0	0.00%
Commerce and distribution	6	10.53%	1	5.88%	4	16.67%	1	6.25%
Construction	4	7.02%	2	11.76%	1	4.17%	1	6.25%
Engineering	15	26.32%	4	23.53%	5	20.83%	6	37.50%

Electronics	3	5.26%	0	0.00%	3	12.50%	0	0.00%
Steel and Metallurgy	4	7.02%	3	17.65%	0	0.00%	1	6.25%
Plant Design	1	1.75%	1	5.88%	0	0.00%	0	0.00%
Transport	2	3.51%	0	0.00%	1	4.17%	1	6.25%
Telecommunications	4	7.02%	0	0.00%	4	16.67%	0	0.00%
Services	3	5.26%	0	0.00%	1	4.17%	2	12.50%
Total	57	100.00%	17	100.00%	24	100.00%	16	100.00%

Source: data from various files and from Mediobanca, 2000-2008

The size of groups involved can be evaluated from the number of employees (Table 4), the first requirement for access to the procedure or, for a smaller sample, from the company turnover (Table 3).

Table 3 - The turnover of companies which accessed EA

Turnover (millions of Euro)	Count	%
more than 200	4	26.67%
from 100 to 200	5	33.33%
from 50 to 100	4	26.67%
less than 50	2	13.33%
Total	15	100.00%

Source: Mediobanca, 2000-2008

About a third (33%) of the companies included in the sample had a turnover between 100 and 200 million Euro. A significant percentage (more than 26%) had a turnover between 50 and 100 million Euro or over 200 million Euro. The other companies do not exceed 50 million. Within four listed companies that filed for EA only one had a turnover of over 200 million Euro and this can be interpreted under a double profile: on the one hand, it is possible that the listed companies, since they are subject to greater controls, file more rarely; on the other hand, there is a sort of self-exclusion from the sample. Since 2003 the largest listed companies can file more easily for the new version of the law (under Act 39/2004), not included in our sample.

Table 4- The size of groups based on the number of employees

Employees	Entire period 2000-2008		2000-2002		2003-2005		2006-2008	
	Count	%	Count.	%	Count.	%	Count.	%
between 1000 and 2000	5	8.77%	1	5.88%	1	4.17%	3	17.65%
between 500 and 1000	11	19.30%	2	11.76%	7	29.17%	2	11.76%
less than 500	41	71.93%	14	82.35%	16	66.67%	11	64.71%
Total	57	100.00%	17	100.00%	24	100.00%	16	94.12%
<i>Average and median employees per group</i>								
Average	444		358		469		499	
Median	324		265		352		365	

Source: Ministry of Industry data

In all, 25,308 workers were employed by companies that filed for EA between 2000 and 2008. More than half of the groups had fewer than 500 employees and during the first three years (2000-2002), almost all had fewer than 1000 employees. From 2003-2005, even though the majority of cases regarded companies with fewer than 500 employees, there was an increase in cases which involved groups between 1000 and 2000 employees. This is linked to the general crisis in labour intensive sectors (see Table 2). The smaller number of large groups is due to the fact that since 2003 these crises have been dealt with using EA in accordance with Law 39/2004, not included in our sample.

As the median data in 2000-2002 is under 300 employees, many groups would not have been able to access EA because of the size limit under the previous Law 95/1979 that required more than 300 workers. Compared with previous data (Floreani,1997), the dimension of the groups involved under the new regulations is much smaller, suggesting that the renewed procedure involved medium-large sized companies.

CAUSES OF CRISIS AND THE SITUATION AT FILING

Once the state of insolvency has been declared by the Court, the observation phase of the procedure begins, aimed at verifying whether there are the conditions for restructuring.

Table 5 illustrates the main causes of the crises as singled out in administrator reports regarding a sample of 22 companies, the largest industrial holdings (subsidiaries are not considered).

Table 5 - The main cause of the crisis.

Factors of the crisis	Count	%
Strategic errors	6	27.27%
Overcapacity/rigidity	5	22.73%
Decline of product/market/technology combination	4	18.18%
Financial and asset imbalance	7	31.82%
Total	22	100.00%

Source: Administrator reports

According to the administrator reports, the reasons for the crisis are as follows:

- strategic errors, due to acquisition or investment operations without appropriate financial planning;
- rigid conditions in the production structure, due to prediction errors which have led to an excessive production capacity. This condition generates fixed costs that are not in proportion to the turnover, with the consequent lowering of operational margins and cash flows;
- decline of the product-market-technology: errors in the market choice, loss of brand image, bad product mix, lack of distribution channels. These errors result in lower competitiveness and consequently in the loss of company market quotas;
- financial imbalances, due to excessive leverage, lack of correlation between sources and uses of funds and insufficient liquidity.

The causes listed above refer to internal company factors, as stated in Italian economic literature (Brugger, 1984; Guatri, 1995). Sometimes the crisis originates from external factors, which management wasn't able to or didn't wish to face, like market globalization, economic cycle trends and changes in consumer behaviour. In many cases, before filing, companies unsuccessfully tried to negotiate a financial settlement through a workout or a preventive creditors' settlement.

Data show a generalized delay in filing. This happens especially when entrepreneurs are unwilling to give up management and leads to a higher percentage of debts on the total assets of the company.

The lateness of many insolvency claims is shown by the balance figures for a sample of 54 companies, for which financial statements at the date of filing were available.

Table 6 – Percentage of assets vs. debts when EA is filed

	Sample 2000- 2008	Sub-sample Companies' balance sheet data	Administrators' data
Average	55.43%	66.62%	36.46%
Median	50.65%	75.55%	40.09%
Count	54	16	16

Source: Company financial statements and administrator reports

Net assets vs. the total debt ratio, which approximates the likelihood of satisfying creditors, seems to be almost half but, for a smaller sample of 16 companies in which comparison is possible, administrator-reviewed data show completely different figures from the company balance sheets (Table 6).

Company financial statements overestimate the asset value by about 30%. This is due to the habit of window dressing (when not falsifying) figures during the period of decline.

MANAGEMENT AND LIQUIDATION PHASE

If the administrator report states that there is a real possibility for recovery, the second phase of the procedure starts with a Court Order. During this phase, EA can be extended to other insolvent companies within the group. In our sample this happened 33 times, involving 126 companies.

About 23% of the group companies in EA were considered recoverable, while the other 77% was attracted by virtue of the opportunity for unified management of insolvency. The significant number of companies admitted due to unified insolvency management is a result of the articulation of industrial groups which include various financial companies without productive activities, for which there is no foreseeable reallocation in the market. Considering the total number of companies (183 units), 47% of them presented the conditions for economic recovery. 53% of the companies in the group do not appear to be recoverable, and are thus destined to be liquidated. For companies with the possibility for recovery (86 as shown above), the appropriate program was adopted.

Table 7 - Types of authorized programs

Types of programs	Sample 2000-2008			
	2000-2002	2003-2005	Sub-samples	
			2003-2005	2006-2008
Sale programs	76	27	31	18
Restructuring programs	3	0	3	0
Unavailable data	7	0	0	7
Count	86	27	34	25

Source: Ministry of Industry data

The recovery was carried out almost exclusively through sale programs. Only one group (Arquati) really turned around in 2005, through an agreement with creditors. This evidence is due to the fact that the choice to recover is obviously more complex than simply a sale of the factories. In fact, a stand-alone recovery process necessitates the continuation of the activities while a buyer is sought for the company facilities. Perhaps the EA procedure lacks appropriate tools to implement economic and financial restructuring, while the new version under Law 39/2004 seems to be better equipped to reach this goal.

The Judiciary Authority is granted the power to convert the procedure into bankruptcy when it cannot be successfully followed through or when the program has not been carried out according to the terms set out. This provides greater protection for creditors. This aspect has been evaluated for a sample of companies (see Table 8) and either leads to: a) a physiological result: the sale of the company or the turnaround; b) a pathological result: the declaration of bankruptcy.

Table 8 -Result of the execution of the program

Result	Sample		Subsample					
			2000/2002		2003/2005		2006/2008	
Sale of the company	53	61.63%	23	85.19%	27	79.41%	3	12.00%
Restructuring	6	6.98%	2	7.41%	4	11.76%	0	0.00%
Bankruptcy	4	4.65%	2	7.41%	2	5.88%	0	0.00%
in progress up to Nov. 2008	23	26.74%	0	0.00%	1	2.94%	22	88.00%
Count	86	100.00%	27	100.00%	34	100.00%	25	100.00%

Source: Ministry of Industry data

In the majority of cases the execution of the program led to the sale with the total liquidation of the company. The only recovery from 2003-2005 was for the already mentioned companies in the Arquati group, which underwent economic and financial restructuring.

Bankruptcy was declared in 4 cases: in one case for one of two branches of a company, in another for the only company it was not possible to sell, despite the sale of the group. The other bankrupt companies belonged to two groups which, during the recovery phase, were evaluated to not have concrete perspectives for restructuring.

The objective to safeguard employment has generally been achieved in cases where the greatest number of employees were transferred with the company to other entrepreneurs. Out of 55 recoverable companies which completed the program, 49 companies transferred the employees according to the table below:

Table 9 -Employees transferred with their companies

Period	Companies	Employees	Transferred employees	%
2000-2002	24	6575	3875	58.94%
2003-2005	23	10352	4713	45.53%

Subtotal	47	16927	8588	50.74%
2006-2008	2	865	666	n.s.
Total (surveyed)	49	17792	9254	52.01%
Not surveyed	6			
Total programs concluded	55			

Source: Ministry of Industry data

The total number of employees at filing in the groups examined was 17,192, of which 9,254 were transferred with the sale of the companies while 4,359 remained in charge of the procedure. The other employees found a different collocation during the initial phase of EA.

The liquidation phase characterizes only those EA procedures involved in a sale program. During this phase, besides following up the sale of the company, cash is returned to creditors.

Table 10 illustrates closed procedures and their duration (not including companies that went bankrupt).

Table 10 - Closed procedures and their duration

	Closed	Open	% Closed	Duration (in years)	
				Average	Median
2000-2002	6	43	12.24%	4.52	4.67
2003-2005	5	67	6.94%	1.98	1.98
2006-2008	0	52	0.00%		
Count	11	162	6.36%	3.36	1.98

Source: Ministry of Industry data

Of all the cases filed between 2000 and 2008, only 11 completed the liquidation phase with an average duration of 3.36 years. During both the first and second periods there were cases which ended with creditors' settlements (see Table 11), so the average duration was lower.

In fact, considering that less than 13% of the procedures initiated in 2000-2002 were completed by 2008, the other 87% will last more than 6 years. The liquidation phase lengthens the total duration, bringing it close to the 9-year period seen for bankruptcy procedures in recent times.

Such a time frame, if it should continue over the next years, would constitute a serious disadvantage for creditors, who have already been relegated a marginal role in EA, besides making the procedure more onerous but the average timespan is shorter than the one for procedures under Act 95/1979 (Floreani, 1997).

There are 4 ways EA can end: the lack of passivity (that never occurs), recovery, settlement with creditors, debt payment (even in percentage). Table 11 shows the closures for each of the 11 completed procedures.

Table 11 - Closures for the procedure

Closures for the procedure	Count	%
Creditors settlement	8	72.73%
Partial debt payment	3	27.27%
Total completed procedures	11	100.00%

Source: Ministry of Industry Data

About 73% of the procedures ended with a creditors' settlement, while the remaining 27% paid a percentage of the debts. In the cases considered, the creditors' settlement was chosen by large companies with the chance to restructure, while ending the procedure due to percentage debt payment regarded smaller companies under EA for group reasons.

CONCLUSIONS

During the period 1999-2008, a total of 57 groups (186 companies) filed for EA. If this data is compared to cases filed under the previous Law between 1989 and 1998 (25 groups with 225 companies), access to EA is more than double. This can only be partially blamed on the diverse economic trends during the two time periods studied.

The dimension of the phenomenon is even larger considering that 8 other large groups made up of 130 companies filed for EA under the Act 39/2004 version. The average dimension of the groups is far lower

with respect to those filed under the previous regulations. Roughly 72% of the companies have fewer than 500 employees and the average number of employees per group is 444.

If we consider that 26 of the 57 cases filed involve companies with fewer than 300 employees (the minimum required by Act 95/1979), the increase of eligible companies, thanks to the new law, is evident.

The distribution analysis of EA cases over time confirms the close link between this management tool and insolvency situations together with the trend of the economy. 42% of the cases, in fact, were filed between 2003-2005, and 15% in 2008, periods characterized by the worst variations of the real GDP in the decade.

The spreading of the phenomenon seems to be linked to trends in specific economic sectors (engineering, textile, distribution) which showed signs of weakness throughout the period, and resorting to EA was a last attempt in order to preserve existing production capacities and protect employment levels.

These two aspects seem to confirm the growing importance that EA has taken on as a tool of political economy.

The causes of bankruptcy were investigated for a few companies. Court documents show that the main causes of bankruptcy were strategic management errors (mistaken acquisitions, activation of new markets without adequate production and financial planning), decline in the market-technology combination due to a delay in the perception of the market and the sector, greater production supply with respect to the demand because of not reaching the required targets. These factors, if not dealt with in a timely manner, seriously altered the income capacity of the company, feeding into a progressive financial imbalance. The causes for the crisis were not sudden, as can be seen in the financial statements of these companies in the years preceding filing. The situation of the companies when EA was put into effect is the result of a progressive degeneration of the economic-financial structure of the company.

This situation was examined in light of the total profit/debt proportion (which approximates the capacity to satisfy company creditors) in a sample of 54 companies from 18 groups. The result shows high indebtedness (the proportion is about 55%), close to figures for companies which filed for EA before the new Law (about 58%; see Floreani, 1997).

If we consider the filing costs and the fact that among creditors 31% were secured creditors (often mortgages), the possibility to satisfy the unsecured creditors decreases significantly.

The delay with which the state of insolvency is declared will last as long as this serious problem is not recognized in time, both by the entrepreneur and the creditors.

Regarding the recovery phase, only 86 of the 183 companies involved were deemed to be recoverable and placed in a sale and/or a restructuring program, while the others were simply destined to be liquidated. This is a positive result, which means greater rapidity and facilitates the process, resulting in lower direct costs.

The analysis of administrator programs shows the generalized tendency towards sale for companies (in the sample studied, there were only 3 restructuring programs, all for companies belonging to the same group). Thus it seems that the new law is more concentrated on recovering entrepreneurial activities through the sale of companies and not on true restructuring. This seems correlated to the short timespan for carrying out the process, as well as the excessive indebtedness of companies which file for EA.

Continuation of company activities and the consequent sale of the company is aimed at safeguarding employment levels. In a sample of 49 companies which completed the program, at the beginning there were 17,792 employees. Following the sale of the company, the transferred employees were 52.01% of the total, and 24.50% of them were still employed by the company until liquidation. The remaining 23.49% were no longer employed, having found other alternatives. These results are better than those for the period 1989-1998 under the previous legislation.

As far as regards the liquidation phase, the analysis was carried out for only 11 companies, the only ones which had completed this phase (8 cases of creditors' settlements and 3 for final partial debt payment). The average duration for the liquidation phase in these cases was 3.36 years, an encouraging result, influenced by 8 cases which ended with creditors' settlements. If we consider that 87% of the cases filed in 2000-2003 are still in progress, we can say that the liquidation phase lasts longer than 6 years. This is close to the time period ascertained for bankruptcy procedures in Italy.

Because of the statistical limits, this analysis must be considered as an initial survey and the basis for future studies, but we hope it sheds light on a procedure whose real economic weight is often merely imagined, rather than known.

METHODOLOGICAL APPENDIX

The aim of the present study was to supply initial empirical evidence regarding how EA was carried out since its introduction in November 2008 by Act 270/1999. We decided to limit the field of survey to the EA procedures filed under the “Prodi bis” Law, including all the cases filed between 1999-2008. Cases filed under Law 39/2004 (“Marzano Law”) were left out. Our sample is composed of 57 groups and 183 companies. The phenomenon has been analyzed in its *globality* in order to emphasize the following aspects:

- the number of cases filed (Table 1) and the relation to the economic trend (Figure 1) and sectors (Table 2).;
- the relevance of groups which filed for EA, based on the dimension of their economic activity (Table. 3) and the number of employees involved (Table 4);

As far as regards how the cases were handled, we examined representative samples of the phenomenon, based on the possibility to gather informations.. Regarding the diagnostic phase, empirical research was carried out on:

- the causes of the crisis (Table. 5): for 22 groups;
- the asset of the companies when they filed (Table 6): for 54 companies and the comparison between the figures provided by the company and those provided by the administrator (Table 6): for 16 companies

Regarding the management phase, the study focused only on companies “with real possibilities for economic recovery”, since for these companies there is a specific, alternative program designed according to Art. 27, while other companies involved underwent liquidation. The study showed that 86 of the 183 companies which filed for EA met the requirements for recovery, and within this sample the types of programs adopted was examined (Table 7) and the result (Table 8).

companies from 36 groups which completed the sales program offered information on the number of employees transferred (Table 9) for a sample of 49 companies. To homogenize the sample, we decided not to include companies belonging to the Arquati group, under economic and financial restructuring, as well as EA cases which led to bankruptcy.

The results of the data gathered is summarized in the following prospectus.

Prospectus 1 – Sample Composition

GROUPS	Date of the main procedure	Count of companies in EA	Companies which meet ex art.27 requirements	Inclusion in the Mediobanca sample	Causes of the crisis	Situation at the time of filing for EA	Result of commissariale management

IMPACT OF THE GLOBAL CRISIS ON THE GOVERNANCE STRUCTURES OF INTERNATIONAL FINANCIAL INSTITUTIONS

ABSTRACT

The global financial crisis dragged many countries into recession, demonstrated that the international financial system has structural problems and started discussions about restructuring of the international financial institutions. The main objective of this paper is to investigate the impact of the global financial crisis on the governance structures of the international financial institutions. To this end, studies made at different international platforms were evaluated. The debates and negotiations among the developed and developing countries about governance structures of the international financial institutions were analyzed. Developing countries' demand to reform the decision-making mechanisms of the Bretton Woods institutions, the IMF and the World Bank and developed countries' reservations were investigated. It was concluded that the new shape of the international financial architecture and governance structures of international financial institutions will depend on international politics as well as the evolution of the global crisis and the economic dynamics. It is anticipated that the restructuring process will proceed slowly because of the complex relations between the international financial system and the international politics.

Keywords: Governance structures, international financial institutions, global crisis, international politics

INTRODUCTION

At the Bretton Woods Conferences in 1944, international monetary system was determined as adjustable peg system tied to the U.S. dollar and gold, the IMF and the World Bank were established, and the Bretton Woods System was constituted. After the collapse of the Bretton Woods System in 1971; volatility in exchange rates, technological innovation, which has accelerated economic integration through virtual and physical time-space compression (Harvey, 1989), and financial liberalization reforms, which led to an increase in levels of capital account openness and financial openness, (Walter and Sen, 2008: 122) increased and accelerated international capital movements and many developed and developing countries entered into financial crises.

The global financial crisis, which started in the U.S., is the last and the largest of these crises. Because of the degree of globalization in financial markets, global crisis quickly spread to other countries. (Yunus, 2009: 6) The globalization of capital has been an integral part of the scale of the financial crisis. (Legg and Harris, 2009: 369) The global crisis started discussions about the restructuring of the international financial system. Some scholars argue that significant transnational regulatory initiatives will advance as a result of the financial crisis. In the contrary, some scholars think the crisis is generating a reassertion of state authority over international financial markets. (Helleiner, 2009a:1) Nonetheless, it is generally accepted that international financial architecture, which is likened to oil in our cars that lubricates the engine of world growth (El-Arian, 2009:88), is far from preventing crises.

The developed countries, particularly the G-7 countries and the developing countries, particularly the BRIC countries (Brazil, Russia, India and China) tried to shape the restructuring process of the international

financial system and the international financial institutions according to their interests. Divergence between the perspectives of developed and developing countries transformed the restructuring process into a political process. It is expected that besides accelerating the restructuring of the international financial system, the financial crisis will have geopolitical reflections (Burrows and Harris, 2009) and the international balance of power will find a new equilibrium because of the crisis. (Germain, 2009)

This paper aims to investigate the impact of the global financial crisis on the governance structures of the international financial institutions within context of international politics. The article proceeds in the following manner. First, impact of the global financial crisis on the restructuring of the international financial system is examined. In the second section, role of the G-20 summits and international politics on the restructuring process is analyzed. In the third section, restructuring of the international financial institutions' governance is evaluated.

THE GLOBAL CRISIS AND THE INTERNATIONAL FINANCIAL SYSTEM

The biggest financial crisis since the Great Depression, which originated in the US and spread quickly to other countries, clearly demonstrated that the U.S. and international financial architecture has structural flaws so that this is not just a crisis in the system, this is a crisis of the system. The crisis was a challenge; the three of the most seemingly effective international institutions (the World Trade Organization, the IMF, and the international network of regulatory agencies) failed to meet. (Zaring, 2010: 475)

Global financial crisis demonstrated that nations are still the most important actors of the international financial system. It was also clearly seen that G-7 countries cannot decide on global economic issues themselves; representation and participation of emerging countries in the decision-taking mechanisms is needed. The crisis moved the center of gravity of the international economy towards emerging countries and the G-20 emerged as the legitimate platform to restructure the international financial architecture in terms of representation, international reserves and economic power. (Bradford, 2009:38) The G-20 countries together represent over 85 percent of world GDP, 80 percent of world trade, and two-thirds of the world's population. (Beeson and Bell, 2009:68) In this connection, creation of the G-20 increases the possibility of effective policy coordination and increase the credibility and legitimacy. (Germain, 2001)

The global crisis also showed that the international financial system has expanded greatly in size, reach and liquidity and gained the potential to drag not only the developing but also the developed countries into crisis. (Wade, 2008) Even if the international institutional framework for international finance is seen as the most sophisticated of the global governance regimes (Kerwer, 2005), the crisis showed that the systemic complexities of the 21st century networks should be better understood. (Schweitzer et al., 2009) The international financial system has become so integrated and the global economy so interdependent that policy coordination at the global level is needed and to do that, international institutions must be reformed in a way that gives greater voice and representation to the emerging countries. (Pisani-Ferry and Santos, 2009:12)

According to the IMF study (2009), synchronized recessions after financial crises tend to be deeper and last longer, which makes coordinated action and cooperation at the global level more urgent. As a result, the global governance concept, which is related to the emerging urgent global problems that cannot be solved by the national instruments of decision making, (Potucek, 2009: 12) is pronounced more and more frequently. It is argued that a comprehensive supervisory and regulatory regime that monitors and assess systemic financial risks stemming from the poor corporate governance, risk-management and management of liquidity risk of all the banks and the shadow financial system should be constructed. Absence of binding international standards to enhance financial transparency and accountability (Abdelal, 2007) is seen as one of the most important factors that intensified the global financial crisis.

It is argued that financial deregulation reforms, which opened up countries to the free flow of capital in and out of them, removed the regulations on financial institutions operating within countries, and removed the political controls from the Central Bank, made the financial sectors of nations parts of the international financial sector and increased countries' vulnerabilities. (Beder, 2009: 18) Nonetheless, there are also views that worldwide drive to regulation is misconceived. (Connolly, 2009:422)

Even if the need for cooperation at the global level was clearly recognized, it was also seen that states are not ready for a global financial regulator and a central bank. In spite of the fact that a supranational regulator and international lender of last resort may be functional to stabilize international financial markets, it is also

accepted that it is not easy to establish these institutions under current circumstances. So, until these kinds of supranational institutions are established, intensifying national regulations, enhancing international cooperation and redesigning the regulatory framework at the national and international levels are seen as short and middle-term options. It is expected that IMF will continue to play the role of “quasi-lender of last resort”.

THE G-20 SUMMITS, INTERNATIONAL POLITICS AND THE RESTRUCTURING PROCESS

As the global crisis deepened in the first quarter of 2009, need for cooperation at the global level was clearly understood. Nevertheless, developed and developing countries, with different points of view about the restructuring process, tried to shape the process according to their interests. The restructuring process turned into a political dispute among the developed and developing countries.

G-20 meetings symbolized the changing balance of power in the international economy. (Bradford, 2009:38) Prior to the crisis, the G-7 summits were platforms where the most important decisions about the international economic order were taken. Nonetheless, the global financial crisis necessitated more participation and representation of the developing countries. G-20 reflected the structural shifts in the system whereby power balances are being altered by the rise of emerging countries, particularly the BRIC countries (Brazil, Russia, India and China). (Armijo, 2007) “The BRIC countries” concept gained a political meaning rather than a just economic term. Putin had mentioned this in his Munich speech in 2007: “There is no reason to doubt that the economic potential of the new centers of global economic growth (the BRICs) will inevitably be converted into political influence and will strengthen multipolarity” (Lukyanov, 2009:130)

G-20 is seen as an important step towards a reformed global economic governance regime. (Schmidt et al., 2009) Nonetheless, it is also argued that since G-20 is merely a gathering of national leaders, not a formally constituted international organization and lacks the capacity to enforce its decisions, it does not result in any fundamental changes to the system. (Buckley, 2010) G-20 is likened to a non executive board of directors for the global system of governance than an executive management committee. (Garrett, 2010: 38) G-20 declarations are also criticized on the basis that no preconditions are defined for more cooperation and no underlying principles are defined. (Graaf and Williams, 2009: 414)

During the initial phases of the crisis, in November 2008, the G-20 countries convened with the agenda of taking measures to prevent the deepening of the crisis. G-20 countries convened again in April 2009 and took important decisions. Finally, at the G-20 meeting in September 2009, the leaders declared that the G-20 became the main platform for international economic cooperation.

G-20 meeting in April 2009 was successful at some extent. Nonetheless, the meeting failed to reform the international financial system because of clash of interests among the Anglo-Saxons, the Europeans and the emerging countries. It is argued that the US blocked the reform of the international financial system and pushed for global fiscal stimulus. The Europeans resisted fiscal stimulus and reform of the IMF and the World Bank since their voting power would be cut to create space for the emerging countries. They shifted the focus from these issues to the regulatory reforms. Meanwhile, emerging countries, particularly BRIC countries stressed the importance of the reform of the international financial and monetary system.

At the end of the summit, it was declared that IMF’s financial resources were increased threefold to \$750 billion, which was seen useful to help stabilize financial sector in troubled regions of the world. (Yunus, 2009:7) Nonetheless, most of this amount consisted of commitments. Only Japan signed a \$100 billion bilateral borrowing agreement with the IMF. The E.U. and the U.S. committed \$100 billion. China pledged to buy \$50 billion IMF bonds denominated in SDRs. Russia, Brazil, South Korea and India also pledged to buy \$10 billion IMF bonds. Canada and Switzerland also committed \$10 billion dollar. Adding commitments of other countries, the total amount amounted to 423 billion dollars by early September. The European Union increased its commitments by 78 billion dollars in September 2009 and in this way the \$500 billion target could be reached before the G-20 summit at the end of the September.

The G-20 meeting in April 2009 was not successful especially from developing countries’ perspectives in terms of reform of the international financial system. Russia voiced its concerns with regards to the problems caused by the dominance of dollar and China, which is expected to provide more resources to the IMF, proposed the reform of the international financial system with specific suggestions; nonetheless G-7 countries simply ignored. (Stewart, 2009) It is argued China pledged to buy only \$50 billion IMF bond rather

than giving long-term loan to give a message that it wants faster reforms in decision-making mechanisms of the IMF. (The Economist, 2009: 79) Other BRIC countries also refused to participate in the New Arrangements to Borrow (NAB) or special arrangements, rather offered to purchase IMF bonds. (Woods, 2010: 59)

Even if fundamental reforms such as the rearrangement the quota system was postponed, some substantial changes were made such as trebling of IMF's financial resources to \$750 billion, a \$250 billion dollar increase in the Special Drawing Rights (SDR), a new facility called Flexible Credit Line (FCL), a change of conditionality that would let borrower countries to keep up social spending during crises, a doubling of the limit on the total amount each member country can borrow, softening of the core conditionality, better surveillance of risks created by individual countries to the international financial system, a change in the selection of managing directors towards merit-based process. (Weissman, 2009:11) Grabel (2010: 12) argues that G-20 representatives gave the IMF pride of place in global efforts to respond to the crisis.

The G-20 countries also agreed to reshape regulatory systems, to extend regulation and oversight to all systemically important financial institutions, instruments and markets. They decided to strengthen international cooperation by establishing the remaining supervisory colleges for significant cross-border firms by June 2009, building in the 28 already in place; by implementing the FSF principles for cross-border crisis management immediately.

Members of the IMF met at the annual IMF meeting in the last week of April and discussed how they will raise the funds that were agreed upon at the G-20 summit. They also discussed the reform of the decision-making mechanisms of the IMF and the World Bank. Developing countries were not convinced that IMF's more powerful countries were serious about ceding any control. They warned that they would not provide financial resources without having more voice in the decision-making process. (Prosser, 2009)

Alexei Kudrin, Russia's finance minister, said at the meeting that, "we already meet a cool attitude and even resistance to reform the IMF. The leading countries are not in a hurry... this was the main discussion, the nerve of the meeting." Brazilian finance minister stated that contributions made by the developing countries would be provisional, meaning that they may be withdrawn if the IMF's decision-making process is not reformed.

From the initial phases of the global crisis, BRIC countries tried to increase their influence in the restructuring process. In March 2009, before the G-20 summit, BRIC countries came together and issued their first communiqué. In this communiqué, they called attention to the reform of the international financial institutions. Taking into consideration the growing weights of the emerging countries in the global economy, they wanted reconsideration of the quotas and voting rights of the IMF and the World Bank. They wanted the reform of the international monetary system. BRIC countries came together again in June and issued another communiqué. Similar to their March communiqué, they called for the reform of the international financial and monetary system. They called for a more diversified monetary system. They also called for a multipolar international system based on international law, equality, mutual respect, cooperation, coordinated action and collective decision-making principles. On June 29, 2009, the United Nations ratified an action plan about the international financial system, according to which the member countries demanded an immediate reform of the Bretton Woods institutions.

BRIC countries continued to criticize the international financial and monetary architecture at other platforms. At the G-8 summit held in July, China repeated its demand for a rational and more diversified international monetary system. Russia also argued that an alternative global reserve currency should be included in the agenda of the G-8 summit.

The United Nations Trade and Development Conference supported BRIC countries' arguments about the international financial and monetary system with a report in September. (UNCTAD, 2009:10-13) According to arguments in report, dollar should be replaced with another international reserve currency issued by an international organization. It was argued that restructuring of the international financial system in this way would eliminate the problem of instability creating capital movements and would decrease speculation. The report specifically emphasized the SDR. It was argued that the SDRs could function as supranational reserve currency. Meanwhile, some scholars argue that since the purchasing power of the SDRs is uncertain and since their liquidity is relatively insufficient, they are not suitable for countries with balance of payments surplus. (McKinnon, 2009:7)

Finance ministers of the BRIC countries came together in September before the G-20 summit, issued a declaration and reiterated their demands about the reform of the international financial and monetary system. They stated that the most serious problem that damages the legitimacy of the IMF and the World Bank is unjust distribution of quotas and voting rights. They demanded a seven percent quota shift from developed countries to developing countries in the IMF and a six percent voting rights shift in the World Bank. They called for a more stable and predictable monetary system. They also demanded a transparent selection process for the IMF and World Bank Presidents based on the merit, not on the nationality.

G-20 summit in September has been a summit, which concrete results emerged from ongoing negotiations and discussions among the developing and developed countries in different platforms since the beginning of the global crisis. The leaders declared that the G-20 has become the main platform of international economic cooperation.

Developing countries', particularly BRIC countries' demands for the reform of the international monetary and financial system were met at some extent. At the G-20 summit, a shift of five percent quota shares from overrepresented developed countries to underrepresented developing countries in the IMF and three percent voting rights shift in the World Bank were agreed upon.

Other important decisions about the international financial system were also taken. The G-20 leaders agreed to launch framework for strong, sustainable, and balanced growth. They agreed to address critical issues such as the size and composition of the Executive Board and ways of enhancing its effectiveness, the Fund Governors' involvement in the strategic oversight of the IMF, enhancing staff diversity and making the appointments of the heads and senior leadership of all international institutions through a transparent, and merit-based process.

The G-20 also agreed to reconsider the regulation system for banks and other financial institutions in a way that prevents excesses that lead to financial crisis, to improve international standards for bank capital, to make necessary arrangements about compensation to end practices that lead to excessive risk-taking, to make the over-the-counter (OTC) derivatives more transparent, to regulate and supervise the hedge funds and credit rating agencies, and to make the regulatory and supervisory arrangements for the systematically important international financial institutions.

At the IMF-World Bank Annual Meetings held in Istanbul in October 2009, decisions that support and complement the decisions taken at the G-20 summit were taken. These "Istanbul Decisions" include:

1. Enlarging the mandate of the IMF in a way that includes all macroeconomic and financial policies, which affect the global stability.
2. Providing insurance to more countries as the lender of last resort by using Flexible Credit Line.
3. To expand the multilateral surveillance authority of the IMF.
4. To shift a quota share of at least five percent from developed countries to developing countries.

RESTRUCTURING THE GOVERNANCE OF THE INTERNATIONAL FINANCIAL INSTITUTIONS

Confidence to the international financial system diminished significantly as a result of the global financial crisis. It is argued that transparency and public accountability of international financial institutions and new complex financial instruments should be augmented to reestablish confidence to the financial system. (Porter, 2009:8)

Since the world is not ready for a brand-new global financial regulator or a central bank after the global crisis, it is estimated that the global financial crisis will possibly lead to the restructuring of the international financial system in a way that enhances IMF's role in the global economy. The decision to increase IMF's financial resources at the G-20 meeting in April 2009 reflects increasing importance of the IMF.

IMF's role was being discussed extensively before the crisis. The Fund was searching for a way to stay in business. (Weissman, 2009:11) The Fund had cut staff by about 13 percent but still faced a \$300 million deficit over the next four years in 2008. (Griesgraber, 2009: 179) There were few countries that had signed stand-by agreements with the IMF in 2000s and it was argued that the Fund could not even find money for its day-to-day activities. Bank of England Governor Mervyn King (2006) had said this: "The Fund's remit is unclear. Its lending activities have waned and its role in the international monetary system is obscure."

The global crisis changed international economic prospect for the IMF fundamentally. It rescued the institution from its increasing irrelevance. (Chorev and Babb, 2009) Nonetheless, to be a legitimate and effective institution, it is argued that reforms must be implemented in four main areas including governance, economic philosophy, IMF staff competencies and substantial increase in financing. (Griesgraber, 2009: 180-183)

The other institution that will probably gain importance is the Financial Stability Forum. The FSF was transformed at the G-20 meeting in April 2009 into the Financial Stability Board. The G20 placed the FSB at the centre of intensified regulatory cooperation. (Arner and Taylor, 2009: 489) It includes all G20 countries, FSF members, Spain and the European Commission. The FSB will collaborate with the IMF to provide early warning of macroeconomic and financial risks and the actions needed to address them. Financial Stability Board was given important roles with regards to the international financial system such as:

- 1) Assessing the weak points of the financial system and identifying the steps to address them. Facilitating and enhancing co-ordination among the authorities responsible for the financial stability.
- 2) Providing the regulatory policy recommendations about the market developments and their implications.
- 3) Monitoring and assessing the practice of regulatory standards. Monitoring the policy development work of International Standard Setting Bodies and ensuring that their work is coordinated and focused on priorities and addressing gaps.
- 4) Promoting contingency planning for cross-border systemic crisis management. Conducting Early Warning Exercises in collaboration with IMF to identify the buildup of macroeconomic and financial risks.
- 5) Establishing a supervisory college to monitor the systematically important international financial firms. Overseeing all systemically important financial institutions, instruments and markets including the hedge funds, which will have to register and report their strategy, debt and risk levels.
- 6) Establishing a clearing house, through which credit derivatives, whose value is derived from an underlying asset, will be cleared.

It is expected that FSB will have an important role in the restructuring process of the international financial system and will function like a global financial regulator.

Decision-making mechanisms of the international financial institutions such as IMF and World Bank are among the most critical and controversial issues of the restructuring process. Developing countries demand larger quota shares and voting rights arguing that they are under-represented.

The U.S. has 17,09 percent quota share in the IMF. This gives the US the veto power over crucial decisions since a majority of 85 percent is required. The European Union countries have 32,09 percent quota share while China has 3,72 percent, Russia 2,73 percent, India 1,91 percent and Brazil 1,4 percent. According to experts, the recalculating quota is very slow because of political dynamics. It took very long negotiations for China to be awarded a "special" quota increase when it reabsorbed Hong Kong. In 2008, Board of Governors agreed to a process of change of quotas in small magnitudes. According to the agreement, US's quotas would eventually reduce to 16,73 percent, while China's quota would increase to 3,81, India's to 2,34 and Russia's to 2,39.

Especially in recent decades, there has been a shift in the international economic balance of power towards east. This shift was not reflected in the quota shares and the voting rights of the IMF and the World Bank, which limited China's contribution to the new financial resources for the IMF. It is argued that China has pledged to buy only \$50 billion IMF bonds since its calls for greater representation were not met. It is also argued that China preferred to buy IMF bonds rather than providing long-term financial sources to IMF to show that it wants acceleration of the restructuring process of decision-taking mechanisms of the IMF and the World Bank. (The Economist, 2009: 79) In this connection, an expanded role for China in multilateral financial institutions is seen helpful for China's cooperation with regards to the global financial crisis. (Prasad, 2009:233)

IMF's functions were determined in the Bretton Woods Articles of Agreement in 1944 and they were in harmony with the post-war conditions and with the preferences of the politically strongest countries, the US and the UK. (Helleiner, 2009b: 191) Its functions started to change in 1970s with the transformation of the international financial system. The US suspended the convertibility of the dollar to gold and the Bretton Woods system collapsed. Technological developments, increasing mobility of capital, financial liberalization and deregulation gave the capital movements the potential to drag countries into financial instabilities and crises. IMF's main function transformed from providing balance of payments support to liquidity crisis

management. IMF signed agreements with many countries most of which were not successful. It was particularly criticized for its policies after the Asian crises in 1997-98. In the first years of the 21st century, IMF's role seemed to diminish as less and less countries signed agreements with IMF.

The global financial crisis changed this picture totally. IMF became almost the most important international institution of the international economy. IMF's financial resources were increased to \$750 billion. New facilities such as Short-term Liquidity Facility (SLF), which provide more flexibility, were created. With Short-Term Liquidity Facility (SLF), IMF will be able to channel funds quickly to eligible emerging markets with sound policies and sustainable debt burdens. It is expected that as IMF's effectiveness and influence in the international economy increase, reform of its decision-taking mechanism will be a more important issue.

Appointment process of the IMF and World Bank Presidents is criticized. It is argued that the IMF and World Bank Presidents are selected according to an informal agreement among the U.S. and the West European countries and as a consequence, all of the ten IMF Presidents since the establishment of both institutions were West European nationals while all of the eleven World Bank Presidents were U.S. nationals. (Cogan, 2009: 209)

A critical issue with regards to the governance of IMF is the degree of control of the staff and management by the Executive Board. There may sometimes be conflicts of interest between the staff focusing on global public goods and the Executive Board that is controlled politically by member states, particularly ones with the larger quotas. It is argued that if there is no change in the structure of the executive board, the Fund's effectiveness in providing a high-level forum for international economic cooperation will decrease. (Thimann, Just and Ritter, 2009: 188)

CONCLUSION

The global financial crisis demonstrated that the international financial architecture has structural flaws. From the beginning of the crisis, debates and negotiations about restructuring of the international financial system and the governance of the international financial institutions continued in different platforms. Since the international financial system is a complex system which consists of various institutions, rules and regulations; it is expected that the restructuring process will be a slow process.

Apart from the difficulties of the restructuring process stemming from economic factors and the complexity of the international financial system, there are also political dynamics that affect, slow down and harden the process. Developing and developed countries have different perspectives and different political concerns about the governance structures of international financial institutions. Developing countries want the reform of the decision-making mechanisms of the IMF and World Bank in a way that increases the quota shares and voting rights of the developing countries.

Negotiations and debates among the developed countries, particularly the G-7 countries and the developing countries, particularly the BRIC countries continued in different platforms since the beginning of the global financial crisis. Political agendas shaped the restructuring process as much as the economic concerns. The result was that along with the regulatory reforms, reforms about the decision-making process of the IMF and the World Bank were made in a way that gives more voice to the developing countries in the international financial institutions.

It is expected that developed countries will try to slow down the restructuring process since their control on the decision-making processes of the IMF and the World Bank provides them various economic and political advantages. Nonetheless, since they also recognize that international economic balance of power has changed in recent decades, they may accept some transfer of control. Decisions taken at the G-20 summit in September 2009, according to which IMF quota shares and World Bank voting rights will be transferred from developed countries to developing countries, can be seen as a first step towards greater role of developing countries in the international financial system.

Meanwhile, the developing countries, particularly the BRIC countries, will probably press for faster reforms in the decision-taking mechanisms of the IMF and the World Bank. They will try to increase the amount of IMF quota shares and the World Bank voting rights that will be transferred to them. It is anticipated that the restructuring process will proceed slowly because of the complex relations between the international financial system and the international politics.

ABSTRACT

The strategic management for human resources plays an important role on the precaution and exceeding of the crisis. Apart from this, with the help of successful crisis managements, the crisis facilitates the exposition of the organization's strong and weak points and the reconstruction of the organization itself. Many large organizations have highly developed crisis management plans and teams that are ready and rehearsed for crises. On the other hand, majority of the small businesses believe that crisis preparations are less important. The latest global crisis, unlike its progress in the world, affected small-scale and relatively weak firms instead of banking sector in Turkey (Alptekin, 2009:5). As a natural consequence of it, SMEs operating in Malatya were also affected negatively and faced with losses. However, whether SMEs operating in Malatya tried to find the right, optimal size and benefited from rightsizing with a systematic strategic human resource management approach during the global recession period is unknown. For this reason, it is aimed to investigate the rightsizing skills of SMEs operating in Malatya.

Keywords: crisis, rightsizing, SMEs

INTRODUCTION

Globalization, knowledge-based economy, fierce competition and rapidly changing technologies increased the importance of the human resources significantly. In today's highly competitive work environment, it is vital for firms to approach human resources as a strategic success component and competition superiority factor. A broader and strategic approach that is beyond classical human resources management is necessary for success (Niehaus, 1995:55). This broader and strategic approach to human resources refers to the strategic role which is integrated to the organization, spreading its vision, mission and all goals to the all units of the company (Wright, 1992:297). Rather than an activity relegated to human resource staff (Taylor, 1996:970), it is necessary for firms to consider human resources as a strategic source of value which creates a competitive advantage in the market. In today's knowledge-based economy, the success of a company depends on accepting the human resource functions as a strategic partner in the formulation of the company's strategies as well as in implementation of those strategies (Tyson, 2001:80).

Competition, lost market share and lowered profit margins are the realities of today's business environment. To survive and outperform in existing conditions, firms need to benefit from their human resources with a systematic strategic approach (Allen, 1997:34-42). As one of the systematic strategic approaches, rightsizing is rethinking and reorganizing to find the optimum size with respect to the existing both internal and external conditions by eliminating unnecessary jobs and improving core activities (Walker, 2003:1). Unlike downsizing, it is a broader strategic approach oriented towards reshaping the organization and involves processes which take both human and financial resources into account at the same time in a frame of strategic plan. In this period, functions may be eliminated, labor force may be reduced or employees may be positioned horizontally in different areas.

The need of reorganization of human resources becomes apparent by the crisis. The crisis facilitates the exposition of the organization's strong and weak points and the reconstruction of the organization itself revealing a reorganization opportunity for the strategic management of human resources in the organizations. The most affected component from the crisis process is human resources. After all, the most powerful weapon for to fight crisis is also human resources.

Many large organizations have highly developed crisis management plans and teams that are ready and rehearsed for crises. On the other hand, majority of the small businesses believe that crisis preparations are less important. Many small organizations have the mentality that 'crises don't happen in our industry/field' or 'we have a well-managed business and could manage our way through a crisis without a plan'. They assume that crisis events only happen to other organizations or that they are somehow protected from destructive effects of crises (Bozkurt, 2009:64-65)

Today, SMEs account for %95 of total number of firms in global economy providing %66 of employment. In Turkey, %99 of the firms is SMEs constituting %46 of aggregate employment (Spillan and Hough, 2003:398-407). Regarding to the importance of SMEs as stimulators of employment, investment and aggregate production in one economy and the fact of their inadequacy in crisis planning; SMEs are selected to be studied on. SMEs operating in Malatya are dynamic units of Malatya stimulating city economy considerably. To illustrate, in the last five months of '09 Malatya came first in Eastern Anatolia accounting for 25 percent of the total number of SMEs getting investment incentive certificate in the region. Therefore, the field of the study is selected as those SMEs and the survey is conducted on them.

The latest global crisis, unlike its progress in the world, affected small-scale and relatively weak firms instead of banking sector in Turkey (Alptekin, 2009:5). As a natural consequence of it, SMEs operating in Malatya were also affected negatively and faced with losses. However, whether SMEs operating in Malatya tried to find the right, optimal size and benefited from rightsizing with a systematic strategic human resource management approach the global recession period is unknown. For this reason, the aim of the study is determined as to investigate the rightsizing skills of SMEs operating in Malatya.

LITERATURE REVIEW

Crisis Management

One of the most significant characteristics of modern times is the existence of crises (Israel, 2007:807-823). Crises are unexpected events in an organization's life which represents a significant threat to its high priority values and demands a time-pressured response. Crises cause firms to face with risks, difficulties, uncertainties and chaotic situations and should be handled seriously. Since crises differentiate in terms of their scope and impacts crises are one of the difficult concepts to be identified in management science (Demirci, 2009:89). Generally speaking, crises can be defined as triggering events which are so significant that they challenge the existing structure, routine operations or survival of the organization (Phelps, 1986:5). Crisis is a chain of sudden and unexpected happenings that is difficult to get under control (Caponigra, 2000:5). Moreover, crises can be described as sudden challenges which test the organization's ability to cope posing threats to the viability of organizations (Kuklan, 1988:21).

When written in Chinese, the word crisis is composed of two characters. One represents danger and the other represents opportunity. Crisis that threatens the existence of organizations also creates unexpected opportunities at the same time. An effective crisis management can convert that opportunities to success stories. With the help of successful managements, the crisis facilitates the exposition of the organization's strong and weak points and the reconstruction of the organization itself (Anderson, 2006:1290-1297). Since crises, regardless of its origin, are one of the realities in today's business environment coming suddenly with destructive effects on firms successful crisis management becomes more important for firms to survive and outperform in uncertain and dynamic market conditions (Bozkurt, 2009:78).

Crisis management can be defined as the management of processes such as taking first signs of crisis, preparations and preventions, removing the loss, improving the organizational structure, learning and determining the affirmative sides of crisis (Wojcik, 260). It is a dynamic and continuous process composed of both reactive and proactive activities and requires identifying the signs, taking measures and developing

responses to crisis (Öcal, 2006:1498-1503). According to Finsk, crisis management is the art of removing risk and uncertainty to gain more control on external factors (Wang, Hutchins and Garavan, 2009:22-53).

The current literature on crisis management focuses on general prescriptive models providing general guidelines for coping with depression periods. There are also descriptive models which categorize business crises. For example, Lerbinger (1997) categorizes crises according to the distinction between external and internal factors and lists different types of crisis. Another stream of research focuses on historical perspective (Fink, 1986:15).

According to Shrivastava, there are four points in crisis management to be taken into account; causes, measures, solutions and results. Causes are the reasons leading to crisis and measures refer to the sum of proactive actions aiming to minimize the negative sides of crisis. Solutions indicate reactive activities which are put into force by management during the time of crisis and finally results are temporary or permanent impacts left from crisis (Kuklan, 1988:21). According to Pearson and Clair, there are four steps in crisis management. These are identifying the early signals of crisis, preparing the emergency plan, implementing the strategies and finally operations for recovery after crisis (Liua, Chang and Zhao, 2009:232-239).

In crisis management process, planning step is important. The old adage states, 'if you fail to plan, you plan to fail'. Clearly, planning is a primary key to success. Not only businesses should plan for positive events, such as new products or factory expansions but they also must plan for adversity situations like crises (Anderson, 2006:1290-1297). Majority of large organizations have highly developed crisis management plans and teams that are ready for crises. On the other hand, small businesses, generally defined as those having fewer than 500 employees, believe that crisis planning is less important. Many small organizations have the mentality that 'crises don't happen in our industry/field' or 'we have a well-managed business and could manage our way through a crisis without a plan'. They assume that crisis events only happen to other organizations or that they are somehow protected from crisis (Spillan and Hough, 2003:398-407). SMEs, as dynamic units of a national economy, contribute to both economic and social systems respectably and are the driving forces behind the strong, dynamic economies. Becoming more important in recent years, SMEs stimulate the market contributing to employment, investment and aggregate production in one economy. For this reason, crisis management is more important especially for SMEs most of which are generally managed by its owners unlike the big, financially strong firms in which generally crisis management processes are handled in separate departments or public relation agencies

Effective crisis management means that top management must manage the impact of the crisis on various sections of the organization, such as information systems, operations and human resources. With respect to human resources, management must be mindful that its employees may experience considerable personal loss in such times and that there may be a decline in their performance. Moreover, employees may be working in conditions of greater levels of stress. Stress appearing during depression periods increases when informational certainty is low, the size and scale of the events seems overwhelming, and executives, managers and even team leaders show little support during the time period of crisis (Wang, Hutchins and Garavan, 2009:22-53)

Firms are integrated not only with their subsystems but also with their environment. Crises, as one of the important issues occurred in the external environment cause firms to face with risks, difficulties, uncertainties and chaotic situations and should be handled seriously. Firms which are lack of crisis management skills and incompetent in reacting properly experience the destructive effects of crises and the existence of firms goes under risk (Sevim, 2009:147). Firms generally go into crisis since they fail to make preparations before crisis and develop appropriate strategies in different managerial levels. To cope with crises, the success of a firm depends on developing a long-run point of view, identifying signs of crisis before it occurs, taking appropriate measures and putting emergency plans into action.

Rightsizing

During the decades of the 1950s, 1960s, and 1970s, corporations expanded by providing new jobs and opportunities. With the beginning of the 1980s, conditions for growth were no longer appropriate and companies needed for a leaner workforce by cutting their staff. Because of competitive pressures around the world, firms tried to cut costs, restructure and reduce their labour force. As a result, the concept of "downsizing" became popular since then (Zeinab, 1999:175). While employee reductions were utilized mainly in response to crises prior to the mid-1980s, downsizing developed into a managerial strategy for most of the companies after mid-1980s (Gandolfi, 2009:3-14). One of the reasons for the continuing

popularity of downsizing practice as a managerial strategy was the accelerating impact of information and communication technology all over the world (Whymark, 1998:158-162)

The first few years of the 1990s were years of trying to find the best way to survive. Words like downsizing, rightsizing, restructuring, management by objectives, diversification, zero-based budgeting, matrix management, re-engineering, and realignment became popular presenting various approaches. They all meant, to some degree, the same thing: getting more done with fewer people. Downsizing came first meaning reducing the workforce without really changing the way the work was done and without changing the corporate infrastructure. Rightsizing was the next approach. It consisted of trying to find the "right" number of people to do only the necessary work aiming to stop doing "non-value added work" (Skehan and Kleiner, 1996:7-12).

Rightsizing is regularly used as substitute for downsizing in literature. Downsizing can always be justified to improve efficiency, but only if it is really rightsizing to prepare a strong base for renewed growth (Thompson, 1998:274). While downsizing is the systematic reduction of a workforce; rightsizing is a different, broader strategic approach aiming to find the optimal size (Appelbaum, Everard and Hung, 1999:535-552). Rightsizing also can suggest growing a business, either to correct a previous downsizing effort or to accommodate growing business (Jusko, 2010:18). It is an integrated, internally consistent and externally legitimated configuration of organizational processes, products, employees and based on a shared vision of the future of the organization. A clearly defined mission and strategy is supported by management and also understood by members of the firm. The strategic dimension of rightsizing requires a continuous analysis of the organization's mission and long-term strategies, actions required to implement them and the skills and people necessary to perform those processes. Companies can be revitalized and individuals can be renewed if the emphasis is rightsizing rather than just workforce reduction (Burke and Nelson, 1997:325-334). In other words, rightsizing is more comprehensive than the concept of downsizing in that it is a proactive, continuous process of configuring the organization to function effectively in the present and be prepared to do so in the future. It emphasizes a proactive, strategically driven process of continuous attention to the "right" size (Hitt, Keats, Harback and Nixon, 1994:19-21).

When the decision to right size is made also a continuous process of reevaluating the company's human resources in relation to business strategies and developments in the external environment is needed (Morrall, 1998:81). The first key to successful rightsizing is to focus on the company's long term strategies and how any reorganization will affect the company's horizon (Elmuti and Kathawala, 1993:10). Rather than just headcount reductions, companies should reevaluate organizational priorities, review core competencies, look to possible organizational redesign, and operate under a "rightsizing". The organization's long-term strategic needs should be taken into account and be balanced by the company's short-term operational needs (Hickok, 1999:9).

The strategic management for human resources plays an important role on the precaution and exceeding of the crisis. Apart from this, with the help of successful managements, the crisis facilitates the exposition of the organization's strong and weak points and the reconstruction of the organization itself. This dimension puts forward a reorganization opportunity for the strategic management of human resources in the organizations by the crisis. Corporations, generally speaking, have a tendency to be narrow in scope when considering reorganization. As a response to crisis, companies immediately focus on cutting costs and try to maintain or achieve specific levels of profitability. One of the first places companies look to make cuts is people-related expenses. Reducing headcount seems like an easy and obvious way to save on costs. During the time period of strategic management of human resources (Kenny, 1999:29), downsizing may cut labor costs in the short run but possibly erode both employee and eventually customer loyalty in the long run (Wilkinson, 2005:1079-1088).

Firms have always encountered workforce fluctuations, particularly as reactive measures to economic crises, such as responses to recessions (Gandolfi, 2008:3-14). Especially, SMEs usually adopt retrenchment practices during economic downturns (Chu and Siu, 2001:845-858). Typically, they respond to decline by cutting back their scale of operations, which usually means that the size of the workforce is reduced. Downsizing is viewed as an organizational intervention aimed at improving organizational performance by reducing the workforce (Pranjall and Kumar, 2009:11). In workforce reduction, the critical point is that employees who can be easily rehired and who are not involved in activities at the core of the firm's competitive advantage should be cut (Chu and Siu, 2001:845-858). However, most of the time, wrong decisions are taken in tailspin and generally key talents that affect an organization's ability to success its business goals are lost.

The current business environment of rapid change and innovation forces organizations to evaluate how human resources (HR) contribute to their effectiveness. In today's knowledge-based economy, intellectual capital is the main factor leading to superior firm performance (Zatzick and Iverson, 2006:999-1015). With the increased global competition and economic fluctuations, the key factor to survive and outperform in the market is "high-value" instead of "high-volume" (Lewin and Johnston, 1996-93-111). As a consequence of prevailing current economic conditions, today companies are confronted with drops in profits, cost restrictions and fierce competition and those become the basic realities of business life. In this context, to survive and compete better in the market requires strategic thinking, acting with a proactive manner and benefiting from human resources effectively (Zeffae & Mayo, 1994:5). In today's knowledge economy, it is necessary for firms to focus on adapting and recognizing patterns rather than just trying to achieve a "optimal performance" (Frey, 2001:38-54). With this reality, to adapt and response to economic fluctuations, structural changes and uncertainty in existing conditions is possible only by high capability of organizational adaptation and high workforce participation requiring a systematic strategic approach. As one of the systematic strategic approaches, rightsizing makes organizations leaner and more competitive in a difficult economy so that they can reap stronger rewards and be in an advantageous position after the recession ends. Rather than simply cutting costs to maintain a specific level of profitability with a narrow point of view, a broader approach and more fundamental strategy; rightsizing should be considered. It is a holistic and proactive approach dealing with corporate restructuring with the goal of both reducing costs and aiming to improve efficiency and effectiveness at the same time (Ataman, 2001:366). By creating a results-focused talent plan, organizations sharpen their employee skills for greater strategic impact (Zeffae & Mayo, 1995:6-18). Putting the right people in the right roles at the right time enables companies to improve the quality and effectiveness of their workforce that is a major competitive differentiator. After all, a revitalized organization with a strategic workforce is better able to execute on business strategy (Türk, 2006:132).

METHOD

Many large organizations have highly developed crisis management plans and teams that are ready and rehearsed for crises. On the other hand, majority of the small businesses believe that crisis planning is less important. Many small organizations have the mentality that 'crises don't happen in our industry/field' or 'we have a well-managed business and could manage our way through a crisis without a plan'. They assume that crisis events only happen to other organizations or that they are somehow protected from destructive effects of crises (Bozkurt, 2009:64-65)

Today, SMEs account for %95 of total number of firms in global economy providing %66 of employment. In Turkey, %99 of the firms is SMEs constituting %46 of aggregate employment (Spillan and Hough, 2003:398-407). Regarding to the importance of SMEs as stimulators of employment, investment and aggregate production in one economy and the fact of their incompetency in crisis planning SMEs are selected to be studied. Since in the last five months of '09 Malatya comes first in Eastern Anatolia accounting for 25 percent of the total number of SMEs getting investment incentive certificate in the region the study is conducted in Malatya.

This study aims to determine whether "SMEs operating in Malatya, which are expected to face big losses during recent crisis, benefited from rightsizing recent global crisis by rethinking and reorganizing their human and financial resources at the same time". The problem statement is determined as "Did SMEs operating in Malatya benefit from rightsizing successfully during recent global crisis?" Accordingly, the hypothesis is determined as "SMEs operating in Malatya did not benefit from rightsizing during recent global crisis by rethinking and reorganizing their human and financial resources at the same time".

The population of the study consists of 750 SMEs. Because of cost issues and conducting the survey in the population include higher probabilities of making mistakes randomly sampling method is selected with confidence level of 0.95, tolerance limit of ± 0.04 and the sample size of 100 (Çingi, 1994:326).

Data collection is performed through questionnaire method applied to managers with face to face interviews. Before survey, pilot study is conducted to realize the validity and reliability of the study. The questionnaire form consists of 10 questions. Confidence analysis is implemented and confidence coefficients are calculated to achieve consistency of questions with each other and homology in measurement. For this reason, it is benefited from Cronbach Alfa coefficient (Özdamar, 2002: 662-663) which has a higher statistical validity.

In this scale, confidence coefficient is found as $\alpha = 0.698$. It can be said that the scale is reliable. Data evaluation is conducted through frequency analysis, arithmetical mean, standard deviation and finally spearman correlation.

APPLICATION AND CONCLUSION

Frequency Analysis

Data is presented in frequency tables (Table1 – Table10):

Table1. Professional Consultancy Services

	Frequency	Percent
(No)	53	53,0
(Yes)	47	47,0
Total	100	100,0

Table.1 shows that more than the half did not benefit from professional consultancy services regarding to rightsizing indicating that firms do not give adequate importance to planning for crisis.

Table2. Strategic Human Resource Management

	Frequency	Percent
1	17	17,0
2	30	30,0
3	41	41,0
4	7	7,0
5	5	5,0
Total	100	100,0

Arithmetic Mean:2.53 Standard Deviation:1.02

5=Strongly Agree 4=Agree 3=Partially Agree 2=Disagree 1=Strongly Disagree

% 53 of the managers interviewed state that one of the main reasons of problems resulted from layoffs during the period of crisis is that they do not benefit from strategic human resources management.

Table3. Decisions Regarding To Rightsizing

	Frequency	Percent
1	07	7,0
2	20	20,0
3	38	38,0
4	25	25,0
5	10	10,0
Total	100	100,0

Arithmetic Mean:3.11 Standard Deviation:1.06

%73 of the managers interviewed state that decisions regarding to rightsizing are taken in management board implying that there is a tendency towards developing appropriate strategies.

Table4. Knowledge Level of Firms About Rightsizing

	Frequency	Percent
1	12	12,0
2	24	24,0
3	31	31,0
4	28	28,0
5	5	5,0
Total	100	100,0

Arithmetic Mean:2.90 Standard Deviation:1.09

% 64 of the managers interviewed state that rightsizing is unknown. According to these results, it can be concluded that the firms in scope of the survey do not make an effort to find the optimal, “right” size by analyzing the hierarchical layers and business processes in accordance to their long term business strategies.

Table5. Dealing With Employee Values, Attitudes and Behaviors

	Frequency	Percent
1	2	2,0
2	25	25,0
3	36	36,0
4	34	34,0
5	3	3,0
Total	100	100,0

Arithmetic Mean:3.11 Standard Deviation:0.88

%73 of the managers state that employee values, attitudes and behaviors are not taken into account and evaluated.

Table6. Rightsizing vs. Downsizing

	Frequency	Percent
1	16	16,0
2	32	32,0
3	30	30,0
4	19	19,0
5	3	3,0
Total	100	100,0

Arithmetic Mean:2.61 Standard Deviation:1.06

%52 of the managers interviewed state that rightsizing concept is confused with downsizing proving that rightsizing is misunderstood by the firms in scope of the survey.

Table7. Workforce Reduction

	Frequency	Percent
1	10	10,0
2	17	17,0
3	33	33,0
4	26	26,0
5	14	14,0
Total	100	100,0

Arithmetic Mean:2.77 Standard Deviation:1.04

%73 of the managers state that workforce reduction is a primarily preferred strategy in cutting costs during the time periods of crisis. It implies that as a response to crisis, they focus on cutting costs and try to maintain or achieve specific levels of profitability by headcount reductions.

Table8. Human Resource Function

	Frequency	Percent
1	15	15,0
2	19	19,0
3	44	44,0
4	18	18,0
5	4	4,0
Total	100	100,0

Arithmetic Mean:3.17 Standard Deviation:1.17

%66 of the managers interviewed state that human resource function is not viewed as a strategic partner in the formulation of the company's strategies spreading the vision, mission and goals to the all units of the company. Regarding to the results, it can be said that human resources is not considered as a strategic source of value

Table9. Ignorance of Emotions and Reactions of Survivors Following the Cutbacks

	Frequency	Percent
1	18	18,0
2	25	25,0
3	29	29,0
4	22	22,0
5	6	6,0
Total	100	100,0

Arithmetic Mean:2.73 Standard Deviation:1.17

% 57 of the managers interviewed state that survivors of a layoff who are frequently left with as many negative emotions and reactions are not taken into consideration. It indicates that firms do little to help or deal with them.

Table10. Negative Impacts of Workforce Reduction Decisions on Employees

	Frequency	Percent
1	3	3,0
2	8	8,0
3	19	19,0
4	55	55,0
5	15	15,0
Total	100	100,0

Arithmetic Mean:3.71 Standard Deviation:0.92

%89 of the managers interviewed state that workforce reduction decisions leave negative impacts on employees.

Spearman Correlation Analysis

Table11. Spearman Correlation Analysis Results

Variables	r	P
Q4*Q6	0.404	0.000
Q4*Q7	0.252	0.011
Q4*Q8	0.280	0.005
Q4*Q9	0.345	0.000
Q4*Q10	0.258	0.010

At the significance level of 0.05, the highest value belongs to the relationship between the knowledge level of firms about rightsizing and the confusion of rightsizing concept with downsizing (r:0.404, p:0.000). Rather than just headcount reductions, companies should reevaluate organizational priorities, review core competencies, look for possible organizational redesign, and operate under a “rightsizing” (as opposed to downsizing) philosophy.

There is a strong positive linear relationship between the knowledge level of firms about rightsizing and ignorance of emotions and reactions of survivors following the cutback (r:0.345, p:0.000). Destructive impacts of workforce reductions on employees left after downsizing is defined as “downsizing syndrome” in literature. It is a significant problem that organizations need to address. That firms whose knowledge level about rightsizing is limited ignore emotions and reactions of survivors following the cutback is an expected result.

There is a positive linear relationship between the knowledge level of firms about rightsizing and classical human resource management approach (r:0.280, p:0.005). The firms in the scope of research with limited knowledge level of rightsizing naturally do not approach human resource activities with a strategic management approach.

There is also a positive linear relationship between the knowledge level of firms about rightsizing and negative impacts of workforce reduction decisions on employees (r:0.258, p:0.010). Management which has limited knowledge about rightsizing naturally do not try to take measurements for removing the negative impacts of workforce reductions on employees and finally “downsizing syndrome” on employees accelerate.

At the significance level of 0.05, there is a positive linear relationship between the knowledge level of firms about rightsizing and workforce reduction (r:0.252, p:0.011). As a response to crisis, companies immediately focus on cutting costs and try to maintain or achieve specific levels of profitability. One of the first places companies look to make cuts is people-related expenses. Reducing headcount seems like an easy and obvious way to save on costs. Rather than approaching human resources as a strategic source of the company to cope with and exceed crisis, it is viewed as a cost item that should be diminished immediately. Rather than putting the right people in the right roles at the right time, reducing expenses in narrow sense is aimed.

Zolkafli Hussin
Northern University of Malaysia

ABSTRACT

There were many cases in corporate turnaround that had seen the influence of government assistance in influencing the process of recuperating ailing firms. However to what extent such assistance positively influenced the outcome of turnaround result are still lacking in the literature. The objective of this paper is to investigate the moderating effect of government assistance towards the improvement of business performance of turnaround companies. Analysis of logistic regression was used to investigate the effect of retrenchment and product-market refocusing strategy and the combination effect of government assistance as a moderator towards the improvement of business performance of turnaround firms. The sample consists of 135 exporter-manufacturing companies listed in the Exporter Directory of the Province of North Sumatra. The study found partial support in the moderating effects of government assistance and firm size and their influence in the relationship between strategy and successful turnaround. The study also found that Product-Market refocusing is one of the important strategies to be implemented during turnaround.

INTRODUCTION

The recent economic crisis of 2008, which swept many of major industrial nations, saw one major shift in government policies towards ailing businesses. The conviction held especially by liberal economy, which dictates that the government interference should be limited in the business world, has been changed dramatically by the act of giving financial assistance in the effort to rescue ailing businesses, especially big companies. Though as literature would later show that government assistance has been there in rescuing troubled companies, this recent recession is perhaps the only one after many decades whereby such assistance massively came in hundreds of billion dollars of rescue package. Before the economic crisis of 2008, government assistance though arguably to be quite limited, was present in many cases of turnaround companies. There were many cases in the literature of corporate turnaround that showed the government taking part in the resuscitation of ailing companies especially if the company was considered to be an important asset to the nation. However, to what extent such assistance truly helped in revitalizing turnaround companies were found to be quite scant in terms of statistical reference.

This paper focuses on the effect of government assistance as a confounding factor and its influence on turnaround strategies towards the improvement of business performance of turnaround companies. The effect of company size, which also suspected to have certain moderating effect on strategy and performance, also will be considered in the study as a control variable. This paper begins with discussions on the theoretical background underlying the selection of turnaround strategies. Then several turnaround strategies commonly adopted by troubled companies will be discussed along with cases of corporate turnaround in which government assistance were present. Several hypotheses were developed in regards to the predictor as well as moderating variable in the study, in which the theoretical framework were based upon. It will then proceed with the section on research design, in which detail explanation on sampling, data collection and analytical procedure will be discussed. The research findings, implication and limitation will be presented in the final section of the paper.

LITERATURE REVIEW

Factors contributing to successful corporate turnaround have been one of the most attracting subjects in the strategic management field. Both researchers and practitioners have strived to further the knowledge boundary of the subject every time the occasion presented itself, which usually comes during economic recession. As literature would later show that certain strategies such as retrenchment, cost reduction or downsizing were among popular strategies adopted by these companies. One of the reasons that these strategies were widely adopted by ailing business was perhaps better explained by survival-based theory. This theory argued that in order to survive, organization had to deploy strategies that should be focused on running very efficient operation and can respond rapidly to the ever-changing environment (see e.g. Lynch, 2003).

However, in reality, not all of these troubled companies which adopted this kind of strategies managed to successfully turnaround. As Slatter (1984) argued, only one out of four troubled companies managed to successfully turnaround itself. The lack of explanation provided by survival-based theory, open up possibilities for other theory of strategic management to lend itself in explaining the behavior of turnaround companies. Contingency theory as one of the most influential theories applied in strategy and organizational studies (Hofer, 1975; Schoonhoven, 1981; Tosi and Slocum, 1984) and one of which is widely adopted in strategic management (Miner, 1984), is one of the proposed candidate. The suspected moderating effect of some undefined factors which influence the outcome of turnaround effort is well within the boundary of contingency theory to explain.

Literature in the field of corporate turnaround in regards to strategy has been quite well developed for the last three to four decades. Since the earliest publication on the subject, published by Schendel & Patton (1976), literature has been well developed to argue that turnaround companies would resort to certain types of turnaround strategies, namely: debt restructuring, operating-turnaround strategy, strategic-portfolio restructuring strategy, and product-market refocusing strategy (Gilson 1989, 1990; Hofer, 1980; Tvorik, Boissoneau & Pearson, 1998; Slatter, 1984; Sudarsanam & Lai, 2001; Chowdury, 2002; Barker III & Duhaime, 1997; Chowdury & Lang, 1996; Gadies, et al., 2003; Hambrick & Schechter, 1983; O'Neill, 1986; Slatter & Lovett, 1999, and others). Although different scholar provided different technical term to these strategies, but basically they are all more or less the same. And although some scholar (see for e.g. Pandit, 2000) still question the rigorousness of such research on strategies of turnaround companies, these strategies nevertheless were being practiced generally by many ailing companies.

Aside from strategy, there are other non-strategy factors which influence performance of turnaround companies, or somewhat influence strategy – performance relationship of turnaround companies. Different business practices between Western and Asian companies for example, were argued by Bruton, Ahlstrom & Wan (2003) as giving different effect on the turnaround effort of Asian companies, which gained much support from other fellow researchers (see for e.g. Fisher, Lee & Johns, 2004; Bruton, Ahlstrom & Wan, 2001). Therefore it would be quite interesting to seek out other differences which exist or being practiced by turnaround companies in other parts of the world, especially in South East Asia. For the purpose of this study, two strategy-related factors and two non-strategy related factors, which will be treated as confounding factor, will be examined in the effort to further explain their influence on the improvement of performance of turnaround companies.

The Factor of Operational-Efficiency Strategies

Early scholars in the field referred to this strategy as retrenchment strategy, which arguably is among the first sets of strategies to be implemented by troubled firms (Robbins & Pearce, 1992; Hofer, 1980). Literature on the field of corporate turnaround has found considerable support in the role of operational-efficiency strategy in revitalizing ailing companies (Robbins & Pearce II, 1992; Chowdury & Lang, 1996; Bruton & Rubanik, 1997; Umbreit, 1996; Vaz, 1996; Tvorik, Boissoneau & Pearson, 1998; Balgobin & Pandit, 2001). However there were several other researchers who found conflicting results in this particular role of operational-efficiency strategy (Barker III & Mone, 1994; Castrogiovanni & Bruton, 2000; Arogyaswamy & Masoud, 1997). This strategy which is usually implemented to address operational (inefficiency) problems of troubled companies was usually aimed to improve short-term performance focusing on operational measures in the effort to gain efficiency and improving margin by reducing direct cost and slimming overheads in line with volume (Tvorik, Boissoneau & Pearson, 1998; Hofer, 1980; Slatter, 1984; Chowdury, 2002). This strategy

usually involves taking actions to improve operational cash flow and restore profitability by pursuing strict cost and operating-asset reduction (Sudarsanam & Lai, 2001).

Turnaround Company usually pursues cost reduction through retrenchment of workers, pay cuts, reducing cost of materials and also overheads, though the first two are the most commonly mentioned. Scholars found conflicting evidence in the role of cost reduction to improve business performance. Many scholars found significant role of cost reduction in turning around ailing companies (Robbins & Pearce II, 1992; Chowdury & Lang, 1996; Bruton & Rubanik, 1997; Umbreit, 1996; Vaz, 1996; Tvorik, Boissoneau & Pearson, 1998; Balgobin & Pandit, 2001), though some others found the role was a bit vague (Barker III & Mone, 1994; Castrogiovanni & Bruton, 2000; Fisher, Lee & Johns, 2004). Arogyaswamy & Masoud (1997) found that retrenchment of workforce and pay cuts were both done by successfully and non-successfully turnaround firms, whereby some firms even successfully turnaround without retrenching their workers. Bruton, Ahlstrom & Wan (2001) also argued that the ability to retrench is somewhat limited in East Asia, although in their subsequent research in 2003 (Bruton, Ahlstrom & Wan, 2003), they argued that in the case that retrenchment occurred, it did improved performance. In practice, the role of cost reduction in improving business performance is widely accepted by turnaround firms. Cases of turnaround, such as IBM (Slatter & Lovett, 1999), National Steel Corporation (Tsurumi & Tsurumi, 1997), Mark & Spencer (Merriden, 2000) were all involved in cost reduction.

Operating-asset reduction was also deemed to be one of the measures taken during turnaround (Slatter, 1984; Goddard, 1993; Goldstein, 1995; Ganto & Sulaiman, 2005). This action usually involves selling-off less than full capacity of operating units such as plant or machinery, selling-off idle assets such as warehouses, office building, vehicles, and even short-term assets such as inventory and receivables (Sudarsanam & Lai, 2001; Barker III & Mone, 1994; Pearce II & Robbins, 1994; Chowdury & Lang, 1996; Castrogiovanni & Bruton, 2000; Bruton, Ahlstrom & Wan, 2003; Fisher, Lee & Johns, 2004). This action were usually adopted to provide fast cash in a badly-needed cash-flow situation experienced by many turnaround companies, while at the same time getting rid of unused surplus of assets, enhancing efficiency at the operational level and improving asset utilization. Based on these arguments, operational-efficiency strategy which aimed to improve short-term performance by gaining efficiency was argued to have a direct influence on performance of company seeking turnaround, which leads us to the first hypothesis.

H1: There is a positive relationship between operational-efficiency strategies and successful turnaround companies

The Factor of Product-Market Refocusing

The strategy of product-market refocusing, was categorized by early scholars of corporate turnaround as part of recovery strategies (Schendel et al., 1976), growth strategy (O'Neill, 1986), revenue-generating strategy (Slatter, 1984), or as part of entrepreneurial turnaround strategy (Hambrick & Schechter, 1983). However, it was Slatter (1984) who first surfaced this strategy as one among its generic turnaround strategies and differentiated it with other recovery strategies, which include strategy of improved marketing, product-market changes and growth through acquisition. In his later writings with Lovett (Slatter & Lovett, 1999), they combined these strategies under product-market refocusing, which include addition/ deletion of product lines, addition/ deletion of customers, changes in sales mix, complete withdrawal from a market segment, and entering into a new product-market segment. Product-market refocusing strategies were widely supported as the instrument of growth in the literature of corporate turnaround (Kow, 2004), especially as the decline deepens (Chowdury, 2002). Chowdury (2002) explained that this strategy has two opposite directions, which is contraction and expansion of existing product/ market niches. Contractions happen when a firm withdraws from unprofitable products, services and market segments. While expansion happens when a firm develops or acquires attractive businesses in the interest of profitability and growth. And this contractions and expansions could be complementary or mutually exclusive. Basically this strategy can be divided into two mainstreams, which is: product refocusing and market refocusing.

Product-market refocusing strategy were found to be quite popular strategies adopted among troubled firms in Malaysia (Siti Maimon, 1999) and Indonesia (Ganto & Sulaiman, 2005) after the financial crisis of 1998. Product refocusing through new product development and deletion of unprofitable product lines were practiced among troubled companies. There were cases in which careful new product development managed to bring the company out of the crisis, such as Fiat for example (Edmondson, et al. 2002). Market refocusing also found considerable support in the literature of corporate turnaround, though Harker (2001) argued it was still quite limited. Some of the scholars even argued that there were several aspect of marketing which

differentiate between failed and successful turnaround companies (Harker & Harker, 1998), such as careful selection of potential market and close relationship with customers (Cunnington, 1996). Bausch & Lomb and also Micron, a Russian microchip manufacturer, were few of many cases in which turnaround companies resorted to this kind of strategy to pull themselves out of trouble (Roger, Pace & Wilson, 2002; Bruton & Rubanik, 1997). Based on these discussions, the second hypothesis is postulated

H2: There is a positive relationship between product-market refocusing strategy and successful turnaround companies

The Factor of Government Assistance

There is no doubt that government has major influences on corporate life. They influence corporate through taxes, regulations and even sometimes in terms of business policy. In the aspect of turnaround, government was found to be helpful in some cases of government-related turnaround effort such as in the case of Lockheed Corporation (Bibeault, 1982). Another case of example was Chrysler Corp., which were helped by U.S. Federal Government by lending the company a total of US\$ 1.5 billion rescue package (Chowdury, 2002). In the wake of 2008 economic crisis, cases like this was found to be quite common. Aside from giving help, in certain cases of turnaround, government was found to be the reason for corporate decline, such as through budget cuts (Rose, 2003), or through tight monetary policy which shrink government spending nature. In some other cases, government might also influence the process of turnaround itself, such as the turnaround of Bethlehem Steel Corp. (Arndt, 2002) and Malaysian Airline System (Jayasankaran, 1999).

The role that government took when they decided to give assistance in the turnaround process was also found to be quite diverse. Many cases of government assistance came in the form of financial backup, such as the turnaround of Rover (Whitehead, 1999). Another type of assistance came in some form of mutual fund, which will be used to facilitate the debt and financial difficulties experienced by these troubled companies (see for e.g. Wilks, 2002; Taylor, 1999). This is the type of assistance which are being used by many Southeast Asian countries during the economic recession of 1998, and also recently being used by industrial nation which were being hit by recent crisis. And sometimes government also influenced the turnaround process by supervising the process itself, such as in the case of turnaround at Daewoo (Lee, 1999) and Malaysian Airline System (Jayasankaran, 1999). Even in some cases, government influenced the market side of turnaround by giving government contracts, such as in the turnaround of AMS (Mullich, 1998). These discussions on the government influence, whether direct or indirect, arguably have some effect on the turnaround process, which lead us to the third hypothesis.

H3: The factor of government assistance shall moderate the relationship between strategy and successful turnaround companies.

RESEARCH DESIGN

Financially distressed firms are defined as companies who experienced a two-year of simultaneous decline in net income and Return on Asset (ROA) between the period of 2000 and 2005. These two measures of performance were previously used by Bruton, Oviatt & White (1994), Castrogiovanni & Bruton (2000) and Fisher, Lee & Johns (2004) in their study. Successful Turnaround Company is defined as companies who experienced a stable increase of profit (net income) and ROA between 2005 and 2007. The sampling frame in this study consists of manufacturing companies listed in the Exporter Directory of North Sumatera Province. From the total of 281 manufacturing companies listed in the directory, 179 falls into financially-distressed category, in which only 135 were included in the study. From the total of 135 companies, 87 companies fall into the category of successful turnaround, while the other 48 is classified as non-turnaround. Data was collected from February – August 2009 by personal interview, in which the respondents were asked to fill up the self administered questionnaire.

Question items which were developed to measure the variables were adapted from the items developed by Barker III & Barr (2002). This study also develops additional question items to strengthen the measures of strategies and also to measure government assistance as new variable. Three managing directors who were involved in a workshop held by local government were invited to discuss and develop the additional question items. Then another eight managing directors who attended the same workshop were given the items to check its face validity in accordance to the technique developed by Zaichkowsky (1985) and Obermiller & Spangenberg (1998). The results are the final question items which were distributed to the respondents

during data collection period. Since the question item was developed in native language, the validity and reliability of the question items has to be re-check. Exploratory Factor Analysis which was used to check the convergent validity of the items produced satisfactory result except for one item from Cost Reduction and another one from Market Refocusing, which both produced communality below .5. These items were excluded from further analysis. Reliability test for each variable is also quite satisfying with the score of Cronbach's Alpha well above .7 (Hair, et.al., 2005).

Scholars have shown that firm size has been somewhat associated with successful turnaround (Bruton, Ahlstrom & Wan, 2003; Bruton, Oviatt & White, 1994; Pant, 1991). Firm size has also been research quite rigorously in the context of contingency approach (see e.g. Donaldson, 2001; Child, 1975). Therefore it was considered to be quite important to investigate the effect of firm size in the study as control variable. However since the exact and reliable figure of total asset of companies in the study was difficult to obtain, the study will use the classification given by the local government as a measure of firm size. For the purpose of measuring the firm size, the companies in the study were divided into three categories: (1) Companies with asset less than Rp. 2 billion, (2) Companies with asset between Rp 2 to 10 billion, (3) Companies with asset more than Rp. 10 billion. Dummy coding was used in the analysis, in which group (1) was considered as the reference group.

RESULTS AND DISCUSSIONS

Test for linearity of the logit as suggested by Tabachnick & Fidell (2007) showed no serious violations of the assumptions. Test for multicollinearity among predictors also showed no serious violation of the assumption of collinearity, with VIF score below 3.6. The analyses of binary logistic regression were performed in number of steps. First, each bivariate association between Size, Operational Efficiency Strategy (OEF), Product-Market Refocusing Strategy (PMR) and Government Assistance (GA) as predictor variables and turnaround success as the DV were examined in Model 1. Then each moderating variable will be paired up with each predictor variable to check the improvement of the model. And finally interaction term will be introduced with each model to check for the significance of the interaction. Mean centering was applied to all predictor variables prior creating the interaction term.

Table 1 shows the bivariate relationship between each predictor variable and turnaround success. Product-Market refocusing strategy has the biggest effect in improving the odds of turnaround success (33 times more likely than non-turnaround), while government assistance also shows significant influence on the odd ratio of turnaround success. Although Size and OES does not produce significant results ($p > .05$), Hosmer & Lemeshow (2000 : 95) argued that any variable with p value less than .25 still can be considered as a candidate in multivariable model. Therefore Size and OES will still be considered in further analysis.

Table 1. Result of Logistic Regression on Model 1.

Variable	-2LL	Omnibus Test			NR-2	B	Wald	Sig.	OR	CI	Prediction Accuracy
		Chi-2	df	Sig.							
Constant Only	175.721										64.4
Size - 1	171.956	3.765	2	0.152	0.038	0.965	3.223	0.073	2.625	.915 - 7.529	64.4
Size - 2						0.228	0.275	0.6	1.256	.536 - 2.947	64.4
OES	173.743	1.978	1	0.16	0.02	-0.653	1.928	0.165	0.52	.207 - 1.309	64.4
PMR	127.265	448.456	1	<.001	0.414	3.519	30.16	<.001	33.763	9.615 - 118.554	74.1
GA	156.2	19.521	1	<.001	0.185	1.64	16.29	<.001	5.157	2.325 - 11.439	69.6

The result of logistic regression analysis involving higher order interaction term is shown on Table 2 below. The analysis involves comparing higher order interaction with lower order components of the higher order model to see whether the inclusion of single variable can significantly improve the model, which is in some way similar to hierarchical regression analysis. Hosmer & Lemeshow (2000) argued that computation of moderating variable in logistic regression is always in the form of hierarchical analysis, in which significance of the interaction term should always be checked prior interpretation of the result.

Test of Hypotheses

Hypothesis 1: There is a positive relationship between operational-efficiency strategies and successful turnaround companies

Hypothesis 1(a): Firm size moderates the relationship between operational-efficiency strategies and turnaround success

Hypothesis 1(b): Government Assistance moderates the relationship between operational-efficiency strategies and turnaround success

A direct bivariate relationship between OES and turnaround success, which is reported at Table 1, shows that OES does not produce significant influence towards turnaround success (p: .165). The interaction between firm size and OES shown under Model 2 in Table 2, also shows that the effect carried by Size is not significant enough to have moderated the relationship between EOS and turnaround success. In this case, it is fair enough to say that the evidence does not warrant sufficient justification to reject H1(a). This finding is in agreement with the findings of some scholars in the literature which found insufficient support of this strategy positively influence turnaround success (Bruton, Ahlstrom & Wan, 2001; Arogyaswamy & Massoud, 1997). One of the logical explanation on this fact is perhaps this strategy was pursued by turnaround as well as non-turnaround companies.

Table 2. Results from Logistic regression for Model 2 - 5

Variable	-2LL	Omnibus Test			NR-2	Prediction Accuracy	Odds Ratio			
		Chi-2	df	Sig.			Model 2	Model 3	Model 4	Model 5
Constant Only	175.721					64.4

OES (SIZE -2)							0.134			
PMR	114.179	57.777	1	<.001	0.503	81.5		4.348		
PMR (SIZE -1)	104.88	9.299	2	0.01	0.561	83		564.165*		
PMR (SIZE -2)								7.299		
OES	146.935	9.265	1	0.002	0.264	74.1			0.001*	
OES (GA)	141.687	5.248	1	0.022	0.306	73.3			16.05*	
PMR	126.283	29.917	1	<.001	0.421	74.1				71.97*
PMR (GA)	124.89	1.393	1	0.238	0.431	74.8				5.468

The moderating effect of Government Assistance (GA) on OES and turnaround success, which is shown in Model 3 in Table 2, produced quite significant result. In the presence of GA, the influence of OES toward turnaround success has somewhat improved. The EOS' odd ratio of .001 is the conditioned coefficient which reflects the changes of OES when GA equals to zero. While the odd ratio of product term (16.05), shows the factor multiplier by which the multiplying factor of OES changes given a unit increase in GA. Therefore, there is enough evidence to argue that Government assistance did influence the relationship between OES and turnaround success (H1b is accepted).

Hypothesis 2: There is a positive relationship between product-market refocusing strategies and successful turnaround companies

Hypothesis 2(a): Firm size moderates the relationship between product-market refocusing strategies and turnaround success

Hypothesis 2(b): Government Assistance moderates the relationship between product-market refocusing strategies and turnaround success

Result of logistic regression analysis presented in Table 1, shows that PMR is the single most important predictor in the model. When entered into the equation model, the variable single handedly improves the prediction of turnaround success to 74.1%. With an odd ratio of 33.76, the presence of this variable in turnaround improves the probability of achieving turnaround success by as much as 33 times. Therefore it can be argued that PMR has a direct influence on turnaround success, which in this case, hypothesis H2 is accepted.

The effect of firm size on the relationship between PMR and turnaround success is reported in Model 3 at Table2. The statistical result shows that Size somewhat moderate this relationship, especially in the case of large companies (Size-1). PMR (Size-1) odd ratio of 564, shows by what "times" the multiplying factor of

PMR would have change in the case of one unit change of Size. This is particularly quite true for large companies, as they have lots of resources and access to many markets, which they can fully use to their extent in order to revitalize their company. Therefore, hypothesis H2(a) is accepted, stating that Size do moderate the relationship between PMR and turnaround success. These finding is also in agreement with the findings of some scholars in the subject (Bruton, Ahlstrom & Wan, 2003; Bruton, Oviatt & White, 1994; Pant, 1991).

The moderating effect of Government Assistance in the relationship between PMR and turnaround success seems quite weak to be supported. The result on Model 5 in Table 2, shows that the model is not significantly different from the lower order model, which means that the introduction of the product term into the model is not significant. This might explain that Government (at least in the sample of study) does not assist much in the product or marketing section of turnaround companies, though this argument is still debatable. The statistical finding of data analysis failed to support sufficient evidence to accept hypothesis 2(b).

CONCLUSION

This study has attempted to see the moderating effect of Government Assistance in the relationship between Strategies and Turnaround Success. Firm Size was also considered as control variable in the analysis. The result shows that PMR has a direct and strong influence on turnaround success. The moderating variable of size and government assistance in this study was found to be partially supported. Firm size was found to moderate the relationship between PMR and turnaround success, while Government assistance moderates the relationship between OES and turnaround success. As with other study using logistic regression, the application of the study findings outside the sample should be carefully considered since normality was not universally assumed in logistic regression. This study is considered to be a mere step in the much-undisclosed world of corporate turnaround, especially in the aspect of government assistance in revitalizing troubled companies.

THE RELATIONSHIP BETWEEN STRATEGIC ORIENTATION AND CULTURAL VALUES: THE EFFECT OF BUSINESS OWNERS'/LEADERS' CULTURAL VALUES ON THE STRATEGIC BEHAVIOR IN CONDITION OF CRISIS: A RESEARCH ON SMALL ENTERPRISES IN ISTANBUL CHAMBER OF INDUSTRY

Binali Doğan
Marmara University, Turkey
Ata Özdemirci
Marmara University, Turkey

ABSTRACT

During the last era in business strategy area, some theoretical and empiric studies were made about the role of culture on adopting strategies. These studies are mostly based on Miles and Snow's strategy typology and Hofstede's value groups. While in some of these works, culture is found as an important factor with other different factors on strategy formulation and adoption, some works defends that culture has a limited effect. The perspective of these works were based on the relationship between strategy and national culture or business culture and because of this difference, they have reached different results.

This study assumes that, "cultural values of business owners or leaders" effects "strategic orientation" and "the perception difference of crisis as opportunities or threats" and also their "strategic behavior in the condition of crisis". As he said, Hofstede's uncertainty of avoidance scale is for multicultural researches, we preferred Voich's "Uncertainty Avoidance" scale for focusing individuals. We also used Rotter's "Internal/External Orientation" which is used by Trompenaars on the management area, are taken as dimensions of cultural values. Miles and Snow's strategy typology (prospector, analyzer and defender) is taken as dimensions of strategic orientation. We strongly assume that if the uncertainty avoidance of business owners or leaders is high and they are external oriented, they will perceive the condition of crisis as a threats because of its uncertain nature, and also they will choose defensive strategies (decreasing the costs, economizing, strengthening the cash flow, staying stabilized in the market, etc.). If the uncertainty avoidance of business owners or leaders is low and they are internal oriented, they will perceive the condition of crisis as an opportunity and also they will choose proactive strategies (making investment, increasing the market share, penetration into new markets, etc.).

On this study, first of all, we made a literature review about culture and strategy relationship. The hypothesis about the relationship between cultural values of "Uncertainty Avoidance" and "Internal/External Orientation and strategic behavior is formed from the theoretical and empiric studies on this area. This hypothesis is be tested on the small enterprises of Istanbul Chamber of Industry.

Keywords: *Cultural values, strategic orientation, crisis management, uncertainty avoidance, internal orientation, external orientation*

LITERATURE REVIEW

There are lots of typologies about the concept of strategic orientation in the strategic management literature. But two of these typologies are accepted as milestones: Miles and Snow's typology (prospector, analyzer, defender, reactor) (Miles and Snow, 1978) and Porter's typology (cost leadership, differentiation, focus) (Porter, 1980). Just like Vankatraman's approach to Miles and Snow's typology with 6 dimensions (aggressiveness, analysis, defensiveness, futurity, proactiveness, riskiness)(Vankatraman, 1989) there had been lots of studies about these typologies. Some of the studies about strategic orientation researched the relationship between strategic orientation and performance (Morgan and Strong, 2003; Kaya ve Seyrek, 2005; Sanchez and Marin, 2005; Pleshko,2006; Pleshko and Nickerson, 2008; Azhar,2008)., and some of

them researched the factors that effects the forming of strategic orientation (Zhou and Li, 2007). The basic factors that effect the strategic orientation are environmental factors (market turbulence and technology turbulence), organizational factors (organizational structure, organizational culture and leadership) and institutional factors (government interference and corporate governance) (Zhou and Li, 2007).

The effect of organizational factors on strategic orientation is researched in the base of structure-strategic orientation (Lin and Germain,2003) and organizational culture – strategic orientation (Muafi, 2009; Fang and Wang, 2006) relationship. Beside these, although there had been lots of studies about the role of leader on success of strategic decisions, there is no research about the relationship between the leaders cultural values and strategic orientation.

The studies about the effect of culture are mostly about the national culture, management styles and organizational practices (Mueller and Thomas, 2000, Dong and Glaister, 2007; Wennekers et al, 2007;), especially after Hofstede's work, "Culture's Consequences" (Hofstede, 1980). The studies about the business strategies and culture can be divided into two groups: The studies that find a weak relationship (Singh, 2007) or no relationship (Meyer,2007) between national culture and strategy, the studies that finds big relationship between business culture and strategy (Muafi, 2001;Fang ve Wang, 2006).

Individuals in a society have different cultural values, these cultural values are the causes of attitudes and behaviors of individuals. On this study, it will be researched that; if the business owners' or leaders' cultural values and their strategic orientations have a relationship or not.

Hofstede defines culture as "collective programming of mind which distinguishes the members of one group category of people from another" (Hofstede, 2007). This collective programming form by the struggle of a group with the threats that comes from three sources (human-nature, living together, life-death). (Hofstede, 1984) Schein defines culture as "the way in which a group of people solves problems". (Schein,1985). For enterprises, Shine attracts attention for a vital problem: The relationship between enterprise and environment. The problem has two sides: One is seeing the real problem and the other is way of solving this problem. Both are about the strategic orientation factor and we can say that the selection process of this factor depends the owner's or leader's uncertainty avoidance and internal-external oriented cultural values.

Uncertainty avoidance is "the extent to which the members of a culture feel threatened by uncertain or unknown situation" (Hofstede, 1991:113). Uncertainty avoidance should not be confused with risk avoidance. There must be a strong relationship between uncertainty avoidance and strategic orientation as we told above. If the owner's or leader's uncertainty of avoidance is high, it's expected that they will keep away from the uncertain and risky strategies like prospector, innovator, future oriented, and if the owner's or leader's uncertainty of avoidance is low, it will be just the opposite.

The cultural value dimension of locus of control can be defined as the response style of a person to his circumstances, with other words, tendency to agree the environment's treatment (external orientation) or dominating the circumstances (internal orientation) (Trompenaars, 1994). It's strongly expected that, internal oriented leaders or owners choose prospector, innovator and future oriented strategy because of their problem solving style; and external oriented leaders or owners tend to choose defender and analyzer strategies.

H1: If the uncertainty avoidance of business owners or leaders is high, they will perceive the condition of crisis as threats and they will choose defensive strategies.

The concept of uncertainty avoidance has got similarities with risk avoidance. Risk is often expressed as a percentage of probability that a particular event may happen (Hofstede, 1991:113). Beyond this definition, risk is a negative attitude to the possible loses in the real life (Forlani, Parthasarathy and Keaveney, 2008). It can be considered as a cultural characteristic that is defined as uncertainty based mood of loss (Williams and Voon, 1999), (Williams and Narendran, 1999). The manners of individuals about the risk have two dimensions. One is the perception of risk, and the other is risk propensity. Risk propensity is individual's current tendency to take or avoid risks (Williams, Zainuba ve Jackson, 2008). Risk propensity is the outcome of the individual's perception of risk (Stkin ve Weingart, 1995). Some people's willingness and unwillingness about taking risks is explained by risk propensity. As we think about the uncertainty avoidance with risk propensity, we see that it consists of two dimensions. One is uncertainties that come from the social relations and its solutions. In management literature, this dimension's effects appear with managers' or leaders' solutions, rules and procedures. Business owners or leaders see rules and procedures as tools for making business. It can be called as being normative. The second is environmental based uncertainty, and its

causes of loss. It can be called as being deliberate. So, uncertainty avoidance will bring the defensive strategies because of the perception of possible loss based on uncertainty. And also;

H1a: If the business owners or leaders is more normative, they will perceive the condition of crisis as threats and they will choose defensive strategies.

H1b: If the business owners or leaders is more deliberate, they will perceive the condition of crisis as threats and they will choose defensive strategies.

H2: If the business owners or leaders risk propensity is low, they will perceive the condition of crisis as threats and they will choose defensive strategies.

The internally oriented business owners or leaders are expected to choose prospector, innovator, and future oriented strategies, the externally oriented business owners and leaders are expected to choose defensive strategies.

H3: If the business owners or leaders are external oriented, they will perceive the condition of crisis as threats and they will choose defensive strategies.

METHODOLOGY

The type of the research is hypothetic research. Data collection method is survey. Sample selection method is coincidental. Our only limitation is about the number of workers. We decided to limit this number with 250 workers, because of the possible strategy formation differences in institutional and big-scaled enterprises. The universe of this work consists of the small-scaled enterprises in the list of Istanbul Chamber of Industry that means approximately 6000 members. Our basic assumption is that strategy process starts from the top, and it's obvious to be like that in small-scaled companies. We made face-to-face survey as much as we can, but we'll also used mail and telephone survey for reaching maximum participation.

Measures

We used the scale of Voich for uncertainty avoidance, the scale of Rotter for locus of control (internal/external orientation), and the scale of Chew for risk propensity (risk liking).

We developed a scale with 11 items for strategic behavior in condition of crisis based on the crisis and strategic behavior literature. The content of the questions is discussed below. We also asked the strategy of their company to the participators that is based of Miles and Snow that has been corrected and adapted by (Zahra ve Pearce, 1990) for strategic orientation.

Table 1: Measures Used in Research

MEASURE	DEVELOPERS	ITEM NUMBER
UNCERTAINTY AVOIDENCE	Voich, (1995)	5
RISK LIKING	Chew, (1996)	8
LOCUS OF CONTROL	Rotter, (1966)	29
STRATEGIC BEHAVIOR IN CONDITION OF CRISIS	Original Measure (2010)	11

The survey prepared for the research has 75 questions. As seen at Table 1, measure of uncertainty avoidance (Voich, 1995) with 5 items, measure of risk liking (Chew, 1996) with 8 items, measure of locus of control scale (Rotter,1966) with 29 items and measure of strategic behavior in condition of crisis (Original Measure, 2010) with 11 items are used in the survey. There is also 1 control question about the participants' contribution to firm's strategy, 3 questions about the strategy type, 8 questions about the firm's perceived

performance, 1 question about firm size, 1 question about the sector of the firm, and 8 questions about the demographics. Likert Scale-5 is used in all questions except Rotter's scale which uses 1 and 0 grading method. (Locus of Control Total Point=0 Internal Oriented, Locus of Control Total Point=23 External Oriented, 6 questions are dummy questions).

We used factor analysis to determine the dimensions of the measures. We also made K-S test for normal distribution and Cronbach Alpha test for reliability. Correlation and Regression tests are made with SPSS 17.0 to measure the power of our hypothesis.

Before testing the main hypothesis, we looked at the descriptive statistics and the correlation between firm size, firm strategy, performance and the factors in the model. Then, we made a multi regression test for measuring the effect of the independent variables (Uncertainty Avoidance, Risk Propensity, Locus of Control) on dependent variable (Strategic Behavior in Condition of Crisis). Then we looked at the effect of Strategic Behavior in Condition of Crisis on Firm Performance and formed the model.

Factor Analysis and Reliabilities

We made expletory factor analysis for establishing the sub dimensions of measures. All factors have passed the KMO Measure of Sampling Adequacy and Bartlett test of Sphericity which means that our data set is appropriate for factor analyses (Table 2). Principal components and varimax method are used in analysis. For all measures, items which have factor weight below 0,50; unique items in a factor; items with close factor weights are leaved out of evaluation. After this processes, factors which have initial eigenvalues over 1,00 and Cronbach Alpha over 0,65 are:

2 factors in Uncertainty Avoidance Measure (Cumulative Extraction Sums= %79,611) which can be called as "Normative" (Cronbach Alpha=0,787) and "Being Deliberate" (Cronbach Alpha=0,679).

1 factor in Risk Propensity Measure (Cronbach Alpha=0,780)

3 factors in Strategic Behavior in Condition of Crisis Measure (Cumulative Extraction Sums= %70,214) which can be called as "Stop Seeking Opportunities" (Cronbach Alpha=0,747), "Financial Discipline" (Cronbach Alpha=0,674), and "Stability" (Cronbach Alpha=0,668).

Also questions about firm performance are collected under two dimensions: Concrete Performance and Abstract Performance. The first factor of performance consists of sales, financial performance, profitability and market share items which can be called as concrete performance criterions; and the second factor of performance consists of reaching goals, handling difficulties, HR quality and meeting expectations items which can be called as abstract performance criterions. Locus of Control is a grading measure and is not adequate for factor analysis.

Table 2: The Results of Factor and Reliability Analysis

FACTOR NAME	ITEMS	FACTOR LOADINGS	FACTOR EXTRACTION (%)	RELIABILITY ANALYSIS (CRONBACH ALPHA)
UNCERTAINTY AVOIDANCE – NORMATIVE	Importance of rules and regulations	,912	52,78	,787
	Importance of job requirements and instructions	,878		
UNCERTAINTY AVOIDANCE – BEING DELIBERATE	Being deliberate for possible problems	,867	26,83	0,68
	Being contented with certain situation	,711		
TOTAL			79,611	
Kaizer Meyer Olkin Measure of Sampling Adequacy			0,596	
Bartlett Test of Sphericity Chi-Square			62,207	
df			6	

			Sig.	0
RISK LIKING (RISK PROPENSITY)	Nothing is compared with value of my life (reverse)	,829		53,97
	Having fun with uncertainty and risk of failure.	,803		0,78
	Life is taking risks.			
	Respect for risk takers.	,758		
	Addicted to the excitement of danger and uncertainty.	,647 ,611		
TOTAL				53,968
Kaizer Meyer Olkin Measure of Sampling Adequacy				0,756
Bartlett Test of Sphericity Chi-Square				88,814

Kaizer Meyer Olkin Measure of Sampling Adequacy				,701
Bartlett Test of Sphericity Chi-Square				163,260
df				36
Sig.				0

When we look at the descriptive statistics at Table 3, we can see that during the crisis, firm owners/leaders prefer the financial discipline (M=3,89) and stability (M=3,68) for defensive strategies. We can also say that firm owners/leaders are very normative (M=4,27), but they have low risk propensity (M=2,64) and they are mostly internal oriented. (M=7,21; 0=internal oriented, 23=external oriented)

Table3: Descriptive Statistics

Factor	N	Mean	St. Dev.
Stop Seeking Opp.	65	2,4718	1,09432
Financial Discip.	65	3,8872	,99001
Stability	65	3,6846	1,06642
Being Deliberate	65	3,7231	1,03468
Normative	65	4,2769	,89281
Risk Propensity	65	2,6444	,82340
Locus of Control	65	7,2154	4,3499
Abstract Performance	65	3,5117	,71190
Concrete Performance	65	3,2654	,72467

Correlation test between factors and demographics are shown at Table 4. There are only 3 significant correlations. One is between firm seniority and financial discipline ($r=0,297$), second is between professional seniority and financial discipline ($r=0,259$), and the last one is between education and risk propensity ($r=0,280$). We see that when seniority is high, managers tend to use financial discipline. It means that experience teaches financial defense to the leaders. Also by the education, risk propensity rises too. It means that education increases leader's courage.

Table 4: Correlations Between Factors and Demographics

	Age	Education	Professional Seniority	Firm Seniority
Stop Seeking Opp.	,204	-,178	,083	,039
Financial Discip.	,131	-,116	,259*	,297*
Stability	,109	-,142	,039	,194
Being Deliberate	-,032	-,194	-,060	-,019
Normative	,004	,047	,042	,000
Risk Propensity	,058	,280*	-,139	-,104
Locus of Control	-,023	-,076	-,184	-,155
Abstract Performance	,119	-,227	,164	,179
Concrete Performance	-,119	,130	,025	-,070

Correlation test between the factors are shown at Table 5. We see a high positive correlation between "external locus of control" and "stop seeking opportunities" ($r=0,360$), "being deliberate" and "stability" ($r=0,436$), and high negative correlation between "risk propensity" and "financial discipline" ($r=-0,312$). These relations confirms our hypothesis, but we'll say the last decisions after the multi regression test. When we look at the relations between the independents, we see that "risk propensity" and "being deliberate" are negatively correlated ($r=-0,319$) and have a risk of colinearity which will be tested before the regression test.

The relations out of the model says that; there is a negative correlation between “prospector strategy” and “stop seeking opportunities”, negative correlation between “prospector strategy” and “being deliberate” as expected; negative correlation between “analyzer strategy” and “stop seeking opportunities”, negative correlation between “analyzer strategy” and “stability”; positive correlation between “defender strategy” and “stability”.

The relations that supports our hypothesis are; the negative correlation between “prospector strategy” and “being deliberate”; negative correlation between “prospector strategy” and “external locus of control”, positive correlation between “prospector strategy” and “risk propensity”, negative correlation between “analyzer strategy” and “external locus of control”; positive correlation between “defender strategy” and “external locus of control”.

When we look at the correlations about the perceived performance, we see that only financial discipline is successful in the defensive strategies, prospector and analyzer strategies are successful in the strategy types and interestingly, external locus of control and perception of performance is negatively correlated. It means that externality brings pessimism whit it.

Table 5: Correlations Between Factors

Analyze of the Research Model

For analyzing the model and hypothesis, multi regression test is applied to the data. The significant effects are “external locus of control” on “stop seeking opportunities” ($\beta=0,335$, Sig.=0,009); “risk propensity” on “financial discipline” ($\beta=-0,296$, Sig.=0,030); “being deliberate” on “stability” ($\beta=0,366$, Sig.=0,005) (Table 6).

Table 6: Multi Regression Test for Hypotesis

	Stop Seeking Opportunties		Financial Discipline		Stability	
	β	Sig.	β	Sig.	β	Sig.
Being Deliberate	0,048	0,711	-0,018	0,895	0,366**	0,005
Normative	-0,116	0,367	0,083	0,533	0,010	0,937
Risk Propensity	-0,145	0,264	-0,296*	0,030	-0,041	0,746

Locus of Control	0,335**	0,009	0,063	0,624	0,186	0,131
Adjusted R ²	0,11		0,044		0,137	
N	65		65		65	
F	2,921		1,711		3,46	
Sig.	0,029		0,16		0,013	
S.E.	1,01334		0,94342		0,98278	

When we look at the effects of strategic behavior in condition of crisis on perceived firm performance, we see that the significant effects are “stop seeking opportunities” on “abstract performance” ($\beta=-0,362$, Sig.=0,003) and “stop seeking opportunities” on “concrete performance” ($\beta=-0,271$, Sig.=0,031); “financial discipline” on “abstract performance” ($\beta=0,339$, Sig.=0,009). (Table 7)

Table 7: Multi Regression Test for Performance

	Abstract Performance		Concrete Performance	
	β	Sig.	β	Sig.
Stop Seeking Opportunities	-0,362**	0,003	-0,271*	0,031
Financial Discipline	0,339**	0,009	-0,041	0,762
Stability	-0,111	0,384	-0,102	0,448
Adjusted R ²	0,173		0,055	
N	65		65

S.E.	0,64722		0,70445	

Research Model

H1: If the uncertainty avoidance of business owners or leaders is high, they will perceive the condition of crisis as threats and they will choose defensive strategies.

H1a: If the business owners or leaders is more normative, they will perceive the condition of crisis as threats and they will choose defensive strategies.(Hypothesis is not supported).

H1b: If the business owners or leaders is more deliberate, they will perceive the condition of crisis as threats and they will choose defensive strategies.

This hypothesis is supported at the $p<.05$ level on one dimension of defensive strategic behavior in condition of crisis. (The significant effect of being deliberate on stability).

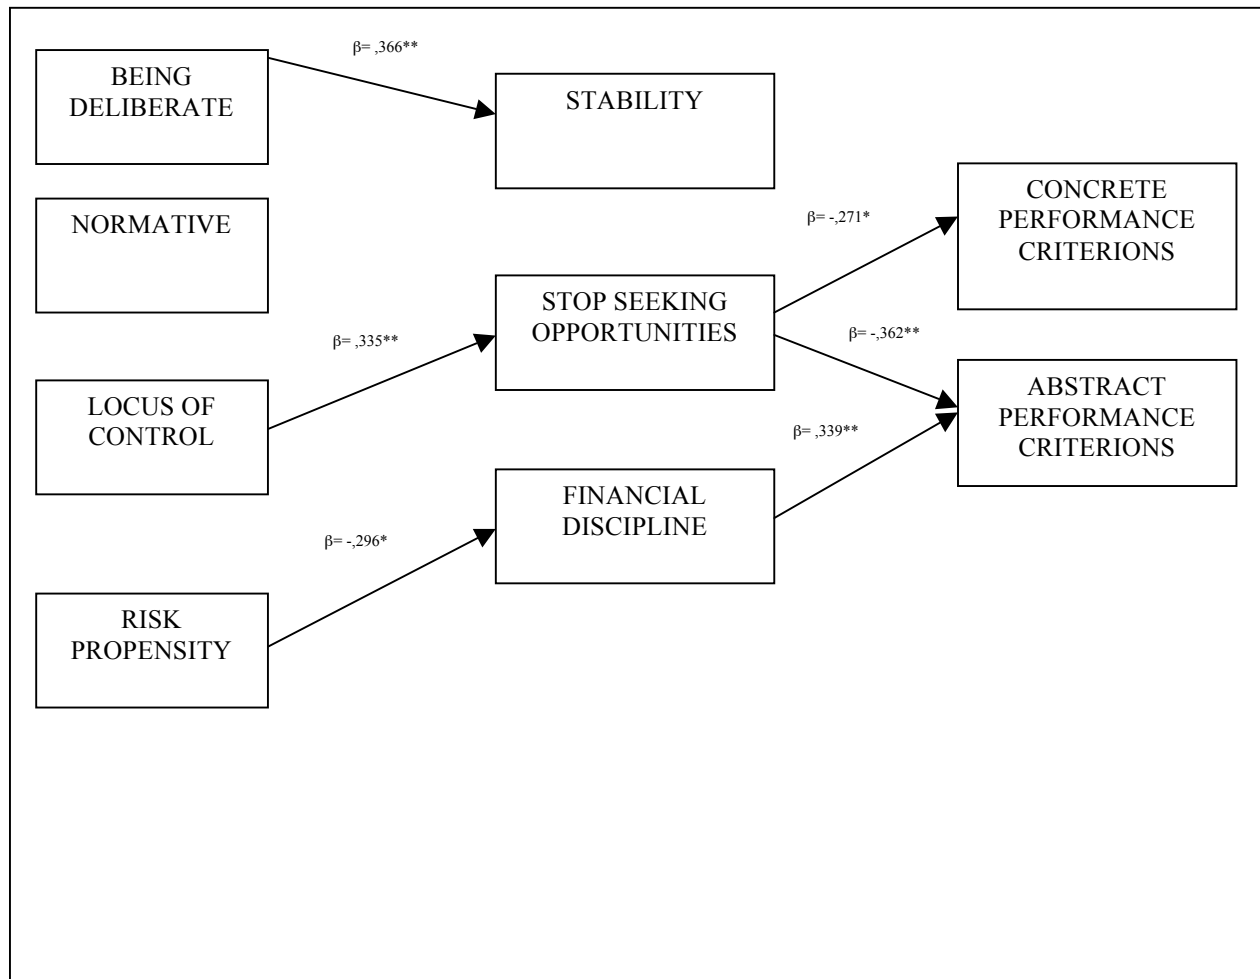

H2: If the business owners or leaders risk propensity is low, they will perceive the condition of crisis as threats and they will choose defensive strategies.

This hypothesis is supported at the $p<.05$ level on one dimension of defensive strategic behavior in condition of crisis. (The significant effect of risk propensity on financial discipline).

H3: If the business owners or leaders are external oriented, they will perceive the condition of crisis as threats and they will choose defensive strategies.

This hypothesis is supported at the $p < .05$ level on one dimension of defensive strategic behavior in condition of crisis. (The significant effect of external locus of control on stop seeking opportunities).

The effect of defensive strategic behavior in condition of crisis on perceived firm performance is not our basic hypothesis but it is shown in the model in Figure 1.

NOTE

This study is supported by Commission of Marmara University Scientific Research Projects (BAPKO). Project code is: SOS-D-060510-0160.

THE EFFECTS OF GLOBAL ECONOMIC CRISIS TO THE MARKETING STRATEGIES OF HOSPITALITY BUSINESS: ISTANBUL FIELD RESEARCH

Burhanettin ZENGİN
Lütfi Mustafa ŞEN
Sakarya University, Turkey

ABSTRACT

Providing current incomes; tourism sector has a significant position on overcoming balance of payment deficits, but as the structure of its demand, tourism is very sensitive on economic, social, political turbulences and various natural disasters. Thereby in economic crisis periods; domestic and outbound demand destruction could be seen in countries which receive tourists. Marketing strategies has a vital importance on preventing that demand destruction, because they are composed of a dynamic structure and forming adaptation to the current situations. It's very important in revising and recruiting marketing strategies, in crisis periods.

The aim of this study is to present alternative suggestions and contribute to the previous researches on marketing strategies of public and private business at tourism sector in probable crisis periods. Thus, its aim is to empower tourism bussiness, and operating Turkey's tourism sector by providing less influence from crisis compared to its rivals and contributing to the national economy, while presenting suggestions to the relevant directors of organizations with alternative marketing strategies.

In our study, primarily, the literature basic study constructed via by giving information on crisis and crisis management, effects of crisis in tourism, and marketing strategies in tourism. Then, by analyzing the causes and the results of global economic crisis besides the current studies in literature, an extensive survey has been prepared in marketing strategies that will be applied by minimizing the effects of probable crisis situations in the future.

Through a survey, the data of our sample -which is 30 % of the realistic universe, analyzed via SPSS for Windows 15.0 package program statistically. The data collection method and data analyzing methods handled in details under Methods title. In the end, by analyzing those datas, alternative marketing strategies developed in tourism business by preventing the negative effects of crisis at probable crisis periods like current global economic crisis.

Key Words: *Tourism, Economic Crisis, Crisis Management, Marketing Strategies, Tourism Business and Crisis.*

INTRODUCTION

Afterwards the global economic crisis, whose impressions felt globally in 2008, international incoming tourists in Europe destination decreased 5,6% to 459,7 million in 2009 which was 487,1 million in 2008 (UNWTO, 2010). On the other hand, the number of foreign tourists visiting Turkey in 2008 which was 30,9 million; increased 3,3% to 32 million in 2009. Beside this, 21.950,8 million of Turkey's tourism revenue in 2008 declined 3,2% to 21,249,3 million in 2009 (www.turizm.gov.tr). As shown above, unlike Europe, Turkey's incoming tourists number was increased despite the crisis. However, the decrease in tourism revenue is pointing the negative effects of global economic crisis on Turkey, too.

Preventing the demand destruction caused by economic crisis, is depending the properties of crisis and applying successful marketing strategies which are developed according to consumer's purchasing behaviours in crisis periods. The success of marketing strategies in crisis periods is depending in macro level; the effects of marketing strategies applying by public authorities; within the tourism business in micro level.

DEFINITION OF CRISIS AND ITS PROPERTIES

“Crisis is unexpected and insensible situation that makes insufficient of organs preventing and adapting mechanisms and threatens the current values, aims and assumptions of organizations which should be counteract immediately. Stress, anxiety, panic etc. are the terms that expressing the emotions living in crisis periods” (Tağraf ve Arslan, 2003:150).

Some crises caused by natural disasters like earthquake, hurricane, volcanic eruption, cyclone, avalanche, etc. Other crises are man-made ones like environmental pollution, crime, terrorism, economical depression and strike, or short, or long term, or natural disaster based, or man-made; all types of the crisis' features that are affecting the tourism industry, can be shown in three titles (Pike, 2004:158):

- In the long term, all destinations are under the threat of crisis.
- A crisis situation will be rarely predictable.
- Crisis causes, are formed under the control of tourism industry.

DEFINITION AND FEATURES OF CRISIS MANAGEMENT

Crisis is arising by the interaction of technology, human behaviours, organizational structure, management politics and organizational culture, etc. Crisis management requires analyzing these factors in detailed. Organizational development, arising with correlative interaction, adaption and efficiency of organizational factors (physical, financial, mortal), besides the bound and mutual interaction of all those. Because of this, in analyzing process of crisis, all of these factors should be taken into consideration (Genç, 2004:336).

Crisis management has some specific features like these (Haşit, 2000:65):

- Crisis management is aiming the recovery of organizations in the shortest time, which are predicting crisis situations, distinguishing its kinds, having precautions and learning from crisis.
- Crisis management is a persistence implementation without a beginning or end.
- Crisis management is formed according to the kind of the crisis. As every crisis has a specific signal and solution, crisis management will be shaped according to the kind of the crisis.
- As crisis is threatening strategic plans, crisis management is handling the part of strategic management.

CRISIS AND TOURISM

In general, tourism crisis can be defined as a situation like; hindering tourism activating process, by destroying the destination's security, attraction and tranquility image, influences negatively the sense of the visitors and as a result of decreasing the tourist comings, expenditure and causes disruptions in tourism activities; effecting negatively to tourism economy (Glaesser, 2005:6; Avcıkurt ve diğ., 2006:50). Crisis management in tourism sector, is an interception function of data collection, evaluation, action planning, application and control for the facts which are effecting negatively to a product's, organization's, country's or region's image unexpectedly and as a result of this it causes social and economical loss (Köroğlu, 2004:71).

Tourism has an economic activity by creating currency and employment; on the other hand a socio-cultural activity with gathering up various cultures and corresponding human's needs of relaxation. As being among the fastest growing sectors in the world, tourism today has important problems. Crisis occurring in the world, effecting tourism industry negatively, too (Aymanıuy, 2001:109). Crisis, occurring in tourism, will effect a country, region, zone and even the world. Crisis may occur because of intra-sector causes as well as exterior causes, too. Although the causes are not economic based, they will expose economic results. Producers of these economic results are coming through due to the demand destruction (Avcıkurt ve diğ., 2006:52).

In 2008, reflection of the credit crisis to the financial sector in the largest economy of the world USA, and growing gradually of this problem, many economies influenced by global base and coming through a financial crisis situation. The negative effects of global crisis are seen in all of the sectors in Turkey, too. Besides the intra-sector crisis of tourism, these global based crises influence the sector considerably and forming difficulties at management of the business operating in this industry (Bahar ve diğ., 2009:28).

It's certain that, coping with this global crisis, which effects decreasing gradually, various touristic products and services produced. Meetings, incentive travels, conferences and exhibitions are determined as the most affected touristic products. Apparently, beside the shopping and entertaining activities in various destinations at shores and cities; cultural attractions decreased significantly (UNWTO, 2009). The strategies that would be followed by Turkish tourism against global economic crisis is very important. In this context, rather than the number of incoming tourists, attracting the high level income tourist profile has gained importance. Emphasizing the service quality, customer satisfaction, and innovation, will decline the costs while increasing the revenue sources and maximizing the revenue and keeping the cash flow are so important to cope with the crisis with minimum damages, and even benefits (Demir, 2008).

MARKETING STRATEGIES IN TOURISM SECTOR

Strategies are the basic preferences depending on the internal and external environmental conditions and in accordance with their own sense of mission and vision, showing the fundamental choice of business resources at which area will be allocated for what purposes (Koçel, 2005:455). Strategies contain the things that should be done to reach the purposes and achieve them. For example, the aim of increasing Saturday sales 20% is a decision, but the methods and should-do things for reaching this aim requires strategies (Akat, 1998:107).

Marketing strategies are made to reach the marketing purposes; forming a performance theme for the business in a particular market. It is related with identifying a target market and developing the suitable marketing mix for his aim. In this case, marketing strategies are forming two main parts following each other (Mucuk, 2001:40):

- i. Target Market Choices: Identifying reasonably homogen consumer group or groups for the business.
- ii. Forming the marketing mix: The controllable variable group (or a suitable combination of those variables) that the business bring together for satisfying the market.

Marketing strategies in tourism sector are the comparison of touristic product supply and environmental factors of customers. Looking at the characteristics of tourism marketing strategies, important clues can be found by business managers at implementing their activities. Strategies should contain long term decisions and activities while they're evaluating frequently (Oral, 1988:19; Hacıoğlu, 2005:46, Kaşlı ve diğ. 2009:90).

According to the product-service life cycle, there are various marketing strategies that can be followed by business. These strategies are discussed briefly below (Altunışık, 2009:335).

1. **Input Stage Strategies:** At this stage, the most important problem is recognition and knowing. Because of this, suitable strategies with this aim;
 - Including the users to service design
 - Identifying the first users
 - Having a feedback from the first user
 - Forming the demand of industry
 - Making presentations to market entry
 - Positive ear to ear stimulation of communication can be considered
2. **Growth Stage Strategies:** This stage is starting from reaching the breakeven stage of goods or services, and continues until the maturity stage. Marketing strategies will be followed like those (İslamoğlu, 2009:119);
 - Production methods and techniques will be developed as reducing the costs.
 - Developmental changes should be done in the functions, qualities or appearances of goods or services
 - Unless new competitors enter the market or you have a free capacity or have expectation of reducing prices will increase the sales; the prices shouldn't be reduced. Otherwise, must be reduced.
 - Increases the numbers of producers, increases the intermediaries in distribution channels, too. Because of this, distribution decisions should be reviewed.
 - Promotion activities should be oriented to brands from goods or services.
3. **Maturity Stage Strategies:** In the maturity stage which is the top selling and afterwards reducing period, three main marketing strategies will be applied. These are (Mucuk, 2001:146);

- Strategies that are making changes in market are helping to find new markets and market segments beside providing usage of goods and services intensively by the current customers.
 - Strategy of making changes in goods or services will be aroused the goods and services by qualified improvement strategy.
 - The innovation of marketing are mixed by changes on various factors of it, will arouse the sales. At the top of it, price reduce strategy is coming.
- 4. Reduction Phase Strategies:** In this period, the sales of goods and services starting to reduce. Following strategies can be applied according to this situation (Tek, 1999:422);
- Keeping the goods and services: Expected vitals will leave the markets one day.
 - Going some restriction in goods and services: Various production and marketing costs are terminated.
 - Withdrawal of goods or services: It will be applied by withdrawing all the goods or services or a part of them from some regions or from all over the country.

PURPOSE

The aim of this study is to present alternative suggestions and to contribute the previous researches on marketing strategies of public and private business in tourism sector in probable crisis periods for minimizing the negative effects of crisis. Thus, this study will be beneficial for empowering the tourism business operating in Turkey's tourism sector- which is an important sector that provides currency income-, with providing less influences from economic crisis according to the rivals operating in other destinations and contributing much more to the national economy, beside presenting suggestions to relevant people with alternative marketing strategies.

METHOD

This study is a quantitative research basing on survey model. The reason for choosing this method, ease of collecting the data in a short time which is wanted from wide range of experimental and the possibility to analyze the data in a quick and reliable way via the computers supported by statistical programs. Survey questions are consisted of 2 groups. First group of demographic questions designed at categorical style. The main scale prepared oriented to solve the main problem of the research, is quinted liqert scale.

The ideal universe of the study is consisting 4 and 5 star hotel managements in Turkey. But by considering the time limit, the realistic universe determined as 32 of 5 star and 75 of 4 star hotel managements in Istanbul. The sample of the study consists 10 five star, 22 four star tourism management certificate hotel managements that constitutes 30% of realistic universe. Surveys applied in the middle and senior managers of 4 and 5 star hotels. 125 of the survey has returned, 101 of them analyzed, and 24 surveys eliminated because of some deficiencies.

The data analyzed via 'SPSS 15.0 for Windows' program at computer platform. 'Frequency Analysis' has done for the demographic and organizational data collected by the survey. Furthermore chi-square test, which is a technique for examining relationships, applied on suitable data.

FINDINGS

By investigating demographic data in Table-1, it is shown that bachelor and master graduated degree staffs hold 75.22% among all staffs. Tourism oriented graduation in staffs is 65.3% Furthermore, the rate of survey participants whose total work-duration in tourism industry more than 11 years - is 42.5%. Besides, 90% of survey participants take part in middle-level managers and senior managers, and participated in our survey suggests such a big part, formed by the middle and upper level managers in our sample group is very high level of training and experience in the sector. This situation is thought to increase the credibility of our work.

Table 2 shows the frequency analysis of data pertaining to business. As shown in table 76.2% of those surveyed 'the work they have produced business services decreased by 1-19%, 1-19% of employment in the lower 92% mentioned that. This state of accommodation businesses that affected by the economic crisis is serious. Against this survey, participants 52.4% of the 2009 year of business in terms of economic as well and as good as had passed to state and in **2010** the 69.2% URL economically well be a year estimate of accommodation establishments in the country in other sectors businesses compared to the crisis is less than impressed.

In this case, no doubt, businesses 61.4% of the previous economic crises have been exposed and hence on this experience of being, as well as large enterprises due to their funding too much about the shortage has not also a great role is considered. Indeed, our survey of participating businesses 59.4% 4 stars, and quarters are five star hotels and also participated in the survey 62.4% of those quarters despite the economic crisis, do not face difficulties in financing stated.

CONCLUSIONS AND RECOMMENDATIONS

Tourism, economic crisis even the smallest businesses in this industry over the destructive effects of a sector that is too large. For this reason, crisis management in tourism industry especially has great importance. In our country, both in state and enterprises, but should work based on crisis management are not given required importance. In this direction, firstly at the macro level by the state and in the micro level the tourism enterprises by the potential economic crisis due to demand contraction preventing aimed at long-term and continuous review to be crisis-management strategies should be developed, it is important in establishing the crisis management team and making anti-crisis management plans against faced possible economic crisis.

The state takes major roles to overcome country's economic crisis with the least damage. In this context, different markets promotional activities devoted to the appropriation to increase, investors given incentives to increase tourism tax to eliminate or at least to the level of, loans payments is delayed, or the maturity to extend the state's Turkish tour operators to support Turkey's own tour operating system installation, accommodation enterprises SME categories are supported by the assessment, is considered as a vital strategy. As known, in times of economic crisis, the country's external current account deficit is close to the exchange rate in terms of tourism, the need is increasing and at this point that could bring foreign currency into the country among the most important business is located. Therefore, except in times of financial crisis to increase demand for tourism marketing strategies is vital.

For example cheap mass tourism marketing efforts can be made, Premier of price decrease of service quality and increasing the alternative tourism by developing tourism, the 12 month spread a destination distinctive side marketing and accordingly different advertising and sales techniques used for this purpose can be applied important strategies, were considered.

Foreign tourist demand, especially in times of global economic crisis caused by narrowing of the income loss, to improve domestic tourism demand can be prevented through the implementation of strategies. For example, in advertising and promotional campaign to increase tourism in this context can be seen as an important marketing strategy. Accommodation businesses also profit from the economic crisis, reduced to prevent the most effective way to indent one, to reduce the cost of resources and activities. Search strategies can be applied for this purpose in the organizational downsizing, businesses to provide significant cost advantages in this point it has great importance.

Canakkale Onsekiz Mart University, Turkey

ABSTRACT

After recent global economic crisis, some precautions were applied to overcome the crisis. Expansionary monetary and fiscal policies were applied to decrease the heavy effects of the crisis. Although optimistic belief has occurred in direction of the crisis ended since 2009 year, presence of stagnation dominated in the world economy. Beyond the signs of stagnation, serious measures were taken against the recession in United States and European countries.

After the global economic crisis, tendency of dwindling in general occurred in the world economy. In this process macro economic targets were based on increasing production and employment instead of providing economic stabilization. In that way economic growth was aimed.

Global recession has created negative impacts on mainly production concerning consumption, employment and investment.

This paper analyzes the long-run relation between investment level and unemployment level over the period 1985-2008 for 19 OECD countries including Turkey by using panel analysis techniques. Firstly, we test Breusch and Pagan (1980)'s cross-section LM testing to investigate whether unemployment level and investment level have cross-section dependency. According to obtained findings, we decide to use panel unit root tests. After determined to panel unit root test to be used, it is focused on the long-run relation between investment rate and unemployment rate. Kao Residual Test, Pedroni Residual Test and Johansen-Fisher Panel Cointegration Tests is used in this study. In terms of the presence of relation which is obtained, some inferences will be made belonging to future.

Key Words: *Global Economic Crisis, Global Recession, Panel analysis*

INTRODUCTION

In this study, firstly it is assessed occurrence of the crisis that began in last quarter of 2008 in USA housing market. Later it was focused on measures taken by Southern Europe Welfare States which are Turkey, Spain, Portugal, Italy and Greece over the period after crisis.

The crisis raised the uncertainty in world economy and caused unsteadiness at first financial markets later real markets. The crisis that started in the finance markets has taken the reel markets under effect with time. The recession started in developed countries has affected the developing countries which are already in critical levels. While the global developments were regressing, the countries were in consensus to take precautions together to struggle with the crisis in the world economy.

Turkey was affected from the crisis as many other developing and developed countries had been affected. We will firstly deal with the appearance and enlargement process of the crisis in the world, before we evaluate the effects of the crisis on Turkey. In this process Turkey took the packages as many other countries applied attention.

Global recession in Turkey created negative impacts on mainly production concerning consumption, employment and investment. After the crisis, because of the recession and of TL's excessive valuableness in the amount of the speculative foreign capital income decreased, therefore total demand reduced and a big fall in importation was seen.

1. THE GLOBAL CRISIS AND ITS EFFECTS ON INVESTMENT AND UNEMPLOYMENT IN USA AND SOUTHERN EUROPE WELFARE STATES

According to Fink (1986); Kash and Darling (1998), a crisis is referred to as an unplanned event emerging from the internal or external environment of an organization or country which can disrupt operations, threaten people physically and mentally, endanger the viability of entities no longer able to cope with the situation using normal managerial procedures.

The current global crisis originated in the USA financial market. Since this is the centre of a network that interlinks the national financial systems of almost all countries in the world, the crisis was spread very quickly.

According to Mishkin (2008), the current global financial crisis has many aspects in common with past global financial crises that have occurred throughout history. The current financial crisis has had three fundamental factors as in many previous crises. The first one is mismanagement of financial innovation, second one is an asset price bubble that burst, and third one is deterioration of financial institution balance sheets.

World-shaking events market capitalism quietly and shifted much of the discredited central planning that was so dominant in the Third World. China which is a large segment of the erstwhile Third World replicated the wonderful economic export-oriented model and this so-called model is Asian Tigers. Besides this, thanks to China fairly well educated, low-cost workforces were joined with developed-world technology. It was protected by an increasing rule of law, so as to release explosive economic growth. So real GDP growth of the developing world has been more than double since 2000.

Along with surge in competitive and low-priced exports from developing countries, particularly those to Europe and the U.S. flattened labor compensation in developed countries, and attenuated the rate of inflation expectations throughout the world by including those inflation expectations embedded in global long-term interest rates. Furthermore, there has been a significant decrease in global real interest rates which affect the all financial markets since beginning of the 1990. So this indicated that global saving intentions constantly had exceeded intentions to invest. Rate of consumption clearly could not keep up with the surge of income in the developing world and as a result, savings rate of the developed world increased from 24% of nominal GDP in 1999 to 33% in 2006 and the savings rate of the developed world went faster than its investment rate (Greenspan, 2007).

The subprime mortgage market underwent explosive growth between 2001 and 2006 years. All investors in order to get higher yields kept increasing their demand for private-label mortgage-backed securities (hereafter MBS), which also caused sharp increases in the subprime share of the mortgage market (from around 8 percent in 2001 to 20 percent in 2006) and in the securitized share of the subprime mortgage market (from 54 percent in 2001 to 75 percent in 2006). According to Apak and Aytaç (2009), unreal financial system created by securitization and insurance transactions reached 120 trillion dollars and 15-18 trillion dollars of its was generated by USA economy. This dramatic growth of the subprime mortgage market and quality of the market became worse dramatically (Demyanyk and Hemert, 2008).

The fundamental factor creating the subprime mortgage crisis was the boom and bust cycle in housing prices. During the boom phase, rising prices encouraged lenders and investors to put ever more money at risk. The Credit Rating Agencies supported these investment decisions by posting ratings that undervalued the impact that falling house prices could have on subprime mortgage defaults. Second factor that pronounced broadened the impact of the subprime crisis was behavior of institutional investors to become intense the riskiness of their subprime MBS portfolios by means of extremely high leverage and by means of extreme maturity mismatches in their funding. This strategy for investment will unfortunately be crisis-prone independent of the underlying securities now we can give two examples in order to confirm this. First one is

that the U.S. Savings and Loan crisis of the 1980s arose from leveraged and maturity mismatched portfolios, although the underlying securities were prime mortgages with minor default risk. Second one is that the Long Term Capital Management crisis also arose from a leveraged and maturity mismatched portfolio, even though U.S. treasury bonds were a primary instrument (Jaffe, 2008).

Now that we focus on the economy particularly investment-unemployment structure of the some countries, Italy, Portugal, Greece and Spain, called Southern European Welfare Countries, were effected from crisis that have impacted all over the world.

Investments have gained importance over the past decade as the tool for accelerating growth and development of economies in transition. Many developing countries do not receive sufficient international investment because weak domestic policy frameworks discourage both foreign and domestic investment. This insufficiency has reached serious dimension due to the experienced global economic crisis.

Worldwide Foreign Direct Investment (FDI) flows have showed an impressive upward trend over the past two decades, which prompted the expansion of international production and the economies' globalization process (Santis and Vicarelli, 2007).

In 2008, according to the provisional data, published by UNCTAD, worldwide FDI fell 14,5% to 1,66 trillion dollars, due to the negative effects of the global financial crisis which has currently gripped economies. Due to global recession, the drop in company profits, the pessimistic prospects of the world economic growth in future, the diminution occurred in workforces, the decline in capital spending, all of which lead to a decrease in FDI (Invest in Spain, 2009).

When we examine economic situation of Spain, we see that residential construction is slowing sharply towards a level which is sustainable in the long run investors and consumers are also adjusting strongly to a marked deterioration in financial conditions in the wake of the international financial crisis, as well as to deteriorating job prospects (Economic Survey of Spain, 2008). According to the projection output may fall by 3½ per cent in 2009 and by a further ¼ per cent in 2010 before recovering at a slow rate in 2011. It is expected that the unemployment rate may peak close to 20% in 2010. Spain is one of the leading global economic powers: the 4th largest recipient of FDI among developed countries (World Investment Report, 2009).

FDI inflows to Spain increased sharply during 1980's as a result of entry into the European Economic Community. In 1994 the rate of investment inflows began to decline gradually, but recovered in 2000 in Spain. Six years following 2000 year saw a decline in FDI inflows. 2007 saw a sharp turn around of investment flows to Spain an increase. Gross foreign direct investment in Spain in 2008, according to the Ministry of Industry rose to 37,715 billion Euros, 0,4% more than the previous year. Net foreign direct investment reached to 34,543 billion Euros, 26,7% higher than in 2007. Specifically, disinvestment in 2008 decreased by 69,5%, reaching 3,113 billion Euros, in contrast to 10,196 billion Euros in the previous year (Invest in Spain, 2009).

Another Southern European Welfare Country, Greece has been deep impact of financial crisis which shook the confidence of households and businesses, which are reining in spending. Moreover, persistent structural imbalances, which are illustrated by the poor state of public finances and the large current account deficit, limit room for policy manoeuvre, and the country's vulnerability to the crisis increased because of Greece's exposure to South-Eastern Europe (Economic Survey of Greece, 2009). Since the effects of the global crisis gradually spread to the Greek economy, real GDP of Greece contracted in 2009. According to the OECD report, the present progress in the external environment should help activity to pick up slowly, and growth could accelerate in 2011. Furthermore, in the report it was seen that gross fixed capital formation of Greece was 4.6, -7.4, and -15.5 respectively 2007, 2008, 2009 years. According to the OECD's expectation for 2010 year and 2011 year, gross fixed capital formation will be -6,3 and 4,6 respectively in Greece. Despite the global financial crisis, FDI inflows in Greece registered a serious increase in 2008. According to Bank of Greece data, gross inflows of funds from foreign investors reached 6.48 million Euro, while net inflows reached 3.46 million Euro (www.investingreece.gov.gr).

When we look at unemployment rate of Greece, we see that it will be an increase in 2010. In 2010 this figure is expected to be 10,4% while unemployment rate of Greece was 9,3% in 2009. It is also expected to be 10,4% in 2011 years (Economic Survey of Greece, 2009).

Another Southern European Welfare Country, Portugal kept growing in the second quarter of 2009, but according to the OECD report, this growth will remain subdued as private sector deleveraging constrains the recovery. Thus, unemployment isn't unlikely to increase to around 10% in 2010 (Economic Outlook no: 86 Portugal, 2009). Portugal received significant foreign direct investment in the past decade. EU Member States are the main sources of FDI, particularly Spain, Germany, the United Kingdom and France. In the OECD's report, it was seen that gross fixed capital formation of Portugal was 3.1, -0.7, -13.6 respectively 2007, 2008, 2009 years. According to the OECD's expectation for 2010 year and 2011 year, gross fixed capital formation will be 0.4 and 2.9 respectively in Portugal. When we look at unemployment data of Portugal, we see that it was 9.2% in 2009 year. This figure will be reached to 10.1% by increasing at 9,7% in 2010.

According to the OECD report, although the recession started earlier in Italy then elsewhere, activity rebounded in the third quarter. With improved financial conditions, confidence has been rebuilt and domestic demand has been reinforced. Italian banks are exposed to low-risk products than those of other large countries, as originators but also as investors. The reason for this is partly in consequence of their conservative behavior and also of some regulatory and supervisory caution so banks have not closed or had not to be bailed out (Economic survey of Italy, 2009). In spite of some falls in wage costs, higher unit labor costs along with oil price upturn will keep within bounds the decline in inflation, while unemployment rises somewhat further. Italy was given high public debt but did not present a large – scale fiscal stimulus. The budget deficit, however, along with periodically weak revenues proceeds 5% of GDP and debt is expected to increase to 120% of GDP by 2011. Because of growth's picking up, significant fiscal consolidation efforts will be required from 2011 onwards (Economic Outlook no: 86 Italy, 2009).

When we look into the case of FDI of Italy, we can say that Italy is one of the most important countries in the world regarding FDI attraction. The privatization program led by the country and liberalization of the energy and telecommunications markets which offer interesting opportunities to investors, all of which lead to an increase in FDI of Italy. However, the foreign investment flow has slowed down in recent years and is expected to continue to decline over the next years due to the global financial crisis (<http://www.egypt-import-export.com/en/country-profiles/italy/investing>). FDI of Italy grew to \$19,6 billion in 2005 and reached \$39,2 billion in 2006. With this development, according to A.T. Kearney's 2007 Confidence Index, Italy was 5th largest recipient country of FDI in Europe <http://www.obeliskinvestmentproperty.com/Italy>. Gross fixed investment of Italy as percentage change from previous year was -12,6 in 2009. This figure is expected to be 0,6 and 4,0 respectively in 2010 and 2011 year (Economic Outlook no: 86 Italy, 2009).

2. THE EFFECTS OF THE CRISIS ON INVESTMENT AND UNEMPLOYMENT IN TURKISH ECONOMY

Labor is one of the most employed factors by obtaining the economic indicators. According to Doğan (1998) gross national product (GNP) of countries depends upon both employment and efficiency of labor factor. Labor is most important factor within GNP. Because the other production factors can not make any economic activity without labor factor during realization production. An increase at a rate of employment in developing countries such as Turkey provides economic growth. Because income enhances due to increase at a rate of investment. Increasing income raises consumption expenditures. Individuals due to increasing in their consumption expenditure firms also due to their increasing income pay too much tax. Because of this enlargement government getting more taxes makes an investment in the field of education, security, justice and medical. This provides economic growth. Key of economics growth is increase at not only a rate of employment but also investment.

Foreign direct investment is one of the most important ways in order to acquire advanced technology in developing countries. Foreign direct investments have serious impact in the process of advancement in the field of technology in developing countries. According to Findlay (1978) foreign direct investments increase rate of technologic advancement. This is supplied with the effect of advance technology which firms uses and management practice. According to Wang (1990) an increase in the level of knowledge which used in production is a function of direct foreign investments.

Lipsey and Kravis (1987) argue that the long-run relation exists between capital formation and growth rate providing efficiency use of investment by encouraging capital formation to occur next periods is support point of economy.

Table 1: Capital Movements Over 1980-2004 Period in Turkey

Year	Total Capital Movements (net)	Direct Investments	Portfolio Investments	Long-run Capital Movements	Short-run Capital Movements
1980	672	18	0	656	-2

Source: TCMB, www.tcmb.gov.tr

Table 1 shows capital movements over 1980-2004 periods in Turkish economy. According to Table 1, there had been increases in capital inflow except during the years those are consider as the Turkish economy in recession between 1980-2004. It seemed that there were increases at a rate of portfolio investment, long run capital movements and short run capital movements but there were serious decreases in crisis years.

Table 2: Domestic Savings and Fixed Capital Investments

Year	Domestic Savings	Fixed Capital Investments
1980	16,0	21,8
1981	18,3	19,8
1982	17,1	19,2
1983	16,5	20,1
1984	16,5	19,3
1985	18,9	20,1
1986	21,9	22,8
1987	23,9	24,6
1988	27,2	26,1
1989	22,1	22,5

1990	22,0	22,6
1991	21,4	23,7

Source: DPT, www.dpt.gov.tr

Table 2 shows relation between domestic savings and fixed capital investments. According to Table 2, when domestic savings' rate fell, fix capital investment also fell and vice versa.

Graph 1: Unemployment Rates

Source: OECD, www.oecd.org

Graph 1 shows us an ability to compare unemployment rate between Turkey and OECD countries. According to OECD's prediction for years 2010 and 2011, unemployment rate for both Turkey and OECD countries will increase. But this increase has reached stable position since last quarter of 2009

Table: 3 Gross Fixed Capital Formation and Unemployment Rates, 2005-2008

	2005	2006	2007	2008
Gross Fixed Capital Formation	20	22,1	21,600	21,500
Unemployment Rates: Total	10,2	9,9	9,8	11

Source: OECD, www.oecd.org

Table 3 shows data of unemployment rates and gross fixed capital investment over period 2005-2008. Because of current economic crisis, fixed capital investment has decreased and unemployment rate has increased.

According to the TÜİK study, a total of 3,471,000 people were unemployed in 2009, which means an increase of 860,000 people compared to the previous year. The unemployment rate rose by three percentage points to 14 percent.

Table 4: Turkey: Demand, Output and Prices

		2007	2008	2009	2010	2011	
	2006						
	Current prices TRL billion		Percentage changes, volume (1998 prices)

Gross fixed capital formation	169,0	3,1	-5,0	-21,3	4,1	9,7	
Final domestic demand	797,4	5,1	-0,8	-6,2	2,8	5,5	
Stockbuilding¹	- 1,8	0,6	0,3	-2,8	2,5	0,0	
Total domestic demand	795,6	5,7	-0,6	-8,8	5,3	5,6	
Exports of goods and services	171,9	7,3	2,3	-7,5	4,5	8,8	
Imports of goods and services	209,2	10,7	-3,8	-19,2	8,7	12,8	
Net exports¹	- 37,2	-1,3	1,5	3,6	-1,0	-1,0	
GDP at market prices	758,4	4,7	0,9	-6,5	3,7	4,6	
	–	6,2	11,7	6,5	5,5	5,6	
Consumer price index	–	8,8	10,4	6,3	5,7	5,3	
Private consumption deflator	–	6,6	10,3	5,6	5,6	5,4	
Unemployment rate	–	10,1	10,7	14,6	15,2	15,0	
Current account balance²	–	-5,9	-5,5	-1,9	-2,8	-3,3	

Note: National accounts are based on official chain-linked data. This introduces a discrepancy in the identity

between real demand components and GDP. For further details see *OECD Economic Outlook Sources*

and Methods (<http://www.oecd.org/eco/sources-and-methods>).

1. Contributions to changes in real GDP (percentage of real GDP in previous year), actual amount in the first

column.

2. As a percentage of GDP.

Source: OECD Economic Outlook 86 database.

According to the Table 4 fixed capital investment decreased in the ratio of 5% compared to previous year. This decrease reached to -21, 3% by keeping declining. At the same period unemployment rate reached to 14, 6% with an increase in the ratio of 36% in terms of previous year in 2009.

3. EMPIRICAL METHODOLOGY and RESULTS

We use to panel data analysis in this study. A longitudinal, or panel data set is one that follows a given sample of individuals over time, and thus provides multiple observations on each individual in the sample (Hsiao, 2003). Hsiao (2003) and Klevmarken (1989) list several benefits from using panel data. Some of these include the following:

- 1) Controlling for individual heterogeneity.
- 2) Panel data give more informative data, more variability, less collinearity among the variables, more degrees of freedom and more efficiency.
- 3) Panel data are better able to identify and measure effects that are simply not detectable in pure cross-section or pure time-series data.
- 4) Panel data models allow us to construct and test more complicated behavioral models than purely cross-section or time-series data.

Our central interest lies on testing whether the co-integration relation exists between unemployment level and the gross fixed capital formation (investment). The annual data covering the period of 1985-2008 for 19 OECD countries is used for empirical analysis. The countries consist of Turkey, Austria, Australia, Canada, Denmark, Finland, Germany, Greece, Ireland, Italy, Japan, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom and United States. We obtain both unemployment level (UN) and Gross Fixed Capital Formation (GFCF) used as investment rate obtained from OECD database.

Primarily, it is necessary to determine whether the variables used in the study have cross-section dependency or not. We used Breusch and Pagan (1980)'s cross-section LM testing in order to investigate the presence of cross section dependency between the variables used. Since number of cross-section observation is smaller number of time series observation in our model, it is take into accounted CDLM1 test of Pesaran (2004). CDLM1 test statistic is following as:

$$CDLM1 = T \cdot \sum_{i=1}^{N-1} \sum_{j=i+1}^N \hat{\rho}_{ij}^2 : \chi_{N \cdot (N-1)/2}^2 \text{ where } \hat{\rho}_{ij} \text{ is correlation of coefficient across residuals obtained}$$

from each regression estimated by OLS estimator. As can be seen from Table 5, we can not reject to the none of cross-section dependency between GFCF and UN variables since the probability values of all CDLM test statistics are bigger than at 0,05 significance level. Hence, we use first generation panel unit root test instead of second generation panel unit root test considering cross section dependency.

Table 5: Results of Breusch and Pagan LM Testing

Test stat	t-stat	p-value
CD _{LM1}	183,390	0,244
CD _{LM2}	0,669	0,251
CD _{LM}	-0,829	0,203

After determined the none of cross-section dependency, it is necessary to determine if the variables used in the study are stationary or not. Therefore in the study Im, Pesaran and Shin (2003) (hereafter IPS), Fisher-type test proposed first by Maddala and Wu (1999) (hereafter MW) then developed by Choi (2001), Levin, Lin and Chu (2002) (hereafter LLC), Hadri (2000)'s tests are performed as first generation tests. In general, type of panel unit root tests is based on the following regression:

$$\Delta Y_{i,t} = \beta_i \cdot Y_{i,t-1} + Z_{i,t} \cdot \gamma + u_{i,t} \quad (1)$$

where $i = 1, 2, \dots, N$ is individual, for each individual

$T = 1, 2, \dots, T$ time series observations are available, $Z_{i,t}$ is deterministic component and $u_{i,t}$ is error term.

The null hypothesis of this type is $\rho_i = 0$ for \forall_i . The first of first generation panel unit root tests is Levin, Lin and Chu (2002) (LLC thereafter) that allow for heterogeneity of individual deterministic effects and heterogeneous serial correlation structure of the error terms assuming homogeneous first order autoregressive parameters. They assume that both N and T tend to infinity but T increase at a faster rate, so $N/T \rightarrow 0$. They assume that each individual time series contains a unit root against the alternative hypothesis that each time series stationary. Thus, referring to the model (1), LLC assume homogeneous autoregressive coefficients between individual, i.e. $\beta_i = \beta$ for all i , and test the null hypothesis $H_0 : \beta_i = \beta = 0$ against the alternative $H_A : \beta_i = \beta \neq 0$ for all i . The structure of the LLC analysis may be specified as follows:

$$\Delta Y_{i,t} = \alpha_i + \beta_i \cdot Y_{i,t-1} + \delta_i \cdot \tau + \sum_{j=1}^{p_i} \phi_{ij} \cdot \Delta Y_{i,t-j} + u_{it} \quad i = 1, \dots, N \quad t = 1, \dots, T \quad (2)$$

where τ is trend, α_i is individual effects, $u_{i,t}$ is assumed to be independently distributed across individuals. LLC estimate to this regression using pooled OLS. In this regression deterministic components are an important source of heterogeneity since the coefficient of the lagged dependent variable is restricted to be homogeneous across all units in the panel (Barbieri, 2006). Other test, Im, Pesaran and Shin (2003) test allows for residual serial correlation and heterogeneity of the dynamics and error variances across units. Hypothesis of IPS may be specified as follows:

$$H_0 : \beta_i = \beta = 0 \quad H_A : \beta_i \neq 0 \quad \text{for all } i$$

The alternative hypothesis allows that for some (but not all) of individuals series to have unit roots. IPS compute separate unit root tests for the N cross-section units. IPS define their t -bar statistics as a simple average of the individual ADF statistics, t_i , for the null as: $\bar{t} = \sum_{i=1}^N t_i / N$

It is assumed that t_i are i.i.d and have finite mean and variance and $E(t_i)$, $\text{Var}(t_i)$ is computed using Monte-Carlo simulation technique. Other test Maddala and Wu (1999) consider deficiency of both the LLC and IPS frameworks and offer an alternative testing strategy (Barbieri, 2006). MW is based on a combination of the p-values of the test statistics for a unit root in each cross-sectional unit.

Hadri (2000) test permits an easy formulation for a residual based LM test of stationary. Hadri adopts the following components representation:

$$Y_{it} = Z'_{it} \cdot \gamma + r_{it} + \varepsilon_{it}$$

where Z_{it} is deterministic component, r_{it} is a random walk:

$$r_{it} = r_{i,t-1} + u_{it}$$

where $u_{it} : iid(0, \sigma_u^2)$ and $\varepsilon_{i,t}$ is stationary process. Hypothesis of Hadri test is different from other first generation tests. The null of hypothesis of trend stationary corresponds to the hypothesis that the random walk equals zero. Further, this test allows the disturbance terms to be heteroscedastic across i . The results of unit root tests for UN and GFCF variables are summarized in Table 6 and Table 7.

Table 6: First Generation Unit Root Tests for UN

First Generation Tests	Test-statistic	Prob. Value
LLC	-1,85 (-6,71)	0,03 (0,00)
IPS	-1,42 (-8,11)	0,07 (0,00)
ADF-Fisher	48,16 (135,96)	0,12 (0,00)
PP-Fisher	26,53 (106,79)	0,91 (0,00)
Hadri Z-stat.	7,21 (-0,52)	0,00 (0,69)

First difference of UN in parentheses.

Table 7: First Generation Unit Root Tests for GFCF

First Generation Tests	Test-statistic	Prob. Value
LLC	7,10 (-5,62)	1,00 (0,00)
IPS	8,98 (-7,36)	1,00 (0,00)
ADF-Fisher	7,26 (123,8)	1,00 (0,00)
PP-Fisher	9,65 (153,1)	1,00 (0,00)
Hadri Z-stat.	13,47 (0,36)	0,00 (0,00)

First difference of GFCF in parentheses.

As can be seen from Table 6 and Table 7, both UN and GFCF with individual intercept are nonstationary variables 1% and 5% significance levels. When we look first differences of used variables, we say that these variables are stationary at first difference is called difference stationary.

If the presence of a unit root is detected in the variables, then it is necessary to check for the presence of a cointegrating relationship among the variables. There are two types of panel cointegration tests in the literature. The first is similar to the Engle and Granger (1987) framework which includes testing the stationarity of the residuals from a levels regression. The second panel cointegration test is based on multivariate cointegration technique proposed by Johansen (1988).

Pedroni (1999, 2004) and Kao (1999) extend the Engle-Granger (1987) cointegration test. Kao(1999) presents DF and ADF type tests for the null hypothesis of no cointegration in panel data. Kao considers the special case where cointegration vectors are homogeneous between individuals. Thus the test don't allow for heterogeneity under alternative hypothesis. The DF type test from Kao follows the following model:

$$Y_{it} = \alpha_i + \beta \cdot X_{it} + \varepsilon_{i,t} \quad \text{where } i=1, \dots, N \text{ and } t=1, \dots, T. \quad (3)$$

Both Y_{it} and X_{it} are random walks. It follows that under the null hypothesis of no cointegration, the residual series, $\varepsilon_{i,t}$, should be nonstationary. The ADF type test from Kao is based on the estimated residuals of the

following equation: $\hat{\varepsilon}_{i,t} = \rho \cdot \hat{\varepsilon}_{i,t-1} + \sum_{j=1}^p \varphi_j \Delta \hat{\varepsilon}_{i,t-j} + v_{it}$ where $\hat{\varepsilon}_{i,t}$ is the estimated residual of equation (3) and p denotes number of the lags in ADF specification. To test whether Y_{it} and X_{it} are cointegrated based on DF or ADF test statistics, the null and the alternative hypotheses can be written as $H_0 : \rho = 1, H_A : \rho < 1$ respectively.

Pedroni (1999,2004) proposes a residual-based test for the null of cointegration for dynamic panels with multiple regressors in which the short run dynamics and the long run slope coefficients are permitted to be heterogeneous across individuals. The test allows for individual heterogeneous fixed effects and trend terms. Pedroni considers the use of seven residual-based panel cointegration statistics, four based on pooling the data along the within-dimension and three based on pooling along the between-dimension.

Johansen Fisher panel cointegration test combines individual Johansen's cointegration trace tests and maximum eigen value tests. In Johansen's multivariate cointegration technique, trace statistic tests for at most r cointegrating vectors among a system of $N > r$ time series, and the maximal eigen value statistic tests for exactly r cointegrating vectors against the alternative hypothesis of $r+1$ cointegrating vectors.

Johansen Fisher Panel Cointegration technique has an advantage when compared with Pedroni and Kao Panel Cointegration tests. It relaxes the assumption of a one cointegrating vector among the variables.

Table 8, Table 9 and Table 10 show results obtained from various panel cointegration tests. Table 8 shows results obtained from Kao Cointegration Test. Lag is selected automatically 2 lags by AIC with a max lag of 8. We reject to the null of hypothesis of no cointegration relation between used variables at 5% significance level.

Table 8: Kao Residual Cointegration Test

	t-Statistic	Prob.
ADF	-2.217138	0.0133
Residual variance	4.96E+10	
HAC variance	7.23E+10	

Table 9 shows results obtained from Pedroni Cointegration Test for without trend model. It is reject to the null of hypothesis of no cointegration relation between used variables at 5% significance level in terms of Panel v-statistics and Panel ADF-statistics.

Table 9: Pedroni Residual Cointegration Test

	Statistic	Prob.	Weighted Statistic	Prob.
Panel v-Statistic	3.797805	0.0001*	1.097118	0.1363
Panel rho-Statistic	-1.035422	0.1502	-0.035304	0.4859
Panel PP-Statistic	-0.676110	0.2495	-0.397201	0.3456
Panel ADF-Statistic	-2.676211	0.0037*	-3.985351	0.0000*

* stand for the level of significance at 5%. Lag lengths are chosen by Akaike Information Criterion (AIC).

Table 10 presents results of Johansen Fisher Panel Cointegration Test for the model without trend but with intercept. Both trace test and max-Eigen test reject the null of hypothesis of zero cointegrating vector. The hypothesis that there is one cointegrating vector cannot be rejected. Thus we could conclude that there exists a cointegrating relationship between investment and unemployment level.

Table 10: Johansen Fisher Panel Cointegration Test

Hypothesized No. of CE(s)	Fisher Stat.* (from trace test)	Prob.	Fisher Stat.* (from max-eigen test)	Prob.
r=0	78.24	0.0001	79.18	0.0001
r=1	35.94	0.5650	35.94	0.5650

* Probability values are computed using asymptotic Chi-square distribution. Lag length is selected as a 1 lag that is minus one of 2 lags obtained from Kao test.

4. CONCLUSION

Globalization tendencies occurred as a result of technological innovations in recent years affect the fix capital investment as well as all other investments. Also, the fix capital investment to be thought to bring up more in the future is the most important factor for accelerating and expansions of globalization. Like in many developing countries, fix capital investment accompanied by the change of sectoral structure in Turkey is the fundamental element which determines economical growth. Fix capital investment has shown a very rapid development in many developing and developed countries.

After the global economic crisis, tendency of dwindling in general occurred in the world economy. In this process macro economic targets were based on increasing production and employment instead of providing economic stabilization. In that way economic growth was aimed. Global recession has created negative impacts on mainly consumption and production concerning consumption, employment and investment.

In this study, 19 OECD countries which include Turkey is selected by employing panel data in order to test long run relation investment and unemployment by using cointegration tests. Panel data were obtained by selecting annual unemployment level and fixed capital formation between 1985-2008 periods. Firstly, unit root tests are applied in order to test series' stationarities. After testing unit root of series, cointegration tests are applied. According to the results of panel cointegration tests used in study, we accept to presence of a long-run relation between unemployment level and investment in selected 19 OECD countries over 1985-2008 periods.

As can be seen from obtained empirical results, in order to get over the crisis with minimum governments must be focused on fixed capital formation. By using efficiently it, governments can struggle with unemployment problem triggered by the crisis.

MARKETING STRATEGIES DURING RECESSION AND ECONOMIC CRISIS

Günel ÖNCE
Dokuz Eylül University, Turkey

Mehmet MARANGOZ
Çanakkale Onsekiz Mart Üniversitesi, Turkey

ABSTRACT

Recession is defined by economists as a decline in real annual gross domestic product (GDP) for a period of at least a six-months. As it is known, GDP is a measure of real amount of goods and services produced in an economy in a certain period of time. A decline in real economy means less production. Less production leads to less use of inputs of raw materials and semi-manufactures, an increased unemployment rate, a smaller percentage of capital stock to be divided for production, which results in a decrease in full capacity. In short, the decline in the amount of real production leads to a decline in the real income. In the marketing literature, recession means a decrease in demand.

Business and marketing managers cannot control the recession in the external economic environment, but they need to predict how their business will be affected by this recession and they should take precautions against it. Recession can affect national and international, small and large businesses in different ways at different levels. Differences in inflation and interest rates and different indicators in the economic environment will also affect these factors. Due to these changes in the economic environment and business, companies change their marketing strategies by making changes in marketing mix elements and target market. They become more sensitive to customer requests and requirements, and develop new products or implement downsizing strategies. The aim of this study is to examine the effects of the current global economic recession on business and marketing strategies, and to suggest remedial marketing strategies to cope with the global recession.

Key Words: Global Economic Crisis, Recession, Marketing Strategies

INTRODUCTION

Recently, the world has gone through periods of economic crisis. The most important ones are the Great Depression in 1929, the economic crisis of July 1997 in Asia, which had regional and global consequences, Turkish economic depression in 1994 and 2001, and recently the economic depression which started in USA in 2008 and spread gradually across the world. In times of economic crisis, consumer behavior and marketing strategies of companies are changing rapidly and this has important consequences. During a recession, consumers tend to consume less and save money whereas companies develop strategies in order to increase demand and reduce savings. The contradiction between this consumer behavior and those strategies adopted by companies makes it essential to examine the effects of recessions on the economy (Ang, 2001:263; Marangoz, Uluyol, 2010:83).

Companies continue to operate both in the internal environment which they can control and the external environment which they cannot control. One of the uncontrollable factors affecting the operations of companies is the economic environment. The fluctuations in the economic environment directly affect the activity of companies. The global crisis experienced today brought together global economic recession and this resulted in a decrease in demand, and business failure rate in Turkey came to the highest level in the last twenty five years. As long as these changes in the economic environment follow a predictable trend and can be pre-defined easily, companies can easily adapt to these changes and benefit from them.

Generally a crisis in economy is defined as 'recession'. In a state of recession, economic growth decelerates and gradually falls to negative values. In this case, employment rate begins to decline and the increase in

general prices start to decelerate. Technically, the state of recession is defined as a continuous decline in GDP for two or three consecutive months.(Arıkan, 2008: 12). Generally, the recession in local and regional levels directly affect companies. Since the recession experienced in national or regional level will have local and regional effects, solutions will also be local and regional. However, the global economic depression spreading the world since the beginning of 2008 is considered to be the greatest depression after the Great Depression globally experienced in 1929. This crisis affects national and international companies dramatically. In this aspect, it is different from other local or regional crises.

In the literature, there is a limited number of studies investigating the marketing strategies implemented by companies at times of recession. To date, there were crises at local (Turkey 1994-2001 crisis, etc.) and regional level (such as the Asian crisis) and there is a limited number of studies related to these crises. These studies generally examine the marketing strategies adopted during periods of economic crises. The number of studies directly examining the marketing strategies at times of recession is very limited both in national and foreign literature.

RECESSION IN GENERAL AND ITS CAUSES

According to the data published by the World Bank in January 2010, as a result of the global crisis which started in USA in 2008, it is estimated that, world GDP declined at a rate of 2.2% in year 2009 when compared to previous year. While developed countries contracted at a rate of 3.3%, developing countries continued to grow at a rate of 1.2%. However, in this group, growth occurred mainly in East and South Asian countries like China and India. Economic shrinkage was observed in Central Asian and Latin American countries and European countries which are not members of EU. It is estimated that in 2009, Turkish economy contracted at a rate of 5.8% in 2009 according to the World Bank and 6% according to the Medium Term Program. According to the estimates made by The Economist at the end of January 2010, among the 56 countries, 14 completed the year 2009 with positive growth while the majority 42 remained with negative growth. Turkey, with a decline rate of 6%, was the 12th among 56 countries, which means that it contracted more than 44 countries. (TISK Report, 2010). These data is a proof of an existing global recession. The main factors causing recession in an economy are as follows (Dursun, Nakip, 1997:17-18):

Decrease in total demand

A decrease in total demand leads to a decrease in the level of employment and causes a decrease in profit and income. If there is a great decrease in total demand, the economy will have to continue to operate under capacity and unemployment will therefore increase. If the decrease in total demand exceeds a period of six months, economic recession will occur. Total demand in an economy may decrease for several reasons. These are, briefly,

- The government and public institutions reduce the purchase of final products and services,
- Tax rates increase, therefore,
- The consumers' disposable income falls, and
- This leads to a decline in spending.
- Consumers tend to save money and so they cut down on their spendings.

As a result of all these reasons, decrease in total demand will cause an increase in final product stock because it cannot meet the total supply at the current price. This increase in the total supply will cause companies to reduce their inputs demand and investments, and they will also increase layoffs. A similar situation will arise for service companies. As a result, income will fall, unemployment will increase and the economy will enter a recession period.

Decrease in total supply

A second cause of recession is the decrease in total supply. It results in decreased production and increased unemployment. The basic factors leading to recession and decrease in total supply are briefly;

- Increasing prices of inputs of key importance, such as oil and energy.
- Shortage of inputs
- Tax increase,
- The application of anti-inflationary policies,

- Enterprises canalize their investments to countries where working conditions are more flexible, labour is cheaper and taxes are lower.

The Economic Effects of Recession

Simultaneous decrease in total supply and total demand will also cause recession in an economy. This will also result in decreased production and increased unemployment.

Whether production techniques are traditional or modern and regardless of the geography, sector and scale, economic recession affects all the institutions. Uncertainty of when the recession might end is the main obstacle for institutional enterprises and individual families who will clearly reduce their spendings. The main effects of a recession in economy can be summarized as follows: (Dursun, Nakip :1997:21-22):

Production loss: The first and the most direct effect of recession is the loss of production. Due to recession, when the production factors remain idle, economy will produce less than it can. This will lead to a loss of production. As a result of the loss of production, some of the requirements of the community will not be met, living standards will decrease, taxes directly or indirectly collected by the state will reduce.

Increased unemployment: The second effect of recession is the increase of unemployment. The decrease in sales will cause a decrease in revenues, and therefore, some companies will cease operations or narrow their activities. When unemployment exists for a long time, some psychological or social problems will arise in society. With the increase in unemployment, the number of unproductive people will increase and some of the unemployed people who were previously productive will also join the group of consumers and this will result in an increase in the number of employed people responsible for looking after those who are unemployed. This means that investment funds will have to be allocated to consumption, so the economic growth and development will slow down.

Decreased economic growth: Apart from unemployment and other psychological and social effects, decrease in economic growth will also lead to a loss in future production. When the economy goes into recession, investments also tend to decrease. The decrease in real production will result in a decrease in capital investment which is one of the key factors of future economic growth and development. Therefore, the economic growth and development in the future will slow down.

In order to cope with global, local or regional economic recession, companies must take various precautions. The strategies adopted in recession period are naturally different from the ones adopted at normal times. In times of recession, the most important and rapid change occur in marketing strategies.

MARKETING STRATEGIES DURING RECESSION AND ECONOMIC CRISIS

When there is a recession in an economy the first thing the companies do is to cut spendings. The first method that comes to mind to cut spendings is to reduce the number of staff and limit marketing spendings. However, companies can benefit from the recession period by following effective marketing strategies. In order to choose the best strategy during crisis period, the nature of the crisis must be understood well, the intensity of the competition with the competitor companies must be examined, the current status of the company must be assessed by SWOT analysis and the difficulties of the strategies to be applied in crisis must be considered. (Yagci, 2009:278).

During economic recession, companies must adapt their marketing strategies in accordance with the period if they want to gain market share and maintain their existing share. (Koksal, Ozgul, 2007). Since recession leads to significant changes in customer behaviour, the goal of the companies must be to stimulate demand and to create and produce new customers instead of creating and producing new products and services. This goal should have priority not only at the marketing department, but also at all departments within the company. To reduce the effects of recession, the product features and existing marketing programs should be reviewed (Dursun, Nakip, 1997:23). Recession affects both the sales and profits of companies and marketing strategies. Also, in shrinking markets, there is a tougher market competition and this affects competition strategies. At times of recession, with the changing marketing conditions, companies can apply the following marketing strategies related to marketing mix elements:(Ang et al. 2000, s.108)

Product Strategy

Product features and product lines should be reviewed. Doing so will help companies observe how their products perform in the market and which product characteristics are acquired positively by consumers. These activities might show the necessary changes on the product line and product features. With regard to products, some of the precautions that can be taken against recession are as follows: (Dursun, Nakip, 1997:24-25):

- Narrowing the product line.
- Launching more functional, cheaper products, and secondary brands in the market.
- Finding ways of using less input in the production in order to reduce costs.
- Applying quality discounts.

At times of recession, companies which are not financially powerful must not present new products to the market in order to fill in the gaps at their product line. There are several reasons why companies must not create new products. Firstly, the companies are already in a period of financial recession. Secondly, customers who are already affected by the crisis do not tend to buy new products. Thirdly, competitors do not fill in the gaps in the product line because they lack liquidity. (Ang et al. 2000, s.112). One of the primary goals of companies should be to present a wide scale of products and options which will meet customer needs and requirements at a maximum level. For launching a wide range of products to the target market, flexible product options based on flexible production systems can be the solution. During recession, marketing managers can analyze the surrounding target market to determine which factors affect (or are affected by) the product range and company's market performance. Therefore, with an external investigation to determine company's market share and product range, the following factors should be taken into account; (Titiz, 2003:116):

- The influence of population fluctuation on the product variety,
- How the demographic structure in the market affect the demand on product variety.
- Positive or negative effects of changing income levels on product variety.
- Analyzing the duration of products which are launched by the company or its competitors.

Price Strategy

For the consumers, price has a special importance especially at times of economic crises. At these times, companies should take radical decisions about their prices. The most common decision is to apply short-term discounts in order to increase sales volume. This situation decreases the profitability and may lead to problems if applied for a long time. At these times, two different pricing strategies can be applied; (Ang et al. 2000; Hruzova, 2009:10):

• High quality, low price: Although it results in a loss of customers with low income, the main consideration is the quality of the product. Once the economic conditions improve, it will be easier to expand the product line and increase prices.

• Low quality, low price: It is a suitable strategy to increase or maintain the existing market share in times of recession. After the economic conditions improve, it is rather difficult to increase market share. Therefore, companies should adopt different strategies(discounts, gifts...etc.) instead of making permanent price reductions.

At the time of recession, some sectors may reduce prices whereas some others may increase. This entirely depends on product features and the structure of target customers (Piercy et al. 2010:5). Companies must review and regulate their prices taking into account the target consumers (Kambil, 2008: 51). The current pricing structure of the company may aggravate the negative effects of recession on the company. In recession periods with respect to pricing strategies, sales and revenues may be increased by (Dursun Nakip, 1997:259):

- Price discrimination between different products
- Resorting to discounts where possible,
- Reducing prices,
- Promoting sales by credit,
- Centralizing pricing decisions,

However, it should not be taken for granted that any change in the structure of pricing may affect the image of the product and the company negatively and customers may regard these discounts as decreasing quality.

Promotion Strategy

Customers tend to change their buying behaviors and habits at times of recession. Therefore, promotion strategies must aim not only to maintain existing customers but also to gain new customers. Customers prefer to obtain more information at times of economic crisis. For this reason, in order to gain customer's confidence, companies should provide information about the security, reliability and usefulness of their products (Hruzova, 2009:12). This strategy is particularly important in the preservation of existing customers.

At times of recession, remarketing activities should be intensified by promotions. Also, by increasing promotion activities the amount of demand will be increased. The product's features, functions and cheapness (if there is price reduction) should be emphasized and customers must be informed about how the product meets their needs. If necessary, the method of planning the promotion budget should be changed. Planning the promotion budget as a percentage of the previous year or expected sales will lead to the inadequacy of the budget and so the sales will be affected negatively at the time of recession. Therefore, the promotion budget should be determined according to objective criteria and methods. Each potential customer or customer group should be carefully examined and should be encouraged to purchase products. Selling power also plays an important role at the time of recession. It should encourage to work more effectively and efficiently and should trigger the increase of sales. (Dursun, Nakip, 1997:25-26). In order to overcome the crisis period of recession, advertising and marketing efforts should be enhanced. The strategies adopted by the companies which successfully coped with 2001 economic crises in Turkey are briefly as follows (Ugur, 2009:23):

- *Dove* increased market share of 9.8 % to 15.7% in 2002 by increasing the share of soap brands from 17 % to 50% in TV commercials
- *Akbank* emphasized trust, loyalty and friendship at the time of crisis and increased the number of its customers from 3750 (pre-crisis) to 4800.
- *Alo* targeted at customers who use their washing machines daily, increased the number of its commercials and increased its market share of 3.5% in 1999 to 16.5% in 2001 despite the crisis.
- *Petrol Ofisi* (PO) renewed its logo and increased its market share with new products first by 20% then by 36%, thus increased its net sales by 89% in 2001.
- *Renault Scenic* increased its market share from 2.1% to 3.8% by starting a promotion in 1998 and continuing it in 2001.
- *Garanti Bank* launched Bonus Card in 2001 and with the help of TV commercials and ads increased the number of its member stores to 17.000. Its total revenue increased at 144% in the first nine months of 2002.
- *Turkcell* launched the 'Free Girl' campaign in September 2000 and increased the number of its customers by 46% in 2002 by adding Tarkan to its promotion campaign.

Despite these gains, the majority of companies tend to cut advertisement budgets as a method of saving. However, when the advertisement budget is reduced the sales decrease and the stock increase. And when the competitors continue advertising, the market share decreases. Indeed, while advertising spendings decline globally, successful companies like P & G and Unilever (the world's two largest advertising companies) resumed advertising spending in crisis. In order to maintain their leadership during recession, the world's best and leading brands resumed advertising spendings in times of crisis (Piercy et al. 2010: 5). When the crisis ends, companies which do not stop advertisements are among the most successful ones.

Companies should reconsider their communication strategies in times of economic crises. Instead of using traditional advertising mediums like TV, companies such as P & G, Unilever and Kimberly-Clark used online communication mediums to promote their new products targeting especially young customers. By not using traditional ways of advertising, these companies had achieved a great amount of savings. At times of crises and recession, digital communication prevails and it becomes difficult to coordinate between various mediums of communication (Piercy et al. 2010: 16).

Distribution Strategy

At the time of recession, the distribution system should also be reconsidered. Companies can increase the sales and revenues by shortening the channels of distribution. Distribution costs can be reduced by directly

presenting the product to the customer or eliminating the ineffective resellers from the distribution line. When distribution costs decrease, it is reflected on the prices and this leads to an increase in sales and revenue. However, this strategy is considered to be risky since the eliminated resellers may go counter to the company and its distribution line and may start to work with the competitors. Therefore, before taking such decisions, it is important to try to estimate the duration of the recession, and determine the short-term and long-term gains and losses (Dursun, Nakip, 1997:26).

At the time of recession, different distribution channel strategies can be applied. For example during the Great Depression in the United States during the 1930s, the number of self-service retailers increased. Today, in Sweden, it is possible to see that self-service is gaining prevalence. Moreover, nowadays, non-store sales activities (by phone, e-mail, door to door, etc..)are also increasing rapidly. Non-store retail sale can generally be a cheaper way to appeal to a large number of customers. (Hruzova, 2009:11-12). For example, internet marketing is a very simple, effective and cheap way to appeal to a large number of customers at one time.

Competition Strategy

Each problem faced by a company can bring with it some new opportunities. Recession can reduce the sales of some products while it increases the need for some others. Therefore, it is important to assess what opportunities are created by recession and how the company can benefit from them effectively. Type of self-made products, stores with limited product variety and cheaper generic products are among those opportunities. (Dursun, Nakip, 1997:26).

At times of recession, companies must withdraw from the markets where they are weak and get stronger in the markets where they are leaders and where they are strong. With limited resources, the companies must stock their products and combine the same or the similar activities. At times of recession, companies must choose markets with the highest potentials and canalize their resources to these markets. Companies which have competitive power must increase their competition abilities. Markets that do not grow and the operations in these markets must be eliminated. Resources gained from the withdrawn markets must be transferred to the financing of strong and reliable markets (Ang et al. 2000:109).

When there is recession or crisis in an economy, weaker competitors in the sector of goods and services withdraw from the market. While the market is being rearranged, the biggest competitors strengthen their positions in the market. For example, recession creates opportunities for some manufacturing companies while it exterminates some others. Strong companies get stronger by buying small companies and they get a stronger position in the market in this way (Piercy, 2010: 9).

The Significance of Customer Relations

Economic recession affects customers not only financially but also psychologically (köksal, özgül, 2007). It is observed that during these periods customers become more sensitive to the prices of the products. In such a case, it can be beneficial to encourage credit card usage and create a pricing system which will psychologically affect consumers' cost-oriented perceptions. (Altunışık et al. 2003:330). According to Ang et al. (2000) buying behaviors of people change at times of economic crisis. During this period, people begin to worry about their jobs and they tend to save their money. According to a study conducted by Nielsen Company (2009), the basic thing that people never entirely stop consuming is food (Hruzova, 2009:1). People start to worry about the future and avoid shopping and spending money. Even if they do shopping, they only buy habitual goods and services. At these times, customers are highly money-oriented. (Hruzova, 2009:7). Customers' buying behavior changes at times of crisis and persists long after the crisis ends (Piercy et al. 2010:6). At the time of recession, the changes observed in consumers' buying behaviors can be summarized as follows; (Dursun, Nakip, 1997:23-24):

- Instead of buying new products, consumers tend to content with what they have, or try to repair their goods or get them repaired.
- They prefer the cheaper substitute of the product.
- They tend to buy from reseller institutions which have discounted prices
- They turn to cheaper brands
- They tend to give importance to the durability and affordability of the products

Because of such changes in customer behaviors, the target consumers should be reinvestigated and if necessary, the definition of consumer groups should be changed. The identification of the target group(s)

may alone enhance the performance of the company and determining the factors affecting consumers' attitudes and expectations may help with the better understanding of the target group.

Entering into new markets

Economic crisis also create opportunities for purchases. In such periods, companies which are new or late in breaking into the market can catch up with the market leaders with the help of purchases. On the other hand, combinations and purchases can be an important and alternative strategy of entering new markets and strengthening their market positions. In times of recession, companies must look for the ways to enter growing and developing markets from their local market. (Ang, et al. 2000, 10-110). For example, in the first six months of 2009, the export of Turkey fell 30.6% when compared to the same period of the previous year. Therefore, Turkish exporting companies started to search for alternative markets and especially the percentage of export to the North African region increased at 35% when although it fell in the other markets (Kalkan vand Ülke, 2009; 3) . Within the framework of market diversification, in 2009 it is expected than some countries will gain importance as new export markets. Among these are Azerbaijan, Algeria, China, France, Holland, Italy, Qatar, Kazakhstan, Mexico, Egypt, Uzbekistan, Russia, Saudi Arabia, Turkmenistan and Ukraine (Acar, 2009; 3).

CONCLUSION AND SUGGESTIONS FOR SOLUTIONS

In times of good economic conditions, it is not difficult for companies to increase their revenues. When the whole market is growing, companies can also grow easily. However, when the economy is weak, it is essential to create and implement an effective marketing plan. There are some strategies which are appropriate to be implemented at times of recession.. These strategies focus specifically on the following topics (Ang et al. 2000:117):

- Defining the target market more clearly
- Reducing unnecessary spendings by eliminating unnecessary products and ineffective distribution channels.
- Conducting activities which will increase productivity,
- Focusing on more competitive products.
- Shifting to more profitable customers.
- Being closer to the consumers and investigating their needs and requirements more effectively.

Both in periods of economic crisis and in normal times, companies must regard advertising not as an expenditure but as a kind of investment. It is a well-known fact that economic crisis is a difficult period for countries, economies, companies and even for individuals. But the real issue is how to survive from the crisis with the least damage. Companies must develop original marketing strategies

At times of recession, most companies tend to reduce expenditures. Advertising expenditure is generally among those which is reduced first. Because senior managers (especially the ones who are finance-based) regard advertising not as a profit generating medium but as a defence and insurance against the competitors. In this classical approach, marketing and advertising budgets are designated as a proportion of the expected revenue. However, a higher marketing budget means a higher revenue. In order not to experience bad surprises, companies must be aware of 'recession marketing' techniques and in addition to the strategies presented below, they must avoid the following issues (Büyük, 2003; Karata, 2010):

- Reducing marketing budget is not a solution. The important thing is not to let the structure to become coarse. Companies should avoid unnecessary spendings such as the purchase of expensive furniture, business class flights for sales team, and plane for the company.
- Companies must never fall below the quality expectations of customers.
- Companies must not attempt to burden suppliers and retailers with the load of the recession. Otherwise, they can get their business partners grabbed by competitors.
- Companies must keep their products at low price for a period of time in order to prevent customers to shift to cheaper products.
- If they have enough resources, companies can get the advantage of the recession period in gaining market share.
- Research results show that if companies continue their marketing spendings in the period of recession they become stronger in the market after recession.
- By a good analyze of expenditures, companies must gain savings from true costs. It is observed that if companies analyze the business processes and cost items created by these processes they manage to

create more value. By examining customer operations and the economy of customer relations, institutions can do a more effective cause-effect analysis, and can build up an index of areas where savings can be possible. Instead of an overall saving strategy which can affect the quality of service supplied to the customer, companies must improve the internal processes or change them if necessary. In this way, customers will be affected by the level of quality at a minimum level.

- Suppliers can be used for lower and flexible costs. Studies show that companies become more successful if they focus on their own specialized areas and give the other special responsibilities to other specialized institutions. Such companies gain savings especially at short-term costs.
- Customers supporting growth must be examined. In times of crisis, it is important to review the service supplied to unprofitable customers who cause high operational costs. During The Far Eastern crisis in 1997, Singapore Airlines limited the number of short-distance flights.
- The distribution of marketing channels should be optimized. If they want to gain leadership in the market, companies with multiple distribution channels must constantly control these channels in order to see whether they are suitable to reach to the customers. It is important to have the most effective distribution channel which is necessary for the most successful customer relations.
- At difficult times, it is important not to stop allocating resources for research and development and innovation. The US-based Gillette Company, launched its shaving product 'Sensor' in the early 1990s, when there was recession in economy. Until 1997, 49% of Gillette's sales revenue consists of new products which were launched in the last five years. In 2001 recession period, Intel, allocated 14% of its sales for product innovation investments in order to produce faster, cheaper and smaller computer chips. In the 2001 recession period, Intel, allocated 14% of sales devoted to investment in product innovation. This was the period of Intel's highest growth since 1996. Investments made during this period are Intel's highest growth since 1996 is the period recorded.

Some other solutions can be suggested, but recessions and economic crisis mostly cause restrictions rather than opportunities. For this reason, as a management strategy, in order to strengthen their defence, companies must adopt some offensive strategies. As a marketing strategy, companies must adopt adaptation and improvement strategies (adaptation or rehabilitation) in order to adapt to the market and keep the existing customers. In this way it is possible to be successful in improving the market and in being affected by the crisis as little as possible. To sum up, it is significant to develop a strategic system without taking for granted the period after crisis or recession.

INFORMATION COMMUNICATION TECHNOLOGIES AND GLOBAL FINANCIAL CRISIS

**Nurdan Colakoğlu
Serkan Dilek**

Beykent University, Turkey

ABSTRACT

The purpose of this study is to search if Information Communication Technologies (ICT) have an important role on economic performance of countries by achieving productivity increases. 2007 Global Financial Crisis effected both advanced and less developed countries. But the countries, which have strong economic infrastructures containing both reel sectors and financial systems, would be effected less than the countries with weak ones. There is no doubt that strong real sectors and financial systems have high rates of productivity which can be realized by ICT investments. Therefore it can be said that these countries have strong economic infrastructures. We benchmarked the economic performances of OECD countries before and after the global financial system. By doing this benchmark we found affection degree of countries from global financial crisis. Also we used ICT data about the countries to measure the ICT infrastructure of countries. We constructed a model which suggests that the countries with strong ICT infrastructures would be affected less from external schocks such as global crisis. In addition we investigate if there is significant relationship between affection degrees and ICT infrastructures of countries by using SPSS 16.00 statistical package programme.

Keywords: *New Economy, ICT investments, Computer Revolution, Productivity*

INTRODUCTION

We are witnessing new era in which Information Communication Technologies (ICT) change all living styles, rules, institutions, culture and economic infrastructures (Dura and Atik,2002,61; Kutlu and Taban, 2007,13). According to many scholars, heavy investments in ICT have changed the rules of economy radically. These scholars notify that the superior performance of the US economy in late 1990's is the product of ICT investments. Because ICT investments caused an acceleration in labor productivity so that US economy achieved economic growth, which is higher than 4 percent, with low unemployment and low inflation rates. Therefore many researches have been published that deal with the contribution of information and communication technology (ICT) to economic growth and to labour and multi-factor productivity (Dilek and others,2009; Pilat,2004).

The world is witnessing the worst financial and economic crisis since the great depression. In 2007 US and advanced economies found themselves facing financial crisis. Banks and other financial institutions would ultimately lose billions of Dollars from their exposure to subprime mortgage market loans. Because of high default rates on subprime mortgages, Investment bank Lehman Brothers went bankrupt in 2008 and many financial institutions were bailed out by governments.

This paper aims to measure if countries, which use ICT widely in their businesses and industries, effected less from the global financial crisis. The results will show if there is strong link between productivity and economic growth. For that reason we used economical data that is obtained from IMF and Worldbank sources, then developed the scale that measures ICT infrastructure. Our hypothesis depend on benchmarking of affection degree and ICT infrastructures of countries. These data are interpreted by using SPSS 16.00 statistical package programme.

NEW ECONOMY

Technological improvements create very important effects on economy, enterprise management and society. Nowadays ICT is a sector that acts as a motor in economy. As a result of the improvements in ICT, the clear and constant effects experienced in economy made a lot of conceptions that are necessary to be redefined in micro and macro levels (Kevük,2006;319). The changes, that occurred on ICT, affect the all sectors of economy. During 1995-1999, US productivity growth experienced a strong revival and achieved growth rates that exceed that of 1913-1972. According to many scholars, the internet and accompanying acceleration of technical change in computers and telecommunications changed the rules of economy radically. These changes created new economy that has equal importance, even more important than the Second Industrial Evolution of 1860-1900 (Gordon,2000;50). According to Sari (2007;659), the impact of internet on economic growth and development is similar to the impact of the worldwide usage of railways for transportation on economic growth.

There is not one definition of new economy. Because it is not a single idea of one author or one group of author. There is no general consensus among the economists using the term “new economy”. Bosworth and Triplett (2000;1) emphasize “The new economy discussion has been inconclusive, because the term new economy means different things to different people”. Several names such as information economy, Network economy, digital economy, intellectual economy, new economy, knowledge economy are used to define the economy climate that is created by the ICT revolution (Kevük,2006;321). But the most common name is new economy.

Stiroh (1999;4) grouped ideas into three broad versions of the new economy. These versions are a long run growth version, a business cycle version and sources of growth version. In all three versions, globalization and ICT are driving forces that are changing economic infrastructure. Long Run Growth version argues that economy will grow faster than before without increasing inflation. According to business cycle version NAIRU has fallen. Therefore economies can provide low inflation and low unemployment together. However this version has no clear explanation about how NAIRU was decreased. Finally, sources of growth version argue that important sectors benefit from increasing returns, externalities and network economies. In a network economy, investment of firm A increases the productivity of other firms. Therefore network economy allows for on going growth that can quickly outpace traditional explanations (Stiroh,1999;5-9).

New economy arose because of the improvement in ICT. So new economy is the direct result of the ability of higher bandwidth communication systems to allow computer to computer communications or networked computers. The new economy enables greater competition, productivity and high growth without inflation (Waverman and others,2005;13).

The most important utility of new economy is the effective mechanism of old economy. Internet and ICT decrease costs, increase competition, provide healthier working mechanism of markets, eliminate entry barriers for markets, organize information flow between buyers and sellers, help productive working of markets, provides economical usage of sources, increase economic efficiency. In other words, Full competitive market, which is defined with no entry and exit barriers, unlimited share of information, transaction with zero costs, can be reached because of internet (Sari,2007;661).

Another property of the new economy is the nature of knowledge goods costs. As production of knowledge goods increase, marginal costs decrease and come near to zero in new economy. So they have the similar properties of public goods. The cost of first production is very high, but the marginal cost of second and other productions are very low. However this decrease was limited in traditional economy. After certain degree of production, average costs started to increase again. For example the first production of software is high, but then it can be multiplied with only the cost of CD (Sari,2007,658; Kevük, 2006,329).

Widespread definition of new economy includes elasticity in labor market, a decrease in NAIRU, an increasing stability in GDP and prices, an increase in long run growth performance. Although traditional economy rules (Phillips curve) say that low inflation can be provided with only high inflation, in new economy rules are some different. The main reason of change in economy infrastructure is increasing productivity because of the usage of ICT, networks (Özgüler,2003;6-7).

PRODUCTIVITY

After the Computer revolution many scholars searched if ICT increased the productivity. Some of these researches found that ICT investments had no role in neither labor productivity nor multi factor productivity (Schrage,1997). Multi Factor Productivity increased 1.9 percent between the years 1948-1973, but the same number was only 0.2 percent (Triplett,1999;310). Solow said his famous aphorism to explain this reality. "You can see the computer age everywhere, but in the productivity statistics" (Keramati and Albadvi, 2006,813-814; Solow,1987).

According to Brynjolfsson (1996) the relationship could not be found because the quality of goods are not counted and also the effects of ICT investments can be seen in long run. Then Brynjolfsson and Hitt (1991) found significant relationship by counting good quality and lag in their model. Also other studies has shown how ICT investments may enhance labor and Multi Factor Productivity (Colecchia,2001; Bosworth and Triplett,2003; Gretton,2004; Baldwin,2004; Hempel,2002; Maliranta and Rouvinen,2004). The studies of Atrostic and Nguyen (2002) and Motohashi (2003) found that networks may increase the productivity statistics. Of Course the usage of ICT is effective when ICT investment is combined with other organisational changes, such as new strategies, new business processes and practices, and new organisational structures (Colecchia,2001; Black and Lynch, 2001; Falk,2001; Greenan and Guellec,1998; Arvanitis, 2004, Hempell and others, 2004).

Emprical studies showed that US productivity increase faster than German and French productivity. According to these studies German industry is %30 and French industry is %40 less effective than US industry. Generally the reasons of the higher labor productivity of US industry are elastic work applications, effective usage of ICT and effective competition climate (Salvatore,2005;59).

ICT revolution has similar impacts on economy, production and organization of firms with steam engine and electricity revolution (David,1990,355; Sari, 2007,658). Electricity and steam revolution enhanced economic growth by the increase in productivity. Both NeoClassical Growth theory and Endogeneous Theory indicates that Technological improvement is a key factor that determines sustainable economic growth (Çolakoğlu and Dilek,2009;1).

The first point we have to care about is the decrease on costs and prices because of the usage of ICT. The cheapest raw materials can be obtained easier, the supply chain works effectively and optimum inventory controls can be done by the usage of ICT. For these reasons firms find opportunity to work with less costs. Researches show that the goods such as books, CD, magazines etc. are sold with the %10 cheaper price in internet than in the retailing shops. Also the cost of a simple bank transaction is 1,27\$ when it is done in branches, 27 cent in ATM (Automated Teller Machine) and 1 cent in internet (Sari,2007;660).

Endogeneous growth theories started with the Pioneer study of Romer (1990). These theories accepts the importance of technological knowledge, human capital, Research and Development activities on providing sustainable economic growth. Emprical studies show that technological improvements are the most important part of the sustainable economic growth (Söylemez,2001;32). Schreyer (2000) investigated the contributions of ICT investments on economic growth by analyzing G-7 countries. There are other studies that deal with the contribution of ICT to output growth of countries (Mateucci and others;2005).

ICT INVESTMENTS

Economic theories have examined the importance of investment in public infrastructure. Some studies (DeLong and Summers,1991) confirmed that specific types of investment, such as public infrastructure and machinery and equipment, have a strong association with productivity and growth. Communication Technology is one of the important part of public infrastructure. So, investment in communication infrastructure such as ICT, generates a growth dividend because the spread of them reduces costs of interaction, expands market boundaries and expands information flows. Efficient communication networks have ultimate importance in modern management methods. Also widespread usage of new technologies provided new production methods and human resources management applications in work organizations, new relationship types between suppliers and customers, new financial methods which enhances high labor productivity (Salvatore,2005;63). For that reason, many studies have been done to measure the growth dividend of communication investments (Hardy,1980; Waverman and others,2005; Schreyer,2000; Roeller and Waverman,2001). These studies showed that communication systems generated economic growth by

enabling firms and individuals to increase productivity, to decrease transaction costs and firms to widen their markets (Waverman and others,2005;13).

Roeller and Waverman (2001) searched the impact on GDP of Telecom infrastructure investments in the OECD countries during 1970-1990 period. As a result of this study the positively significant relationship was found between GDP growth and Telecom demand. It is found that the spread of modern fixed line telecoms networks were alone responsible for one third of the economic growth between 1970 and 1990.

Waverman and others (2005), tested whether the roll out of mobile phone Networks had contribution to economic growth. They found that mobile telephony has a positive and significant impact on economic growth, and this impact may be twice as large in developing countries compared to developed countries.

Madden and Savage (1997) studied with the data of Central European Countries and examine the relationship between growth and economy-wide investment. Finally, they found a positive and significant relationship between aggregate telecommunication investment and economic growth. So improving the chronic underinvestment in the telecommunications infrastructures of these countries may ultimately improve the channel between aggregate investment and growth.

Collecia and Schreyer (2001), examined the contribution of ICT capital to economic growth in nine OECD countries by looking at investment trends in ICT equipment and software and at the role played by ICT in overall capital accumulation between 1980-2000. Contributions to growth are quantified in a growth accounting framework. ICT contributed between 0.2 and 0.5 percentage points per year to economic growth, depending on the country. During the second half of the 1990s, this contribution rose to 0.3 to 0.9 percentage points per year. Effects of ICT on economic growth have clearly been the largest in the United States, followed only by Australia, Finland and Canada. But Germany, Italy, France and Japan have the lowest contribution of ICT to economic growth. There is evidence that new potential driving forces of growth such as ICT, require suitable framework conditions. Many of the same policy prescriptions that may allow the traditional factors of growth to work better are likely to be useful to improve framework conditions conducive to ICT and related technologies.

Hardy (1980) tried to reveal the effects of telephone on economic development by constructing a linear regression model between income per capita and the infrastructure of knowledge society (Dura and Atik, 2002;192-193). The regression equilibrium is like (1)

$$D_t = P_1(D_{t-1}) + P_2(T_{t-1}) + P_3(M_{t-1}) + E(D_t) \quad (1)$$

T= number of telephone per capita D=income per capita M=Radio number per 1000 person
E=error coefficient

METHODS

Data were provided from IMF and United Nations sources. We searched about only OECD countries to limit our study. Also we can find healthy and enough data by choosing these countries. Then ICT infrastructure of these countries is obtained from statistics which were published in World Development Report by World Bank. Finally the regression and relationship between internet users per 100 people and PC per 100 people are searched by using SPSS 16.00 statistical package programme. We utilized from previous studies that search about the relationship between telecommunication, ICT equipment and software (Collecia and Schreyer, 2001; Roeller and Waverman, 2001; Hardy, 1980; Waverman and others, 2005; Madden and Savage,1997). So we revealed if ICT investments and infrastructures effect economic performance of the countries.

Table 1 shows GDP per Capita of OECD countries. As it is seen 2007 Global Financial Crisis hit many of OECD countries. As it can be seen that Table 1 is prepared with current prices, not constant prices. So we neglect the effects of prices on GDP. As it is seen GDP of 28 countries decreased in 2009 according to 2008. Only GDP of Japan increased in this period. The decrease on GDP of Canada (-%11,97), Hungary (-%16,48), Iceland (-%28,48), Ireland (-%15,12), Mexico (-%20,37), Norway (-%16,04), Sweden (-%15,70), UK (-%19,21) are very interesting.

We have 2 suggestions in this study. First; ICT investments increase productivity. Second there is a strong link between economic growth and productivity. So, we searched if the countries that invest in ICT realized higher growth rates and were effected less by the global financial crisis.

Table 1. GDP Per Capita Currently (US\$) of OECD Countries

Country	2006	2007	2008	2009

Source: <http://www.imf.org/external/pubs/ft/weo/2010/01/weodata/weoselser.aspx?c=193%2c542%2c122%2c137%2c124%2c181%2c156%2c138%2c423%2c196%2c935%2c142%2c128%2c182%2c172%2c576%2c132%2c936%2c134%2c961%2c174%2c184%2c532%2c144%2c176%2c146%2c178%2c528%2c436%2c112%2c136%2c111%2c158&t=33> (date: 15.04.2010)

Table 2 shows internet users per 100 people. In Denmark, Netherland, Norway and Sweeden at least %80 of people use internet and therefore they are leading countries in this statistic. Other Northern European country Finland also has a higher rate on this statistic. Old Soviet Block countries (Czech Republic, Hungary and Poland) and South European Countries (France, Greece, Italy, Portugal, Turkey and Spain) have lower rates in this statistic. For 2007, the lowest rate is observed in Mexico. We found the average of Internet users per 100 people in OECD countries as 59,6 in 2007. Other continent's countries (Canada, Japan, Korea, New Zeland, US) have higher rates than the average except Australia and Mexico. Table 2 shows also personal computers per 100 people. We found the average of personal computers per 100 people in 2006 as 50,7. Old Soviet Block countries (Czech Republic, Poland and Hungary) again lower rates. But this time France has higher rates than other South European Countries (Greece, Italy, Portugal and Spain). For North European countries, again Denmark, Netherland, Sweeden have higher rates, but Finland and Norway have the rates which are near the average. Turkey has the lowest rate in this statistic. Turkey, Mexico, Greece, Portugal, Poland, Slovakia have low rates in both statistics. So they are behind other countries in computerization when we are witnessing knowledge era.

We used Table 2 for calculating ICT infrastructure of countries. For that reason the sum of internet users per 100 people between 2000-2006 and Personal Computers per 100 people between 2000-2006 was calculated. This sum is called as ICT infrastructure of countries. 2007 statistics about PC and internet has not been published yet. Therefore they can't be used in this analysis. Also it is meaningful to think that ICT infrastructure of countries between 2000-2006 can effect the economic performance of countries 2007 and later. Although Global financial crisis began in 2007 with the crash of financial institutions, it's effects are generally held after 2007. So we analysed the relationship between ICT infrastructure of countries between 2000-2006 and the GDP movements after 2006. In other words if ICT cause productivity and productivity

cause economic growth, then we will see that the countries with high ICT infrastructure will grow faster and be effected less from Global Financial Crisis.

ICT INFRASTRUCTURE AND THREE GROUPS

After calculation of economic infrastructure we sorted OECD countries according to their ICT infrastructure rates. This gives us opportunity to divide countries into three groups. ICT infrastructures and groups are shown in Table 3. We called first gorup as High Digitalized OECD Countries; second group as Medium Digitalized OECD Countries and Third group as Low Digitalized OECD Countries.

Table 3. Economic Infrastructures of Countries

High Digitalized OECD Countries			Medium Digitalized OECD Countries			Low Digitalized OECD Countries		
1	Switzerland	138,71	11	Luxembourg	109,85	21	Italy	66,28
2	US	130,42	12	Finland	106,56	22	Slovakia	58,56
3	Sweden	129,42	13	N.Zeland	103,42	23	Spain	54,56
4	Denmark	125,13	14	UK	102,99	24	Czech Republic	46,56
5	Netherland	121,70	15	Germany	99,13	25	Poland	37,56
6	Canada	119,28	16	Japan	97,42	26	Portugal	37,56
7	Australia	117,56	17	Austria	96,99	27	Hungary	36,84
8	Norway	117,27	18	France	77,71	28	Greece	25,84
9	Iceland	115,13	19	Belgium	76,99	29	Mexico	23,28
10	Korea	111,28	20	Ireland	76,27	30	Turkey	15,28
Average Shrank		%11,13	Average Shrank		%9,75	Average Shrank		%12,21

High Digitalized OECD Countries: These countries have higher economic infrastructure of other countries. So they are the part of global network, the barriers against good-service trade and capital movements are very weak. These provides both opportunity and threads for these countries. The members of these group are Switzerland, US, Sweeden, Denmark, Netherland, Canada, Norway, Australia, Iceland and Korea. Switzerland is the most digitalized country between OECD countries. It is observed that Sweedish, Danish, Canadian, Norwegian, Icelander and Korean economy shrank by higher than %10 in 2009 due to 2008. Their economy shrank by at average %11,13. This is not a low ratio. Although their economies have got the productivity advantages of ICT, another effect came into account. The reason of this shrank is globalization. These economies are more sensitive to the financial crisis than others, because of the improved Networks. This result will be subject for further academic studies.

Medium Digitalized OECD Countries: These countries have economic infrastructure rates between High Digitalized and low digitalized countries. The members of this group are Luxembourg, Finland, N.Zelland, UK, Germany, Japan, Ireland, France, Belgium, Austria. They are not linked into world as strong as high digitalized countries. Therefore they can protect themselves against global crisis easier than high digitalized countries. Luxembourgean, Finnish, Nez Zellandian, Irelander and UK economy shrank by higher than %10 in 2009 due to 2008. Japan's GDP increased in this period. Their economy shrank by at average %9,75. Even we exclude Japan GDP new mean becomes %11,26, not much higher than high digitalized countries. It is lower than the other two groups. Contemporary studies showed that ICT investments provide productivity gains. When we suggest that there is a strong link between productivity and economic performance of countries, then we should have seen that High Digitalized Countries with higher growth rates. But we didn't observed this solution.

Low Digitalized OECD Countries: These countries have the lowest economic infrastructure rates. The members of this group are Italy, Slovakia, Spain, Czech Republic, Poland, Portugal, Hungary, Greece, Mexico and Turkey. Their economy shrank by at average % 12,21. Spanish, Czech, Poland, Hungarian, Mexican and Turkish GDP decreased higher than %10 in 2009. Also in 2010 Global crisis hit Greece economy, but it was not seen in 2009 statistics. These countries are effected higher than the other countries. Because of the low ICT investments, these countries have not utilized from the productivity gains. Probably this is one of the reason why global crisis hit these countries strongly.

If ICT effected productivity and productivity effected economic growth then the countries with higher digitalization degree, would be affected more from the global crisis and their GDP would decrease. However the economy of medium digitalized OECD countries shrank less than the others. Because other factors such as institutional infrastructure, financial transparency, economy policy etc are more effective than productivity gain.

CONCLUSION

There are many studies which search about the relationship between ICT investment and productivity. If productivity effects economic growth, in other words if there is strong link between productivity and ICT investment then external schoks will effect the countries, that invest on ICT, less than other countries. First we divided countries into three groups according to their ICT investments. These groups are High, Medium and Low digitalized OECD countries. Then we searched if GDP of High Digitalized Countries decreased less than the others. We got results as below.

- 1-) GDP of High Digitalized Countries decreased more than GDP of Medium Digitalized Countries.
- 2-) GDP of High Digitalized Countries decreased less than GDP of Low Digitalized Countries.
- 3-) GDP of Medium Digitalized Countries decreased less than GDP of Low Digitalized Countries.

Although second and third result is expected by ones who believe in strong relationship between productivity and economic growth, first result does not defend this relationship. High Digitalized Countries have strong Networks with the rest of the world and they have lack of protection of Global Crisis. We estimated that the reason of first result is this lack of protection, but it should be proved by further studies.

As a result we could not confirm the link between productivity gain, which is obtained becuase of ICT investments, and economic growth. But the productivity gains of ICT could not be seen until Bresnahan and Brynjolfsson's studies in 1990's. We hope that further studies will show the mechanism, which studies how productivity effect economic growth and prove the link between two variables.

ABSTRACT

The aim of this study, in which the personnel turnover rates in Turkish banking sector is examined for the periods before the crisis (2004-2006) and during the crisis (2007-2009), is to answer the question; “Is there any statistically meaningful difference between the personnel turnover ratios for the periods before and during the crisis in Turkish Banking Sector?”. In this scope, first the global crisis and personnel turnover concepts are examined; then the personnel turnover ratios of Turkish Banking sector for the periods before crisis (2004-2006) and during the crisis (2007-2009) are examined by Mann-Whitney U test. For description purposes the increases and decreases in personnel turnovers are shown by bar and line graphs. Finally, to make an international benchmarking the yearly personnel turnover ratios of the U.S. banks, which is accepted as the starting point of 2007 crisis, are compared to Turkish Banks’ by the help of graphs. The results of this study are given in “Conclusion and Evaluation” section in detail.

Keywords: Global crisis, personnel turnover, Turkish banking system.

INTRODUCTION

Economic crisis can arise in various forms like rapid downsizing in production, rapidly decreasing prices, bankruptcy, rapidly increasing unemployment ratio, decreasing salaries, stock-market decline, and bank crisis. Weak banking legitimate, complaisance and not satisfying standards of fundamental capital adequacy can be listed as the main reasons of financial crisis (Stiglitz, 2001: 12). Besides the effects of crisis in macro level it also causes many important problems in company level. One of these problems is its “negative effect on personnel turnover ratio”.

In this study, the banking sector, which has a great importance due to its big effect on country economy and high number of personnel, is chosen as the application area. The personnel turnover in the sector is examined for before and during crisis periods. In this scope, the hypothesis of the study is “there is not a statistically meaningful difference between the personnel turnover ratios of periods before (2004-2006) and during crisis (2007-2009) in Turkish Banking Sector”.

Global Crisis

When the history of crisis is examined, the World Economical Crisis in 1929 is accepted as the first crisis. The oil crisis at the beginning of 1970s caused a deep economical depression since recession and inflation were lived together (Güçlü and Ak, 2001: 913). After this crisis, the energy crisis related to the Iran Revolution in 1979 and stock market crisis of the U.S.A in 1987 occurred. Towards the end of this century, the crisis that enclosed the whole Asia and Latin America were lived. Then the new century has begun with

the global crisis that started in the banking sector due to the decreasing prices of the housing and the collapsing of mortgage system in the U.S. and spread out to the whole world. This crisis is the second biggest one, after World Economic Crisis in 1929 and it has been affecting all of the countries without making any discrimination between developed or developing countries (Alptekin, 2009: 1).

Turkey met the crisis first by living a serious crisis due to the World Economic Crisis in 1929 and the debts of Ottoman Empire (<http://www.atonet.org.tr/turkce/bulten/bulten.php3?sira=316>). After that period, Turkey experienced many other financial crises like the other countries, due to the “restructuring of the economy” and “financial freedom policy” applied to come out of the difficult and depressing times of political, economical and social turbulences (Armutlu, 2005: 1197). The 1982 Banker Crisis, April 1994 Crisis, February and November 2001 and finally 2007 crises have an important place in these crisis.

Personnel Turnover

The crisis always has serious effects on managerial issues. For example, a study on the impact of crisis on Norwegian banks showed that managers contributed to the crisis, due to a set of common managerial misrepresentations of the situation like “external attribution of failure, overoptimism and overconfidence, the confirmation trap, the illusion of control, irrational escalation of commitment and insufficient adjustment” (Lai, 1994:397-408). Besides these strategic human resources management becomes more important in such crisis periods. Thus, in this study, the impact of crisis on the personnel turnover ratio, which is one of the most important strategic management issues, is examined.

As a concept, personnel turnover is the ratio of the mobility of personnel in a specific period to the average personnel number in that period. Besides the effects of personnel turnover ratio in company level, it also has an effect on country economy especially on increasing unemployment. This subject has always been attractive for the labor planners in general. Because like the increasing temperature of the organism is an indicator of a problem, very high or low personnel turnover is an indicator for the managers telling that “there is something wrong in the operation of the organization” (Gaudet, 1960:12).

In general, personnel turnover has positive and negative effects on both the companies and the personnel. Positive effects are; providing new blood to the organization by the circulation of personnel, changing the personnel that are old or have health problems with stronger and younger ones, meeting the personnel’s career expectations by promoting them to the empty degrees, and contributing to the solution of their internal conflict. It is also seen as an application which helps to sustain the opportunity equity in business life (Saruhan, 1986: 50). Besides these positive effects, the negative effects of personnel turnover can be listed as follows:

- a) The “qualified labor” that is found in the quitting personnel, is reflected as an advantage to the competitors (Rigers and Myers, 1989: 306).
- b) Cause a delay in the operation of the company (Lam, Baum and Pine, 2003: 160–177).
- c) The “qualified labor” that is found in the personnel quitting, causes more expenses since the candidates will be less experienced and need training (Jones, 2005: 43–47).
- d) The anxiety and stress of the personnel that are dismissed or saved from dismissing, damage the organizational continuity and information flow (Aycan, Kabasakal, and Erkovan, 2009: 618).
- e) The assumption saying “the quitting personnel is less productive than the remaining personnel” causes “Hobo Syndrome”. This syndrome describes “the impulse of periodical migration from one job to another” and it is believed that the personnel turnover creates this impulse by instinct (Munasinghe and Sigman, 2004: 191-218).
- f) Decrease in the performance of the department that has lost their personnel because this would cause pressure and depression on the remaining personnel. The effects of this vicious circle make difficult to keep the remaining personnel (Coomber, and Barriball, 2007: 297–314).

In the Strategic Human Resources literature, the concept of “exiting” is used as synonymous of personnel turnover frequently. There are two types of “exiting”, which describes finishing the relations of personnel with his/her organization. The first one is quitting the job voluntarily; the second one is being dismissed. The high number of both types of exiting shows that there is a problem in the organization. But since this application is seen as a tool for decreasing the expenses, controlling the risks and uncertainties (Aycan, Kabasakal, and Erkovan, 2009: 618.), it is preferred frequently by the companies, especially in crisis periods (Asunakutlu and Dirlik, 2009: 49-51). Thus, in this study “personnel turnover” is examined from “exiting” point of view.

METHODS

In the study, it is examined whether there is a significant difference for the personnel turnover of Turkish Banks for the periods before (2004-2006) and during the crisis (2007-2009). In this scope, the personnel turnover ratios are calculated by using the “Bank, Branch and Personnel Information” quarterly statistics (for March, June, September and December) that are published by Turkish Banking Association (Turkish Banking Association, www.tbb.org.tr) for the period 2004-2009. In the first part of the analysis, the banks are examined in two groups as accepting and not accepting deposit, and then, the personnel turnovers are examined for all Turkish Banks. In the second part, the banks accepting deposit is examined by its subtitles as private, public and foreign banks.

Since the data is obtained by calculation, in the first two parts Mann-Whitney U test is applied, which is the nonparametric correspondence of t test. Besides these tests the increases and decreases of personnel turnovers for the respective data is described by bar and line graphs. In the third and last part, to make an international benchmarking the yearly personnel turnover ratios of the U.S. banks, which is accepted as the starting point of 2007 crisis, are compared to Turkish Banks’ by the help of graphs. The data for the U.S. is obtained from the web site of American Bankers Association (American Bankers Association, <http://www.aba.com/default.htm>). In this scope, the personnel turnovers are calculated by using the published data with the help of equation (1):

$$\text{PersonnelTurnoverRatio} = \frac{PE - PB}{APN} \quad (1)$$

PE : The number of personnel for the end of the period that is interested in.

PB : The number of personnel for the period before the one that is interested in.

APN : Average personnel number (Average of PE and PB)

FINDINGS

In this part, the Turkish Banks’ personnel turnover rates for all of the banks and sub units of the banks that accept deposit are examined separately. Then the personnel turnover rates of the Turkish Banks and the U.S. banks are examined and compared.

Personnel Turnover Ratios of Turkish Banks

In this part, first statistical analysis are done for the personnel turnover ratios of banks accepting and not accepting deposit for the periods before (2004-2006) and during (2007-2009) crisis by quarterly periods for each year. Then for comparison the bar and line graphs (see Figure 1 and Figure 2) of banks accepting and not accepting deposit are drawn. Finally the analysis is done for all of the banks as a total.

- **Banks Accepting Deposit**

To find out whether crisis has a significant effect on personnel turnover or not, 2004-2006 period is considered as before the crisis, and 2007-2009 period is considered as during the crisis period. As a result of Mann-Whitney U test, the value of test statistics, $U=62$ and its respective probability value is $P=0.59$. Since $P = 0.59 > \alpha = 0.05$, it can be concluded that there is no significant difference between the personnel turnover ratios of the periods before and during crisis for the banks that accept deposit.

- **Banks Not Accepting Deposit**

Similar to the analysis of banks accepting deposit, Mann-Whitney U test is used for the comparison of periods of before and during crisis for the banks that do not accept deposit. As a result of this test, $U=47$ and its respective probability value is $P=0.16$. Since $P = 0.16 > \alpha = 0.05$, it can be concluded that there is no significant difference between the personnel turnover ratios of the periods before and during crisis for the banks that do not accept deposit.

- **Comparison of Banks That Accept and Do not Accept Deposit**

When Figure 1 is examined, it can be seen that personnel turnover increases upto 2008 continuously, then it rapidly decreases to 2004 level for banks accepting deposit. The personnel turnover ratios for the banks that do not accept deposit take its minimum value in 2005. This value is negative, which shows that the personnel number is decreased compared to the previous year. The following years this value increases continuously, but in 2008 it rapidly decreases to 2004 level and it again becomes negative. This can be seen in Figure 2. When Figure 2 is examined, it can be concluded that there is a continuous increase in personnel turnover ratios until 2008 for both banks accepting and not accepting deposit and then there is a rapid decrease.

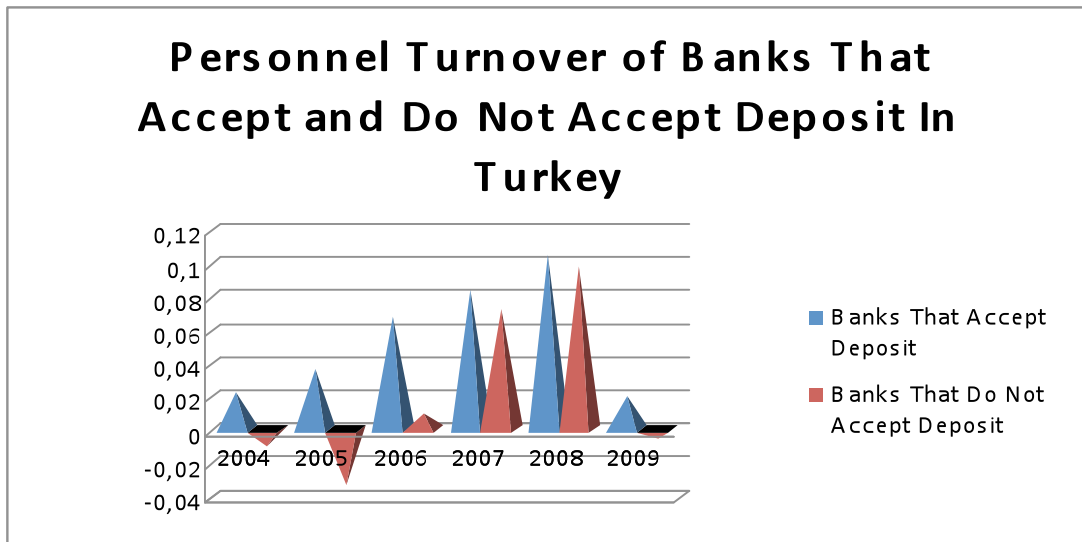

Figure 1. Bar Graph of Personnel Turnover for Banks Accepting and Not Accepting Deposit

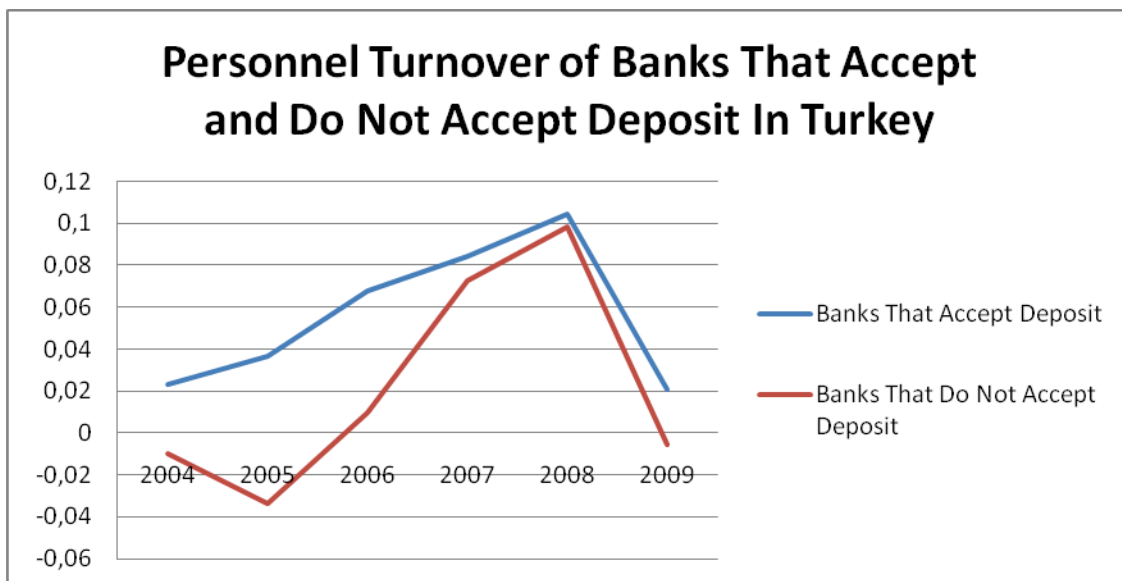

Figure 2. Line Graph of Personnel Turnover for Banks Accepting and Not Accepting Deposit

- **All Turkish Banks**

The results of Mann-Whitney U Test for all of the Turkish Banks (Accepting and Not Accepting Deposit) are $U = 61$ and its probability is $P = 0.551$. Since $P = 0.551 > \alpha = 0.05$, there is no significant difference between the personnel turnover ratios of the periods before and during crisis, when all of the Turkish banks are concerned.

Comparison of Personnel Turnovers of Sub-Units of Banks Accepting Deposit in Turkey

In this part, first the personnel turnovers of banks accepting deposit are evaluated within some of its sub-units, public banks, private banks and foreign banks, and then these banks are examined by the help of graphs given in Figure 3 and Figure 4.

- **Public Banks**

As a result of Mann-Whitney U test for public banks, the test statistics value is $U=35$ and the corresponding probability is $P=0.03$. Since $P = 0.03 < \alpha = 0.05$, it can be concluded that there is a significant difference for the personnel turnover of public banks when the periods before and during the crisis are concerned.

- **Private Banks**

As a result of Mann-Whitney U test for private banks, the test statistics value is $U=68$ and the corresponding probability is $P=0.843$. Since $P = 0.843 > \alpha = 0.05$, it can be concluded that there is no significant difference for the personnel turnover of private banks when the periods before and during the crisis are concerned.

- **Foreign Banks**

As a result of Mann-Whitney U test for foreign banks, the test statistics value is $U=57$ and the corresponding probability is $P=0.41$. Since $P = 0.41 > \alpha = 0.05$, it can be concluded that there is no significant difference for the personnel turnover of public banks when the periods before and during the crisis are concerned.

- **Comparison of Personnel Turnovers of Public, Private and Foreign Banks**

When Figure 3 is examined, it can be seen that especially between the years 2005-2008, the personnel turnover ratios of foreign banks are much higher than public and private banks. The ratio for public banks increases in 2008 and 2009 compared to the previous years. The ratio for private banks becomes negative only in 2007. This means; personnel number of private banks decreased in this year compared to the previous one. These changes in personnel turnover of the banks are also shown in Figure 4 by the line graph. Both Figure 3 and 4 show that while changes in personnel turnover ratios for public and private banks are parallel, the changes for foreign banks has more sudden upturns and downturns.

Figure 3. Bar Graph of Personnel Turnover Ratios for Public, Private and Foreign

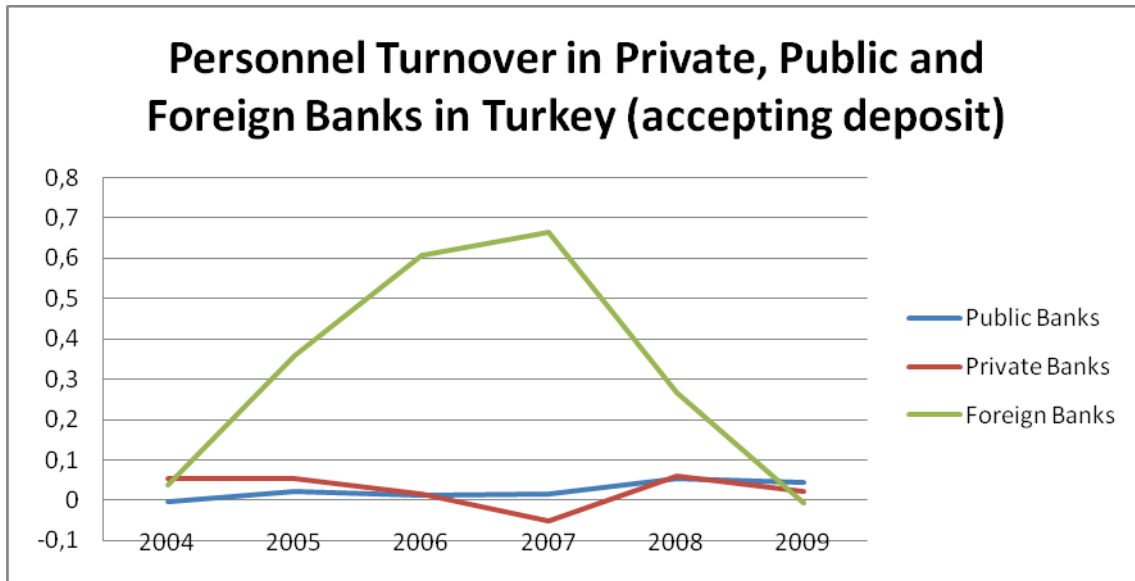

Figure 4. Line Graph of Personnel Turnover Ratios for Public, Private and Foreign

Comparison of Personnel Turnover Ratios of Turkish and the U.S. Banks

In this part, since the data for the U.S. was inadequate which was published in yearly basis, a statistical analysis cannot be done. But to be able to make a comparison between the behaviors of Turkish and the U.S. banks, bar and line graphs are drawn as seen in Figure 5 and Figure 6.

Figure 5. Bar Graph of Personnel Turnover Ratios for Turkish and the U.S. Banks

When Figure 5 is examined, it can be seen that there is a continuous upturn in Turkish Banks' personnel turnover ratios until the year 2008, but in 2009 there is a downturn approximately to the level of 2004. On the other side, the U.S. banks' personnel turnover ratios were almost in the same level in 2004-2006 but it decreased in 2007 and it took a negative value in 2008 and 2009. The personnel turnover ratio for the U.S. Banks had the minimum ratio in 2009. This can be also in the line graph given in Figure 6.

Figure 6. Line Graph of Personnel Turnover Ratios for Turkish and the U.S. Banks

CONCLUSION and EVALUATION

As a result of the analysis, it is found out that there is not a significant difference in personnel turnover ratios between the periods before and during the crisis when all of the Turkish Banks (accepting and not accepting deposit) is concerned. More clearly, we can conclude that, in the crisis period, banks did not choose to dismiss employees to decrease the expenses and increase the profitability. Despite this human resources strategy, the banks did not bear a loss and mostly sustained the profitability level of the period before the crisis.

In the study, the personnel turnovers are analyzed for also in the level of subtitles of banks accepting deposit, as private, public and foreign banks in detail. It is found out that there is not a significant difference in personnel turnover ratios between the periods before and during the crisis, when the private and foreign banks are concerned. On the other hand there is a significant difference in personnel turnover ratios for public banks but this result can also be explained by human resources strategies independent from crisis.

When the personnel turnover ratios of Turkish and the U.S. banking sector are compared for the crisis period, the result is found as expected. Since the global crisis has emerged and spread from the U.S. banking sector, it is natural that due to the damages and bankruptcies the employees in this sector had lost their jobs.

It is commonly accepted that “When compared to the other countries, Turkish economy managed the crisis more strategically and so not affected as much as many other countries”. This general assumption is valid for Turkish banking sector. The main reasons of why the effects of crisis on Turkish banking sector is low, can be summarized as follows:

The crisis that has occurred in 1980-2001 period in Turkey had deep and destructive traces on Turkish banking sector. Some structural and operational regulations were done for repairing this destruction and decreasing the fragility of the sector to make the sector ready for the new shocks and crisis. In this scope, Banking Regulation and Supervision Agency (BRSA) was established to organize and control the banking system and Savings Deposit Insurance Fund (SDIF) was established to preserve saver’s rights and benefits. Besides with new legal regulations the efficiency of these associations increased in time. For the public banks; restructuring process was started and the task damages were refined. So usage of these banks by the politicians for their personal benefits was avoided. As a result, financial risks were decreased to a manageable level, the transparency in the auditing system was increased, capital structure was strengthened by increasing the adequacy of sector’s capital and the fragile structure of the sector was eliminated.

STRATEGIC FINANCIAL LEADERSHIP: CAN IT TAKE US OUT OF GLOBAL CRISIS?

Korkmaz Uluçay
Beykent University, Turkey

ABSTRACT

The purpose of this study is to evaluate the level of trust to financial leaders who were mostly blamed for the current economic crisis. People believe Chief Financial Officers (hereafter CFOs) played a key role in this global crisis. To gain the trust of the people is essential for every leader. Financial leaders cannot be effective without full confidence of the people. Due to lack of confidence, people feel overwhelmed with problems.

The article proceeds in the following manner. First, the literature was briefly reviewed and the roles of CFOs were discussed. The hypothesis was developed concerning the effects of financial leadership in the current crisis. Then, the hypothesis was tested by using data from 384 people in Turkey. Finally, research findings were discussed considering their impacts.

Keywords: CFO; confidence; finance; financial crisis; financial leadership

INTRODUCTION

A leader can be defined as an individual with the ability to influence others. Without trust, a leader cannot achieve his goals. Leaders cannot be effective without full confidence of the constituencies that grant their institution its legitimacy, nor can capitalism function without trust (George, 2008). One of the CFO's primary tasks is the analysis of a wide range of financial issues, resulting in recommendations for action to the management team (Bragg, 2007).

The decline in confidence in financial leaders is outstanding. Nowadays we witness some governments have to bail out many financial institutions to keep the system from breaking down. Although it has been said the crisis was caused by complex instruments, the real reason was maybe the failures in leadership. While many experienced people in financial markets warned the leaders against the forthcoming danger, few were listening to them. In recent years, financial leaders felt forced to produce short-term profits, and massive short-term gains caused great losses.

FINANCIAL LEADERSHIP

Leading CFOs around the world say they need "it" to bring their teams to the next level in driving business performance within their organizations. "It" is Financial Leadership (Thomson, 2008). Some sources mention about the "six Cs of leadership credibility", which are *Conviction, Character, Care, Courage, Composure* and *Competence*. On the other hand, due to another classification, some harder skills, such as strategic planning, enterprise risk management, and continuous process improvement, and softer skills, such as negotiation, collaboration, and change management are often taken into consideration. The first responsibility of financial sector leaders is to create value for the owners of their companies. In doing so, they will make a series of decisions that are good for the economy as a whole.

Leadership really is a continuum, an opportunity to continually grow and improve your ability to influence others for the greater good (Thomson, 2008). The CFOs need to adapt quickly to new realities, changing themselves as well as their institutions, rather than going into denial when things do not go as intended. They should have the integrity to tell the truth, admit their mistakes, and acknowledge their shortcomings. Leadership is not about being perfect. It is having the courage to admit when you are wrong and to get on with solving problems, rather than covering them up. Resilience enables leaders to restore trust by empowering people to create new solutions that build great institutions for the future. Only then can people regain trust and confidence.

H: The current crisis caused a decline of the trust in financial leaders.

The CFO Team

As the leader you cannot perform all the functions yourself (Adair, 1983). Regarding financial leadership, CFOs are generally concerned that there is a gap between the current state of reality and the aspirations for their CFO teams in helping to drive business performance inside their organizations. Stakeholders would like their CFO teams to be more focused on decision support, helping to create wealth, and creating influence at the table as a strategic business partner while still ensuring a clean bill of health for the company financially (Boyle M. & Gaynor P., 2008). Today one can observe that the CFO team mainly focus on processing transactions. In fact, it is time to make changes in the traditional CFO roles and every day it is getting more important to be a strategic business partner. Developing skills on the CFO team, including financial leadership, can bring the organization to a upper level of performance in global marketplace. In order to achieve the desired goals, these skills should involve strategic planning, including integration of planning, budgeting, and forecasting; “predictive” analytics, including more advanced forecasting methods, competitive analysis, business intelligence, and data mining; enterprise risk management; financial statement quality assurance; greater integration with IT; project management to enable the CFO team’s leadership role on crossfunctional organizational initiatives; process management for key business processes; and “softer” skills, such as negotiation, collaboration, change management, and communication (Thomson, 2008). From an organizational perspective, that’s what financial leadership is all about. Besides, CFOs have to have a strong ability to work with other members of the company who are probably not directly supervised by them (Bragg, S. M., 2007).

Difficult times

Leadership and management are a lot easier when times are good, but organizational life runs in cycles, so like it or not, times are also going to be bad (Autry, 2001). In today’s challenging economic environment, it can be hard to justify an investment in the finance function. Leading CFOs know that a strong finance function is very important and it guides their companies through difficult times. The world has to face a new financial architecture and it is beyond the control of national governments. Recent financial crises have shown the need for new kinds of global financial regulation. On the other hand, times of crisis should not take attention away from the importance of transformation. In fact, being skilled in the business partner role is a very important competency for hard times.

Today’s chief financial officers (CFOs) face a complex and challenging business environment. In this environment, innovation is a must. Financial executives must play a leading role in accelerating strategic growth across the enterprise. CFOs are uniquely qualified to provide meaningful input to their organizations’ current and future investments, participate in the broader corporate vision, and advocate and produce strategic transformation. CFOs who understand this new requirement to be a catalyst agent of change—and to lead transformation across the enterprise—can create enormous competitive advantage for their corporations (Boyle M. and Gaynor P., 2008). Today, every CEO worth his salt wants to be transformational leader, in part because down in the canyons of Wall Street, a good leadership persona can add several billions to a company’s market capitalization (Dauphinais & Price, 1998).

Vision

The factory manager and the combat commander may be superb leaders, but many of their goals are set at higher levels (Gardner, 1993). The visionary leader may generate new views of the future and may be a genius at synthesizing and articulating them, but this makes a difference only when the vision has been successfully communicated throughout the organization and effectively institutionalized as a guiding principle (Bennis, Parikh & Lessem, 1994). The organizations require their CFOs to have the vision to look beyond the basic functions of finance and to drive new value and higher levels of business transformation and performance. You have to have a vision and you have to care – passionately (Peters & Austin 1985). CFOs have to deal with changes. Demands on the CFO’s role have been mounting for years. New pressures on the finance function, conflicting demands from different stakeholders, and increased business and personal risk have eroded job satisfaction for many and made it difficult to stay with one company for long. Then it’s ironic to note that the value of strong financial leadership— and the necessity for CFOs to participate in the business at a broad and strategic level—has never been greater (Boyle M. and Gaynor P., 2008).

Business partners

The CFO as a business partner does not have to neglect his/her other roles in the finance department. He/she anticipates changes in the business environment and uses every tool at his/her disposal to drive improvement and preparedness across the entire enterprise. This involves identifying the appropriate set of improvements—ones that are aligned with the business strategy—and putting in place measurement frameworks to gauge the success of those improvements and see that they return sufficient value. The central theme of being a true business partner is transformation (Boyle M. and Gaynor P., 2008). Through continual priorities and changes in the project portfolio, the CFO can make some adjustments that keep resource

utilization aligned with business strategy. In addition, updating capabilities, tools and skills within finance on a continuing basis, they can increase efficiency.

Strategists

With respect to formulating strategy, it may be true that, especially in larger organizations, only the more senior-level finance professionals are actually involved in creating or formulating the organization's strategy (Thomson, 2008). Actually, for a successful strategy, every worker at every level need to understand how their everyday work activities contribute to strategy. Strategic competency requires that the CFO focus on growing the business and returning shareholder value. The CFO is maybe the closest person to the chief executive officer (CEO) in the enterprise and he is always there whenever business strategy is discussed. The CFO must be a leader in the creation and use of information across the enterprise, including business intelligence and performance management techniques, to provide robust planning and forecasting, predictive analytics, and results monitoring (Boyle M. and Gaynor P., 2008).

RESEARCH

The survey sheets with 20 questions (except demographic information) were used for 500 people. They were workers in 37 different firms (banks, intermediaries etc.) in finance sector. The effective sample size of the study is 384. On the other hand, some data were also collected through face-to-face interviews with the CFOs of firms in the Turkish markets. The constructs in the study are developed by using measurement scales. The survey has three parts. First part is about demographic and general questions. Second part investigates the opinions and thoughts about the trust to financial leaders. Third part tries to find out how people think about the financial leaders to get out of the crisis. Five Likert Scale is used in second and third parts. The scales are

- I strictly disagree=1
- I disagree=2
- I have no idea=3
- I agree=4
- I strictly agree=5

First Part of Survey

Table 1: Sex Classification

	Frequency	Percent
Male	262	% 68.2
Female	122	%31.8
Total	384	% 100

Table 2: Education Level According to Sex

Education Level	General		Female		Male	
	Frequency	Percent	Frequency	Percent	Frequency	Percent
Primary-Secondary	0	0	0	0	0	0
Lycee	55	%14.3	17	%13.9	38	%14.5
Bachelor or more	329	%85.7	105	%86.1	224	%85.5
Total	384	%100	122	%100	262	%100

Table 3: Distribution According To Age

Age	Frequency	Percent
Less than 30	73	%19
30-39	161	%41.9
40-49	111	%28.9
50-59	39	%10.2
Total	384	%100

The first part of the survey, as mentioned, is about demographic characteristics. 262 (%68.2) of the participants are male, while 122 (%31.8) of them are female. The education levels of the participants according to their sex are given in Table 2. It is seen that most of the participants (%85.7) have at least bachelor degree. Since the firms in finance sector usually prefer to hire high educated people, there are no primary-secondary school graduates; they are at least graduated from Lycee. The ages of the participants are given in Table 3. Most of the participants (%41.9) are in the 30-39 years group. %19 of them are younger than 30 years and %28.9 of them are between 40-49 years. It is seen that almost % 90 of the workers are younger than 50 years. We can say that rather dynamic people are preferred in this sector.

Second Part of Survey

TRUST TO FINANCIAL LEADERS	Average
1. Financial leaders deserve to be trusted.	2.02
2. Financial leaders are innocent on the current global crisis.	1.99
3. Personal expectations of financial leaders played no role in global crisis.	2.09
4. Economic system did not force financial leaders to make mistakes.	2.15
5. Financial leaders care enough about institution interests.	2.57
6. Financial leaders care enough about workers interests.	1.98
7. Financial leaders care enough about country interests.	1.99
8. Financial leaders take no high risks before crisis.	2.01
9. Financial leaders were not aware of forthcoming crisis.	2.44
10. Financial leaders gave no misinformation during crisis.	2.31
11. Financial leaders were helpful about market information before crisis.	2.65
12. The current global crisis caused no decrease in the level of trust to financial leaders.	2.09

Looking at the answers given to the statements above, we can say there is a decrease in the level of trust to financial leaders. Considering that the participants are working in the finance sector, the results might be reviewed more outstanding. Especially, we can say, people do not believe that financial leaders think of the interests of workers and they do not think that they are innocent on the current global crisis. Not directly asked in the survey; but we witnessed during conversations with participants, it was clear most of them had the fear that they could lose their jobs during these days because of the crisis.

Third Part of Survey

SOLUTION TO CRISIS	Average
1. Financial leaders took lessons from the global crisis.	3.5
2. Financial leaders can help to get out of the global crisis.	2.4
3. Financial decisions of firms cannot affect the levels of unemployment.	2.1
4. No need for financial leaders to make more transparent decisions in the future.	2.1
5. No need for a new mechanism for coordination in financial markets.	2.5
6. No intensive control of financial leaders needed after crisis.	2.0
7. No need to reconsider the whole financial system.	1.8
8. No need for financial leaders to change their mindset.	1.9

Considering the results taken from the survey above, we can say people think that financial leaders took lessons from the crisis, but it is not easy to say that they believe they could take us out of it. It is also obvious that financial leaders should change the way of leading they were doing before. During interviews with CFOs, it is noticed that they were aware of the decline of trust and admit their faults, but still they think “only they” can take people out of the crisis. In addition, they say that their intensions were good and what they were doing, they thought, would be profitable for everyone.

CONCLUSION

We can say that the survey shows the financial leaders and the whole financial system can play a serious role to get out of the global crisis, but there are some changes to be made. First of all, there should be a change of mindset. Taking lessons from the current crisis, the financial leaders should place the interests of their institutions and society as a whole above their own interests. In order not to repeat the mistakes in the future, after changing the mindset, most probably a new leadership is needed.

As mentioned above, the CFOs think “only they” can take people out of the crisis. This might be true, because the skills they have, do not develop by accident. They are built over time by a sustained, focused program of financial leadership that invests continually in people, processes and technologies financially (Boyle M. & Gaynor P., 2008). They took risks, but maybe they had no other choices. Common sense managers see risk-taking as a natural prerequisite for success (Wartburg, 1991). We should keep in mind that CFO turnover is higher than ever nowadays.

Taking all the matters mentioned above into consideration, too, the leaders of institutions of international finance, today’s policymakers and finance ministers can find the right way somehow to get out of global crisis.

MANAGEMENT MEASURES TO BE TAKEN FOR THE ENTERPRISES IN DIFFICULTY DURING TIMES OF ECONOMIC CRISIS

Sudi Apak
Beykent University, Turkey

Mikail Erol and Gülgün Erkan
Çanakkale Onsekiz Mart University, Turkey

ABSTRACT

After the liberalization of capital movements, Turkish Economy went through a crisis in 1994. The process has ended up with the IMF stability program and the stand-by arrangement with the IMF after the financial crises on November 2000 and February 2001. The reason for the financial crisis that intensified in October 2008 in USA was the low-income housing policy of the USA government. The sliding currency policy implemented by USA before the crisis was misdirected.

In connection with the global crisis, there has been an economic recession in Turkey towards the end of 2008, and unemployment rate has increased rapidly albeit the economic stimulus packages proposed. Despite a leastwise stability in Turkish markets, the socioeconomic outcomes of the crisis have become more serious.

While those events in economy impacted upon the whole business world, small enterprises had great difficulties. Especially the ones that were taking debt in foreign currency went bankrupt.

In this paper, we discuss the measures to be taken for the enterprises in difficulty during times of economic crisis.

Keywords: *economic crisis, enterprises in difficulty, management measures*

INTRODUCTION

The failing of a firm under the circumstances of economic crisis encompasses a process including situations ranging from a firm's inability to administer its current account responsibilities for temporary causes to bankruptcy.

Measures to be taken for the improvement of the financial situation of a failing firm differ in accordance with the level of the enterprise's financial distress. Management can help and guide the enterprises in difficulty during times of economic crisis in certain ways with the aim of helping them survive.

Apart from the introduction, our study is divided into four parts. The first part deals with "Enterprises During Times of Economic Crisis", the second part with "Signs of Failure in Enterprises in Difficulty", the third part with "Decisions Made by Enterprises", and the fourth part with "Management Measures".

ECONOMIC CRISIS AND THE ENTERPRISES

Turkey took a remarkable step in foreign expansion policies with transition to convertibility in 1989. After the liberalization of capital movements, Turkish Economy went through a significant crisis in 1994. The

inflation increasingly reached %150, and Turkey entered into an economic recession. Right after these, the crises experienced in global economy (November 1998 Crisis and the Asian Crisis) influenced Turkey deeply.

Crisis means depression and despondency (Biçer, 2008: 90). Crisis is the tension which is unexpected and unforeseen, which threatens the existing values, aims and assumptions by making protection, prevention and adjustment mechanisms insufficient and which should be responded to immediately (www.forumpedi.net/halkla_iliskiler_ve_iletisim/kriz_nedir_2619.html). Crisis is the significant decrease of national income in a short time. Long-term crises are named as depression. Minus %1 growth is recession. Crisis arises from the divergence of real and unreal economy. Another definition is the divergence of financial and physical economy (<http://hurarsiv.hurriyet.com.tr/goster/haber.aspr?id=3708792yazanid=171>).

Economic crisis, on the other hand, is defined as the macro-economic depressions occurring during certain times unexpectedly or as the result of insufficient or wrong managerial decisions (Apak, 2009: 6). Another definition is the recession or depression in which an economy can not develop with its own resources and regresses (www.incefikir.com/index.asp?id=56888/).

Increases in the public sector borrowing requirement also led to the deepening of the crisis. The stand-by agreement signed with IMF in the beginning of 2000 was an effort to re-stabilize economy in the following three years. According to the agreement, the foreign exchange rate was to be determined as “peg”, and at the end of the first year an inflation rate which will be in harmony with the foreign exchange rate was to be fixed. At the end of the second year, it was to be permitted to move within the band regime (Erol, 2008: 1521).

In order to struggle with inflation, the structural harmonization programs were to be implemented in these three years. However, the program could not be implemented as planned. In November 2000, i.e. towards the end of the first year, a crisis emerged. Although there were efforts to escape it with little harm for a short period time, in February 2001 the ongoing stability program and the stand-by agreement with IMF ended due to the crises in the financial sector. Foreign exchange rate was freed under open market conditions and in a very short period of time Turkish Lira was devaluated at a high rate. All these economic events influenced all the enterprises, especially the small ones (Erol, 2008: 150).

In October 2008 the financial crisis that originated in USA influenced the whole world and all the sectors. The crisis influenced also Turkey where massive dismissals, bankruptcies occurred and businesses were closed. Both crises in economy and enterprises in difficulty have dominated the agenda in Turkey.

Phases of the crisis

In enterprises, crisis can occur in four different and distinct ways. Crises in enterprises consist of initial crisis phase, acute crisis phase, chronic crisis phase and recovery phase (Çetin, 2009: 1184).

Initial Crisis Phase: If there are warning signs of the crisis, this is the initial phase. In many examples, this phase is the turning point. If the turning point, i.e. the initial phase of the crisis goes unnoticed acute crisis emerges. In the initial crisis phase the enterprise should recognize the signs of the crisis and take measures accordingly. Irrespective of the signs in the initial crisis phase, the crisis management gets easier if they are noticed in due time.

Acute Crisis Phase: In many aspects, this is the phase in which it is impossible to return to the previous situation. The signs disappear and when an enterprise enters the acute phase it is impossible to regain what is lost till then. The degree of the subsequent damage depends on the management. The acute crisis phase is the phase when crisis is made a current issue.

Economic Crisis Phase: It is the period in which enterprises try to repair the damages of the crisis. For this reason, it is also called cleaning period. In this phase there is recovery, enterprises make analysis and they have suspects.

Recovery Phase: During this last period the enterprises observe the outcomes of the efforts to control the crisis. In the beginning of the initial phase, the crisis manager should find the direct and appropriate control mechanisms for resolving the crisis. In general, managers pay more attention to the acute and chronic crisis phases and think of recovering as fast as possible and ways of avoiding other possible crises.

SIGNS OF FAILURE IN ENTERPRISES IN DIFFICULTY

Signs of failure in enterprises in difficulty during times of economic crisis can be explained as follows (James, 1997: 1):

a- Economic Failure: It is possible to mention economic failure when operating incomes are less than total costs.

b- Company Failure: It happens when an enterprise can not meet its obligations to its creditors (Zenoff and Zwick, 1969: 127). In this respect, economic factors include choosing a wrong place and the circumstances of the industry, financial factors include high level of debt and inadequate capital and experience factor includes management and inexperience.

c- Technical Bankruptcy: An enterprise goes technical bankrupt when it can no more meet its obligations in due time and can not pay its due debts.

d- Bankruptcy: If the book value of an enterprise's obligations is more than its assets' market value, liquidation of the firm comes up.

DECISIONS MADE IN THE ENTERPRISE

Decision can be defined as a judgment reached after thinking on an issue or problem or as the policy adopted from among others in an institution, enterprise or in politics (www.cep-x.com/cep-x-sozcuk/138034-karar-nedir-karar-anlami.html). To make a decision is to choose the best among the existing options to solve a problem (Can and Tuncay, 1991: 291). Decision-making processes are divided into following groups: decision-making in risk environment, decision-making in uncertainty environment and decision-making in certainty environment.

On the other hand, we can group the types of decisions to be made by the enterprises under three titles (Ansoff, 1965: 9):

a- Strategic Decisions: These are the strategic decisions related to the existing and future system of an enterprise. Generally, these decisions concern the outside environment of the enterprise. Decisions about production and marketing fall under this category.

b- Administrative Decisions: These are the decisions related to the management of the enterprise. They concern the structure of the organization, charges and responsibilities, workflow, information flow and distribution.

c- Operating decisions: Production-oriented decisions made in the existing administrative processes including pricing to maximize profit, settling marketing strategies, determining the production methods and stock levels.

MANAGEMENT MEASURES

Management is the art and science of performing work by means of others (Can and Yaşar, 1995: 75). According to another definition, it is the coordination of the resources of an organization in order to attain a goal (Yüksel, 2003:58). Contemporary management techniques in enterprises include management for certain purposes, total quality management, exchange engineering, analogy and learning organizations (Yüksel, 2003: 88). Besides these, expectations from management especially during times of economic crisis can be explained as follows (Çetin, 2009: 1186-1188):

Strategic measures

Swot Analysis: By means of swot analysis the strengths, weaknesses, opportunities and threats of an enterprise and its state before and during the crisis can be evaluated, and the panic-stricken enterprise can be put at ease.

Barter system: In simple terms, barter is an exchange. According to its broader definition, barter is a modern and comprehensive funding tool (Örten, 1998: 10-11). By means of barter system, during the time of an economic crisis, an enterprise can secure its liquidity, have the opportunity to receive interest-free commodity credit, increase its competitive advantage in marketing, gain new customers, increase its profit, convert deferred claims into cash and take measures against inflation (Baysal, 1994: 11-14).

Planning: Managers should ascertain the state of the enterprise carefully. To achieve this aim, they should clearly determine what they will do and where they want to be in the middle and long-term and they should watch economic data closely. In this way, in case of an economic crisis, enterprises can implement their measures.

Product Diversification: In parallel with the plans of the enterprise, marketing goals should be determined according to the product groups. Profit goals, market share, product diversity and field of business activity should be pre-determined and measures should be taken accordingly.

Human Factor: No matter how developed an enterprise's technological infrastructure, it is human being who will take these opportunities and make the enterprise successful. For this reason, employees should be minded and continuously motivated. Otherwise, the enterprise might lose its staff in a small crisis.

Customer Satisfaction: The enterprise should exercise all due diligence to protect its reputation and should sustain close customer and public relations. Especially during times of crises, it should not restrict its customer services. Even a minor error in this respect might affect the future success of the enterprise adversely.

Cost-cutting measures

During times of crises, one of the biggest problems of the enterprises is liquidity shortage. Thus, measures to increase the liquidity of the enterprise should be taken. These measures include cutting the costs, avoiding unnecessary costs and to economize (Çetin, 2009: 1186). Cost-cutting measures are as follows:

Suspending Production: If there is less consumer demand than the supply of the enterprise and build-up of stocks, production might be suspended in order to avoid production costs and deplete stocks.

Downsizing of the Enterprise: The enterprise might maintain its activities in the fields where it is successful and suspend them in the fields where it is weak and, by this way, can avoid the related costs.

Cutting Cost of Raw Materials: If the import costs of the enterprise are high and if the price of currency increases, import inputs can be cut and these inputs can be obtained from domestic market, if possible. Alternative sources of raw materials can be searched and cost of raw materials can be reduced.

Cutting Staff Costs and Number: During times of economic crisis, without damaging the internal discipline in the enterprise, the number of staff can be decreased gradually when there is a decrease in enterprise's production due to the shrinkage in the domestic and foreign market.

Adjusting Staff Salaries: Staff salaries can be frozen, and if the crisis gets worse staff salaries can be reduced with the consent of the staff, overtime and social assistance payments can be cut.

Cutting General Expenses of the Enterprise: Expenses of travel, hotel and business trips can be reduced without disrupting workflow, freight costs can be reduced, public transportation can be used in order to minimize fuel costs and stationery, electricity, water and telephone costs can be reduced.

Cutting Interest Expenses: Interest expenses of the enterprise might be cut by paying all credits in due time.

Suspending Investments: The enterprise might suspend optional investments in order to cut cash output for these investments and stop making new investments.

Measures to accelerate cash flow

During times of crisis an enterprise, the financial structure of which is damaged and which is having difficulty in meeting its obligations, should take measures to accelerate cash flow along side taking measures

to cut its costs in order to recover. The aim is not to liquidate the firm but to ensure its survival (Akgüç, 1994: 917-919).

Extending Debt Maturity: Due to temporary reasons like crisis, a firm might be in a difficult financial situation. In such a case, it would be wiser for the creditors to extend the debt maturity instead of having recourse to law, which would result in the liquidation or bankruptcy of the firm.

Consolidating Debts or Refinancing: Consolidating debts or paying debts via borrowing new debts under more convenient circumstances is another method of extending debt maturity.

Creditors might Disclaim Certain Amount of Credits via Amicable Settlement: Indebted enterprise might make creditors disclaim certain amount of credits via amicable settlement and with the condition of paying some part of the credits. It would also be wiser for the creditors to disclaim certain amount of credits and to receive a partial payment, instead of receiving nothing.

Re-arranging and Strengthening the Capital Structure of the Firm:

The capital structure of the firm might be re-arranged in order to increase equity capital and to alleviate its fixed responsibilities. Measures to be taken in order to re-structure the capital might be:

- To allow capital participation in lieu of debts
- To give shares in lieu of equities
- To take new sharers
- Changing equities with fixed interest load with shared equities
- Reducing equity interests

Revaluation of Assets: Revaluating assets and using value increase to meet the deficit does not provide the firm with new resources but help the firm to find new resources.

Selling Fixed Assets and Long-Term Leasing: Selling fixed assets and long-term leasing enables the firm to benefit from the service of fixed assets and to maintain its activities along with providing the firm with new resources. The firm can pay short-term debts and strengthen its capital structure.

Converting Shares and Fixed Assets into Money partially or fully: Converting shares, if any, into money partially or fully can strengthen the financial structure of the firm. One function of sharing is that it can be used as resource in case of unexpected situations.

Converting Debts into Security: The firm can pay back its short-term bank credits by putting securities and equities on the market. In a crisis, it is difficult for an enterprise to sell securities on the financial market. However, creditor banks can achieve this by giving guarantee for paying.

Proposing a Composition: Composition is the partial disclaim of credits. It resembles disclaiming certain amount of credits via amicable settlement in terms of its outcomes. Composition is an agreement which is made between debtor and most of its creditors, the provisions of which becomes valid upon the approval of the commerce court and according to which unprivileged creditors disclaim a certain amount of their credits and the debtor gets rid of its debts by paying the amount of debts accepted in the composition.

Changing the Financial Status of the Firm: If the enterprise has one owner, transition to ordinary share, or if the firm is a company, changing the type are measures that can be taken to strengthen the financial structure of the firm. Different types, especially joint-stock company type, can have superior aspects in terms of providing the company with financial opportunities.

Merging with or Joining Other Firms: During times of crisis, a firm's merging with one or more firms and forming a new type of enterprise is another measure that can be taken in order to fix the financial structure.

Selling Some Enterprises Partially or Fully: If an enterprise has more than one enterprise it can sell some of them partially or fully and can fix the financial structure of the remaining enterprises with the resources to be obtained by this way.

CONCLUSION

Economic crises experienced from time to time in Turkey have left enterprises in difficult situations and especially small enterprises have been affected directly.

In the last decade, financial instability has been a characteristic of world economy and sequential, short-term crises have made lasting impacts on the real economies of especially developing countries. Apparent impact of the economic crises occurs in the financial markets while the real impact occurs in the real section.

In order to struggle with the crisis, Turkey should set an anti-crisis agenda and implement it immediately. Managers of enterprises should take necessary management measures in order to struggle with the crisis. Furthermore, during times of economic crises, professional associations should help business world and give financial and consultancy support to the enterprises.

DIFFERENTIATED MARKETING POLICIES IN TERMS OF COMPANY SIZE AND SECTOR DURING GLOBAL RECESSION

**A. Kazım Kirtiş
Filiz Karahan
Çanakkale Onsekiz Mart University, Turkey**

ABSTRACT

The main aim of this study is to investigate whether perceptions of marketing managers of and responses to the global recession differentiated among the companies in terms of the company size and sector. It is clear from the former literature that both consumers and companies change their perceptions, attitudes and behaviours during economic hardship. In this research, it was searched what the meaning of current economic situation after the 2009 global recession to marketing decision makers is, what the effect of the present economic conditions on marketing decisions is, what kind of arrangements marketing decision makers are doing and how differ all these perceptions and activities according to the company size and sector. In the study, totally 95 firms were surveyed, including 30 large industry firms, 30 large service firms and 35 small firms. According to the results of the surveys, there are some significant differences between large industry and large service firms as well as small firms and large industry firms in terms of their responses to the current economic situations after 2009 global economic crisis while their perceptions of crisis and the impact of the crisis on their companies does not differentiated according to their size and sector.

INTRODUCTION

The last global economic crisis arised from the global banking crisis which stems from subprime mortgage credits and appeared first in the US and then affected almost all countries in the world (Batirel, 2008;1). This crisis made worse the effects of Asia Crisis which the globe has not fully recovered from. Thus the world economy moved towards recession which is identified as fact of decreasing demand for raw materials, products and services (Shama; 1993). In the US and EU countries, a recession is identified as at least two quarters of a decrease in real GDP (Srinivasan et al, 2005;110) and recessions can firmly affect the performance of whole economic sectors (Cundiff, 1975; 2, Shama;1993;64, Srinivasan, Rangaswamy and Lilien, 2005; 109, and Quelch, 2008; 1).

The recession like other economic crises affect consumers' perceptions and behaviours (Kotler, 1973;43, Kelley and Schwee, 1975;45, Cundiff, 1975;1, Shama, 1978;46 , 1993;6 and Shapiro, 1985;28). Related literature stated that consumers change their perceptions, preferences and purchasing behaviours during economic downturn, in recession in particular (Shama, 1978;45, Ang et al , 2000;98, Ang, 2001;6 and Na et al, 2003;48). For this reason, marketers need to adjust their strategies according to these changing perceptions and behaviours (Shama, 1993;63).

During the recession, marketing function plays a crucial role in a lots of decision areas (Cundiff, 1975;1). The decisions sometimes may be important for their survivals (Torlak, 2005;41) and sometimes to stay profitable and consumer-responsive (Shama, 1993;64) while some firms view the recession as an opportunity to develop (Srinivasan et al, 2005;110). This difference may be relevant with the insights of the companies regarding the recession or the company size and sector (Shama, 1993; 65). Eventually, it can be said that the recession may affect firms in a different size and sector and marketing decision makers get diverse strategic measures to adopt changes in economic milieu (Shama, 1993;63).

After all, this paper seeks to find out perceptions and responses of the marketing decision makers to the last global recession regarding the company size and sector in Turkey by measuring the followings:

1. The meaning of the current economic situation after the 2009 Global Recession to marketing decision makers

2. The effect of the recent recession on their marketing decisions
3. Their adjustments in marketing strategy and activities regarding the global recession.

Another purpose of this paper is to make recommendations to marketing decision makers and whole economic players as well as marketing academicians. Performed the aims of this paper, the research will be a connection between the companies and scholarly marketing literature.

LITERATURE REVIEW

Some researchers defined the relationship between the recession and marketing related issues in the literature (Yang, 1964;26, Cundiff, 1975;1 and Coulson et al, 1980;99, Shama, 1993;63; Srinivasan et al, 2005;112, Quelch, 2008;1). Recession was defined as a situation in which the demand for a product is less than its previous level by Kotler (1973) and as decreasing demand for raw materials, products and services, including labour by Shama (1978;45). The next researches (Goodell and Martin, 1992;7, Shama, 1993;64) remarked again similar but limited issues of the recession and marketing relationship. Companies' various responses to the recession were also stated in Barwise's various studies (Barwise, 1999;10, Barwise and Styler, 2002;6).

Cundiff (1975;1) and Srinivasan et al (2005;112) stated that some companies fall down during recession while some others prosper and even develop. Various researches indicates that the firms investing during recession may get considerable benefits (McGraw-Hill Research, 2002; Strategic Planning Institute, 2002). Some researches reveal the results of proactive marketing strategies during economic downturn (Teece et al, 1997;512, Srinivasan, 2005;113). On the other hand, lots of firms severely reduce the marketing expenditures in economic downturn and firms may be also forced to fire some of their employees, or diminish wages (Cundiff, 1975;1).

During a recession, consumers are spending less and saving more of their income (Cundiff, 1975;1) and they become value-oriented (Quelch, 2008;1). There are many other researches indicating that consumers change their purchase behaviours regarding all marketing mix elements during economic distress (Shama, 1978;45 Milanova, 1999;426, Ang et al, 2000;99 Ang, 2001;7). There are several indicators which measure consumers' attitudes toward the economy as a whole and perceptions in particular. These measurements may differ according to the countries. The Survey Research Center's Consumer Sentiment Index (CCI) and The Conference Board's Consumer Confidence Index (CCI) are two of them used in the US (Shama, 1993; 62). In Turkey, Consumer Confidence Index shows the general tendency of consumers toward economy.

As a reaction to these shifts, many changes also occurred on the firm side. Quelch (2008;1) underlined eight factors four of which are maintaining marketing spending, adjusting product portfolio, supporting distributors and adjusting pricing tactics which firms should take into consideration during the recession. Besides, Bonoma (1991;10) recommended to marketing managers about the recession as marketing practices to avoid 'empty middle' marketing, not to mistake expansiveness so much, "*do more for less and remember and what winter is like when summer again comes*". It is specifically emphasized that marketers use considerable more coupons in marketing mix to battle the negative effects of the recession and well-planned promotion, product policies and quality are noteworthy issues for the firms during recession according to Cundiff (1975;1).

There are also important but limited researches about the recession and marketing relationship regarding company size and sector in the literature. A research reported that small companies are much more affected by recession (Feder, 1991;22, Torlak, 2005;43) and Shama cited from Bowers' (1991) journalistic literature that how small firms reduce their expenses in economic hardship. Torlak (2005;47) also stated that small firms should know how to adjust pricing, carrying out advertising policies and granting credit to customers. MarketingSharpa(2008) examined the marketing during a downturn on the other hand, reported that mid-size companies and manufacturing companies in particular, experience more hardship. Beyond these studies, Mandel (1991;60) and Shama (1993;65) who benefited from journalistic literatures of Pearlstein (1991), Stout (1990) and Nasar (1991) published in several journals investigated effects of recession in service sectors.

Recession in Turkey

Recession was felt since the last quarter of 2008 in Turkey and recently a recovery is felt by various economic signs. The financial indicators confirmed that Turkish economy has been severely affected by the recession and then have just leant to rise again. The unemployment rate was recorded at 11,6% in January

2008 while the rate increased to 15,5% by January 2009 while decreased to 14,5% by January 2010 as well as Monthly Industry Production Index declined 20,9% during February 2009 comparing with February 2008 and it increased again 18,1% by February 2010 comparing with the last year (TurkStat). Table 1 also shows the fluctuation in GDP amounts from the first quarter of 2008 to the last quarter of 2009 in Turkey.

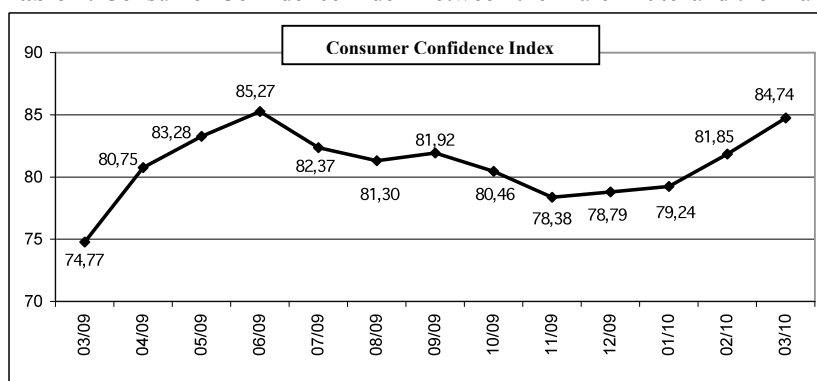

Table 1: Gross Domestic Products for Eight Quarters in Turkey between the first quarter of 2008 and the fourth quarter of 2009 (in million dollars).

Source: TurkStat, <http://www.tuik.gov.tr/PreHaberBultenleri.do?id=6219> (19.04.2010)

Table 2 reveals that consumer confidence index (CCI) decreased by June 2009 and increased by January 2010 in Turkey. This graph also confirms general tendency regarding consumers' common attitudes towards economy.

Table 2: Consumer Confidence Index Between the March 2009 and the March 2010 in Turkey

Source: TurkStat, http://www.tuik.gov.tr/PreTablo.do?tb_id=21&ust_id=7 (19.04.2010)

Firms adjust their strategies in terms of consumers' attitudes and behaviours so it's expected that firms' general insights are in company with the fluctuation of general economic indicators.

Company-Size Level

Companies with different size may face to different economic environments depending on their target markets and market power. Larger firms usually have more market power which may help them weather the economy has bad effects on their functions (Shama, 1993:67). However, a small business might have a small market niche which can protect it during a recession while other small firms unable to borrow needed cash. Shama (1993; 67) examined the journals of Feder and Bowers in his study. Feder (1991) stated that especially small businesses are affected in the recessionary milieu, and Bowers (1991) stated how small firms are reducing their expenses in their journals. On the other hand, Marketingsherpa examined the issue of marketing during a downturn via a research carried out by itself (MarketingSherpa, 2008). It was surveyed whether the marketing budget and effect of downturn is changed in response to the economy through company size in MarketingSherpa Survey, 5;11).

Torlak (2005;41) emphasized that recessions initially become a threat for small firms regarding their scales and they should know to adjust pricing, advertising, selling promotions and granting credit to customers.

Shama (1993) reported that marketers in small firms and large firms perceive the economic situation differently. According to his findings, perception of economic conditions and perceived impact of economic climate as well as adjustments to the changing conditions vary by firm size.

Sector Level

The theory about sector-level studies is that different sectors may be experiencing different economic climates in the same economic milieu. Service sectors generally have been seen as developing sectors for many years. However, Shama (1993;65) reported that the service sectors are also in recession referring to journals of Nasar (1991) and Stout (1990).

Nasar (1991) stated that the service sector in the United States initially regarded as an engine for new jobs, is undertaking a wide cutting back, much as the industry sector did in the former decade. According to Nasar, such a cutting back characterizes service firms in retailing, financial services, accounting, real estate, and temporary help. Mandel (1991;61) also differentiated different service sectors, stating development in some firms and decrease in other firms. Pearlstein (1991) examined the recession in the financial sector as an example of recessionary pressure in the service sector.

Shama (1993;66) studied whether the marketers perceive the economic conditions and adjust their marketing activities differently in terms of their sector. He found out that there's significant difference between firms for perception of recent economic climate, perceived impact and adjustments in marketing activities in terms of firm size. Additionally, service firms are differentiated from industry firms regarding especially promotional appeal, spending relatively more on printed media, adding more distribution channels increasing market segmentation efforts, diversifying and reducing labour force.

To this end, in this study we constructed our hypotheses as:

H1: The subjective meaning of 2009 recession to marketing decision makers vary by company size, as small and large, and sector in Turkey.

H2: The perceived impact of the economic environment of 2009 recession on marketing managers vary by company size, as small and large, and sector in Turkey.

H3: The arrangements of marketing managers out of 2009 recession vary by company size, as small and large, and sector in Turkey.

RESEARCH METHOD

Sample

To test the hypotheses of this study, three samples of marketing decision makers in different sectors and different size companies were surveyed. There are three sample groups which are large industry firms, large service firms and small firms and their populations as can be seen below:

Sample 1: 60 randomly selected companies from Fortune 500: Large industrial firms

Sample 2: 40 randomly selected companies from Fortune 500: Large service firms

Sample 3: 60 randomly selected small business companies KOBİNET list: Small firms

Large industrial and service firms are selected from Fortune 500 Turkey list. KOBİNET includes the list of small and mid-size companies so small firms are selected from KOBİNET list.

Procedure

In this study, a scale developed by Shama (1993) was used. The scale including mostly close-end, Likert-scaled questions about the meaning of the present economic environment to them, the impact of this

environment on their firms and their marketing activities and their responses to the perceived economic milieu. Particular questions measuring the affect of and adjustments to recession were constructed, based on marketing literature (Kotler 1973, Shama 1978 and Shapiro 1985). There were totally 31 questions, 29 of which are Likert-scaled questions.

The scale was initially translated into Turkish then translated into English again in order to eliminate translation problem. Pair of marketing academicians was surveyed to control the comprehensibility of the expressions in the questions. Marketing managers were contacted by e-mail and follow-up phone calls to make sure of their cooperation in this study. Marketing managers agreeing to participate to the survey answered the questionnaire form.

The study reflects 59 percent response rate (95 marketing managers are divided by the total 160 marketing managers). For the subsamples, 30 marketing managers of total 60 managers in industry sector, 30 marketing managers of 40 managers in service sector and 35 marketing managers of 60 managers in small firms were responded in the survey.

Analyses

Nonparametric tests would be most appropriate tests for the first two hypotheses of the study that will examine how the marketing managers describe the present economic environment as their companies is concerned and what the impact of the environment is on their companies. There are 6 choices for the first question and three choices for the second one as positive, neutral and negative. Kruskal-Wallis Test was performed to analyze the difference between three groups which are large industry, large service and small firms. Analysis of variance, ANOVA, was also performed for the Likert type questions for a parametric test.

RESEARCH FINDINGS

Table 3 presents the perceptions of marketing managers (N=95) of the nature of the economic environment by sector. There's a clear difference between small firms and large firms while the responses of the managers can not differ by sector.

Table 3: Marketing Decision Makers' Perception of the Economic Environment (Total sample, N=95, in percentage)

How would you describe the present economic environment inso far as your company is concerned? (In percent)	Industry	Service	Small
1. Growth	18 (60%)	18(60%)	17 (48%)
2. Recession	3 (10%)	2 (7%)	2 (6%)
3. Depression	1 (3%)	3 (10%)	3 (9%)
4. Stagnation	8 (27%)	5 (16%)	13(37%)
5. Inflation		2 (7%)	
6. Other			
TOTAL	30	30	35

In Table 4, marketing decision makers' perceptions of the impact of the economic environment on their companies. There's again no significant difference between industry and service sectors. However, small firms seem more pessimistic regarding the impact of the environment on their companies.

Table 4: Marketing Decision Makers' Perception of the Impact of the Economic Environment on their companies (Total sample, N=95, in amount and percentage)

What has the impact of the environment been on your company? (In amount and percent)	Industry	Service	Small
1. Positive	13 (43%)	13 (43%)	6 (17%)
2. Neutral	6 (20%)	7 (23%)	12 (34%)
3. Negative	11 (37%)	10 (34%)	17(49%)
TOTAL	30	30	35

Table 5 and Table 6 present the results of ANOVA analyses. Table 5 indicates the means of the sector groups in terms of their responses to the questions about how much the present environment influenced their marketing strategies. Specific differences seem between the companies regarding company's size and sector.

Similarly, Table 6 presents the means of the sector groups regarding marketing managers' responses to the economic environment.

Table 5: The Results of Kruskal-Wallis Test for the First Question About the Description of the Marketing Managers the Economic Environment

Table 6: The Results of Kruskal-Wallis Test for the Second Question About the Impact of the Economic Environment on Companies

Test Statistics ^{a,b}

Chi-Square	1,288
df	2
Asymp. Sig.	,525
a. Kruskal Wallis Test	
b. Grouping Variable: VAR00001	

Test Statistics ^{a,b}	
	SORU2
Chi-Square	5,065
df	2
Asymp. Sig.	,079
a. Kruskal Wallis Test	
b. Grouping Variable: KOD	

The result of Kruskal Wallis Test is given in Table 5 for the answers of the first question. Kruskal Wallis is a nonparametric alternative test of ANOVA. Since the data on the first question is not parametric and there are more than two independent samples, Kruskal-Wallis is the best choice to analyze the answers of the second questions. According to the test results, there's no significant difference ($p \leq 0,05$) between the three sectors regarding their descriptions the economic environment as their companies are concerned. For this reason, the subjective meaning of 2009 recession to marketing decision makers do not vary by company size, as small and large, and sector in Turkey, adverse to the former literature, so H1 is not supported.

The result of Kruskal Wallis Test is given for the answers of the second question in Table 6. According to the test results, there's no significant difference between the three sectors regarding their responses given to the second question which searches the impact of the economic environment on their companies. Namely, the perceived impact of the economic environment of 2009 recession on marketing managers does not vary by company size, as small and large, and sector in Turkey so H2 is not supported.

Table 7: Results of ANOVA: The Impact of the Economic Environment on Specific Marketing Decisions

Overall, how much has the present environment influenced your....	Industry	Service	Small	F-Ratio	Sig
Competitive strategy	4,05	3,70	3,65	1,880	,158
Marketing strategy	4,37	4,26	4,11	,232	,793
Consumer credit policies	3,83	3,96	3,85	,972	,382
Selection of target customers	2,93	3,20	2,68	1,646	,198
Pricing decisions	4,13	4,16	4,37	,601	,550
New product introduction	3,62	3,76	3,74	,680	,509
Promotion budget	4,17	3,73	3,68	1,413	,249
Promotional (advertising) appeal	4,03	4,13	3,57	,605	,548
Sales employees	2,41	2,43	2,97	4,979	,009
Selection of promotion media	3,37	2,66	2,40	7,654	,001
Public relations	3,34	2,76	2,02	11,906	,000
R&D budget	2,55	2,53	3,31	5,370	,006
Distribution of your product(s) or service(s)	2,13	1,53	1,94	2,877	,061

According to the results of ANOVA tests, the marketing managers in the three different groups of companies vary regarding influence degree of present economic environment to their companies in terms of sales employees, selection of promotion media, public relations and Research and Development budget issues. Marketing managers in large companies state that present economic environment selection of promotion media and public relations. However, small firms state that present economic environment sales employees and research and development budget significantly different from the other sectors.

Table 8: Results of ANOVA: Marketing Managers' Response to the Economic Environment

To what extent did your company engage in each of the following measures in response to the present environment?	Industry	Service	Small	F-Ratio	Sig
Changed marketing strategy	4,03	3,70	3,85	1,195	,307
Increased strategic planning efforts	4,55	4,16	4,02	2,773	,068
Loosened customer credit	3,73	3,43	4,11	4,155	,019
Modified target markets	2,85	2,96	2,62	1,155	,320
Used more price incentives	3,63	3,53	4,20	3,004	,054
Added new products or product lines	2,53	1,76	1,40	16,783	,000
Pruned some product lines or products	2,55	1,76	2,17	7,168	,001
Increased promotional budget	3,34	2,16	1,65	23,361	,000
Changed promotional appeal	3,83	2,66	2,22	13,348	,000
Used more sales promotion	3,53	3,20	3,77	2,126	,125
Spent relatively more on radio and print ads	2,83	1,86	1,88	11,018	,000
Reduced R&D budget	2,24	2,26	2,91	4,872	,010
Added more distribution channels	1,72	1,53	1,22	5,593	,005
Increased market segmentation efforts	2,37	2,13	1,62	4,774	,011
Diversified into other products or businesses	2,05	1,90	1,97	,190	,827
Reduced labor force	2,17	1,80	2,42	3,491	,035

Marketing managers also vary in terms of their response to the changing economic environment. Marketing managers in small firms have much more tendency to loosen customer credits while the marketers in service firms are not reluctant for this. On the other hand, large industry firms positively look at adding new product or product lines as well as prun some product lines or products while the marketing managers in small companies don't. Additionally, the marketing managers increase their promotional budget and change the promotional appeal significantly much more than the marketers in small companies. Marketing managers in large industry companies spend much on printed advertisement and increase their market segmentation efforts comparing with the service firms and small firms. On the other hand, small firms reduce their research and development expenses and reduce their labour force relatively. For this reason, H3 is partially supported.

Table 9: Result of Reliability Analysis

Reliability Statistics		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
,935	,937	29

For evaluating the internal consistency of the present study, reliable analysis was performed based on the Cronbach Alpha coefficient Method. As known, the minimum value of Alpha coefficient is expected to be 0,7 on descriptive research (Hair et al, 1998). The results presents in Table 9 that the level of internal consistency of this study is satisfactory, with 93 percent.

CONCLUSION AND DISCUSSION

The last global economic recession severely affected the whole world and Turkey in particular. Consumers' attitudes and behaviours change during economic hardship including recessionary climate. Many reseraches confirm that consumers have different purchasing behaviours in a recession and several economic indicators like Consumer Confidence Index support this insight.

Marketing strategies play a key role during a recession and other economic crises. Marketers should adjust their companies' marketing strategies to the changing economic milieu. However, their descriptions of present economic conditions and perceptions the impact of the economic climate on their companies may not be similar regarding company size and sector. Former studies reveal that there are significant differences between the companies' marketing strategies during economic hardship in terms of their size and sector type.

This study examined how marketing managers perceive the present economic conditions regarding as their company, what the effects of it on companies as positive, negative or neutral and what kind of marketing policies they apply and the responses vary according to the company size and sector.

Findings don't fully support the study's hypotheses. under the present economic conditions in Turkey, according to the answers of 95 participants, more particularly, findings are that:

1. The meaning of the present economic conditions to marketing managers doesn't depend on company size and economic sector.
2. The perceived impact of the economic environment doesn't vary with the size of the company and by economic sector.
3. The marketing managers in the three different groups vary regarding influence degree of present economic environment to their companies in terms of sales employees, selection of promotion media, public relations and R&D budget issues.
4. Marketing managers in large companies stated that selection of promotion media and public relations is relatively much more affected by the present economic environment.
5. Marketing managers in small firms state that they have been relatively so much influenced by the present economic environment through their sales employees and R&D budget.
6. Marketing managers in small firms have much more tendency to loosen customer credits while the marketing managers in service firms are not reluctant for this.

7. Large industry firms positively look at to add new products or product lines as well as prun some product lines or products while small firms don't.
8. Large industry firms increase their promotional budget and change promotional appeals significantly much more than small companies do.
9. Marketing managers in large industry companies spend much on printed advertisement and increase their market segmentation efforts comparing with the service firms and small firms do.
10. Small firms diminish their R&D expenses and reduce their labour force much more than large firms.

As a result, it can be said that marketing managers in large industry firms, service firms and small firms perceive the influence of the present economic environment different from each other. Similarly, there's again no significant difference among their perceptions of general economic environment regarding their firms. However, there are some significant differences especially between small firms and large firms regarding influence of the economic environment on specific marketing decisions and their adjustments to the economic environment.

Large firms with broader financial sources may act more independently. Because they especially don't cut back their R&D budget, they can invest in new products or product lines. Besides, they don't diminish promotional budget in economic hardship so they may enjoy benefit. On the other hand, small firms cut back their costs, R&D and human resources in particular during economic downturn. They actually may go collaboration with other small firms to profit from scale economy and then they may invest in new products, services not to lose competitive strategy with the larger firms during economic downturn. Additionally, they may seek for niche markets as opportunity, to which large firms do not pay attention or miss. Small firms may go on their activities in such market areas as a way to survive and stay profitable during economic hardship.

COMPETITIVENESS

MAINTENANCE MANAGEMENT IS NOW OF STRATEGIC IMPORTANCE: SO WHAT STRATEGIES ARE YOUR COMPETITORS USING?

**Kym Fraser
Janek Ratnatunga
University of South Australia, Australia**

ABSTRACT

Maintenance and its management has now reached the level of strategic importance in most medium to large organisations. Due to ever increasing pressures from customers companies can no longer simply rely on a 'repair as required' philosophy and hope to be successful in the long run. A strategic approach is needed to determine which maintenance model or system will best suit the organisation. A recent review of maintenance literature found that Total Productive Maintenance (TPM), Reliability-Centred Maintenance (RCM), and Condition-Based Maintenance (CBM) were the most popular maintenance management models discussed in academic journals. In this paper a comprehensive review of these three models is undertaken to identify empirical 'real world' examples of each model being used in industry. Further analysis is provided in the form of author's origin, research method, study country, sector and industry. The paper provides practitioners with a breakdown of the practical applications for each model in industry today, and academics, a point-of-reference for further empirical research efforts. For practitioners seeking to expand their knowledge of a particular model or how a maintenance management model may fit an organisation, listed references have been chosen for their practical links to present day organisations. In regards to the energy sector the review identified a number of power plants with RCM being the dominate maintenance model. In addition, the paper provides readers with a detailed description of the three models reviewed.

Keywords: *Maintenance management, total productive maintenance, reliability-centred maintenance, condition-based maintenance, literature review.*

INTRODUCTION

As competitive pressures intensify on organisations around the globe to be more efficient and effective a once peripheral management activity, maintenance, has now been given a central focus. Up until the recent past maintenance activities have been regarded as a necessary evil by the various management functions in an organisation (Cooke, 2003; Eti *et al.*, 2007). However, over the past 15 to 20 years, this attitude has increasingly been replaced by one which recognises maintenance as a strategic issue in the organisation. Eti *et al.*, (2006c, p.1237) state "Business leaders increasingly realise the strategic importance of the maintenance function for organisations". The role of maintenance in maintaining and improving the availability of plant and equipment, product quality, safety requirement and plant cost-effectiveness levels, constitute a significant part of the operating budget of manufacturing firms (Al-Najjar and Alsyouf, 2003).

According to Mobley (1990), between 15 to 40 percent (average 28 percent) of the total production cost is attributed to maintenance activity in the factory. In reference to the Nigerian electric-power industry, Eti *et al.* (2005, p.255) assert "maintenance costs over 70% of the total production expenditure". Wireman (1990) discussed how the cost of maintenance for a selected group of companies increased from US\$200 billion in 1979 to US\$600 billion in 1989, three-fold in just 10 years. With the advent of more automation, robotics and computer-aided devices, maintenance costs are likely to be even higher in the future (Blanchard, 1997).

The effective integration of maintenance function with engineering and other manufacturing functions in the organisation can help to save huge amounts of time, money and other resources in dealing with reliability, availability, maintainability and performance issues (Moubray, 2003). For most organisations it is now imperative they take opportunities via maintenance management programs to optimise their productivity, while maximising the overall equipment effectiveness. With increasing focus on just-in-time, quality and

lean manufacturing, the reliability and availability of plant are vitally crucial. Poor machine performance, downtime, and ineffective plant maintenance lead to the loss of production, loss of market opportunities, increased costs and decreasing profit (Cholasuke *et al.*, 2004). This has provided the impetus to many organisations worldwide to seek and adopt effective and efficient maintenance strategies over the traditional firefighting reactive maintenance approaches (Sharma *et al.*, 2005; Ahuja and Khamba, 2007).

For some critical need sectors such as energy, water, health and transport utilities maintenance takes on an even greater importance. Eti *et al.* (2007, p.202) explain “the reliabilities of power plants have become increasing important issue in most developed and developing countries”. The loss of electricity, clean water, health services and public transport due to unexpected failure is the cause of increasing customer and society dissatisfaction around the world.

While the importance of maintenance and its management to modern organisations is clear, questions still persist about what are the popular maintenance management systems and what empirical evidence is available to support these systems in practical ‘real world’ examples. In 2001 Ireland and Dale discussed the lack of empirical research in regards to the popular maintenance model, Total Productive Maintenance (TPM). They commented that in the early 1990s Western organisations started to show interest in TPM following on from their Total Quality Management (TQM) interventions. They argue that whilst there are a few publications on the subject, “there is little in the way of empirical study and analysis” (p.184).

The objective of this paper is to review the maintenance literature and identify empirical evidence for three popular maintenance management strategies in practice today, analysing the country, author, method, sector and industry that these models are being employed in around the world. While empirical analysis/reviews of the maintenance literature are rare, a recent study by Fraser (2009) found that three maintenance management models, Total Productive Maintenance (TPM), Reliability-Centred Maintenance (RCM), and Condition-Based Maintenance (CBM) dominated the maintenance literature. This paper will review these three models and the industries they are employed in including their use in the energy sector. The outcomes will provide practitioner and researchers with a practical insight of a business process which now holds significant strategic implications for nearly every organisation.

POPULAR MAINTENANCE MODELS REVIEWED

The following section will individually review the three most popular maintenance management models found in the literature, TPM, RCM and CBM (Fraser, 2009). The focus of review is to identify practical, ‘real world’ examples of maintenance models within the literature, therefore any articles of a purely mathematical nature, theoretically derived, or of a conceptual basis were not considered. The review involved all peer reviewed journals and textbooks available on the University of South Australia large database. This source included well respected databases such as Business Source Complete (EbscoHost), Emerald fulltext, ScienceDirect, Wiley InterScience, SAGE full-text collection and Compendex. These databases represent the major publishers in the maintenance field such as Elsevier, Emerald, Palgrave Macmillan, and Taylor & Francis. To keep findings as contemporary as possible, only articles published within the past 14 years (1995 – 2008) were reviewed and analysed. A description of each model is given followed by the corresponding table listing the empirical examples found in the literature.

Total Productive Maintenance (TPM)

The development of TPM began in Japan in the 1970’s where it proved to be very successful in enhancing the effectiveness and profitability of Japanese companies. TPM is now well accepted by Japanese industrialists and is attracting the interest of industrialists in several countries around the world.

Nakajima (1988, p.21) described it as “productive maintenance carried out by all employees through small group activities. Like Total Quality Control, which is company-wide total quality control, TPM is equipment maintenance performed on a company wide basis.” He continued to say that TPM was actually the new direction in production and added: “Now, with increasing robotisation and automation, it is more appropriate to say that quality depends on equipment. Productivity, cost, inventory, safety and health, as well as quality – all depend on equipment.” TPM, which organises all employees from top management to production line workers, is a company-wide equipment maintenance system that can easily support sophisticated production facilities. The ultimate objective of TPM is to keep both mechanical breakdowns and defects to zero.

According to Nakajima (1988), a more complete definition of TPM should take into account the following elements:

1. TPM aims to maximise equipment effectiveness (overall effectiveness).
2. TPM establishes a thorough system of productive maintenance extending the equipment's entire life span.
3. TPM is implemented by various departments (engineering, operations and maintenance).
4. TPM involves every single employee, from top management to workers on the floor.
5. TPM is based on productive maintenance through motivation management: autonomous small group activities.

Nakajima argued that zero defects and TPM have a common philosophy. While zero defects strive to prevent defects, productive maintenance in Japan has emphasised the importance of breakdowns for over 30 years. Since equipment failure is a type of defect, both zero defects and preventive maintenance, in effect, are preventive systems aimed at eliminating defects. Zero defects is particularly important in relation to just-in-time operations.

Zairi (1991) supported Nakajima's view of a common link between zero defects and TPM by arguing that zero defects aims at producing goods and services right at the first time and every time. This concept has mainly been people oriented involving changing workers attitudes towards the importance of waste elimination and producing goods and services to customer requirements in the context of customer-supplier chains. Total Productive Maintenance is an opportunity for achieving production of goods and services right first time. Indeed by determining process capability and ensuring process stability, inputs can continuously be converted into quality output with zero defects.

Zairi (1991) goes on to discuss the close relationship between TPM and Total Quality Management (TQM) and that a comprehensive maintenance policy was necessary for a successful TQM implementation. TQM can have a great impact on the operation and infrastructural decision making process. The planning, scheduling and control of operations depend largely on process capacity and capability. The latter two conditions can be provided by an efficient and effective TPM programme. Process capacity cannot be made available at the cost of quality and this decision lies with the responsibility of TPM personnel. Similarly, process capability may appear to be acceptable, but information based on predictive may reveal the process has to be corrected immediately to avoid major disruption later.

From the above, one can notice the strong link between TQM and TPM. To successfully implement TQM it is relevant to have a comprehensive maintenance policy. TPM is the vehicle by which such a maintenance policy can be formulated. According to Zairi and supported by Johnson (1995), the implications of TPM on TQM are numerous.

Another important objective of TPM, according to Nakajima (1988) and Kennedy (1994), is to strive for overall equipment effectiveness. To achieve overall equipment effectiveness, TPM works to eliminate the "six big machine losses" that are formidable obstacles to equipment effectiveness. They are:

Down time:

1. Equipment failure
2. Setup and adjustment

Speed losses:

3. Idling and minor stoppages
4. Reduced speed

Defect:

5. Process defects
6. Reduced yield

The life cycle cost (the cost incurred during the equipment's lifespan) required to maintain equipment at its optimal level is limited as a result of TPM. TPM strives to achieve overall equipment effectiveness by maximising output while minimising input, i.e. life cycle cost.

Ramesh *et al.* (2008, p.45) described TPM as being the "medical science of machines". It is widely used in manufacturing and recognised as a strategic weapon for improving manufacturing performance (Ahuja and Khamba, 2008c). The strategic outcome of TPM implementations is the reduced occurrence of unexpected machine breakdowns that disrupt production and lead to losses which can exceed millions of dollars annually (Gosavi, 2006).

To demonstrate how TPM is used in practical 'real world' applications, Table 1 lists the various empirical examples found in the literature between 1995 and 2008.

Table 1 TPM – Empirical examples in literature

Reliability-Centred Maintenance (RCM)

The changes to maintenance management defined by RCM have evolved over the past two decades. RCM was developed by, and for, the United States commercial airline industry in cooperation with the federal government, aircraft manufacturers, and air carriers. With the arrival of the Boeing 747, a wide-body aircraft, U.S. airlines realised that their maintenance activity would require considerable change due to a large increase in scheduled maintenance costs.

Moubray (1991, p.212) stated that RCM could be described as “a process used to determine what must be done to ensure that any physical asset continues to fulfil its intended functions in its present operating context”. Dhillon (2002) added that RCM leads to a maintenance program that focuses preventive maintenance on specific failure modes likely to occur. For this reason, the RCM process starts by defining the functions and performance standards of each asset in its operating context. It also places great emphasis on the need to quantify performance standards where possible. These standards cover output, product quality, customer service, environmental issues, operating costs and safety.

This therefore leads to the need to know what these assets are and to decide which of them are to be subjected to the RCM review process. In most cases, this means that a comprehensive plant register must be prepared requiring extremely detailed review of each asset and its individual components.

While the process is very time consuming, the RCM review yields four principal outcomes: (Moubray, 1991)

- greatly *enhanced understanding of how the asset works*, together with a clear understanding of what it can and cannot achieve.
- *a better understanding of how the asset can fail* together with *the root causes of each failure*. This means that maintenance energy is correctly focused on trying to solve the right problems. Not only does this help to prevent failures which occur of their own accord, but it also leads people to stop doing things which cause failures.
- lists of *proposed tasks* designed to ensure that the asset continues to operate at the desired level of performance. These take three forms:
 - maintenance schedules to be done by the maintenance department
 - revised operating procedures for the operators of the asset
 - a list of areas where changes (usually design changes) must be made to deal with situations where maintenance cannot help the asset to deliver the desired performance in its current configuration.
- greatly improved *teamworking*.

Moubray went on to list the benefits organisations can achieve by using RCM as being:

- Greater safety and environmental protection
- Improved operating performance (output, product quality and customer service)
- Greater maintenance cost-effectiveness
- Longer useful life of expensive items
- A comprehensive maintenance database
- Greater motivation of individuals
- Better teamwork

While he accepts that these issues are part of the mainstream of maintenance management, and many are already the target of improvement programmes, RCM provides an effective step-by-step framework for tackling all of them at once, and for involving everyone who has anything to do with the equipment in the process.

It must be noted that RCM did draw criticisms from a number of authors. Kelly (1997) argued that although RCM is a technically sound approach, it is questionable whether or not the resources required implementing it are justified. The benefits are certain, but often they do not outweigh the costs. Al-Najjar (1996) felt that RCM concentrates on improving existing plant rather than getting future plant right from the beginning, which can be achieved only by data feedback to designers. He also noted another shortcoming of RCM is that it does not make full provision for the use of condition-based techniques. Sherwin (2000), like Al-Najjar, stated that the worst aspect of RCM is its refusal to face up to the need for data. He also believes that RCM perpetuates the myth of over-maintenance. Therefore RCM tended to be used

Deshpande and Modak (2003) described RCM as a new strategic framework for ensuring that any asset continues to perform, as its users want it to perform. Having said that RCM tended to be used in maintenance sensitive industries with complex systems (Jia and Christer, 2002). RCM concept developed by US commercial airlines industry has been successfully implemented by military, navy, nuclear power plants, electric power generation and several other sectors (Backlund and Akersten, 2003).

To demonstrate how RCM is used in practical ‘real world’ applications, Table 2 lists the various empirical examples found in the literature between 1995 and 2008.

Table 2 RCM – Empirical examples in literature

Condition-Based Maintenance (CBM)

Condition-Based Maintenance (also known as on-condition maintenance, condition-directed maintenance, or predictive maintenance) relies on the detection and monitoring of selected equipment parameters, the interpretation of readings, the reporting of deterioration and the vital warnings of impending failure. Bloch and Geitner (1983) have noted that 99 per cent of all machine failures are preceded by certain signs, conditions, or indications that a failure was going to occur. Many times, such signals precede failure by weeks or even months. CBM implements closed loop maintenance control in which sensor feedback information from equipment is utilised in making maintenance-planning decisions.

CBM uses direct monitoring of the mechanical condition, system efficiency and other indicators to predict the actual time to failure or loss of efficiency for each item. CBM tasks are performed to serve the following purposes: (Mobley, 1990)

- To determine if a problem exists in an equipment, how serious the problem is, and how long the equipment can run before failure;
- To detect and identify specific components (e.g. gear sets, bearings) in the equipment that are degrading, i.e. the failure mode, and to determine the root cause of the problem – the diagnostic function.

Condition-monitoring techniques developed for CBM can be classified according to the type of symptoms they are designed to detect. The classifications are as follows:

- Dynamic effects, such as vibration and noise levels;
- Particles released into the environment;
- Chemicals released into the environment;
- Physical effects, such as cracks, fractures, wear and deformation;
- Temperature rise in the equipment;
- Electrical effects, such as resistance, conductivity, dielectric strength, etc.

The current constraints of the economic climate have underlined the natural aversion to over-maintenance, which can arise from calendar-based methods, and these have steadily been modified to include predictive maintenance techniques. The case for greater emphasis on maintenance management is reinforced by constant fresh evidence of organisational changes, ferocious commercial competition and increased demands for quality products and improved performance. The role of condition monitoring is to watch over and hence protect equipment.

Stoneham (1998) while discussing the various maintenance methods currently available had this to say about CBM. “Of the different maintenance philosophies discussed in this handbook, condition-based maintenance is almost certainly the most dynamic. It has erupted on to the maintenance scene, growing from an interesting scientific application around 15 years ago to a proven and established technology today” (p.81). Stoneham goes on to list a number of benefits associated with CBM, and in turn, provides the reasons why this particular method has proved to be so attractive:

1. *CBM methods and their results can be introduced quickly.*
2. *CBM can be used to complement existing methods.*
3. *CBM can be introduced gradually and checked for effectiveness before other methods are discontinued.*
4. *CBM is readily applicable to widely different industries.*
5. *CBM is particularly relevant when applied to production-critical equipment.*
6. *CBM finds the balance between over- and under-maintenance.*
7. *Condition monitoring addresses the surveillance problem arising from reduction in site manning.*
8. *CBM amplifies the fault detection power of experienced human beings and introduces powerful additional methods of detection and interpretation.*
9. *Condition monitoring is essentially required for normally unmanned facilities.*
10. *By using modern computer-based interpretation, operational situations may be interpreted automatically and experienced resources assigned where they are needed.*

Don Jarrell, Principal Investigator at the Pacific Northwest National Laboratory for the Decision Support for Operations and Maintenance (DSOM) system had the following to say about CBM, “First, there was preventive maintenance. Then, in what most observers considered to be a major step forward, predictive maintenance was introduced. With DSOM, both are obsolete, replaced by condition-based maintenance (CBM)” (Quinn, 2002, p.38).

Table 3 CBM – Empirical examples in literature

2008	Zuashkiani <i>et al.</i>	Canada	Case Study	Canada	Manufacturing	Steel Plant

In describing CBM, Jardine *et al.* (1997) stated current practices in maintenance range from breakdown maintenance through preventive maintenance, all the way to CBM. Lin *et al.* (2006, p.910) added support by stating “many companies have shifted their maintenance programs to a smarter way of doing maintenance – to CBM”. Yam *et al.* (2000) discussed how CBM has been widely accepted in practice and is in use in the manufacturing, construction, food processing and energy industries.

To demonstrate how CBM is used in practical ‘real world’ applications, Table 3 lists the various empirical examples found in the literature between 1995 and 2008.

FINDINGS

While many hundreds of maintenance related articles were reviewed only 79 provided empirical ‘real world’ examples of the three most popular maintenance systems found in the literature. Nine of these papers discussed more than one model therefore 90 studies are covered in the 79 articles reviewed, with the coverage percentage of each being:

- TPM – 66% [52]
 - RCM – 33% [26]
 - CBM – 15% [12]
- [] No. of studies

A breakdown of the methods undertaken in all the studies reviewed showed the following:

- Case study – 47% (37)
 - Anecdotal – 27% (21)
 - Survey – 16% (13)
 - Descriptive – 6% (5)
 - Comparison – 3% (2)
 - Pilot study – 1% (1)
- () No. of papers

If the articles which provide anecdotal accounts (21) were removed from the total of articles reviewed, this would leave only 58 empirical publications on maintenance management models for the past 14 years. This would seem a somewhat small figure given the level of importance maintenance management is to most organisations around the world. To further breakdown the research output in this area, data about author origin and study country is presented. Authors and countries of two or less articles are not listed.

<u>Author origin</u>		<u>Study country</u>	
UK	– 27% (21)	India	– 22% (13)
India	– 18% (14)	UK	– 19% (11)
USA	– 11% (9)	USA	– 9% (5)
Sweden	– 9% (7)	Sweden	– 7% (4)
Canada	– 6% (5)	Canada	– 7% (4)
Hong Kong	– 6% (5)	Italy	– 5% (3)
Japan/China	– 4% (3)		

In regards to research output, the UK and India dominate both author origin and country of study, with these two countries combining to provide 44% of the authors writing on the field and 41% of the locations where studies were undertaken.

While authors from Hong Kong produced five publications, Asian powerhouses such as Japan and mainland China produced only three combined. With TPM being developed in Japan and also being the dominate maintenance model in the literature (66%) it is interesting to note that only two studies were conducted in Japan, both on TPM. It is worth noting that five of the six publications produced in 2008 were from India, with four of these being contributed to the same authors.

Finally, analysis of sector and industry was conducted on the 79 articles. The three dominate sectors in which these studies were conducted included; Manufacturing (57%) (45 articles), followed by a General classification (18%) (14 articles) and Energy (13%) (10 articles). When narrowing the sectors into specific industries, power plants were clearly identified as being the popular for maintenance research with nine

papers identified (see Table 4). Power plants were followed by steel mills and the semiconductor industries with four each and the automotive industry twice.

Table 4 Energy sector – Empirical examples in literature

Year	Author	Models			Method	Study Country	Industry	Type
		TPM	CBM	RCM				
1995	Jones			✓	Case Study	USA	Power Plant	Nuclear
1996	Srikrishna <i>et al.</i>			✓	Descriptive	India	Power Plant	Coal
2000	Yam <i>et al.</i>			✓	Comparison	*Hong Kong	Power Plant	Coal/oil
2003	Backlund & Akersten			✓	Case Study	Sweden	Power plant	Hydro
2003	Hansson <i>et al.</i>			✓	Case Study	Sweden	Power Plant	Hydro
2004	Birkner			✓	Case Study	Germany	Distribution	-
2006a	Eti <i>et al.</i>	✓		✓	Anecdotal	Nigeria	Power Plant	Unknown
2006	Ciarapica & Giacchetta		✓		Case Study	Italy	Power Plant	Gas

2009	Doyle <i>et al.</i>			✓	Case Study	Canada	Power Plant	Nuclear

* Study country not explicitly stated but from given information likely to be in Hong Kong

CONCLUSIONS

The primary focus of this paper was to identify practical ‘real world’ examples of the three most popular maintenance management models used in industry today, Total Productive Maintenance (TPM), Reliability-Centred Maintenance (RCM) and Condition-Based Maintenance (CBM). The review identified many hundreds of articles associated with each these three models but only a total of 79 papers demonstrated empirical evidence. While Ireland and Dale (2001) argued that there was ‘little in the way of empirical studies on TPM’, this study found even less empirical research had been conducted on the other two models with TPM showing 66% coverage, followed by RCM 33% and CBM 15%. When compared to the large amount of mathematical/theoretically derived articles in the literature on these three models there is clearly a disproportional disconnect between academia and the practical world on this important field.

Looking further, this review provides practitioners and academics with a detail description of the three most popular maintenance management models found in the literature, including a point-of-reference for each models. For practitioners seeking to expand their knowledge of a particular model, or how a maintenance management model may fit a particular organisation, each paper has be broken down into areas such as country, method, sector and industry so better practical links to present day organisations can be made. At a collective level, a review of literature offers researchers in the field an up-to-date base or index at which more concentrated levels of research can be developed.

STRATEGIES FOR COMPETITIVE ADVANTAGE IN ELECTRONIC COMMERCE

Siamak Azadi

**Iranian Academic Center for Education ,Culture and Research
(ACECR), Iran**

ABSTRACT

Despite rapid and sustained development of electronic commerce, many companies doing e-business are still in the investment and brand-building phase and have yet to show a profit. However, as e-businesses shift their focus from building a customer base to increasing revenue growth and profitability, they should re-evaluate their current business strategies, if any, and develop strategies that provide a clear path to profitability. This study uses McCarthy's four marketing mix model and Porter's five competitive forces model to identify strategies for Internet companies that respond to the five competitive forces and thereby achieve a competitive advantage. The study provides significant new insights into the development and implementation of e-business strategies that contribute to increased profit.

Keywords: E-Business, Business Strategy, Marketing Mix, Competitive Forces, Profitability, Competitive Advantage

1. INTRODUCTION

E-commerce is fundamentally changing the economy and the way business is conducted. E-commerce forces companies to find new ways to expand the markets in which they compete, to attract and retain customers by tailoring products and services to their needs, and to restructure their business processes to deliver products and services more efficiently and effectively. However, despite rapid and sustained development of e-commerce, many companies doing e-business are still in the investment and brand-building phase and have yet to make a profit (Zwass 1998). Many e-businesses (or Internet companies) have focused on the visual attractiveness and ease of use of their Web sites as the primary method of increasing their customer base. However, as e-businesses shift their focus from building a customer base to increasing revenue growth and profitability, they should re-evaluate their current business strategies, if any, and develop strategies that provide a clear path to profitability.

This study uses McCarthy's (1960) four marketing mix model and Porter's (1980, 1985) five competitive forces model to identify strategies for Internet companies (or dot.coms) that respond to the five competitive forces and thereby achieve a competitive advantage. The overall goal is to provide significant new insights into the development and implementation of e-business strategies that contribute to increased profit.

This research is organized around two questions:

- 1) What impact does the Internet have on McCarthy's four marketing mix (product, price, promotion, and place) and Porter's competitive forces (the threat of new entrants, rivalry among existing firms, the threat of substitutes, the bargaining power of suppliers, and the bargaining power of buyers)?
- 2) What strategies can be derived from the four marketing mix that will affect the five competitive forces and thereby bring a competitive advantage to e-businesses?

2. Theoretical Background

2.1 McCarthy's Four Marketing Mix Model

According to McCarthy (1960) and Perreault and McCarthy (1999), a firm develops its marketing strategies by first identifying the target market for its products or services. It then develops a marketing mix—a particular combination of product, price, promotion, and place (i.e., distribution and delivery functions in the supply chain) designed to enhance sales to the target market. A unique mix of these elements in a given industry allows firms to compete more effectively, thus ensuring profitability and sustainability. For example, by coordinating various product offerings and associated price discriminations with sales promotions and effective logistics, a firm can increase its sales and profit. Since the Internet has a significant impact on the makeup of this marketing mix, Internet companies should develop strategies that take the unique nature of online marketing into account.

2.2 Porter's Five Competitive Forces Model

According to Porter (1980, 1985) and Porter and Millar (1985), a firm develops its business strategies in order to obtain competitive advantage (i.e., increase profits) over its competitors. It does this by responding to five primary forces: (1) the threat of new entrants, (2) rivalry among existing firms within an industry, (3) the threat of substitute products/services, (4) the bargaining power of suppliers, and (5) the bargaining power of buyers.

A company assesses these five competitive forces in a given industry, then tries to develop the market at those

points where the forces are weak (Porter 1979). For example, if the company is a low-cost producer, it may choose powerful buyers and sell them only products not vulnerable from substitutes. The company positions itself so as to be least vulnerable to competitive forces while exploiting its unique advantage (cost leadership). A company can also achieve competitive advantage by altering the competitive forces. For example, firms establish barriers to deter new entrants from coming into an industry by cultivating unique or capital-intensive resources that new firms cannot easily duplicate. Firms also increase bargaining power over their customers and suppliers by increasing their customers' switching costs and decreasing their own costs for switching suppliers. The five competitive forces model provides a solid base for developing business strategies that generate strategic opportunities. Since the Internet dramatically affects these competitive forces, Internet companies should take these forces into account when formulating their strategies .

In his recent study, Porter (2001) reemphasized the importance of analyzing the five competitive forces in developing strategies for competitive advantage: "Although some have argued that today's rapid pace of technological change makes industry analysis less valuable, the opposite is true. Analyzing the forces illuminates an industry's fundamental attractiveness, exposes the underlying drivers of average industry profitability, and provides insight into how profitability will evolve in the future. The five competitive forces still determine profitability even if suppliers, channels, substitutes, or competitors change .

3. Impact of the Internet on Marketing Mix and Competitive Forces

The Internet can dramatically lower entry barriers for new competitors. Companies can enter into e-commerce easily because they do not need sales forces and huge capital investments as they do in offline markets. As the number of people with Internet access increases, the competition for online business in many industries will also increase. According to the Department of Commerce's 'Digital Economy 2000' report¹, in 2000 the number of people with Internet access reached an estimated 304 million worldwide, an increase of almost 78 percent over 1999 (Betts 2000). The Internet also brings many more companies into competition with one another by expanding geographic markets (Porter 2001). The Internet changes the basis of competition by radically altering product/service offerings and the cost structure of firms (e.g., cost reductions in production, distribution, and transaction). The Internet also changes the balance of power in relationships with buyers and suppliers by increasing or decreasing the switching costs of these buyers and suppliers. By reducing customers' search costs, the Internet makes price comparison easy for customers, and thus increases price competition (Bakos 1998).

The price competition resulting from lowered customer search costs increases rivalry among existing competitors, reduces switching costs of customers, and thereby shifts bargaining power to customers. On the other hand, IT reduces menu cost—the cost of administering multiple prices for a number of different products or services—and, in part, facilitates price discrimination (Bakos and Brynjolfsson, 1997). The Internet creates new substitution threats by enabling new approaches to meeting customer needs and performing business functions (Porter 2001). World Wide Web (WWW) technology itself has produced new promotion venues. The Internet also facilitates an electronic integration of the supply chain activities, achieving efficient distribution and delivery. It also facilitates partnerships or strategic alliances by networking partners or allies.

4. E-Business Strategies for Competitive Advantage

This section considers the impact of the Internet on marketing mix and competitive forces, and suggests strategies for achieving a competitive advantage.

4.1 Product Strategy

On the Internet, consumers can easily collect information about products or services without traveling to stores to inspect products and compare prices. In the offline market researching product offerings can be extremely expensive and time consuming. As a result, consumers rely on product suppliers and retailers to aid them in the search, and the suppliers and retailers take advantage of this situation by charging higher

prices (Allen and Fjermestad 2000; Viswanathan 2000). Consumers end up paying more and often not getting the product they really wanted. However, this is not the case for e-commerce. In the Internet market, a complete search of product offerings is possible at virtually no cost. Because consumers can easily compare prices and find close substitutes, companies are forced to lower prices. Companies cannot achieve competitive advantage simply by exploiting consumers' search costs, as they did in the physical market.

An alternative is for companies to make consumers' product comparison more difficult by differentiating their products from others. One possible competitive strategy is product bundling. Product bundling promotes the benefits of the whole package, thus keeping buyers from comparing individual items. For instance, Gateway started bundling its Internet services and computers in response to plunging computer prices (Sinha 2000). AOL, recently merged with Time Warner, is strengthening its bundling strategy by adding interactive and on-demand television, music on computer, and email on mobile phone to its existing services. By adding more services to a bundle, the company could command a higher price for its bundling service. Moreover, adding services to bundles is financially attractive because it is less expensive to sell an additional service to an existing customer than it is to attract a new customer (Schiesel 2001).² This product (or service) bundling strategy counteracts the threat of product substitutes and rivalry among existing firms.

Another strategy is innovation or the introduction of niche products, which also counteracts the threat of product substitutes, new entrants into the market, and competition among existing firms. By using the direct access to consumers enabled by the Internet, companies can collect information, identify target consumers, and better introduce products or services to meet consumers' needs. Companies can also collect information on new products desired by small segments of the market. By creating products that meet the needs of consumers in these niche markets, companies can command higher prices (Sinha 2000). Another strategy associated with niche products or innovation is customer-centric strategy. Compared to a product-centric strategy, which pushes products to consumers, customer-centric strategy pulls information from consumers to improve and customize products (Viehland 2000).

An expansion into related product lines can also be a good strategy. According to Porter (1987), the expansion into related product lines can exploit transfer of skills or sharing of activities such as promotion and distribution, which will lead to competitive advantage. Sharing can lower costs by achieving economies of scale and effectively utilizing company resources such as market information, managerial or technical expertise, and knowledge.³ Like traditional companies, Internet companies can also expand their product line into areas related to their existing product lines. For example, Amazon.com recently started selling personal computers in addition to its existing line of electronic products such as disk drives and memory (Hansell 2001). Amazon.com holds no computer inventory and has computers shipped directly from a computer distributor to its customers. This allows Amazon.com to save inventory-holding costs. However, such expansion cannot bring increased profits to Amazon.com without effective utilization of its existing customer base and information, and managerial or technical knowledge of e-business.

4.2 Price Strategy

The Internet enables consumers to compare prices, products, and services across suppliers. For example, by logging onto price-comparison sites like Pricescan.com and shopping agents like Bottomdollar.com, consumers can readily compare the prices and features of more than 10,000 products available on the Web (Sinha 2000). This leads to increased price competition and lowers the prices of products or services. According to Bakos (1998), lower search costs for price and product offerings in Internet marketplaces promote price competition among sellers. The Internet thus significantly affects competition, and intensive price competition can eliminate sellers' profits.

To overcome these threats, companies have to employ appropriate pricing strategies for selling products over the Internet. Sellers can employ a price discrimination strategy that makes it difficult for buyers to compare the prices of alternative product offerings (Bakos 1998). By collecting information about buyers, companies can perform more effective price discrimination. For instance, Staples.com charges different prices for different markets by asking customers to enter their zip codes before they can obtain prices. Sinha (2000) suggests two strategies for price discrimination: price lining and smart pricing. Price lining refers to the practice of offering the same products or services at various price points to meet different customers' needs. For example, American Online charges five different rates that vary according to subscriber usage. Smart pricing refers to the practice of charging various prices from market to market, depending on market conditions and differences in how customers value the product (e.g., the pricing strategy of Staples.com). Bundling can also be thought of as a type of price discrimination since it reduces the heterogeneity of choices facing consumers and thus their willingness to pay for individual items (Bakos and Brynjolfsson 1997). In bundling, a single price is applied to a bundle. If consumers' demands remain heterogeneous even after

bundling, then a mixed bundling strategy, which charges different prices for different bundles, can be applied.

Companies can also protect profits by achieving cost leadership in a particular market or industry. If sellers cannot price discriminate, the lowest price sellers can charge is the marginal cost of production. As competition intensifies, companies may have to lower their production costs to protect profits. Or companies may have to improve their product or service offerings with added values. Even in intensive price competition, better products or services will raise customers' switching costs and still command higher margins. For example, OfficeDepot.com provides added value to customers' order process (Gulati and Garino 2000). Each contract customer has a customized view of the OfficeDepot.com site. When logging on, the customer's employees are automatically assigned an authorization level that limits what they can buy and how much they can spend. With this value-added service, OfficeDepot.com can protect its profits. By eliminating paper purchase orders, the authorization system also benefits customers by reducing their purchase order costs and thus keeps them from switching to other suppliers.

4.3 Promotion Strategy

One of the reasons why many dot.com companies do not realize profits is that they spend a great deal of money for mass marketing to promote their e-brands to consumers. One television executive recently said, "The dot comes spent like drunken monkeys trying to build their brands. They were willing to pay any price. They were unsophisticated and in a hurry" (Elliott and Rutenberg 2000). The recent demise or downsizing of so many Internet start-ups has had a significant effect on television network revenues (Carter 2000).

Traditional mass marketing using television commercials, trade allowances, discounts, coupons, and sweepstakes is no longer successful in the Internet market, even in consumer-packaged-goods segments, where rival products now differ very little, since consumers can easily acquire information on the price and characteristics of products (Sealey 1999; Hoffman and Novak 2000). Sales promotions with coupons and discounts seldom build customer loyalty to brands because customers conclude that the lower prices are a fair reflection of the company's costs. When the promotions are over, customers evidently believe the regular prices are excessive and turn to rival products (Sinha 2000). Thus mass marketing and sales promotions result in expensive, inefficient brand management.

To manage e-brands effectively and efficiently, companies have to employ promotion strategies different from those used by traditional marketing. One tactic is to build a direct link with consumers and enter into a dialogue with them about products (dialogue-based marketing or one-to-one marketing). This allows companies to provide customers with information about their products, collect information about their customers, and engage in data mining. They can then customize products to meet customer needs and offer promotions tailored to specific customer groups. This process helps build a base of loyal and profitable customers (Sealey 2000). Allan and Fjermestad (2000) also argue that the benefits of personalized promotions will be greatest when customers are interested in detailed product information or the product is marketed as state-of-the-art. The Internet encourages companies to employ this marketing based on direct, personalized relationships with customers (so-called 'relationship marketing').

According to Sealey (2000), the Internet also provides customers with an unprecedented degree of control over the entire marketing process. As consumers become proficient at using the Internet, they will only buy products that precisely match their needs. Thus, companies must formulate customer-centric promotion strategies that respond to this new customer power. Allen and Fjermestad (2000) suggest that brand management will be successful only when it is associated with beliefs and experiences such as feelings, associations, and memories. Thus, Internet promotion must also focus on presenting information about the experiences and beliefs of consumers associated with each brand.

Another promotion strategy for gaining competitive advantage is revenue-sharing marketing strategy (Hoffman and Novak 2000). A revenue-sharing marketing strategy is an affiliated marketing program with partners based on commissions. For example, Amazon.com launched its affiliate program in 1996 and now has some 400,000 affiliates. CDnow.com (the pioneer of revenue-sharing strategy), REI.com, and Dell Computers also have strong affiliate programs. As the Internet continues to mature, companies can seek out specific segments of potential customers and the corresponding Web sites, and then establish revenue-sharing marketing programs with Web sites that can deliver those potential customers.⁵ Compared to traditional mass marketing, revenue-sharing programs allow companies to keep track of purchases made by customers and draw a direct line from marketing (expenses) to sales (performance). However, traditional marketing mechanisms such as television commercials are still important in that they can attract off-line customers.

Thus, Internet companies need to find a good balance between Internet promotion (one-to-one or many-to-many marketing) and traditional mass promotion (one-to-many marketing).

4.4. Place Strategy

For most companies, place refers to the supply chain (or value chain). The place aspects of the marketing mix are closely related to the distribution and delivery of products or services. The Internet and its associated application software have significantly changed the way companies' products or services are delivered by reducing transaction and distribution costs.

One way for companies to differentiate their products from rival companies is faster and more efficient delivery of products to their customers. The Internet allows companies to jump over parts of the traditional supply channel. Direct sellers like Dell Computer do not rely on wholesalers and retailers to deliver their products to consumers.

Instead they contract with third-party providers such as FedEx and UPS, which provide fast, efficient delivery because they have superior logistical expertise and economies of scale in distribution (Bakos 1998). Delivery providers such as UPS also have programs to set up e-commerce sites for businesses that ship with them (Gosh 1998).

Another strategy related to faster and more efficient delivery is integration of online and bricks-and-mortar businesses (clicks-and-mortar strategy). E-businesses (particularly e-tailers) need fully automated distribution warehouses to meet demand from shoppers on the Internet. For example, Amazon.com leased a new 322,560 sq. ft. distribution center in Fernely, Nevada in late 1998 (*New York Times*, January 8, 1999). By investing in physical assets such as a warehouse, Amazon.com can compete more effectively with Barnes & Noble. The Gap also recently leased a new 424,000 sq. ft. warehouse near its existing 270,000 sq. ft. warehouse in Ohio to accommodate the growth of Web sales (Deutsch 2000). In a related development, Amazon.com recently started to sell toys on its so-called co-branded Web site, forming a partnership with Toysrus.com in which Amazon.com handles merchandising and order fulfillment and Toysrus.com handles purchasing (Tedeschi 2000). Amazon.com also made an arrangement for Ingram Books, a large distributor, to ship certain books directly to its customers. This arrangement could cut in half the cost of fulfilling book orders (Hansell 2001). Table 1 summarizes e-business strategies in terms of product, price, promotion, and place that can achieve competitive advantage by responding to the five competitive forces.

5. Choice of E-Business Strategies

A look at e-business strategies composed of the five competitive forces and the four marketing mix (Table 1) shows that there is no single optimal business strategy for e-commerce because the sources of competitive advantage differ across different industries or markets. By the same token, in industries or markets where different levels of competitive forces are present, certain combinations of product, price, promotion, and place strategies may not work for gaining competitive advantage.

In industries or markets where the threat of new entrants, rivalry among existing firms, and threats of substitutes are significant (commodity markets in most cases), only certain combinations of appropriate product, price, promotion, and place strategies can succeed in achieving a competitive advantage. For example, Internet companies in commodity markets cannot rely on price discrimination strategies because products are basically identical, and customers are able to seek the lowest price for each product by comparing many competitors. In this situation, companies must reduce costs in order to maintain market share and profits, which they can do by forming partnerships with suppliers and distributors, expanding into related product lines, deploying customer-centric promotion strategies, or building strong e-brands based on experiences and beliefs. On the other hand, in industries or markets that are concentrated and have differentiated products, threats of new entrants and/or product substitutions are relatively weak. In these differentiated markets, Internet companies can capture most of the value generated in the market by building strong product brands, adding unique features to their products or services, setting up revenue-sharing systems, and strengthening their strategies alliances. The same e-business strategies may not work for all Internet companies. For example, expansion of its product offerings by selling personal computers may be effective for Amazon.com, whose business focus has moved from selling books to providing convenient online shopping for a great variety of products (as shown in its e-commerce trademark, Earth's Biggest Selection™). The same strategy may not work, however, for online book sellers such as barnesandnoble.com because such an expansion strategy could undermine its brick and mortar counterpart, Barnes & Noble, whose business focus is on selling books and information-based products. To capitalize on the recognized brand value of Barnes & Noble, barnesandnoble.com should retain its focus on information-based products and services, not general consumer items like personal computers. According to Porter (2001): "Having a

strategy is a matter of discipline. It requires a strong focus on profitability rather than just growth, an ability to define a unique value proposition, and a willingness to make tough tradeoffs in choosing what not to do”.

6. Concluding Remarks

It is extremely difficult to value Internet companies because most of them have few assets and make little profit (De Figueiredo 2000). There are a number of reasons why many Internet companies have been unsuccessful at making a profit: heavy spending on mass marketing, intensive price competition, lowered customers' search and switching costs, increased customer power, and lowered entry barriers. However, the main reason is that most Internet companies do not have business strategies that provide a clear path to increased profit.

In this study, we used McCarthy's four marketing mix model and Porter's five competitive forces model to identify strategies likely to bring a competitive advantage to Internet companies. By understanding the impact of the Internet on marketing mix and competitive forces, e-business managers can adopt appropriate strategies for meeting the unique challenges of e-business. This study provides e-business managers with a framework to help them systematically analyze and develop successful strategies to address the problems of doing business online.

Although this study addresses the need for unique strategies for different Internet companies, further research is required to address the problems faced by traditional firms when they compete against e-business companies. The possible questions to be raised are: When traditional companies enter into e-commerce, what strategies should they implement? How much integration should take place when traditional and online businesses merge? For traditional firms, one of the most serious challenges to going online is deciding how much to integrate their traditional operations with online business (Gulati and Garino 2000). The problem is that integration provides the benefits of cross-promotion, shared information, purchasing leverage, and distribution economies, but this often comes at the expense of speedy decision-making, flexibility, and creativity. Other challenges to integration include price competition and avoiding the problem of online and offline businesses cannibalizing each others' customers. Faced with these challenges, traditional companies need to develop unique business strategies in order to compete against Internet companies. In any case, corporate managers who best understand the impact of the Internet and e-commerce on marketing mix and competitive forces will be best prepared to meet the challenges of the e-business marketplace.

Table 1: E-Business Strategies for Competitive Advantage: Product, Price, Promotion, and Place Strategies Responding to Five Competitive Forces

	Product	Price	Promotion	Place
Threat of New Entrants	Product Differentiation (e.g., Bundling) Niche Products or Innovation Customer-Centric Strategy Expansion into a Related Product Line	Price Discrimination (e.g., Price Lining and Smart Pricing) Cost Leadership Value-added Products or Services	Customer-Centric Promotion Strategy (One-to-One Marketing or Relationship Marketing) Brand Appeal Based on Experiences and Beliefs Revenue-Sharing Marketing (Manyto-Many Marketing or Performance-Based Marketing)	Outsourcing or Strategic Alliances Clicks-and-Mortar Strategy (Integration of Online and Offline Businesses)
Rivalries among	Product	Price Discrimination	Customer-Centric	Outsourcing or Strategic Alliances

Existing Firms	Differentiation (e.g., Bundling) Niche Products or Innovation Customer-Centric Strategy Expansion into a Related Product Line	(e.g., Price Lining and Smart Pricing) Cost Leadership Value-added Products or Services	Promotion Strategy Brand Appeal Based on Experiences and Beliefs Revenue-Sharing Marketing	Clicks-and-Mortar Strategy
Threat of Substitutes	Product Differentiation (e.g., Bundling) Niche Products or Innovation Customer-Centric Strategy	Price Discrimination (e.g., Price Lining and Smart Pricing) Cost Leadership Value-added Products or Services		Clicks-and-Mortar Strategy
Bargaining Power of Suppliers		Value-added Products or Services	Revenue-Sharing Marketing	Outsourcing or Strategic Alliances
Bargaining Power of Buyers		Value-added Products or Services	Customer-Centric Promotion Strategy Brand Appeal Based on Experiences and Beliefs Revenue-Sharing Marketing	Outsourcing or Strategic Alliances

A FRAMEWORK FOR MEASURING STRATEGIC COMPETITION

ABSTRACT

The intensity of competition in an industry is of relevance to all its stakeholders. Managers and owners of individual firms, industry associations, analysts, consumers and suppliers, and various bodies of governments are constantly concerned about competition. A widely accepted industry competition model is the “five forces model” postulated by Michael Porter, which offers qualitative assessments of the factors that shape competition. The Porterian model is attractive because of its simplicity, adaptability and flexibility, and yet managers find it hard to operationalise because it lacks quantification as to how competitive factors are to be measured. This paper presents a multivariate approach, referred to as the ICM framework, which is unique in that it is the first quantitative operationalisation of the Porter five forces model, both at a firm and industry level. The framework quantifies the degree of industry competition with reference to a hypothetical “average” state of competition. The degree of competition is thus seen from a comparative perspective rather than fixed in reference to either a perfectly competitive or monopolistic (i.e. non-competitive”) state. The study then demonstrates the applicability of the ICM Framework by examining the competitive positions of 19 selected Australian industries. The results obtained indicate that the degree of competition varies widely amongst Australian industries and is characterised by high intensity of rivalry, low bargaining power of buyers, minimal bargaining power of suppliers, high threat of new entrants and wide-ranging threat of substitutes.

Keywords: Competition, Five Forces Model, Porterian Framework, Australian Study.

1. INTRODUCTION

Can industry competitiveness be measured quantitatively? The primary objective of this study is to answer this question by developing a competition measurement framework, which will then allow a quantitative empirical analysis of the structural determinants of competition. What benefits would such a measurement approach bring? The tools currently available to analyse industry competitiveness are qualitative in approach, done by industry experts, analysts, or by a researcher based on face-to-face unstructured interviews of managers in a particular industry (Ratnatunga, 1995; Bresnahan & Greenstein, 1999). This study proposes a quantitative approach that allows managers; industry analysts, researchers and policy makers to further understand the numerous signals of competition in a firm or an industry, or across industries. On a *firm level*, through the understanding of the factors that affect competitiveness, managers can improve the understanding of their respective industry and identify critical benchmarks of their firm’s current position. They could also cross-check the results with their own qualitative research within the industry. At an *industry level*, the application of the framework could show analysts and researchers, the comparative level of competition in their industries, again confirming (or questioning) their qualitative perceptions.

The proposed framework, termed the *Industry Competition Measurement (ICM) Framework*, is an analytical approach that facilitates the quantifiable measure of competition that can be used by managers in determining strategies of competitive advantage in their industries. It can also be used by industry analysts in advising their clients with regards to comparative investment and other opportunities across industries, and by

academics in conducting future studies that seek to examine relationships between competition and other constructs of interest.

Are there any constraints to the use of the Framework? Yes, and it should be emphasised that such an analytical approach only provides a starting point for more detailed industry analysis and strategic response. One constraint is that the interpretation of the scales used may be influenced by the position of a firm within that industry, for instance niche versus mainstream, market share leader versus smaller firms, and the resources available at both an industry level and firm level. Hence, there may be variations in interpretations which need to be correlated with the focal variable(s) used in the study. Another constraint in considering industry niches is that of equivalency or 'response bias', i.e. a systematic tendency to respond to a range of questionnaire items on some basis other than the specific item content (Spender, 1989; Welkenhuysen-Gybels *et al.*, 2003). It will be demonstrated that whilst consideration of such issues are important (Porac *et al.*, 1989; Dornier & Karoui, 2003), these constraints do not diminish the value of the insights generated by the ICM framework (see Appendix 1).

2. JUSTIFICATION FOR EXTENDING PORTER'S 5 FORCES MODEL

Competition is the "heart of our economic system" (Schoeffler *et al.*, 1974). Many authors have written on the dynamic, comparative, multi-dimensional and complex nature of competition (Clark, 1961; EPAC, 1991; Day & Reibstein, 1997; Hooley *et al.*, 1998). Some schools of thought consider competition to be comparative to other firms, whilst others consider competition to be more contextual, encompassing wider environmental issues (Hunt & Morgan, 1995; Moore, 1996; Sheth & Sisodia, 2002). Both these views will be specifically considered in developing the model presented in this paper. The literature indicates an absence of a singular absolute measure of competition, and instead that competition can only be gauged from various "signals of competition" (Boyle, 1972; Industry Commission, 1992; EPAC, 1993). Each signal can be thought of as one dimension of competition: none, by itself, is sufficient to infer the overall state of competition in an industry.

A widely accepted model of competition is that postulated by Michael Porter, who is regarded as one of the most significant contributors to the field of competition and business policy in recent times (Porter, 1980, 1985). Porter's structural determinants of industry competitiveness (the "five forces model") suggests that the level of industry competition is a function of five signals: the intensity of rivalry between existing firms; the bargaining power of buyers; the bargaining power of suppliers; the threat of new entrants and the threat of substitutes. Porter's work in this area has been largely based on case studies of single industries (although the collection of these case studies may give the appearance of inter-industry studies). However, the model, in its current form, is essentially a univariate model in which analysts *qualitatively* assess the level of competition one force at a time, and then subjectively combine the individual force assessments into a single measure of industry competition. The Porter model does not appear to have been applied quantitatively across a number of industries at the same time, i.e. in a multivariate manner at both the firm and industry level simultaneously.

Whilst Porter model has been used extensively in single industry studies (Boyle *et al.*, 1993; Munk & Shane, 1994; Ratnatunga, 1995), it has had his share of criticisms. For instance, researchers in strategic management, adopting a 'resource based view' of the firm, have questioned the role of industry conditions alone in determining firm performance (Wernerfelt, 1984; Hooley *et al.*, 1998). Increasingly researchers are of the view that both the industry and firm specific resources require combining if a holistic view of competitive advantage generation and performance outcomes is to be developed. Thus, while the Porter framework has been adopted as an important contribution to understanding the industry dynamics facing the firm, it is recognised as only one part of the strategic jigsaw puzzle (Speed, 1989; Sutton, 1991).

According to the Porterian model, an industry is said to be most competitive when all of the five forces are perceived to be "high". Each competitive force is, in turn, determined by the strength of its respective *competitive factors* (see Appendix 2).

Thus, when using the Porterian model in its conventional form, the determinants of competition have to be (qualitatively) measure at this competitive factor level, rather than simply measuring the higher level "five forces" (Goldsmith, 1991). The characteristics and effects of the five competitive forces (and their respective competitive factors) that shape industry competition can be complex and it can be difficult to see the effect of

one competitive factor on the overall degree of competition. This is particularly the case when a group consensus is being sought, and is one of the major difficulties faced by managers and business analysts even when using the model in a qualitative manner.

Despite these perceived difficulties in using the model in its conventional (qualitative) form, the researchers did not find a significant “gap” in the literature suggesting difficulties with the practical application of the Porterian model. This raises the “Why fix it, if it isn’t broken?” question.

In order, therefore, to justify improving upon the model, the researchers tested out the use of the model in its current form by groups of managers in a controlled environment. In the resulting discussion regarding the conventional use of the model, two common comments were that groups found that they were trying to implement the concepts of by ‘guesswork’, and that key concepts were sometimes overlooked in group discussions and key assumptions may have been false. Another interesting comment from one group was that the model, though being a powerful structure for discussion, has its limitations mainly because of its simplification of complex relationships. The managers perceived the model to be linear in structure, whereas in reality competition arises more in the form of networks and clusters. The results of the simulated test provided some justification for the need for a more quantitative approach to the analysis of industry competition.

3. THE PERCEPTUAL MAPPING OF COMPETITIVE FACTORS

The challenge in developing an industry competition measurement framework lies in the formulation of the five forces into a model that could combine perceptual information from respondents across different industries. This study suggests that if one collates the perceptions of competition that managers have in individual firms within an industry, one would then be able to extrapolate the *overall* perception of the state of competition of that industry, and that this measurement of perception could be used as a surrogate measure for the intensity of competition in that industry.

The proposed approach in this paper, the *ICM Framework*, is based on a multivariate analysis of the competitive factors detailed in *Appendix 2*. If every condition holds for a particular industry, it would be “hypothetically” the most competitive industry one can find under the Porterian model.

The conditions required for a hypothetically “most competitive industry” as per the five forces model are described in *Appendix 2* (i.e. all competitive factors being “high”) and it is relatively easy to imagine a hypothetically “least competitive industry” with the reverse of such conditions (i.e. all factors being “low”). Similarly, if respondents were to rate all the competitive factors as “neutral” on the Likert scale (*Appendix 3*), one can imagine a hypothetical “average” or “par” state of competition. Thus, the state of competition derived in this paper is not based on theory, but instead it is an empirically derived statistical average, in which the mid point of the 5-point Likert scale is considered as “average”. The level of competition can be measured as a *departure* from this average or par value, thus examining competition from a comparative rather than static perspective (Hunt & Morgan, 1995). Industries that are more competitive than this average state of competition would have a *positive (or increasing)* level of competition (i.e. their level of competition is “above par”), while those where competition is low would be “below par” and have a *negative (or decreasing)* level of competition. Thus, a zero competition level does not mean an absence of competition, but merely a state where competition is perceived to be at par.

There is, of course, the possibility of a systematic tendency to respond to a range of questionnaire items on some basis other than the specific item content, which is known as equivalency or response bias. If this bias is significant, then the very basis of the paper in quantifying perceptions can be questioned. However, as discussed in *Appendix 1*, there is no strong evidence in this study to indicate that such bias or skew would only be in one direction, especially given its single cultural setting. Further, there is evidence that managers in an industry do sometimes see competition as similar and at other times as different (Spender, 1993; Krueger & Funder, 2004). The researchers, therefore, made the simplifying assumption that the respondents would have both positive and negative skewing in their personal scales, and that these would, on average, cancel each other out, resulting in the reported average being a reasonable surrogate for the ‘true’ average. Thus it could be assumed that the researchers’ use of the scale would be considered identical for all respondents, and therefore that any deviation in the interpretation of the midpoint was not significant to the discussion of firm or industry specific issues

Another related issue, as discussed earlier, is that cognition experts have cautioned that the firms that have different perceptions of how the competitive forces operate should be treated separately, as they may represent a different conception of the industry from the consensus. Similarly, various authors (including Porter) have cautioned that as the importance of an individual competitive force differs from industry to industry, the measurement framework must also take into account the degree of importance of the competitive force in the industry. In the model presented in this paper, therefore, a perceived “Competitive Force Rating (CFR)” will be developed to assess the perceived degree of importance of each competitive force to respondents in each industry (Khandwalla, 1972; Bjornsson & Lundegaard, 1992; Abraham *et al.*, 1993; Fry, 1996).

4. SCORING METHOD AND INTERPRETATION

The *ICM Framework* (Figure 1) is the quantitative operationalisation of Porter’s five forces model, at both a firm and industry level, and seeks to quantify the degree of perceived industry competition in reference to a hypothetical firm or industry with an “average” state of competition. Note that CFI_2 to CFI_5 are also derived in the same manner as elaborated for CFI_1 , but this is not shown to avoid making the model appear too complex.

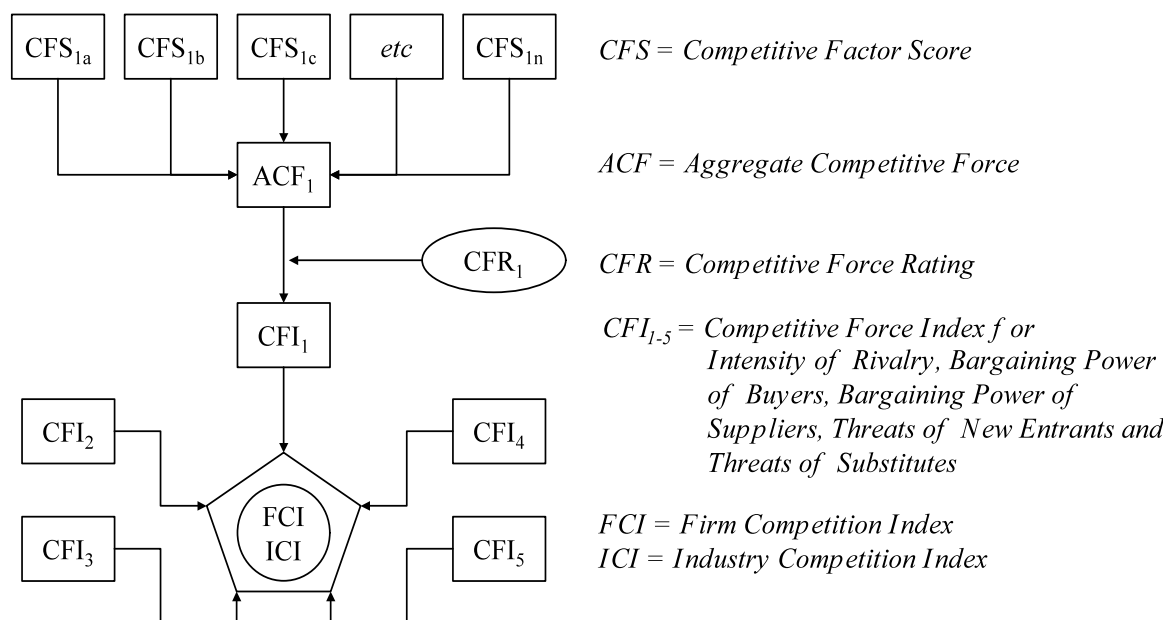

Figure 1 – Industry Competition Measurement (ICM) Framework

All of the competitive factors (32 items) in the five forces were expressed into reasonably short, meaningful and bipolar (low and high) statements on which respondents can indicate their agreement or disagreement (see *Appendix 3*). The 5-point Likert scale is translated into a dispersion scale from a midpoint of zero. To illustrate this scoring methodology, Figure 2 shows two sample competitive factor scores. If the mean Likert-score on the “industry growth” competitive factor is, say, 4.5, the dispersion score of 1.5 (i.e. 4.5 - 3) will be used as the *Competitive Factor Score (CFS)*. Similarly, if the mean Likert score for the “Learning Curve” factor is 2.6, the CFS will be -0.4 (i.e. 2.6 - 3). These dispersions are then further analysed by studying if there were significant differences in competitive factor scores across industries.

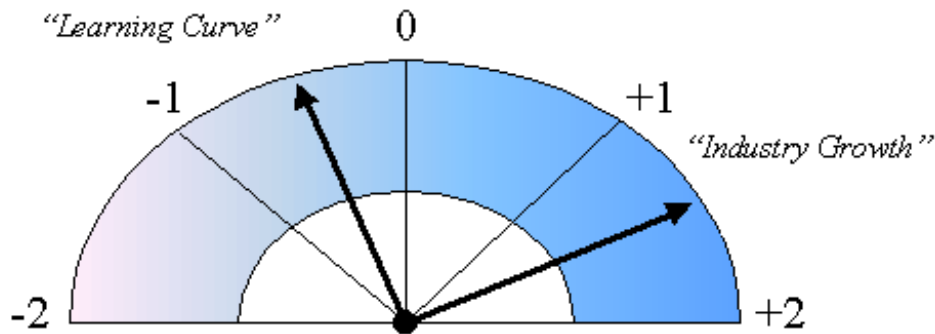

Figure 2 – Competitive Factor Scoring Methodology

The *Aggregate Competitive Force (ACF)* is the composite CFS in a competitive force, taking into account the number of competitive factors within the force. This averaging process ensures that a competitive force will not ultimately become more significant merely because it had more competitive factor measures (see *Appendix 3*).

It must be noted that whilst the scoring system using a scale from *minus 2* to *plus 2* was useful at the CF level, the authors translated the scale into percentages for ease of readability. Thus in the aggregation of CF measures, the scale was converted so that minus 100% represented the minimum level of minus 2, and plus 100% the maximum level (plus 2). This conversion was done by expressing these aggregates as a percentage of the maximum scale values for a respective competitive force (+2 in the positive direction and -2 in the negative direction). This can be shown in the following equation:

$$\left(\sum_1^n CFS \right) / (n \times 2)$$

Where CFS = Competitive Factor Score and n = the number of competitive factors in the respective competitive force, with the number 2 representing the maximum value on the scale used.

Once the industry's *Aggregate Competitive Force* scores (ACFs) have been obtained, as the *level of importance* of each competitive force may be different for different industry respondents, it must be adjusted using a *Competitive Force Rating (CFR)* in order to derive the *Competitive Force Index (CFI)*. The CFR is a weighted average percentage calculation using scale of 1-5 (1 being least important and 5 being very important, the 1+2+3+4+5 responses totalling 15, which is used as the base). For example if the respondents indicated the degree of importance of a particular competitive force is 4.00, then CFR weight works out to (4/15), or 26.7%. Another industry may perceive the same competitive force as less important, say 2, which translates to a CFR of (2/15) or 13.3%. The CFI for each force is then calculated using the following equation, which demonstrates how the ratings were factored into the individual *Competitive Force Index (CFI)* as shown in Table 1, again showing the values as percentage of the minimum and maximum scale values obtainable.

$$CFI = [(ACF \times \%CFR) \times 5]$$

The aggregate of all five *CFIs* shows the level of competition faced by a firm, termed the *Firm Competition Index (FCI)*, i.e.

$$[\sum (CFI_1, CFI_2, CFI_3, CFI_4, CFI_5)] / 5$$

On an industry level, the level of competition in an industry (*Industry Competition Index, ICI*) is a function of the collective firm competition indices for all members of the industry. Concern may be expressed about the development of such an operational framework, i.e. one that is *simultaneously* applicable at both the firm (micro) and industry (macro) levels. There are many acknowledged situations in the economic, organisational behaviour, accounting and marketing literature in which micro phenomena cannot be so aggregated at the macro level. In this case, however, the authors used aggregations as accepted in respondent-based statistical surveys in which individual responses are aggregated as group responses, ignoring the real possibility that individual objectives may differ from group objectives (Porter, 1990).

In summary, CF refers to a factor within an individual competitive force, e.g. the ‘growth rate’ factor within the ‘Intensity of Rivalry’ competitive force (with a measurement range between -2 and +2) for an individual firm. ACF refers to the aggregate of CF scores in a competitive force for an individual firm (given as a percentage of the maximum score of 2 for ease of readability and interpretation). As each individual competitive force may have varying degrees of importance for different industries a CFR (a weighted percentage) is used to determine an adjusted individual competitive force, called CFI (with a measurement range between -100% and +100%) for an individual firm. Having adjusted for the relative importance of each CFI using the CFR weighting, the *FCI* for an individual firm can be calculated by adding the 5 individual CFI scores, and then dividing by 5. This represents the average score of the five competitive forces within an individual firm, again with a value range of between -100% and +100%.

These individual firm CFIs can *also* be summed across an industry, to obtain an industry CFI (again with a measurement range between -100% and +100%). The 5 CFI measurements for each industry grouping are given in Table 1. The *ICI* - the arithmetical averaging of the 5 CFI competitive forces, again with it’s a value range between -100% and +100% - is also shown in Table 1.

By surveying its senior executives, a firm’s management could use such a hierarchical multivariate approach to obtain a quantitative composite perception (i.e. FCI) of the impact of the five industry forces of competition on the firm. This would be faster (an arguably more objective) than similar more subjective reports undertaken either by an “industry expert” commissioned by the firm, or by an in-house researcher based on face-to-face unstructured interviews of its key managers.

In order to test this claim, the researchers tested the approach on 37 managers undertaking MBA studies at an Australian university. The preliminary results indicated that managers not only considered the results more objectively derived, but were also able to use such reports as a cross-check of the more qualitative studies, and investigate variances in perceptions, if any. Similarly, industry analysts can interview managers in firms across an industry to obtain quantitative measures of the 5 industry CFIs, and their impact on industry competitiveness (i.e. ICI). Finally, at the highest hierarchical level of the model, researchers and policy makers can go across industries, to obtain the ICIs for all industries, in order to investigate cross-industry comparatives. Such analyses would be useful in areas such as anti-competitive and trade practices legislation.

5. TESTING THE ICM FRAMEWORK – AN APPLICATION IN AUSTRALIA

Data Collection and Analysis

The industry classification scheme employed was based on the Australian Stock Exchange (ASX) Industry Classification, which contains 24 main industry and 124 industry subgroups. The selection procedure included deleting industries with less than 10 members, diversified industries and using industry subgroups in place of “Miscellaneous” industry groups. A total of 19 industries were selected for inclusion in the study (see Table 1), and all firms in these industries were surveyed (N and n = 463). The “subjects” chosen were the highest managing personnel in the organisations as listed by the ASX, mostly Managing Directors (56%), CEOs (16%) and Chairmen (16%).

Data were collected via mailed questionnaires with a time frame for completion of two weeks, followed up by two reminders. Of the 463 questionnaires sent out, 374 (80.7%) were returned, of which 195 (52.14%) were useable. There were no significant difference between the early respondents and later respondents.

CFIs for each of the five forces in the 19 industries were calculated using the *Industry Competition Measurement* framework (Table 1). Significant differences in CFS and CFR measurements across industries were tested using one-way ANOVA with Bonferroni post hoc tests, which adjusts the significance level by the number of tests performed, with a significance level of 0.05.

Insights from the Findings

The paper set out to make a significant contribution to research by both introducing a new tool to enable business policy makers to undertake a quantitative approach to measuring the intensity of industry

competition, and then demonstrating its applicability using Australian data. The discussion that follows, therefore, needs to not only show that the quantitative approach is a viable alternative to the more qualitative approaches, but also that it provides deeper insights than possible via conventional analyses.

Table 1 summarises the *Industry Competition Index* in ascending order of competition. CFI₁ to CFI₅ refer to Intensity of Rivalry, Bargaining Power of Buyers, Bargaining Power of Suppliers, Threat of New Entrants and Threat of Substitutes, respectively. Table 1 shows first that there is a wide spread between the least competitive industry (*Medical Services*, ICI of -20.45%) and the most competitive industry (*Media*, ICI of 105.22%). Such a holistic view of industry competitiveness is not possible in conventional univariate analyses.

It can be seen that there is a noticeable consistency in impact of the five forces. The CFIs of both *Intensity of Rivalry* and *Threat of New Entrants* all have positive effect on the competitive states of the industries, whereas the CFIs for *Bargaining Power of Buyers* of all but one industry (*Paper and Packaging*) have a negative impact on competition. Whilst one can argue that these overall rankings do not have a ‘surprise value’ in terms of the conventional perceptions of industry competitiveness in such industries, this can be seen as a positive sign, in that they enable managers to have more confidence as to the robustness of the model. This was seen as important if managers are to accept some of the more surprising findings when analysing each of the five forces separately.

Table 1 – State of Industry Competition

Industry (responses/n)	CFI1 (Rivalry)	CFI2 (Buyers)	CFI3 (Suppliers)	CFI4 (Entrants)	CFI5 (Substitutes)	ICI (Average)
Medical Services (6/11)	21.39%	-35.19%	7.14%	17.31%	-31.11%	-4.09%
Pastoral and Agricultural (6/10)	7.13%	-25.46%	8.33%	13.89%	-19.44%	-3.11%
Industrial Services (17/33)	9.95%	-41.98%	-1.58%	29.34%	-8.72%	-2.60%
Automotive (6/8)	41.48%	-24.07%	-22.86%	29.81%	-35.00%	-2.13%
High Technology (12/30)	11.71%	-25.91%	1.75%	21.24%	-14.09%	-1.06%
Chemicals (3/6)	14.26%	-22.22%	0.00%	33.33%	-22.22%	0.63%
Developers & Contractors (17/36)	16.73%	-29.80%	-7.21%	20.13%	22.61%	4.49%
Transport (8/13)	43.83%	-22.92%	1.43%	29.17%	-19.50%	6.40%
Retail (14/25)	41.74%	-22.89%	-9.54%	20.88%	7.25%	7.49%
Engineering (18/32)	34.12%	-23.66%	6.40%	25.02%	-2.92%	7.79%
Computer & Office Serv. (12/22)	14.64%	-27.08%	8.98%	30.14%	23.33%	10.00%
Paper and Packaging (4/9)	35.00%	3.33%	-23.57%	16.67%	18.75%	10.04%
Building Materials (10/25)	31.33%	-10.63%	0.60%	21.00%	11.11%	10.68%
Alcohol and Tobacco (8/14)	52.86%	-23.33%	-6.03%	34.27%	0.00%	11.55%
Insurance (6/8)	42.50%	-42.22%	-11.43%	40.00%	36.00%	12.97%
Tourism and Leisure (17/25)	42.25%	-26.08%	-19.49%	35.72%	33.82%	13.24%
Banks and Finance (11/15)	35.10%	-50.94%	-7.14%	31.03%	67.27%	15.06%
Food and Household (12/29)	38.75%	-5.71%	1.90%	24.14%	24.07%	16.63%
Media (8/23)	26.67%	-7.29%	4.29%	36.56%	45.00%	21.05%
Average (195/374)	29.55%	-24.42%	-3.58%	26.82%	7.17%	7.11%

Intensity of Rivalry (CFI₁)

The results show that there is a perception across the board that the intensity of rivalry generally leads to an increase in the state of competition in all industries. With a range of 7.13% to 52.86% and an average of 29.55%, the perception of intensity of rivalry was positive for all industries, although it varied considerably from one industry to another.

The data suggests that there are significant differences in competitive factor scores across industries (see Table 2), and that these align with conventional views and other statistical data held with regards to competition. For example, considering variability of demand (Table 2), the *Retail*, *Transport*, and *Tourism and Leisure* industries all operate with well-established seasonal patterns (e.g. Christmas shopping period,

summer or mid-year holiday periods, and other events-based fluctuations of demands). The *Alcohol and Tobacco* and *Insurance* industries rated the growth rate in the industry as low, confirming the perception of these as mature markets in Australia (and perhaps indicating higher intensity of rivalry for market share) (ABS, 2000), when compared to *Computer and Office Services*, *Tourism and Leisure*, and *Industrial Services* industries, all of which are widely considered as high growth areas in Australia (tourism had a growth of 14.3% in 2000-01) (ABS, 2000). The data also showed that product differentiation plays a more crucial role in the *Alcohol and Tobacco* and the *Tourism and Leisure* industries than the *Building Materials* industry, which is in keeping with conventional marketing wisdom.

The Banking industry showed a significant amount of industry rivalry (35.1%) mainly due to a shift in competitive emphasis with the slowly fading away of regulatory protection and other collective imperfections, which had previously provided sustainable advantage in the industry (Mehra, 1996).

There was, however, no significant difference noted in the study in terms of the perceived degree of importance of Intensity of Rivalry across industries.

Table 2 – Significant Differences in Intensity of Rivalry Competitive Factor

Competitive Factor (F ratio, F prob)	Differences observed (μ_x and $\mu_{y(1, 2, \dots, n)}$)
Growth Rate (3.44, .0000)	<ul style="list-style-type: none"> • <i>Engineering</i> (2.78) and <i>Tourism and Leisure</i> (-1.18) • <i>Alcohol and Tobacco</i> (0.88) and <i>Computer and Office Services</i> (-1.25), <i>Tourism and Leisure</i> (-1.18), <i>Industrial Services</i> (-1.18)
Variability of Demand (3.34, .0000)	<ul style="list-style-type: none"> • <i>Banks and Finance</i> (-1.27) and <i>Retail</i> (.71), <i>Transport</i> (.75) • <i>Tourism and Leisure</i> (.82) and <i>Banks and Finance</i> (-1.27), <i>High Technology</i> (-.83), <i>Computer and Office Services</i> (-.75), <i>Engineering</i> (-.67)
Exit Barriers (2.19, .0049)	<ul style="list-style-type: none"> • <i>Tourism and Leisure</i> (.59) and <i>Computer and Office Services</i> (-1.00)
Product Differentiation (2.22, .0045)	<ul style="list-style-type: none"> • <i>Building Materials</i> (-.50) and <i>Tourism and Leisure</i> (1.78), and <i>Alcohol and Tobacco</i> (1.50)

Based on the alignment of the CFI ranking results with conventional wisdom perceptions, it appears that the ICM Framework appears to adjust reasonably to ‘equivalence’ and ‘mimetic behaviour’ statistical concerns. The dispersion of scores however, provides insights not possible in conventional approaches. For example, analysts can look for niches where there are few firms as rivals and then benchmark against them.

Bargaining Power of Buyers (CFI₂)

A surprise finding from the data gathered pertaining to this force is that it paints a bleak picture for customer groups: according to our results the marketing notion that “customer is king” does not seem to be borne out in reality. The bargaining power of buyers had a range of -50.94% to 3.33% and a fairly low average of –

24.42%. Clearly, the industries overall are perceived to command an advantageous position in their dealings with their customers. The industries showing the least buyer bargaining power are *Banks and Finance* (CFI of -50.94%), *Insurance* (CFI of -42.22%) and *Industrial Services* (CFI of -41.98%).

Our study showed that whilst there are many competing products/services in an industry, other competitive factors, such as low buyer purchase volumes, high level of importance of the products/services to the buyers, and low threat of backward integration by buyers, point to low bargaining power of buyers. Macro-economic cycles also play a role in shaping firms and industry perceptions in this area.

The above analysis demonstrates how the quantitative approach minimises a significant limitation of the conventional Porterian model, i.e. its univariate and linear simplification of complex relationships. This multivariate analysis enables competition to be viewed in the form of networks and clusters, with the forces each having multiple impacts on each other.

One-way ANOVA tests show that there is only one notable difference ($F=2.56$, $p=.0009$) amongst the 19 industries. The *Food and Household* industry rated the importance of its purchase volume at a mean of 1.17, a finding that confirms what other studies have shown about the presence of high collective bargaining power on the part of food and household industry players (Ratnatunga, 1995; Dobson *et al.*, 2001).

This figure is significantly different to the findings for the *Banks and Finance* (-.64), *Developers and Contractors* (-.58), and *Insurance* (-.47) industries. Our results suggest that individual customers or buyers in these industries have significantly less purchase volume, which weakens their overall bargaining power. It is important to draw the distinction here between individual and corporate buyers with regards to banking and insurance products and services: while individuals have little bargaining power, large corporate clients, such as airlines or pharmaceutical companies, may well have considerably more influence in these industries (Barrados, 1998).

The study found that there is no significant difference in terms of the degree of importance of Bargaining Power of Buyers across industries.

Bargaining Power of Suppliers (CFI₃)

Compared to buyers, suppliers were perceived as having more power in their dealings with the industries, but only at about a 'par' level of competitive bargaining strength. With a range of -23.57% to 8.98% and an average of -3.58%, their bargaining power was not perceived as a dominant force.

These were important findings in that these ranking can be used when considering supply-chain strategies. In terms of suppliers, the findings can be used to explore issues of balance and how to develop advantageous relationships. For example, if the supplier is exploiting its strong bargaining position (like the steel makers in the automotive industry) then a strategic response on the customer firm's part might be to explore alternative sources of supply or even alternative materials or processes so as to reduce this dependence. Equally if the supplier power is weak one strategy might be to exploit this weakness by tying the supplier into price reduction or other contract requirements which provide strategically advantageous inputs to the customer firm.

In comparison to other industries, the *Paper and Packaging* (CFI of -23.57%), *Automotive* (CFI of -22.86%) and *Tourism and Leisure* (CFI of -19.49%) industries rated their suppliers as having very little power. The main reason for this is that in such industries the suppliers are fragmented, so their bargaining power is low, which leads in turn to a lower level of competition. One significant difference across industries was noted ($F=2.14$, $p=.0062$) in the *Food and Household* industry, which rated the importance of its supplier's inputs highly, with a mean of 1.17.

The study found no significant difference in terms of the degree of importance of bargaining power of suppliers across industries.

Threat of New Entrants (CFI₄)

With a range of 13.89% to 40.00% and an average of 26.82%, the threat of new entrants is perceived to be real and credible by all industries. The data suggests that the industries face an average CFI of 26.82, ranging from the lowest threat of new entrants in the *Pastoral and Agricultural* industry (CFI of 13.89) (which is understandable given the finite limitation of land), to the highest threat in the *Insurance* industry (CFI of 40.00).

The fact that the *Insurance* industry was perceived as being susceptible to new entrants seems to run counter to the conventional association of industries with such liability having low economies of scale, low capital requirements and shallow learning curves that pose little barriers to entry. This might seem to raise questions as to the robustness of the ICM Framework approach - however, further analysis seems to indicate that it may be the robustness of the conventional wisdom that is questionable. *The Insurance Handbook (2005)* notes that whilst the average entrepreneur cannot come along and start a large insurance company, the threat of new entrants lies within the insurance industry itself. Some companies have carved out niche areas in which they underwrite insurance. These insurance companies are fearful of being squeezed out by the big players. Another threat for many insurance companies is other financial services companies entering the market. What would it take for a bank or investment bank to start offering insurance products? (Fjeldstad & Ketels, 2006). In some countries, the handbook notes that it is only regulations that prevent banks and other financial firms from entering the industry. If those barriers were ever broken down, as they were in the U.S. with the Gramm-Leach-Bliley Act of 1999, the perception is that the floodgates would open. These explanations supported the insights provided by the ICM Framework, adding to the credibility of its results.

The study found that there is no significant difference noted in terms of the degree of importance of this competitive force across industries.

Threat of Substitutes (CFI₅)

The threat of substitutes in the industries selected for study is the most varied of the five competitive forces, and the ICM Framework provided surprising insights in this area. The range stretches from -35.00% (*Automotive*) to 67.27% (*Banks and Finance*), with an average of 7.17% (see Table 1), which translates to a range of over 100 CFI points. In comparison, the ranges of the other competitive forces, i.e. the intensity of rivalry, bargaining power of buyers, bargaining power of suppliers and threat of new entrants are only 45, 55, 32 and 26 CFI points respectively.

The highest threats of substitutes are in the *Banks and Finance* (CFI of 67.27%), *Media* (45.00%) and *Insurance* (36.00%) industries. Further analysis of these results showed that the proliferation of non-traditional mortgage providers and the increased blurring of the industry boundaries can perhaps explain the threat of substitutes in the *Banks and Finance* and *Insurance* industry. The Internet also enables many new firms to offer services traditionally the domain of banks, finance or insurance industries.

The *Media* industry is also one where products are facing substitutes from the Internet (Robinson *et al.*, 2000; Hie & Hillygus, 2002). The high level of their perception implies that managers are well aware how important the Internet is to their overall operations, and are taking this threat to their industry (which relies on advertising revenue) seriously in their strategic planning. The industry has responded to this threat of Internet-based substitutes by openly embracing the new frontier, with many firms putting much effort into developing series of associated websites to promote their products and services. The blurring of industry boundaries is evidenced by the activities of such as AOL-Time Warner and MSNBC.

On the other side of the spectrum, the *Chemicals*, *Medical Services* and *Automotive* industries do not see themselves to be under threat from any substitute products or services. It is unclear whether the respondents actually perceive that there are no substitutes to their products or services, or whether the substitutes pose little credible threats (e.g. hard to switch and expenses involved in the switching process). *Medical Services*, for example, face “alternative medicines” as a possible substitute to their services, but respondents rated the threat of substitutes as very low.

Again, there were no significant differences noted in terms of the competitive force ratings for threat of substitutes across industries.

The above discussion demonstrates that the ICM Framework is a good 'starting point' for a more detailed industry analysis and an insight of a possible strategic response. However, it can be seen that interpretation of rankings must then be considered by further analysis of the position of a firm within that industry, industry niches and other supply-chain factors. The model provides a clear focus to the direction of this extended analysis, and is therefore of practical value to managers and other users.

6. CONTRIBUTION OF MODEL TO PROVIDING COMPETITIVE INSIGHTS

The major contribution of this study is the operationalisation of the Porter five forces model and its application across industries in a multivariate manner. In no prior study has the Porter model been applied quantitatively across a number of industries *at the same time*. The *Industry Competition Measurement Framework* described in the paper converts the numerous competitive factors in the Porter model into quantifiable signals of competition and examines the competitive positions of firms and industries from a comparative, rather than absolute, point of view. Competitive factors that have been identified as significantly different offer grounds for firms and industries to improve their respective competitive positions. Firms will improve their performance *within* their industry through the deployment of idiosyncratic 'advantage generating resources' tuned to industry conditions, while industries will improve performance *relative* to other industries through attention to ICM factors.

The second contribution of the paper is in the application of the model to selected Australian listed industries, both to demonstrate model robustness and to provide strategic insights not possible via the conventional univariate approaches. The paper has also attempted to cross-check the quantitative results obtained with conventional qualitative research conducted in specific industries, particularly in Insurance, Retail and Banking, and demonstrated a good 'fit' in the results obtained. Where surprising results were found, explanations have been sought in an industry context via further analysis of the data and the literature. This enhances the methodology and the generalisability of the model.

Standing back, what have we learnt? The model shows that there is a noticeable consistency in the impact of the five forces. Specific analysis of the five forces indicates that in general, industries are characterised by high intensity of rivalry, low bargaining power of buyers, minimal bargaining power of suppliers, high threat of new entrants and wide-ranging threat of substitutes. The more competitive industries such as Banks and Finance, Media and Insurance face significant threats from substitute products or services (e.g. through new technologies such as the Internet and e-commerce).

A detailed analysis of the results shows that whilst the *intensity of rivalry* was positive for all industries (although it varied greatly from one industry to another), the average *bargaining power of buyers* was extremely low. Clearly, most industries commanded an advantageous position in their dealings with customers. A surprising finding of the study is that the marketing notion of "customer is king" is not a perception shared across most industries. While the *bargaining power of suppliers* was not a dominant force in many industries, they were perceived as having higher bargaining power in their dealings with their industry than the buyers, most likely also due to 'relative volume' factors. This again was an important finding having significant supply-chain impacts in niche markets.

The *threat of new entrants* was perceived as real and credible by all industries, the highest being in the Insurance industry. It may appear surprising that the Insurance industry appeared to be susceptible to new entrants, but when this threat is linked to the availability of substitute products from other industries such as Banks and Finance, the result is more understandable. In fact, the results indicated that the *threat of substitutes* in the industries selected for study is the most varied of the five competitive forces, and high on the list of industries facing such threats were Banks and Finance Media and Insurance industries.

All of these results sit well with conventional wisdom and the results of other studies, once again demonstrating that the model is well grounded and generalisable. This, of course is to be expected, being based on the reported strengths of Porter's Five Forces model that led to its wide acceptance and conventional use. The results can give managers confidence in using the quantified approach to Porterian

analysis being postulated here, especially as it provides deeper insights and a clearer directional focus for further analysis.

Finally, the resulting ranking of competitiveness in Australian industries provides identification of significant competitive factors and offers grounds for firms and industries to improve their respective competitive positions. They also provide benchmarks for future studies.

Limitations and Future Research Directions

As with any empirical investigation this study has limitations and shortcomings that warrant further attention in future research.

First, the study can be enhanced by further clarifications of industry boundaries and the inclusion of more firms that represent a particular industry. In addition, whilst the industry response rates are high, the underlying number of listed firms in Australia is low, resulting in only a handful of responses in some industries. Similarly, the research has been carried out in one cultural and market setting (Australia) and replication in other countries would be desirable in order to gauge the extent to which the constructs developed are applicable across national boundaries. We have tested this by cross-checking our results to other (single) industry studies, and the results appear to be confirmed.

Second, the measurement of industry competition is based on Porter's five forces model. Although this is perhaps the most popular and universally accepted model of competition, the results of the study hinge upon on how well this model fits reality. For example, the Porter model argues that an industry with high growth rate is likely to be less competitive than one that has a low growth rate. This does not seem to mirror observations in many newer industries such as telecommunications, Internet and other technology industries, where both competition and growth rates appear to be high. While efforts were made to take into account the possibility of differing levels of importance of each competitive force, this study would have benefited from a competitive-factor rating as well (e.g. is "product differentiation" more important than "switching costs"?). Remembering that the Porter model was developed nearly a quarter of a century ago, a possible future research area is to test if the competitive factors in the Porter model adequately explain competition in the 21st century.

A further limitation of the research pertains to the role of the managerial categorisation processes (i.e. the formation of managerial perceptions with regards to competitive groups) in that we do not have an understanding of how managers' form beliefs about competitors, and how managers' perceptions, decisions and actions interact in the creation of competitive boundaries (Porac *et al.*, 1989; Porac & Thomas, 1990). This issue must be tackled in any future research on managerial perceptions.

Future research could also usefully focus on the interaction of industry factors, as developed here, with firm specific factors, in seeking to explain performance variations among firms within industries more fully. Specifically a study which correlates industry competitiveness with firm (and industry) profitability would be interesting, as would a study on how market concentration, market size, organisation density and size distribution impact upon the (evolution of the) shape of the underlying resource landscape. To the extent that accounting returns measure the presence of economic rents, by far the most important sources of rents in businesses are due to resources or market positions that are specific to particular business-units rather than to corporate resources or to membership in an industry. Put simply, business units within industries differ from one another a great deal more than industries differ from one another. In this regard insights from the resource based view developed over the past two decades in the strategic management literature could usefully be combined with the model developed above (Rumelt, 1991; Wernerfelt, 1995).

Finally, another possible further area of refinement is that of aggregating markets which are business-to-business from supplier to end-user. A tailor-made study could, for example, consider the impact of the five forces across a specific number of firms in industries linked across a supply-chain. For example, if a study of the fast moving consumer goods (FMCG) industry in Australia may show that those industrial processing firms supplying to supermarket chains in the retail industry would perceive that the bargaining power of their buyers (the supermarket chains) to be high. Thus an application of the model to supermarket supply-chains should show the bargaining power of their suppliers (the food processors) to be low.

In summary, the ICM framework offers a perspective of competition measured as dispersion from the average stage of competition based on Porter's Five Forces Model. Having applied it to the selected Australian industries and validated its results with other studies, the framework offers a new insight into how various competitive factors increase or decrease the level of competition in an industry. The application of the ICMA framework as a tool of business analysis has the potential of significantly enhancing our understanding of how competition works.

APPENDIX

Appendix 1: Equivalency or Response Bias Issues

An important aspect of considering industry niches is equivalency or 'response bias', i.e. a systematic tendency to respond to a range of questionnaire items from some basis other than the specific item content. This tendency has been observed in various disciplines, especially in cross-cultural research.

While there is some evidence of equivalence issues, where managers tend to develop strategic group representations based on categorisation processes in order to simplify and make sense of their competitive environment in cross-cultural studies, the situation is unclear in studies of same industries, where some studies showed that strategic group cognitions are largely homogeneous whilst others have reported opposite results (Porac *et al.*, 1989; Dornier & Karoui, 2003). On the basis of these conflicting results, this study chose not to undertake procedures for controlling for acquiescence or equivalence issues. Instead, the researchers made the simplifying assumption that the respondents would have both positive and negative skewing in their personal scales, and that these would, on average, cancel each other out, resulting in the reported average being a reasonable surrogate for the 'true' average.

There are two contrasting implications of such an assumption in terms of this paper. One view is that the consensus opinion could be quite wrong as the respondent scales could be skewed differently in a systematic direction for different industries. A counter view is that the existence of such a diversity of views would actually provide a strong case to justify the approach taken in the paper in that competitive forces are not obvious to all those in the industry and a quantitative approach should be taken in obtaining a consensus view. The situation that, in a single cultural setting, there is little evidence to indicate that any such skew would be only in one direction could be said to be similar to findings in psychological research, for instance, where there is evidence is that the skew can both positive and negative amongst respondents in a single study (Spender, 1993; Krueger & Funder, 2004).

It is recognised however that omitting a factor accounting for the acquiescent response bias could lead to a biased assessment across the groups under study. Therefore, care was taken such that the firms that have different perceptions of how the competitive forces operate were given different weights because they possibly represented a different conception of the industry from the overall Australian industry consensus.

Despite these differing weights been used, it is recognised that in comparing the competitiveness scores of different industries, some further research may be required in adjusting for equivalence. Further, whilst the research study undertaken in this paper was essentially to demonstrate the practical applicability of the ICM Framework across industries, the quantitative methodology detailed in this paper could be used in whatever way industry niches are defined.

Appendix 2: The Most Competitive Situations under the Porterian Model

- **Intensity of Rivalry:** *low industry growth, high surplus production capacity, high variability of demand, high informational complexity, high exit barriers, low product differentiation, low value-adding activities, high corporate stakes, low switching costs, high diversity of competitors and low industry concentration.*

- **Bargaining Power of Buyers:** *high number of competing products, low number of buyers, high importance of buyers' purchases volume, high knowledge of cost structure, low importance of industry outputs, and high buyer's threat of backward integration.*
- **Bargaining Power of Suppliers:** *high supplier switching costs, high importance of supplier's input, low number of suppliers, low importance of sales volume to suppliers, low availability of substitutes, high threat of supplier's forward integration and low threat of industry's backward integration.*
- **Threat of New Entrants:** *low economies of scale, low capital requirements, high access to distribution channels, low learning curve, high level of pro-competition government policy, and high expectation of retaliation from existing firms.*
- **Threat of Substitutes:** *high availability of substitutes and low substitutes switching costs.*

Appendix 3: Competitive Factors in the Five Forces Model

The statements below were used to measure the direction of the competitive factors on a 5-point Likert scale (1=strongly agree, 2=agree, 3=neutral, 4=disagree and 5=strongly disagree). All scores were then recoded such that competitive factors which strongly increase competition is scored at +2 and those that strongly decrease competition at -2.

Question asked were as follows

(Note: within sections the questions were mixed-up so that respondents were not alerted as to which competition factor was been tested):

Section 1: Intensity of Rivalry

*The following statements relate to the **intensity of rivalry** among existing firms in your industry. Please indicate your agreement or disagreement by circling the corresponding response. (1=strongly agree, 2=agree, 3=neutral, 4=disagree and 5=strongly disagree).*

A. Intensity of Rivalry

1. The growth rate of my industry is very low
2. The surplus production capacity of my industry is very high
3. Demand for products / services produced by my industry is very seasonal
4. My organisation requires complex information to conduct its operations
5. It is difficult for current firms to exit (leave) the industry
6. There is high value for brand identify or product differentiation in my industry
7. We do not perform much value-added activities
8. There is very high pressure (e.g. from shareholders, parent company, etc) to perform well
9. It is very easy for my customers to switch to my competitors' products or services
10. My competitors pursue very similar strategies to those of my own organisation's
11. My competitors vary greatly in size

Section 2: External Industry Environment

*The following statements relate to the **external environment** of your industry. Please indicate your agreement or disagreement by circling the corresponding response. (1=strongly agree, 2=agree, 3=neutral, 4=disagree and 5=strongly disagree).*

7.

B. Bargaining Power of Buyers

12. We have very few competitors in this industry
13. There are numerous competing products or services available to my customer

14. There are numerous customers in the industry
15. Most of my business comes from high-volume customers
16. My customers have a reasonable knowledge of my costs or cost structures
17. My products or services are very important to my customers' businesses or styles of living
18. My customers can easily produce the products/perform the services they currently purchase from us (backward integrate)

9.

10. C. Bargaining Power of Suppliers

19. Cost of switching from one supplier to another is very high
20. Suppliers' input (raw materials, goods and services, etc) are a large part of the costs of my finished goods/services
21. The number of suppliers to my industry is very limited
22. My firm's purchase volume is very important to my suppliers
23. Substitute or alternative (not directly competing) inputs are readily available
24. My suppliers could easily enter my industry (forward integrate)
25. My organisation could easily produce the materials / perform the services we currently purchase from our suppliers (backward integrate)

D. Threat of New Entrants

26. There are significant economies of scale in this industry
27. There is a high capital requirement to enter this industry
28. Prospective new entrants to my industry have limited access to distribution channels
29. There is significant learning curve (e.g. technical know-how) to enter this industry
30. Government policies favour firms currently in industry
31. When a new competitor enters the industry, existing firms often retaliate strongly

11.

12. E. Substitutes

32. Customers can easily switch to substitutes and/or alternative (not directly competing) products/services
33. There are high costs associated with switching to substitutes and/or alternative (not directly competing) products/services

ABSTRACT

Target costing is a strategic management tool that always tries to get lower cost of the product for whole product lifetime. Traditional costing methods can not meet the needs of the enterprises, because affects of the global competition is getting harder, the lifetime of the products are becoming shorter and the conditions of the market is being formed by the demands of the customers which are always changing.

Under the effects of the global competition, the strategy of getting lower of the prices and the costs like as target costing is becoming a strategic tool. Target costing which is directed by price with design orientation that needs to be worked as matrix based working groups is a profit planning and cost management system. Enterprises must satisfy their customers about quality, functionality and price by using their specialty on product development for keeping standing in the market and being competitive.

Basically, target costing is used for product design and development stages at where it is more effective. More than 85 percent of product cost is figured at design process, that's why cost management must be started at design level. Target costing process is started by defining the selling price which is obtained by detailed analysis of the market. Enterprises can get the target cost by subtracting the profit share from the selling price. In target costing, the cost is an input of the product development process, it is not an output.

In this paper, applicability of Target Costing system in tableware glass manufactory enterprise is to be aimed. While marketing a new product, customer needs and enterprise needs are considered at the design stage. That's why, target sale price and target profit margin are defined at this stage. To achieve these targets, target costing process is applied to design, production and purchasing processes. Whereupon, target cost is obtained by using cost reduction techniques. Thus, the cost of new product is reduced to a level which the customers willing to pay, and also a level which enterprises gaining the power of competition. Consequently, this study shows that Target Costing can be used in manufactory enterprises for marketing new products.

Finally, the cost reduction pressure issued by using target costing system must be applied onto the design, production and purchasing processes. For reaching to the defined price according to the customer demands, the cost reduction techniques have to be used. After reaching the target price, target costing system is disciplined to guarantee the sustainability of this system in the flow of the enterprise processes. Providing the sustainability of the target costing system means that gaining the power of the global competition.

Keywords: target costing, cost management, product design, product development, product pricing, sustainability

INTRODUCTION

Target costing is a cost management technique that is used for cost reduction with the contribution of production, engineering, research and development, marketing, and accounting departments (e.g. Michiharu Sakurai, 1990). Target costing is a planning tool that helps us to identify the features to be improved and helps us in setting targets for designing and cost reduction (Cooper and Slagmulder, 1997). Target costing technique focuses on searching opportunities for cost reduction at the product planning stage as well as and providing continuous cost reductions (Sakurai and Scarbrough, 1997). It is a multidisciplinary tool while traditional costing methods focus on departmental burden; target costing calls attention on customer needs and product design (e.g. Robin Cooper and Bruce W. Chew, 1996). Therefore, target costing is more similar to engineering and management than accounting. Successful applications of target costing require value engineering and cost engineering tools (e.g. Michiharu Sakurai, 1990). Target costing enables product development groups to develop products, not only acceptable quality for the market and also acceptable price for target customer segment (J.M. Brausch, 1994).

This paper aims to show applicability of Target Costing system to market new products which can make enterprises gain target profit margin and meet customers' demands and desires, in order to get power of sustainable competition for especially standard products in tableware glass market.

For marketing new products, determination of customers' demands and needs, product, target sale price and target profit margin tasks are carried by Marketing and Sales Department, for reducing cost, using cost reduction techniques with applying cost pressure to processes is done by Design, Production and Purchasing Departments.

At the first step of application study, cost analysis of the initial product design is done. By using adding-up method target cost is determined. Afterwards, a study is done to get market-level target costing. Therefore, customer needs and desires are determined to take into consideration in design stage. Target sale price and target profit margin are defined at this design stage. To achieve target profit margin, product-level target costing study is done. In this study target cost is determined via adding-up method. Hereafter, a cost analysis is done for final product design, with the new product characteristics and production parameters. To fulfil target cost, cost reduction techniques are applied to design, production and purchasing processes. Eventually, target cost is obtained via cost reduction techniques.

THE CONCEPT OF TARGET COSTING, PROCESS AND TECHNIQUES

Target costing is a strategic cost and profit management process. Conceptually, target cost is a acceptable level of cost which can provide target profit margin for enterprises via target sale price accepted by customers.

Target costing lays out a Japan originated cost management concept and generates information to assist strategic decisions of enterprises in a competitive market environment. Basically, target costing means;

- Setting sale prices for future products in the target market
- Subtraction target profit margin from sale price
- Determination target cost of product to be produced.

Target Costing Process

Target costing comprises the profit management for all functions of the enterprise during product development process stage. The tasks to do for all functions of the enterprise can be listed as below.

- Plan the product quality that satisfies the customer.
- Define the target costs that can provide the profit which is required not only to be able to produce new product in the mid and the long term but also to meet the investment costs in the market conditions.
- Design models to make the product design reach the target cost.

- Meet the customer needs in terms of quality and short delivery time.

Target costing process must be arranged to support the profit planning of the enterprise and joined into the general profit management. In the application stage of the target costing, the answers of the questions below are searched;

1. What are the long term marketing and profit strategies of the enterprise?
2. Where will be the target life zone when new products are produced?
3. What is the target profit margin?
4. How much the cost reduction level is realistic?
5. How can the aim of cost reduction be obtained?
6. Are there any outdoor conditions to force the target cost to be flexible?
7. How can the aim of cost reduction be shared among the product parts?

In order to be effective, target costing processes must be much disciplined. As Figure I indicate, the sub-processes of the target costing can be classified into three groups like;

- Market Level,
- Product Level and
- Component Level.

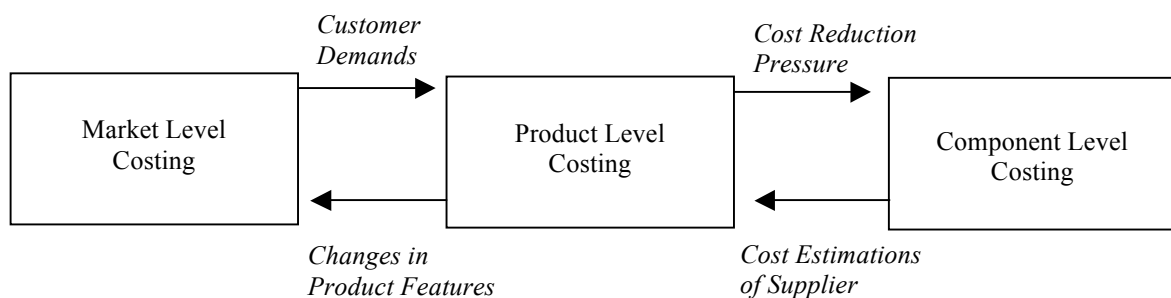

Figure I: A representation of process and relations in Target Costing

Market Level Costing

Target costing process begins with market level costing and the aim of this process is to define acceptable cost of the products that will be produced in future. Acceptable cost is the cost that the product has to be cost to gain desired profit in case of selling the product with the target sale price. Market level costing can be separated into five basic steps.

- Defining long term sales and profit aims.
- Planning the product lines entirely for maximum profitability.
- Defining target sale price.
- Defining target profit.
- Calculating acceptable cost.

Product Level Target Costing

The aim of the product level target costing is to define reachable product level target costs. These target costs must create pressure for the product designers to find the ways for reducing the product costs. Product level costing can be separated into three steps:

- Defining target cost,
- Obtaining target cost,
- Disciplining target costing process.

Component Level Costing

In this stage of the process, product level target cost is separated into component level and it is being defined that the prices of the components which the enterprise willing to pay. In other words, while the enterprise is defining the level target costs, it is already defining the sale price of the components which are produced by

its suppliers and also it is focusing to find the ways for its suppliers to design the components with lower costs. In order to realize this aim, the suppliers are using inter-organizational costing, while they are creating new communication channels between the customers and the product designers.

Methods of Defining Target Cost

For defining target cost, three different methods are used. They are subtraction method, addition method and combination method.

Subtraction Method: The basic factor in defining target cost by using subtraction method is the prices that are given by the competitor firms. The product target costs in the subtraction method are calculated reversely beginning from the sale price which is founded from the market searches. While the sale price of the product is being created, the market conditions, customer needs and the competition situation are more cared about than the product cost. After that, the profit that enterprises expect is defined. Also, while this profit is being defined, the customers in the market and the competitor firms must be aware of. In order to calculate the target cost, the profit which is defined by the enterprise is subtracted from the sale price which is created by the market.

$$\text{Target Cost} = \text{Target Sale Price} - \text{Target Profit}$$

Addition Method: According to the addition method, while the target cost is being created, it is started from the indoor factors and the capacity subject. In the addition method, three different factors can be taken into consideration. These factors are equivalent products, design features and new rapprochements.

Equivalent Products: In this method, the target cost is defined in accordance with the equivalent products or equivalent blocks. This kind of target cost is figured out from the past production experiences.

Design Features: While the target cost is being defined by taking into consideration the very important design features, the statistical techniques are even used like factor analyze and regression analyze. As the easiest way, the past data are used for equivalent products as an rapprochement by finding the relation between the normal real cost and one of the specific design features.

New Rapprochements: This method includes the usage of the some basic functions of the product or the some basic dimensions in case of reaching the new rapprochement that is never used before in the enterprise. At this point, if the new rapprochement is giving useful opportunity of reducing costs, its application can be appropriate.

Combination Method: Combination method is joining the addition method (depending on existing technology and abilities) and the subtraction method (depending on the market rapprochement). This method even includes the evaluation process that is made after obtaining the results from addition and subtraction method. Even if addition method is playing more important role in combination method, it is ignored that the mentioned method is the method that joins two methods and giving target cost for a long term view.

GAINING POWER OF SUSTAINABLE COMPETITION THROUGH TARGET COSTING

In the most recent period, change and transform, the world lived result from the structural change in the free market economy. In other words, the structural tissue of the free market economy has evolved from product-focused to information-focused. This evolving process eventuates rapidly. This global change and transform process affects both the sub-structure and upper structure of the countries. The countries who have poor structural systems, in spite of having sufficient own physical resources may have less per capita gross national product and growth rate than the other countries who have inadequate own- resources but make significant investment to infrastructure. In business terms, this transformation trend increases pressure on genetic staff of businesses, customer, technology, product manufacturing processes, human resources, management styles, internal business climate and corporate culture of a business, etc. This transformation also makes compulsory the requirement of recoding the genetic code as a customer focused. Because these

countries and businesses which have not competitive power at this market may not possible maintain their lives. Competitiveness of a business is an indicator of the ability of costumers that provides to prefer the products produced by enterprises persistently in the view of their substitutions. There are two critical factors that affect this capability. One of them is productivity and the other is growth (sustainability). While productivity has its train to increase general level of efficiency and cost advantage, growth (sustainability) has its train to capture the revenue opportunities and to enrich the customer value.

To keep the enterprises standing in the market that is under control of the global competition, the customer demands must be placed at the first priority of design, production and logistics processes. That's why, there is an obligation to use the management tools which are costumer demands oriented. In order to gain the power of sustainable competition, using target costing system as a strategic management tool is one of the most effective methods.

MARKETING NEW PRODUCT USING TARGET COSTING TECHNIQUE IN TABLEWARE GLASS MANUFACTORY ENTERPRISE

GURALLAR ARTCRAFT was founded to produce tableware glass according to customer demands by using automation system completely in 1994 by Gürok Turizm Ve Madencilik Co.

In order to market the new product, the production cost parameters which are created in Design, Production and Purchasing Processes are given to Marketing Department who calculates the product costs by using existing cost component structure. All cost data in this paper are provided via this method.

Design Process of Initial Product

Domestic Sales Team gives all the detailed design data which are collected from the customers in the market according to their needs to the Design Team that is also working under control of The Marketing and Sales Department. The defined product specifications create the design inputs which are required for Design Team. Figure II shows the artwork of product done by design department.

**Figure II: Artwork of the initial product design in the light of customer demands
Defining Target Sale Price and Target Profit**

In the study of defining target sale price for the new product, all the indoor and the outdoor factors of the enterprise are taken into consideration. Firstly the required data about desired price value of the customers are collected for the new product which is designed according to their demands. In addition, as an outdoor factor, the sale prices of the competitor's products in the market that are equivalent to the new product are searched. In result, in accordance with the required collected data and the board members of the enterprise's strategic view for the new product, the all studies are completed and the target sale price of the initially designed product is defined as 0,50 TL / piece.

In order to define the target profit, one of the most important factors is positioning of the new product in the existing product range of the enterprise. The data come from the costumers and the market show that the sale volume of the new product is going to be high and keep its sale level stable through the year. According to the study of the Marketing and Sales Team in the light of these all data, the target profit ratio of the new product is defined as % 12.

Product Level Target Costing

The competitor's prices for the equivalent products are the basic factor in the study of defining target cost by using subtracting method. For the new product, all required searches are already made for getting created price data from the market and in order to define the target sale price also utilized from these data. The product target costs in the subtraction method are defined reversely beginning from the sale price which is created in the market. The target profit is subtracted from the target sale price in order to calculate the target cost of the new product.

$$\begin{aligned} \text{Target Cost} &= \text{Target Sale Price} - \text{Target Profit} \\ \text{Target Cost} &= 0,50 - (\text{Target cost} * 12 / 100) = 0,446 \text{ TL.} \end{aligned}$$

Cost Analysis for Initial Product design

The features of the initial product design which is designed according to the customer demands are given and in the light of these data, Production Team illustrated the production process parameters in Table I. In accordance with these production parameters, the cost calculation of the new product is given in Table II.

Table I: Production parameters and product features of initial product design

<i>Production Parameters</i>		<i>Product Features</i>	
Weight (gr.)	220	Weight (gr.)	220
Production Rate(product/min)	76	Height (mm)	99
Efficiency (%)	80	Mouth Diameter (mm)	67,5
Production Loss (gr.)	55	Base Thickness (mm)	5
Total Weight (gr.)	275	Volume (cc)	210
Daily Production (products)	87.552		

Table II: Cost analysis of initial product design under given production parameters and product features given in Table I

Cost Analysis (TL per Product)	
Material Cost	0,144 TL
Packing Cost	0,049 TL
Other Variable Cost	0,051 TL
Direct Labour Cost	0,039 TL
Energy Cost	0,051 TL
Shipping Cost	0,039 TL
Cost of Depreciation	0,057 TL
Burden	0,025 TL
General Administration Cost	0,051 TL
<i>Total Product Cost</i>	<i>0,506 TL</i>

The target cost is calculated 0,446 TL by using the target sale price and the target profit ratio, however, according to the existing cost structure of the enterprise, the cost of initially designed product is calculated 0,506 TL. As it can be seen that in the existing conditions, the cost of the product will be higher than the defined target sale price which will make it impossible to market the new product. For that reason, the cost reduction methods must be applied to processes.

Application of Benchmarking Technique in Design Process

Firstly, the weights of the equivalent products in the market are searched and it is noticed that the weight of the new product is heavier than them between %8 and %12. For not only providing the competitor's products weight but also not causing any quality defects in the production process, the sidewall and the bottom thickness of the new product is redesigned. The important thing in this step, the final design must exactly meet the customers' first priority which is inside volume of 200 cc and it must not affect the product negatively in customers' opinion. Artwork of final product design is given in Figure III. Every design which will not meet the customers' demand and every design which will affect the quality of the product negatively are going to create a product that is not accepted in Target Costing System.

**Figure III: Artwork of the final product design in the light of customer demands
Application of Kaizen Costing Technique in Production Process**

Firstly, in forming team of production department, the production speed of 76 pieces / minute and the production efficiency of %80 which are the production parameters of the new product are cared about. The brain storm meetings are arranged to find the new ideas to pull the production speed and the efficiency up. After meetings, making improvements about two subjects are decided.

The first subject who affects negatively the efficiency by breaking down the forming line and limits production speed is about the main servo motor that is used for driving the machine table. After searching deeply about this problem, it is found out that the cooling system of the main servo motor is not enough to cool down the system effectively. As a result of required scanning, appropriate cooling system equipments for the motor is found and provided. The trials with new cooling system shows that exceeding temperature is avoided so that the production speed reaches 78 pieces / minute and the efficiency reaches % 82.

The second decision is to make new design for the application about new product holding equipment at transfer points to pull down the production losses. This solution is just for avoiding losses to affect the efficiency positively and even rising up the production speed can be tried. The design of the new production holding equipment is applied then seen that the result is positive. It can be managed that the production speed will be 80 pieces / minute and the efficiency will be % 84. Table III indicates the production parameters of initial and final product products' production parameters.

Table III: Production parameters of initial product design and final product design

<i>Production Parameters</i>		
	<i>Initial Design</i>	<i>Final Design</i>
Weight (gr.)	220	200
Production Rate(product/min)	76	80
Efficiency (%)	80	84
Production Loss (gr.)	55	38
Total Weight (gr.)	275	238
Daily Production (products)	87.552	96.768

Cost Reduction in Purchasing Process

The Purchasing team works on the material cost parts of the new product to decide which subjects are prior to get the costs lower. In result, two main cost subjects are chosen to improve.

Raw material: The meetings are held with the existing suppliers. It is declared to them that supplying raw material is impossible for the new product with current prices and also it is strictly need to make cost reduction. For supplying raw materials with price advantage, the suppliers are requested to apply this cost pressure to their processes and to quote new prices that can be as low as possible in result of these works.

Packing: The meetings are held with the existing suppliers. It is declared to them that supplying packaging material is impossible for the new product with current prices and also it is strictly need to make cost reduction. For supplying packaging materials with price advantage, the suppliers are requested to apply this cost pressure to their processes and to quote new prices that can be as low as possible in result of these works.

After evaluation and improvements, for supplying raw material and packaging material, the most appropriated prices are given by existing suppliers as reduction of % 10.

ACHIEVING TARGET COST

In order to reach target cost by applying cost reduction techniques to Design, Production and Purchasing Departments, the result are managed to get is listed below:

- In Design Process, after benchmarking works in the market fort he equivalent products, the weight of the product which define raw material quantity is getting lower from 220 gr. to 200 gr. by making new design.
- In Production Process, after making improvements to the forming production line, the production speed is raised from 76 pieces / minute to 80 pieces / minutes and the efficiency is raised from %80 to %84.
- In Purchasing Process, after applying cost pressure to the suppliers, the cost reduction is obtained for raw material and packaging material as both %10.

Cost Results

Consequently, after application of Target Costing system with using cost reduction techniques unit price of the new product is calculated. The cost analyse of initial and final product designs are given in Table IV.

Table IV: Cost analysis of initial product design and final product design and cost differences among product designs

Cost Analysis (TL per Product)			
	Initial Design	Final Design	Difference (Initial – Final)
Material Cost	0,144 TL	0,112 TL	0,032 TL
Packing Cost	0,049 TL	0,044 TL	0,005 TL
Other Variable Cost	0,051 TL	0,051 TL	-
Direct Labour Cost	0,039 TL	0,035 TL	0,004 TL
Energy Cost	0,051 TL	0,051 TL	-
Shipping Cost	0,039 TL	0,035 TL	0,004 TL
Cost of Depreciation	0,057 TL	0,051 TL	0,006 TL
Burden	0,025 TL	0,022 TL	0,003 TL
General Administration Cost	0,051 TL	0,046 TL	0,005 TL
<i>Total Product Cost</i>	<i>0,506 TL</i>	<i>0,447 TL</i>	<i>0,059 TL</i>

The cost of the product is decreased nearly %12 by the Target Costing system. As it is designated in Table IV, biggest part of the cost decrease is on account of reduction material cost. This figure reveals the importance of design process.

CONCLUSION

With rising global competition, the conditions of the market are getting more difficult and the customer's demands are getting more complicated. It changes the mind of the enterprises that we can sell anything with any cost by defining prices ourselves to add the profit to the existing cost. The enterprises can stand and compete as long as they can meet the flexible customers' demands in terms of quality, price and functionality. In order to adapt these changed conditions, the enterprises have to follow the improvements and the innovations and to apply them into their processes. These points bring new rapprochements in terms of cost and account management. One of these new rapprochements is Target Costing as a strategic management tool which is born in Japan.

Cost of product is defined as 85 percentage in design process and after design process during production applying cost reduction techniques bring much difficulties and high losses so that it must be focused on the costs during design process before production. The truths of being defined prices by market and being defined costs mostly by design force enterprises to manage costs before creating product and rise up the importance of market oriented target costing. Target Costing is not only a strategy focused dynamic cost

management system which is formed by market demands and firstly aims customer satisfaction but also a way of getting power of sustainable competition in global market.

This paper shows the benefits of Target Costing System in production industry. Achieving target cost is a crucial need for the enterprises to sustain competitive power. The calculations made in this study show the importance of controlling costs. The cost of the product is decreased by 12% and the profit margin is increased to 12% which is equal to target profit margin. These results and conclusions can be generalized for other companies in the any sector. Under competitive market conditions it is important to set sale price which customers are willing to pay and at the same time brings enterprises target profit margin.

Target costing system is not only applicable for production industry; it is also available for other sectors, the concepts have been universal. Target costing system can be studied for other sectors as a future work for controlling the costs. Regardless of what they produce, target costing system can ensure enterprises to achieve target profit margins. We will concentrate our future work on the completion of fully implementation of the Target Costing system to tableware glass industry to improve the competitive power of enterprise.

ABSTRACT

In recent years the world energy resources shift from fossil fuels to renewable energy. In spite of strategic geographical condition and various renewable resources of Turkey there is a fossil fuel dependency of other countries. Turkey has been able to turn these disadvantages to advantage by way of giving importance to R&D activities on boron technologies for storage and transportation of hydrogen energy. Turkey has 72% of the world boron reserves and know-how of Sodium Borohydrate production. Sodium Borohydrate is a compound that enables to store and transport hydrogen energy. Its productivity level is 95% in Turkey. It is a significant opportunity for Turkey who wants to become a leader of the energy sector. This paper analyzes the international competitiveness level of Turkish boron in energy sector by using Porter's Diamond Model. It explains main features of competitiveness structure of industry, and also, suggests strategies to evaluate potential better. Primary and secondary research collection methods (the written literature, sector reports and interviews) are used for methodology of research.

INTRODUCTION

Energy as a physical quantity is an input which should be used in production. Its consumption rate is regarded as an indicator of development of countries. Without its presence, it is not possible to mention production, consumption, economy and human life. (Bahar, 2005: 35) Energy has a strategic importance in the macro-and micro-sized development plan of countries. Moreover from the simplest to the most advanced technologic products used in daily life, all depend on energy. Hence, energy should get by way of continuous, reliable, clean and inexpensive. Because of the energy storage problem and environmental awareness, developing countries ensure economic-ecological balance and planning of effective usage approach instead of only resource allocation and production. (Maç, 2006: 1; Pamir, 2003: 1)

Energy consumption has increased because of the life style in Turkey (TBMMO, Metalurji Mühendisler Odası, 2006: 15). Although strategic geographical condition as an energy transmission line conjunction between gas and oil producers (Russian, Africa, Middle East) and consumers (Europe, North Africa, India, China, Japan) and various energy sources of Turkey, current energy resources can not meet demand and the consumption balance has shown downward trend (Türkyılmaz, 2007:70).

As a natural consequence of fast industrialization, globalization, increased population, exhausted fossil fuels, unbalanced distribution of resources on the world, increased energy costs, crisis and increasing environmental pollution, countries has tried to find easy ways to access energy sources directly. They also switch out renewable energy resources. In spite of dependency of other countries in Turkey, there is a potential to turn this disadvantages to advantage by way of giving importance to R&D activities, applying

right energy policies, making supporting law and increasing the rate of capacity utilization in production. Beside these, it is required to strengthen industries wherein energy is an important input.

After the oil crisis in the 1970s, unstable character of oil prices has increased the importance of energy supply security and the sustainable usage of energy resources. Global warming and climate change force countries to balance between economic activities and the environment (Kum, 2009: 208). In this model, the researches and investments on renewable energy sources (hydroelectric, geothermal, wind power, solar energy, bio fuels and hydrogen) has been increased. Renewable resources have potential to be used as primary energy instead of fossil fuels in transportation, housing and heating industry. In recent years, countries have begun to give importance creating policies about wind, solar and hydrogen energy. Savrul (2010: 49) argued that production and consumption turnaround in renewable energy is about 12%, whereas fossil fuels production and consumption has decreased about 1% between the years 2001 and 2008.

As a renewable energy, wind power is a circulation patterns in the Earth's atmospheres that are driven by heat from the sun. Wind turbines convert the stream of air into electrical energy. While wind tribunes cover large area, create noise pollution and have some quality problems about generating electricity, reduces fuel costs, risks and economical and political dependency of others countries unlike conventional power plants. (www.enerji.gov.tr, Access Date: 19.04.2010)

Another renewable energy source is solar energy that is there for the use of home-heating, hot water needs, electricity generation, solar thermal systems and solar batteries. Electricity production from solar energy however is there for the use of satellites, calculators, watches, street lights and traffic signals in practice. Another use of solar energy is electricity supply for home, work place, villages, farms or communication facilities which locate out of the network. (Çolak et al., 2008: 40)

In future, world will meet a significant part of its energy demand from hydrogen. As an energy carrier, hydrogen is one of the most abundant elements in the world. Hydrogen is not found in nature as an element but it can be obtained in various ways. Hydrogen energy is the cleanest energy among the others. The most important use of hydrogen is fuel for transportation sector (cars, buses, planes, trains and other vehicles), space shuttles and rockets. Other uses of hydrogen are electricity energy for mobile (mobile phones, computers, etc.) and locations, out of the network respectively. (Fuel Cell Report to Congress, 2003: v-vii) The advantage of hydrogen energy is to be produced from all available energy sources. Developed countries continue their intensive researches about converting solar energy into hydrogen fuel and solving problems of storage and transportation of hydrogen. (Ider, 2003: 1)

Among the other renewable energy sources, hydrogen energy has attracted more attention because it has been able to be fuel and to transport through hydrogen technology. In world there are many methods such as pressure cylinders, liquid hydrogen storage, metal hydrides, carbon nanotubes, etc. that enable transportation and storage of hydrogen but none of these methods meet full criteria. One of the most important criteria is the security of hydrogen density (both weight and volume) used. The other important criterion is the cost of the system. At this point, Sodium Borohydrate can be a solution for the problem. The system which uses Sodyum Borohydrate has 20% more storage capacity than other systems and minimizes the risk of hydrogen exploitation. Moreover the reaction is controlled easily. In reaction half of the hydrogen comes from the hydride, and the remaining comes from water. Catalyst and sodium metaborate are reusable. (www.mam.gov.tr, Access Date: 19.04.2010)

In a direct sodium borohydrate fuel cell, there is produced electricity without an interim stage of hydrogen production. The basic principle of this production is the reaction with water and borax. Hydrogen production and storage units are used as fuel directly, without sodium borohydrate. Direct sodium borohydrate fuel cell has a great importance in civil (telephone, radio, small television, a hand cleaner, etc.) and military (local lighting (Varta, etc.), portable radio, telephone, electronic warfare equipment (radio receivers, etc.), staff, heating, unmanned vehicles, sensors, etc.) applications. (www.mam.gov.tr, Access Date: 19.04.2010)

The purpose of this study is international competition of Turkish Boron in the Energy Sector according to Michael Porter's Diamond Model. Turkey has approximately 72% of world boron reserves and boron is used in a wide scope from detergent to space industry. If Turkey evaluates her high potential, she will be one of most important countries who determine the costs of fuel in energy sector.

The article proceeds in the following manner. First, we briefly review the literature regarding the competitiveness of the energy sector according to Michael Porter's Diamond Model. Second, we give general information about boron and emphasize its importance for energy sector. Third we detail the factors of Diamond Model according to boron in energy sector. The final part of the article is conclusion.

LITERATURE REVIEW

In the most recent period, the structural tissue of the laissez-faire economy has evolved from product-focused to information-focused. This global change and transform process affects both the sub-structure and upper structure of the countries. The countries who have poor structural systems, in spite of having sufficient own physical resources may have less per capita gross national product and growth rate than the other countries who have inadequate own- resources but make significant investment to infrastructure. In business terms, this transformation trend increases pressure on genetic staff of businesses, customer, technology, product manufacturing processes, human resources, management styles, internal business climate and corporate culture of a business, etc. This transformation also makes compulsory the requirement of recoding the genetic code as a customer focused. Because these countries and businesses that have not competitive power at this market may not possible maintain their lives. Competitiveness of a business is an indicator of the ability of costumers that provides to prefer the products produced by enterprises persistently in the view of their substitutions. There are two critical factors that affect this capability. One of them is productivity and the other is growth (sustainability). While productivity has its train to increase general level of affiances and cost advantage, growth (sustainability) has it its train to capture the revenue opportunities and to enrich the customer value.

In 1990, Porter developed Diamond Model which analyzes international competitiveness of sectors in his book named 'National Competitive Advantage of Nations'. The model designed like a diamond defines four factors that affect the competitive advantage. These basic factors are factor conditions, firm strategy and rivalry structure, demand conditions and related and supporting industries. State affects four factors externally in the model. Diamond Model introduces a system where fundamental variables are taken in consideration all at once, not one by one. In other words, all factors placed on a corner of the diamond and affect each other. Therefore system gains a dynamic structure (Eraslan et al., 2006: 53-54).

There are two studies which analyze competitiveness of the Turkish energy sector by using Michael Porter's Diamond Model in the literature. The first of these studies is Hınç's study wherein the electricity sector is analyzed (www.emo.org.tr, Access Date: 19.04.2010) and second study analyzes the energy sector of the province of Tekirdag (www.tekirdag.gov.tr, Access Date: 19.04.2010). Denizli is selected as a pilot province in cluster studies for energy sector in Turkey (www.tumgazeteler.com, Access Date: 19.04.2010). Furthermore, energy is utilized as a production factor in competitiveness analyses of some sectors by Diamond Model (Eraslan and Et al., 2006, 2007, 2008). In these studies, energy is a cost factor which affects the competitiveness of the sector in these analyses, because it has a strategic importance. Özdemir and Yüksel (2006) who set out set out energy as a input factor investigate impact of forward and backward links of the sector on economy in their studies.

Developments, policies, problems and evaluations of energy sector in Turkey are discussed in Symposiums and regional forums. Some of those are Chamber Turkey Energy Symposium, the National Clean Energy Symposium, New and Renewable Energy Sources Symposium, Renewable Energy Resources Wind Energy Symposium and the Hatay region, Eastern Black Sea, Southeast Anatolia and the Aegean forums, etc. These studies help having an idea about the level of competitiveness of energy sector indirectly. Utlu and Hepbaşlı (2004) make comparative sector analysis of availability of energy for industry, transport and residential sectors between the years 1999 and 2000 and they explain the importance of planning to increase efficiency of energy. In recent years, academic studies related to energy sector in Turkey emphasize on renewable energy sources.

State Planning Organization (SPO), one of the most important institutions in Turkey, has identified the current situation and has developed energy policies in Five Year Development Plan since 1963. SPO is published Mining of Ad-Hoc Committee Report in the Eighth Five-Year Development Plan for 2001-2005 period. Furthermore, Ninth Five-Year Development Plan (2009-2013), pays attention to boron technology for high value added products. There are found vast academic works about technical improvements for production, increasing productivity and developed technologies on boron in universities.

Moreover, mining, chemistry and engineering departments fully treat this subject at their thesis. Boren Institute, TUBITAK Mineral Research and Exploration, General Directorate of Eti Mine General Organization have had many projects on boron.

BORON

As a fundamental input of manufacturing sectors mines play an effective role in the development of economy. Turkey has an important competitive advantage according to other countries in terms of reserves, quality and variety of minerals, production capacity, ease of processing and low cost of production. (Buluttekin, 2008:2-3)

Boron does not exist in nature as a free element. It is bounded by oxygen in nature and found in soil, rocks and water. The most important minerals with their different B_2O_3 contents are tincal, colemanit and ulexite. Although boron minerals can be used in some industries as concentrates, refined boron products and special boron chemicals products are very widely used in many various industries. (Eti Mine Annual Report, 2005: 12) Tincal, a raw material of Sodium Boron Hydride has great importance in the energy sector. Tincal is from Sodium class of boron with 26% B_2O_3 content and its reserves locate at Kırka in Turkey. Beside tincal, colemanite, a raw material of Boric acid is from calcium class of boron with between 28-30% B_2O_3 content. Colemanit reserves locate at Emet, Kestelek and Bigadiç at Turkey. Boric acid is a reactor of Sodium Meta borate which provides using hydrogen as energy in fuel cells and is a production by reaction of colemanit and sulfuric acid. Colemanit and Tincal are mined through open – cost mine method and are processed in factories. Boron products can substitute each other because the main use of them is their B_2O_3 content (Eti Mine Annual Report, 2005:14). But in Turkey, as a single producer of boron Eti Mine doesn't allow competition between its exploitation managements.

General Directorate of Eti Mine General Organization is all state-owned capital and responsible for production, processing and marketing of Turkey's boron products. Eti Mine Works consists of Bandırma, Kırka, Emet, Bigadiç, Kestelek Boron Works (www.etimaden.gov.tr, Access Date: 19.04.2010).

Within its oligopoly structure, world boron market differs greatly other raw materials markets. Major boron producers of the world are US Borax Inc. in USA and Eti Mine in Turkey. Supply, demand and prices are determined according to their short-medium and long expectations. After 1978, nationalization is made in Turkey to provide a pricing discipline and to prevent developing small-scale mining companies disappear among American companies which have strong capitals. After nationalization, (Akdaş, 2004: 40) Eti Mine has increased its market share rate from 11% to 38%.

75% of world boron consumption concentrates in glass, ceramics, and agriculture, textile and detergent industries. Boron is there for the use of mobile telephony and radio batteries, solar energy and hydrogen storage, solar cells as a fuel cells, etc. in the energy sector. Boron minerals can be used in land and sea transportation vehicles (cars, trucks, locomotives, ships) as a fuel. Boron has been researched to obtain engine fuel or to be a engine fuel since the 1950s (Karakoç and Eraslan, www.maden.gov.tr, p.155, Access Date: 19.04.2010). Karakoç and Eraslan explain an engine system introduced by Graham Cowan that uses boron as fuel in detail. Cowan argues that boron is more efficient even more than hydrogen.

A.B.D is one of the most advanced countries who make R&D research to develop boron technology. On the other hand, Europe Space Agency is another institution who researches boron fuels. Boron Research Institute and TUBITAK MAM Chemistry and Environment Institute maintain their R & D activities corporately about production of high valued boron compounds and sodium borohydrate synthesis and production. They complete a common Project named 'direct sodium borohydrate fuel cell production'. They have a pilot establishment for production of sodium borohydrate. Inger et.al (2009) gives detailed information about this project in their study.

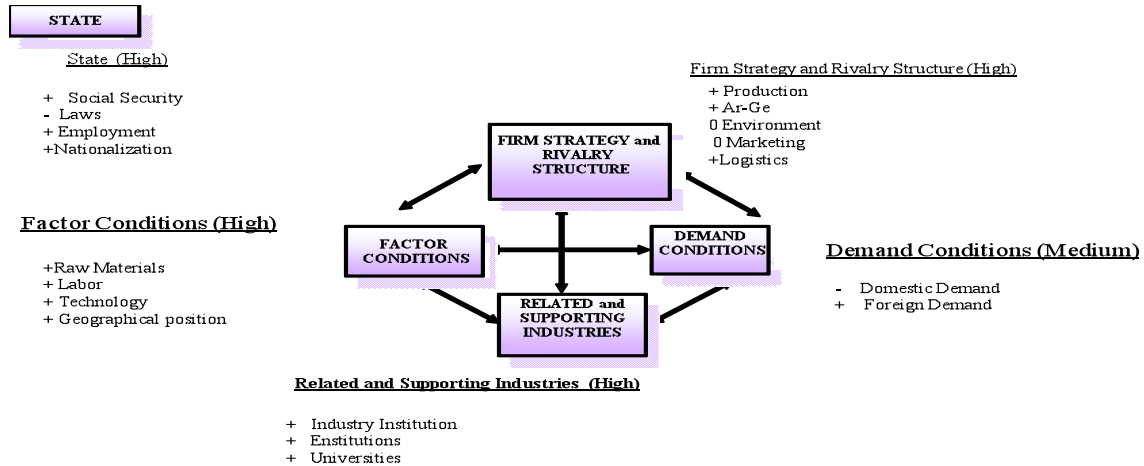

METHODOLOGY OF RESEARCH

The aim of the study is to identify the international competitive position of Turkish Boron in Energy Sector by using the Diamond Model of Michael Porter. In this study primary and secondary research methods are used. Datas are collected from various sources such as sector reports, catalogs, records, related internet resources of related organizations, scientific articles etc. Besides sector data, interview method was applied to department managers of Eti Mine and related university members as a secondary data. Questions are orientated Eti Mine's general structure and policies, personal thoughts and opinions of, interviewees and the academic researches in light of literature review. The factors of Michael Porter's Diamond Model (factor conditions, demand condition, related and supporting industries, and firm strategy and rivalry structure and state) are divided sub factors and analyzed their international competitiveness power within rating with low (-), normal (0), and high (+).

INTERNATIONAL COMPETITIVENESS ANALYSIS OF TURKISH BORON IN ENERGY SECTOR BY MICHAEL PORTER'S DIAMOND MODEL

Data gathered through primary and secondary data collection methods are evaluated according to rating mentioned above, and then sub factors are located in Figure 1 as seen below.

Figure 1: International Competitiveness Analysis of Boron in Energy Sector According to Michael Porter's Diamond Model

Reference: Michael E. Porter. (2008) *On Competition* Harvard Business School Publishing Corporation, U.S.A, p.5.

- **Factor Conditions:** These factors are raw materials, unskilled and skilled labor, technology, geographic location. These factors have strong impacts on competitiveness of boron in energy sector. Which country has a big amount of reserves, advanced technology, wide transportation network and skilled labor, this country has become leader in sector and has right to determine prices.
- **Raw Materials:** Turkey has approximately 72% of world boron reserves. The most important boron reserves are collected in four main regions in the world: (Buluttekin, 2008: 12):
 - Located in the south of the U.S. State of California "Mojave Desert"
 - South America the "Andean Belt"
 - Turkey is also where the "South-Central Asian Orogenic Belt"
 - Eastern Russia

In 2009, world production of boron has approximately decreased 19% and has reached 3.29 million tones. Turkey has 41% share in first place in the world while North America (USA) 29%, South America (Chile, Argentina, Peru and Bolivia), 18% and Asia (Russia, China and India) 12% share is followed Turkey. (Eti Mine Annual Report, 2009: 6)

The B_2O_3 identifies the quality of Boron. According to the annual report of Rio Tinto companies in America, B_2O_3 content of Tincal is 25%. In Peru, this rate is 25-27%, in China and Kazakhstan it is 8-10%, Russian average B_2O_3 rate is 9-12% (Annual Report of Eti Mine, 2009: 4). In Kırka, Tincal B_2O_3 rate is 26%, in Emet B_2O_3 rate is between 28% - 30%, in Bigadiç B_2O_3 rate of colemanite and ulexite are 29%-31% and in Keselek B_2O_3 rate of Colemanite is 29% (TMMOB, 2003:3).

- **Labor:** Turkey has an advantage over other countries in terms of skilled and unskilled labor (engineer, chemist, miner, metallurgy or workers etc.). If we look at OSYS (University Entrance Examination) 2009 Statistics, identified quota in mining, chemistry, metallurgy and their engineering departments has 3.3% all in undergraduate degree programs while this rate is 1% for 2 years programme. In accordance with the quota, interest shown in these programmes at the undergraduate level is 91% and 83% in 2 years programme. Unlike the identified quotas are low, the interest in these areas is high. At Eti Mine Organization, 76% are workers. 88% of workers are high school and over educated. It can be said that there is enough potential and skilled workforce at Eti Mine.
 - **Technology:** Eti Mine has evaluated domestic sources for technology, particularly for equipment and machines. In conclusion, technology is sufficient.
 - **Geographic Location:** Turkey has already a strategic point in terms of closeness of Europe markets. The foundation and closeness of raw material has created an advantage. In addition, establishing factories near residential area and having a basic structure of distribution network have created cost advantages in the international area. For example, in the U.S.A. and China, reserves are located very wide area but not clustered in a region. Mining and processing are expensive. Most of the minerals B₂O₃ rate is below than 12% rate.
 - **Company Strategy and Competitive Structure:** Company growth strategy has placed on competition, enterprise development and the environment axis. By developing advanced technology, they aim to establish boron oriented industrialization in Turkey. In this direction, they change production line from concentrated to refined products. They take patent at their first technological product Calcine Tincal. In addition, they make investment continuously to get bigger the production capacity. In the field of advanced research and development aim to compete with America while following the cost leadership strategy. To be fast and just in time to access international markets, they give importance to their logistics and overseas trade agencies. To prevent pollution of production conducted business activity, the ISO 14001 Environmental Management System (EMS) is created a system for environmental activities. Since 2005, they have been market share leadership. They have to determine prices but crises affect them in a negative way. Also there is some speculations about that they don't reliable to environment standards. This speculation also affects the demand of boron. (www.etimaden.gov.tr, Access Date: 19.04.2010)
 - **Demand Conditions:** The more demanding the customers in an economy, there is a pressure facing firms to constantly improve their competitiveness via innovative products, through high quality, etc.
 - **Domestic Demand:** Domestic demand is low in Turkey. Eti Mine meets all domestic demand but domestic demand has only 3% share in entire income. In 2009, domestic demand was approximately 16 million U.S. \$ revenue. It is decreasing according to previous year within 2008 global crisis.
 - **Foreign Demand:** Eti Mine is responsible for approximately 37% of world demand. RT Borax with 28% rate follows Turkey and other manufacturers are responsible for 35% in world demand. In 2009, Eti Mine imports U.S. \$ 435 million worth of boron to world. Although foreign sales of Eti Mine in 2009 have increased 126 % according to year 2002, with the global crisis, foreign sales showed a decrease 26% of the total product basis according to year 2008. Since 2003, China glass industry in the Far East countries, primarily increase the demand of boron and consumption rate. (Eti Mine 2009 Annual Report)
- On the other hand the sodium borohydrate in the U.S.A. where its consumption is about 2000 tons / year. Consumption rate has reached two-digit numbers. Prices of Sodium borohydrate is between 50-75 U.S. \$ / kg (powder) and 40-55 U.S. \$ / kg (12% NaBH₄ solution). It used for paper industry to whiten except energy sector. (Başoğlu, 2003 TMMOB Boron Report)
- Sodium borohydrate in the world, some brand names are sold with patented: Borol (Paper Industry), Sws (pharmaceutical industry), Venmet (waste water), Venpure (purification of organic chemicals), Venvat, Venhit (Cotton transactions).
- **Related and Supportive Industrial Organizations:** Industries, universities and research institutes exchange information and promote a continuous exchange of ideas and innovations.
 - **Industrial Organizations:** Industry uses boron as a raw material in production in a wide spectrum. They allow institution to experience new products to see their performance. This application helps Eti Mine has developed new high technologic products.

- **Logistics:** Logistics has an important role in transportation of goods abroad. It has a basic and well structured land and sea transport network. Boron products are coming to Bandırma in trucks and are transferred by sea to the European market.
- **Research Institutes:** Boren Institute always aims that develop production processes and increase value of products and makes collaboration with TUBITAK MAM to give technical support to investment projects of Eti Mine.
- **Universities:** Universities not only supply qualified employment for the institution but also give support with academic studies.
- **State:** Government is acting as a catalyst and challenger to encourage raising company's performance, to support company financially and make laws. It has more powerful than other factor despite it affects system externally.
- **Employment:** A particular part of employees hired by central examination system.
- **Nationalization:** Boron in the world market differs from energy sector. Privatization may be a good strategy for energy sector but not boron sector because of having a pricing discipline.
- **Social Security:** Eti Mine is a state institution so all employees are guaranteed by state.
- **Laws:** Gaps in the legislation cause delay in investments of the institution and bureaucracy may slow down works.

RESULTS

Turkey has depended on other countries in terms of fossil fuels; but she has advantages over other countries in terms of renewable energy resources and geographical position. Nowadays, the world countries shift their attention to renewable resources especially to hydrogen energy which is the most clean and available to transportation. Researches on energy aim to find the best way to storage hydrogen. Sodium Borohydrate has found the best solution of this problem. Turkey has 72% of boron reserves. General Directorial of Eti Mine Organization is the single producer of boron in Turkey. This is a necessity because of the world boron market structure. In past Eti Mine only import concentrate minerals such that Colemanite, Tincal and Ulexit but USA is developed technology and get high income through selling rafine boron products. Therefore, sustainability of Turkey's competitiveness, Eti Mine has changed its strategies and to be a leader in both energy and boron sector increased investments on R&D activities. It is successful to have knowledge and know-how to product sodium borohydrate.

When boron in energy sector analyzed with Diamond Model of Michael Porter, it is seen that its international competitive level is high. But Eti Mine needs some improvements still especially in domestic consumption. The share of domestic demand in total income is %3. There should established industries which will use boron intensively to increase national demand. Also state should give special importance to automotive industry. Because when boron or hydrogen will start to use as a fuel, automotive sector will develop faster than other sectors. State should pay attention to not leave gaps in law, because the other countries makes problem waste of boron especially Europe, far from raw materials. Eti Mine should follow more environmental strategies and apply total quality management every department of the institution. To make better marketing strategy, Eti Mine diversifies its products and makes brand in boron and distribute its dealers in a wide area. Eti Mine has a brand, Calcine Tincal but it's the first product since the institution has existed in boron market. There is last problem is negative impact of crisis on demand of boron. The supported financial structure and foundation of institution may solve this problem. It can be done with give significant importance to R&D activities and should increase its share in capital.

TECHNOLOGICAL SPECIALIZATION AND THE INTERNATIONAL COMPETITIVE POSITION OF THE EUROPEAN UNION'S ENTERPRISES

Alina Hyz

Technological Educational Institute of Epirus, Greece

ABSTRACT

The common market of factors of production in the European Union (EU) involves the free movement of labour factor, financial capital and innovation/technology. Technology as a separate factor of production in an integrating area is rarely incorporated into theoretical analysis. From a theoretical point of view, there are different relationships between various segments of the market of factors of production. Importance and strength of the relationship between them changes with each shift in the economic development of the EU member countries and deepening of integration processes. No doubt, however, that the central element becomes innovations / technologies, that lead to structural changes and local changes in integrating areas. Therefore, the purpose of this article is to assess the progress of the integration processes on the technology market in the EU and the identification of the relationship between this segment of the market of factors of production and its remaining segments.

The first part of the article presents the technology as a factor of production in an integrating area. Next we describe the influence of R&D on the region's competitiveness and we identify the main characteristics of the technology market in the European Union. The main aim of the next part of the paper is to indicate the role of international business in the creation and transfer of technology in the European Union. The analysis conducted in the paper is based on specialist literature and statistical data.

INTRODUCTION

With the economic opening up of Eastern Europe and the advances of Asian newly industrializing countries in the world market global competition has intensified - especially in the field of labor-intensive products and medium intensive technologies. For European Union's countries and regions facing intensified import competition and the relocation of production in the context of foreign direct investment outflows it is therefore important to increasingly position themselves in advanced technology fields. Hence Research and Development (R&D) are increasingly important for growth and international competitiveness. It particularly enables the development of new products and process, the reduction of production costs and the improvement in the quality of production.

When regional differences in the European Union are discussed, the focus is often on economic differences. However, if the analysis is extended to research and technology factors, it becomes clear that the gap between strong and weak countries is even more pronounced in connection with research and technology than the economic gap. Furthermore, pronounced differences exist not only between the member states, as there are also major differences between regions within individual countries (European Commission, 1994; European Parliament, 1997).

TECHNOLOGY AS A FACTOR OF PRODUCTION IN AN INTEGRATING AREA

Technology as a factor of production in an integrating area was not the subject of comprehensive studies in the theory of integration. Technology understood in the broad sense includes not only the production technologies (product and process technologies), but also managerial knowledge, marketing skills, and other so-called intangible assets on the level of a company (Pavitt, 1999; Van Tho, 1993). Constant development and spread of technology is widely recognized as a key factor distinguishing modern and modernizing societies.

Technology can be transferred in the form of tangible assets such as new products and equipment; in the form of intangible assets such as patents and licenses and in an informal way, by exchanging information and knowledge (Howells, 1998). It can be transferred through various channels, which are divided, generally speaking, into public and private. In the first case, the transfer is carried out by public organizations: the governments of highly developed countries and international agencies. Technology is then the public good. Its transfer is a part of technical assistance and economic cooperation with developing countries. In the second case, the technology is transferred by private companies on commercial basis.

Creating a technology is subjected to the process of internationalization starting from the early '80s, what is expressed in the so-called R&D internationalization (Gerybadze, Reger, 1999). Traditionally, this process was characterized by a unilateral transfer of technology, i.e., ideas for new products and technological knowledge have been created by a dominating parent institution and copied in other peripheral locations. This process can be interpreted as learning from the outside or the exploitation of knowledge moving from the center to the periphery. In contrast, the new innovation process is characterised by: 1/. Multiple centers of knowledge in different geographic locations; 2/. A combination of learning through the transfer of knowledge from the parent company and the knowledge created in a given location; 3/. Technology transfer, both between different geographical locations and between organizational units. Developments in science and technology (see Note 1) have led to crystallizing of the polycentric structure of national research and innovation systems. In every important area of research there have developed two - three so-called "centers of excellence", which compete with each other and which rankings can change quickly.

RESEARCH AND DEVELOPMENT AS A FACTOR OF COMPETITIVENESS

Research and technological development or, more generally, the ability to innovate and produce new products and knowledge are important factors for competitiveness and hence for a economy's growth potential (O.E.C.D., 1996; European Commission 1997; Schmookler, 1966; Solow, 39/3; Kaldor, Mirlees, 1962; Gomulka, 1971). Since continual change is the feature of the market, on-going research and technological development and innovation are essential. Access to technological development and innovation is of crucial importance for a region's capacity to compete in a global market.

The post-war view of R&D policy was based on an implicit routinized model of innovation in an economy where the most important inputs were land, labor and capital. R&D and technological change itself were viewed as being simply supplement to these factors of production. This was also an economy of relative certainty and stability. The international competitive advantage was generally achieved through cost reduction resulting from large-scale mass production to exploit scale economies. The supplemental role of R&D in the post war economy was designed to reduce costs through process innovation and to generate incremental innovations. The routinized role of R&D was perhaps first articulated by Schumpeter who observed that, "Innovation itself is being reduced to routine. Technological progress is increasingly becoming the business of teams of trained specialists who turn out what is required and make it work in predictable ways" (Schumpeter, 1942).

Companies in the weaker regions can no longer compete with procedures in the developing countries on wage costs. At the same time, they are subject to the pressure of competition from strong countries and regions with rapidly changing patterns of innovation and a faster and shorter life cycle for products. In order to compete on high-tech markets, the weaker regions must adjust to the demanding pace set by the prosperous regions in the Community in the area of product and process invention and innovation (note 2). R&D is needed for process innovations, which allow costs to be cut and hence markets to be widened - this could facilitate the exploitation of static and dynamic economies of scale (Audretsch, 1995; Scherer, 1992). R&D is also a requirement for product innovations, which allow firms to charge higher prices. Firms that are eager to recover R&D investment costs and to earn a Schumpeterian rent from innovation will try to ensure intellectual property rights, typically via patents. They will also massively invest into marketing in order to create preferences in favor of the novel products. R&D as well as marketing expenditures create market entry barriers because they largely represent sunk costs; newcomers will find it therefore difficult to successfully enter the market. Innovative firms thus can enjoy extra profits which partly will have to be shared with workers since trade unions in highly profitable industries will strongly lobby for wage rises. With continued product innovations the value-added by the firm will indeed rise continuously such that the wage bargaining process will result in rising real wage rates and higher real incomes in some sectors. This in turn will result in multiplier effects in the overall economy.

Launching product innovations will stimulate the growth of demand directly as was emphasized by Schumpeter who also stressed that entrepreneurship is the basis for long-term growth and economic cycles (Schumpeter, 1939; Korres, Lionaki, Polichronopoulos, 2001). Both for R&D devoted to product innovations and to process innovations it holds that unit R&D costs can be reduced if large output volumes are realized during a given innovation cycle. From this perspective the gradual increase of R&D expenditure - GNP ratios is bound to stimulate competitiveness. While competitiveness certainly has aspects of relative technological positing in world markets - typically emphasized in the literature - one should not overlook the global real income effect of process innovations (the price reduction effect). Product innovations create new markets and stimulate the expansion of firms as diffusion of novel products and processes follow a logistical expansion path. In the context of an open economy it is crucial that EU firms specialize in a way that is consistent with their respective comparative technological advantage (Dosi, 1988). This could be an actual comparative advantage of a potential advantage that relies on strong domestic market growth or R&D subsidies in the context of dynamic scale economies.

CHARACTERISTICS OF THE TECHNOLOGY MARKET IN THE EUROPEAN UNION

Market of knowledge is highly imperfect, and when left to its own, functions improperly. This results from the characterization of knowledge as a public good, which discourages the supply of knowledge and investment in research. Three ways are indicated to improve the functioning of the market of knowledge and commercial ideas (Pelkmans, 1997): 1/. Subsidizing the supply side by the government; 2/. The internalisation of the market of knowledge within enterprises by controlling the internal R&D activity and a systematic commercialization of results; 3/. The introduction of and respect of the protection of intellectual property rights. It should, however, be noted that these methods could also be the source of distortion in the market.

With regard to the subsidization of R&D sphere in the EU's support for R&D, activities can be made at the level of a member country and at EU level. (Basic data on the size, structure and effectiveness of expenditures on R&D are summarized in table 1 and graph 1). Functioning of multi-research programs funded by particular governments can lead to a reallocation of R&D activities among member states. Subsidizing R&D activities at EU level is, as it was evaluated, not more than 6% of expenditures of the member states on this purpose.

Table 1. Basic data on the size, structure and effectiveness of expenditures on R&D

	1998	2001	2003	2005	2007
7.1 Research and development expenditure, by sectors of performance	1.79	1.86	1.86	1.82	1.85

Percentage of GDP

The internalisation of the market of knowledge within companies, as a method of correcting its deficiencies at the EU level, requires consideration of two aspects: ie the extent of internationalization (or to be more precise "europeanization") of companies and their participation in cooperation for networks in the scope of R&D. Internationalization of production and R&D means the distribution of these activities in different EU member states and a free movement of knowledge within the integrated areas but exclusion of single companies from this activity. This can result in uneven distribution of R&D function in the whole European Union and in concentration of more developed countries, attracting these types of activities.

Creating a network of cooperation between companies in the field of technology is also an indicator characterizing the technology market in the EU. This cooperation is made between institutions of non-profit type and in business sector. Institutions which are not focused on gaining profit (such as various types of colleges and universities) are traditionally open to international cooperation. Business sector, operating in conditions of competition, is seen as an unwillingly cooperating with strategic rivals, especially in the field of technology. Data on cooperation agreements between the companies - not just in the European Union - collected in the 90s deny, however, this quite common view (Cantwell, Janne, 1999; Archibugi, Michie, 1995). An increase in creating networks of cooperation between companies is observed, especially in the field of so-called high technologies (biotechnologies, new materials, information technologies). According to estimates, approximately 70% of all monitored agreements were attributed to these sectors (Archibugi, Michie, 1995).

Two main reasons for the increase in popularity of these agreements are indicated: 1/. Due to the nature of new technologies, which require a substantial „wealth” of knowledge for their mastering, the success of innovative activities of individual companies depends on the access to information about what is happening in a given field; 2/. In the case of emerging industries, particularly important is to gain and exchange information in order to reduce potential losses. Benefits of companies arising from this type of cooperation include distribution among partners considerable financial outlays necessary for the specific activity, which is the R&D, accelerating the return on investment incurred by a faster spread of the company's assets, risk

spread, increasing efficiency owing to the benefits of scale, scope and specialization, turning of competition into collaboration.

In relation to companies from the European Union, a strong growth in the number of cooperation networks between them, especially in the field of information technologies. These are networks created independently by companies, and such, which are sponsored by the European Union. The available data suggest, however, that it would be unjustifiable to make a conclusion about the dominance of intra-EU relationships in the different segments of EU technology market, or the existence of general patterns of behaviour attributed to the operation of the market. Data collected at the stage of finalizing the construction of the Single Market indicated that, European companies in a greater extent cooperated with partners from the U.S. than with European partners. Intra-European joint research projects accounted for 19% of all such operations, while Euro-American – 21%. This would indicate that there is a more global rather than regional approach to technology issues. It should also be remembered that intra-European cooperation was not only a result of the shifts in market forces and effects of market integration in the market of the factors of production, but also the effect of policy to support the research and technological development, carried out at EU level.

Technology Policy of the European Union

The technology policy's objective is to promote technological research and technological development as one of the key factors of the improvement of the competitiveness of the whole EU on the international markets. From the point of view of this analysis it is important to identify those elements of technology policy that affect the functioning of the market of the factors of production in the integrating area. This policy is based on the principle of subsidiarity. The Member States retain the freedom in the field of research and development, and at EU level, the attempts are made to coordinate and finance, with respect to these research areas which are of a supranational meaning. The technology policy of the European Union covers both support for basic research and diffusion of technology, as well as for the development of technological cooperation of various organizations and institutions, focused on the development of scientific research base for small and medium-sized companies. Realization of such formulated objectives corresponds to the need of the improvement in functioning of the market of knowledge within EU functioning of markets previously discussed. Crucial elements here include: 1/. Support for the basic research, 2/. Support for the spread of technology, 3/. Promotion of the technological cooperation. The technology policy of the European Union is realized in practice within long -lasting research framework programs (the so-called Framework Programs). These programs, define the scientific and technological objectives, priorities and proposed projects necessary for their implementation, together with financial resources and their distribution among particular leading research tasks.

Technological specialization and the international competitive position of the European Union

Indirect answer to the questions posed above can be sought in analysis and evaluation of technological specialization of the European Union and its international technological competitiveness. Evaluation of technological specialization of the EU, in the scope of the deepening of integration came out unfavourably against its competitors: the U.S. and Japan.

The technological specialization of so-called Triad (USA, Japan, EU) measured by the sum of absolute differences in shares of patented ideas (which are assigned to specific industries in the tested period of time) and by so called Herfindahl index - which is a measure of the concentration of patent patterns (sum of squares of the shares of individual industries in the total number of patented ideas from each country, multiplied by 100) - shows significant differences. Between 1992-2002 the U.S. and Japan have reached a much stronger shift towards a concentration of innovative activity, and as a result, a higher degree of technological specialization than the EC. At that time the European Union experienced a reduction of technological specialization, what proved not enough use of their potential to achieve scale benefits within R&D activity. It is assumed, that the lack of an innovative specialization still results from parallel competitive functioning of R&D programs in various countries. Studies show that there is still a considerable scope for improving the effectiveness of European Union technology policy coordination between national policies in the field of R&D and policy at EU level.

Assessment of the position of the EU in trade in technologically advanced products come out more favourably, although they are geographically diverse and concern a slightly different period than that examined above. In the years 1999-2005 the trade in high-tech products was characterised by a deficit. Japan is the top net exporter, through with a negative trend (42beuro in 1999, 31beuro in 2005). US has a negative balance in 2002 and 2003 (-20beuro); its balance was positive in 1999 and become positive again in 2004 and 2005. China had negative balance till 2004 (-2beuro), but in 2005 it becomes positive. EU25 has the highest negative balance over the period 1999-2005 (-28beuro in 2005) (European Commission, 2007)

Other studies conducted for the years 1999-2005 are based on the amount of exports/imports of high-tech products per capita. This provides the magnitude of high-tech trade in relation to the population of the country considered. (Table 2 and 3).

Table 2. Exports (euro/cap)

	1999	2000	2001	2002	2003	2004	2005
EUR25	307	401	414	371	356	389	437
JAPAN	771	1096	872	796	743	796	791
CHINA	21	34	42	55	73	99	132
USA	725	843	894	683	575	694	747

Source: European Commission, 2007

Table 3. Imports (euro/cap)

	1999	2000	2001	2002	2003	2004	2005
EU25	400	536	507	458	437	474	499
JAPAN	439	644	563	520	486	516	543
CHINA	24	39	50	64	80	101	126
USA	658	932	811	749	645	666	719

Source: European Commission, 2007

The data show that exports of high-tech per capita (i.e. the intensity of high-tech exports) are higher in Japan than in US, although the world market shares of Japan's exports are consistently much lower than those of US. In EU25, exports of high-tech products per capita are much lower than those of Japan, despite the fact that EU25 has higher exports world market shares. China's figures are very small compared to the other countries: its intensity in high-tech trading is still very low and it will take many years to catch up with the other countries. The statistical data show that the picture of EU and Japan for imports across years is very similar (around 500 – 550 euro/cap in 2005). However, such intensity is highest in the US (US population and enterprises are eager of high-tech products, above 700 euro/cap). China, due to its large population, has very small intensity (about 120 euro/cap).

These results allow only in an indirect way to answer the questions previously raised about the legitimacy and effectiveness of technology policy of the EU. Critically evaluating the technological specialization of the Union one should pay attention to the need for a better coordination of efforts in the scope of R&D, non-spreading and non-replication of R&D programs at the national level. By contrast, the observed improvement of the competitive position of EU in relation to its main rivals was a joint effect of activated mechanisms and conducted technology policy. One should agree with the view that the establishment and proper functioning of this market is, so far, the most important incentive for private innovations. Technology policy corrects imperfections of the European market of knowledge which are being revealed.

CREATION AND TRANSFER OF TECHNOLOGY IN THE EUROPEAN UNION. THE ROLE OF INTERNATIONAL BUSINESS

The European Union is an area where the largest transnational corporations operate. Change in behaviour of these companies in the process of deepening European integration were the subject of research, whereas, an attempt to define the specific processes of internationalization of technological activity of transnational corporations in the EU faces difficulties due to lack of research focusing on this aspect of the problem.

From the empirical research conducted in a wider context than the integration and focusing on a selected group of 21 largest transnational corporations it can be concluded that European companies are characterized by some identity in internationalization strategies of research - development activity (Gerybadze, Reger, 1999). These strategies depend on the size of the country of origin, specificity of industry and features of enterprise itself. We can distinguish companies of a global range that come from small, but highly developed

European countries. The size of their national R&D base is limited, so the transnational companies which come from these countries are obliged to actively participate in foreign researches. However, many transnational companies from large European countries, characterized by significant technological base (Germany, France, United Kingdom), still shows a tendency to focus a substantial part of their research in country of origin. This concerns in particular the engineering industry and the construction of means of transport and electrical equipment. By contrast, the strategies of companies of chemical and pharmaceutical industry are different, since they are characterized by a substantial share of foreign R&D in their activities. For comparison, transnational corporations which came from the U.S. based on their own, and a strong national research base and were less internationalized in R&D than European companies. Major Japan corporations were characterized by the low degree of internationalization of R&D. By contrast, studies conducted on a sample of 244 transnational corporations operating in technologically intensive fields indicate that European companies were characterized by the greatest share of R&D activity located abroad, in total capital expenditures on R&D in comparison with their major competitors that are American and Japanese companies (Roberts, 1999). This share was shaped on the level of 30%, but the European companies had a tendency to focus on intra-European investments.

Deepening of European integration, that is passing through its successive stages pushed researchers to formulate hypotheses that with the advancement of integration processes there are changes made in specialization of innovative activity of transnational corporations in an economically integrated region. In J. Cantwell model (Cantwell, 1987) on the cumulative causation in the scope of specialization of innovative activity in integrated area, two types of production undertaken by transnational companies are distinguished: 1/. Intensive research production usually associated with local research and development works; 2/. Assembly production type that does not require support of local research and development.

Production of research intensive components final assembly operations can be separated by location but integrated through intra-European market, as a result of the strategic decisions of transnational companies. Regularity is that the research intensive production is drawn in to places of strong innovation activity. In countries where local firms are strong in the innovation sector operations of transnational companies are becoming an additional incentive for the development of this sector. They induce increase in the share of research intensive activity in the whole of local production; and this in turn, is associated with a higher rate of productivity growth and -by increasing local competitiveness – with a higher rate of production growth. A kind of virtuous circle is being activated.

Conversely, is in the case when local companies in a given sector are technologically backward. If a transnational company invests there in production, this will be the type of an assembly production, and innovation and advanced components will be imported. Local activities in R&D field may be then in danger. Highly competitive transnational companies may strengthen their position by increasing the transfer of funds from local sales to the parent company, intended to further develop their R&D. Local companies lack the resources and are forced to cut their expenses on this purpose. It moves down the function of technical progress in countries where companies are relatively weak in important innovative industries. Mechanism of a vicious circle is activated. In countries that are not quite able to compete effectively with TNCs, the activity of the latter can stop this "vicious circle" through indirect influence on the function of technical progress. Then the local innovations take the form of skills development, improvement of manufacturing processes, better technical equipment of the production process, a new quality of technical control, etc.

Today's global economy reveals a tendency for geographical concentration of innovative activity in areas that bring investors the benefits of technological agglomeration. These are benefits arising from conducting innovative business activity in geographic proximity to other entities involved in such activity. Knowledge, unless it is codified, does not spread in an automatic and simple way. Its diffusion is made easiest through direct personal contacts. Then the concentration of innovative activity in a certain geographical area, in which other innovators are present, strengthens and facilitates innovation processes. In this way the so-called. Clusters, i.e., different activities accumulated in the same geographical area, including innovation, which attract each other.

CONCLUSIONS

Integration in the scope of market of production factors is not yet a completed process in the European Union and proceeds unequally. The European Union technology market is just emerging. Because of the specificity of this market, that is its encoded imperfection which results from character of knowledge as a public good, the integration efforts in this field will not be able to bring quick results. On the one hand, the EU's Common Technology Policy is trying to support the emergence of a more integrated technology market, on the other -

the internationalization of creation and technology made beyond the borders of EU countries and integration groups, as a result of the activities of transnational corporations, can constitute a serious barrier in realizing the common technology market.

It is necessary to create now in all regions of EU a basis for future growth and development. Short-term solutions to a number of problems are not enough, as they jeopardize future growth. As a result of the changes in economic activity, which have meant that knowledge has become the crucial factor for economic growth, policies must also be adjusted to keep pace with those changes. The increasing importance of R&D require regional, national and union's R&D policies to be adapted to the new structures and requirements. How new structures and policies-are to be formulated is still open to debate and this paper can be seen as an introduction to that debate.

APPENDIX

Note 1. In this paper the term "science" is understood to cover the creation, discovery, examination, classification, reorganization and dissemination of knowledge on physical, biological or social subjects. "Technology" is science application know-how. As such, it belongs to a large group of like activities, which embrace the creation and use of artifacts, crafts and items of knowledge as well as various forms of social organizations. Technology does not only signify the application of scientific results, but any purposive treatment, methods, working method and skill in the exploitation of scientific knowledge together with the products of so doing. The significance of the "research" process in the materialization of the innovations nowadays is uncontested. According to the rules of present day research statistics, a distinction must be made between fundamental research, applied research and experimental development. The three subsequent differentiated concepts are often combined under the heading "Research and Development". See: Frascati Manual, OECD 1992; Proposed Standard Practice, for Surveys of Research and Experimental Development, Fifth Revision, Paris 1993.

Note 2. Invention can be defined as the discovery of new solutions and new ideas for acquiring new knowledge. Innovation is when an invention is for the first time implemented and put into production or a new idea is for the first time put into practice.

Note 3. Technology policy can be defined as comprising the sum of all state measures promoting new or existing technologies for economic application in broad sense. Although Ergas concluded that "precise boundaries of technology policy are often difficult to identify", there are district technology policies, which have been pursued in the European Union. The legal basis for supranational research and technology policy in the European Community is laid down in specific articles of the ECSC Treaty (steel and coal union), the EAEC Treaty (nuclear research) and the European Community Treaty, the Single European Act and the Treaty of Maastricht on European Union.

(4) The main objectives of the common R&D policy are to provide impulses for welfare-increasing progress in important technological fields and to stimulate the diffusion of new technologies. The idea is to develop coordinated national policies as well as supranational research activities, where the concrete aims are: 1/. strengthening the scientific and technological bases of Community industry and encouraging it to become more competitive at the international level, 2/. eliminating unwarranted duplication of national R&D programs, 3/. improving the efficiency of projects by task and cost sharing or use of pooling resources, 4/. helping to reduce unemployment in the EU through new technologies and product innovations.

COMPETITIVE STRATEGIES AND FIRM PERFORMANCE

A literature Survey

I. Hakki Eraslan, Izzet Kılınç, Yunus Emre Taşgit
Düzce University, Turkey

ABSTRACT

Competitive strategies and Firm performance are between the key topics in strategic management literature. In this respect, examining the relationship between the concepts is quite important. Firm performance is a prominent means to gain competitive advantage and a multidimensional construct which includes financial performance, business performance, and organizational effectiveness. Competitive strategies are concerned with obtaining sustainable competitive advantage, gaining a position and making strategic decisions on actions. The main object of this paper is to research the relationship between competitive strategies and firm performance. Achieving to this, the concept of firm performance, competitive strategies and competitive advantage are determined; then looked at the relationship between competitive strategies and firm performance. According to the result of the literature surveys, there is an important relationship between competitive strategies and firm performance.

Keywords: *Strategy, Competitive Strategies, Firm Performance*

INTRODUCTION

Globalization, new economy, the changing competitive conditions in markets, the changing characteristics of trade relations have formed a new dynamic and complex business environment. Achieving superior performance relative to competitors becomes more and more difficult in this dynamic environment (Haarla, 2003; Zyl, 2006).

According to Banker et al., (2006) both academicians and non-academicians underline firm performance as a prominent means to gain competitive advantage in today's dynamic business environment. In this respect, the accurate and appropriate definition of performance becomes quite important in order to discuss the relationship between competitive strategies and firm performance. There are a number of criteria that measure firm performance which are used for various research purposes. However, the measurement of performance has always been the subject of debate, and objective measurement of performance is of greater importance rather than the subjective measures based on manager perceptions (Beal, 2000).

Surviving in this complex and uncertain environment, competitive strategy is another important concept. Competitive strategy is defined as the formulas which the company develops about gaining a position different from its competitors in order to form a value for the customers (Harrison and John 2004) and as strategic decisions on the actions that a company do so as to obtain a sustainable competitive advantage in the industry where it is (Morschetta and et al., 2006).

Qualitative research method was used in this study, by taking the aims and content of the study into consideration. The study was designed to examine the relationship between competitive strategies and firm performance through a comprehensive literature survey. First stage, related to the research topic published and non-published, theoretical and empirical secondary data were determined. Later, data were obtained through library research and online sources. Next stage, obtained data were categorized primarily according to the topics, methods and findings, and analyzed. Finally, in the light of the analyze, research paper was prepared. The theoretical framework of the study was designed on focusing on relationship between competitive strategies and firm performance. Before analyzing this issue, the study firstly determines the concept of firm performance and competitive strategies; then examines the relationship between competitive strategies and firm performance.

LITRETATURE SURVEY

The importance of competitive strategy in both large and small firms has been continuously emphasized in the strategic management literature since almost three decades (David, 2001; Wheelen and Hunger, 2002). Competitive strategies help to firms to outline the fundamental steps they need to follow in order to realize their organizational objectives. Accordingly, business strategy is regarded as a significant variable for business performance (Gibcus and Kemp, 2003).

It is expected that there should be a relationship between firm performance and different types of business strategies. Along with extensive research on the business strategy formulation, there has been also existence literature that focus on the relationship between strategy and the firm performance, and much of the research on performance measurement has been conducted in the field of organization theory and strategic management (Murphy et al., 1996). Beard and Dess (1981) demonstrate the relative importance of corporate-level strategy and business level strategy in the determination of firm profit performance.

Firm Performance Concept

The concept of firm performance is a key element in the strategic management literature. However, the measurement of performance has always been the subject of debate, and objective measurement of performance is of greater importance rather than the subjective measures based on manager perceptions (Beal, 2000). In this respect, the accurate and appropriate definition of firm performance becomes quite important in order to discuss the relationship between competitive strategies and firm performance. Porter (1980) define good performance as the above-average rate of return sustained over a period of years. Other researchers define the firm performance as a prominent means to gain competitive advantage (Banker et al., 2006) and a multidimensional construct which includes financial performance, business performance, and organizational effectiveness (Venkatraman and Ramanujam, 1986).

There are many performance indicators, which have been employed and determined in the literature for a long time. For instance, according to Venkatraman and Ramanujam (1986) the firm performance is a multidimensional construct. The authors have defined three levels of firm performance, which are financial performance, business performance, and organizational effectiveness. As Parker (2000) outlines in his study, accounting-based standards such as Return on Assets (ROA), return on sales (ROS), and Return on Equity (ROE) can be tools to measure the performance of the firm in terms of financial success. Nevertheless, Gray (1997) draws attention to market-related items such as market share, growth, diversification, and product development as business performance measures. Moreover, a study employed by Lee (1987), indicates that composite measures of financial profitability such as return on equity (ROE), return on assets (ROA), return on investment (ROI), return on sales (ROS) would be a relatively comprehensive criterion to measure the performance of SMEs in different industries.

Competitive Strategy and Competitive Advantage Concepts

Attempts to describe, explain, and categorize competitive strategies that firms use has been a favorite challenge of strategy researchers. Three popular approaches have drawn a great amount of attention in strategic management literature. Miles and Slow's adaptive strategies (1978), Abell's business definition framework (1980), and Porter (1980)'s generic competitive strategies (Coulter, 2005). According to Porter (1980) Competitive strategies are concerned with obtaining sustainable competitive advantage and gaining a favorably position. There are three competitive strategies: (called also as generic strategies) cost leadership, differentiation and focus. The cost leadership strategy is an integrated set of actions taken to produce goods or services with features that are acceptable to customer at the lowest cost, relative to that of competitors. The differantiation strategy is an integrated set of actions taken to produce goods or services (at an acceptable cost) that customers perceive as being different in ways that are important to them. The focus strategy is an integrated set of actions taken to produce goods or services that serve the needs of a particular competitive segment (Hitt et al, 2005: 115–124). Miles and Slow (1978) explain the concept as action used by firms to adapt to their uncertain competitive environments. According to the approach, four strategic posture are possible: prospector, defender, analyzer and reactor. Mintzberg (1988) has developed an alternative typology of competitive strategies that he felt better reflected the increasing complexity of the competitive environment. He proposed six possible competitive strategies: differentiation by 1) price, 2)marketing image, 3) product desing, 4) product quality and 5) product support (Coulter, 2005).

There are two main views that shape the competitive advantage phenomenon in the strategic management literature; namely, Resource-Based View (RBV), and The Position School (also referred as Industrial Organization view) which are two leading views used to explain firm performance through the competitive advantage paradigm (Barney, 1991). The Position School argues that firm's strategies are determined in accordance with the external environment, whereas RBV suggests that a firm's strategy is shaped by the unique resources and capabilities possessed (internal environment) (Haarla, 2003).

According to RBV, the unique assets and resources of the firm can lead the firm to competitive advantage (Conner, 1991; Barney, 1991; Peteraf, 1993), and firm resources include all assets, capabilities, organizational processes, firm attributes, information, knowledge, etc. controlled by a firm that enable the firm to conceive of and implement strategies that improve its efficiency and effectiveness (Barney, 1991: 101). Barney (1991) provides some criteria for resources that pave the way for competitive advantage. According to Barney (1991), for a resource to provide competitive advantage, the resource should meet some criteria, which include value (it should be valuable or it should create value), rarity (it should be rare), inimitability (it should be difficult to duplicate) and non-substitutability. The competitive advantage of the firm is highly associated with its internal resources such as financial, physical, organizational, technological, and intangible and human resources that form organizational capabilities (Almor and Hashai, 2004; Steinle and Schiele, 2008). Although, the view gained support from many academicians in the strategic management field, it drew criticism, as well. RBV is perceived as tautological, or self-verifying.

The positioning approach, on the other hand, which is an extension of Harvard Business School approach, is perceived as the contrasting view of RBV. This approach highlights the environment as the key determinant of performance (McKiernan, 1997). Porter (1980) emphasizes that the importance of the firm's environment in competitive strategy, and states that firms that possess a defensible position in the long-run, will be able to out-perform its competitors. According to Porter, competitive advantage is regarded as the profitable and sustainable position of the firm, which is adopted against the forces of industry competition, which are namely; supplier bargaining power, the threat of substitute goods and/or services, the threat of new competitors, customer bargaining power, and the intensity of internal rivalry (Porter, 1985). Positioning is constituted through adopting one of competitive strategies (differentiation, low cost leadership, focus differentiation, or focus low cost leadership). Also, there are a number of tools that are used by firms that adopt positioning approach in shaping the business strategy, such as business definition models, value chain analysis, the five forces industry analysis model, situation-cum-competitor analysis framework, strategic group mapping, brand maps, value/cost driver analysis and industry life cycle analysis.

THE RELATIONSHIP BETWEEN COMPETITIVE STRATEGIES AND FIRM PERFORMANCE

According to Porter, firms with a clear strategy outpace firms without a strategy. This argument constitutes the base of his competitive strategies. The literature on strategy defines three essential conditions for the firm success attaining a competitive position or series of competitive positions that lead to superior and sustainable financial performance (Porter, 1991). The first condition for the success is the definition of clear goals and functional policies of the firm that define the position of the firm in the market. The second condition is the consistency between the organization's strengths and weaknesses and the external opportunities and threats in the industry. The third condition is the discovery of the firm's distinctive competences.

Hrebiniak and Snow (1980) suggest that functional areas such as general management, production, and marketing can become distinctive competences. Results of their show significant relationships among business level strategies, certain distinctive competences, and performance. Some of the studies embracing Porter's (1980, 1985) typology of strategy contends that viable business units must seek either a low cost or a differentiation strategy to be successful (Dess and Davis, 1984; Hambrick, 1981, 1982; Hawes and Crittendon, 1984). Dess and Davis (1984) categorize firms from paints and allied products on the basis of their intended strategies. Total firm sales, sales growth, and average after tax return on total sales are used as performance measure. Findings support that firms adopting at least one of the generic strategies have superior performance than firms that do not. According to results, the overall low cost leader firms have the highest average return on assets while firms adopting a focus strategy achieve the highest performance on sales growth.

Karnani (1984) derives that a superior cost or differentiation position leads to a larger market share, which in turn leads to higher profitability. Similarly, looking firm performance through the profitability perspective, Jones and Butler (1988) have studied the relative advantages of a cost leadership strategy versus a differentiation strategy. The theory they developed demonstrates that both cost leadership and differentiation strategies must be combined when choosing a business strategy that help the organization outperform the others regarding the performance. White (1986) handles the strategy-organization-performance context within Porter's competitive strategies' typology. He concludes that business units that employ pure cost strategies achieve higher ROI when they have low autonomy, and the sales growth of pure differentiation strategies benefits from strong functional coordination for key functions under the responsibility of business unit manager. Conclusions of the research highlight that strategy-structure-performance paradigm is relevant for the business level in multi- business firms. The study of Banker et al. (2006) investigates the relationship between the strategic positioning of firms whose financial data is publicly available and the sustainability of their financial performance. Results reveal that firms employing a differentiation strategy are seen to be able to have sustainable financial performance and higher price-earnings multiple in the eyes of capital market participants.

Tehrani (2003) discusses the impact of five types of competitive strategies (product differentiation, low cost, marketing differentiation, focus product differentiation, and focus low cost) on preeminent performance among sixteen segments of high-tech industries in the US and EU. His findings indicate that the relationship between competitive strategy and performance depends on the geographies the firm operates in, since US firms that adopt product differentiation, low cost, and focus product differentiation had superior performance than others while in Europe only the low cost firms outperformed other firms.

The paper of Chandler and Hanks (1994) examines relationships between new venture performance, market attractiveness, and resource-based capabilities through analyzing 49 start-up manufacturing firms. Innovation, quality and cost leadership are included in the study as three competitive strategies. Findings show that performance of these manufacturing firms increase in case resource capabilities enable adopting a cost-leadership strategy.

The study of David et al. (2002) analysis the performance contingency effect between product competitive strategy and organization design using a sample of 194 firms from 20 industries. Results of the study prove that there is a contingency relationship among product competitive strategies, purchasing design characteristics, and firm's financial performance (return on assets). McGee et al. (1995) discuss the competitive strategy-performance relationship through the new venture context. They reveal that if firms adopt marketing differentiation, positive relationship between marketing cooperative arrangements and average sales performance is explored.

Barth (2003) discusses the impact of the fit between competitive advantage and organization of a firm over the performance of the firms that compete in mature or new industries.

Porter (1980) indicates that in new industries strategic errors can be masked by the rapid growth; therefore, it can be argued that the fit between strategy and organizational structure is not as significant as it is in mature industries because in mature industries the fit is necessary in order to survive. The researcher adopts managerial skills as the mediating variable in his study. Sales growth is used as the main performance measure and the competitive strategy is measured by focusing on cost and differentiation strategy proposed by Porter (1980). According to results, strong support was achieved only for the second hypothesis, which states, the degree of managerial skills is related to the performance of the firm especially for manufacturing firms.

The field study of Dess et al. (1997) seeks to demonstrate the relationship among entrepreneurial strategy making, strategy, environment and performance. They regress the research which supports that marketing differentiation strategy in a heterogeneous environment is significant and positive for the profitability/ ROI, and for company performance measures. Moreover, support for higher performance (for sales growth and overall company performance) in uncertain environment through innovative differentiation strategy is found, and overall high company performance is achieved in a heterogeneous environment through innovative differentiation strategy.

Pelham (2000) studies the manufacturing firms in USA in the context of Porter's strategy typology and uses market/ sales effectiveness and profitability as performance measures. Basic parameters for market/ sales effectiveness are relative product quality, new product success, and customer retention rate, sales level, sales growth rate, share of target market, and for profitability were return on equity, gross profit margin, and return

on investment. Results reveal that for small firms there is a strong correlation between performance and the combination of market orientation and growth/ differentiation strategy, and market orientation has the strongest positive relationship with measures of performance compared to strategy selection, firms size or industry characteristics.

The study of Ariyawardana (2003) employs the resource-based and strategy-based views of the competitive advantage paradigm in order to explain the performance of value-added tea producers in Sri Lanka. Results of the study highlight that Sri Lankan value-added tea producers should strengthen their sources of competitive advantage in order to achieve higher firm performance and challenge the globalization threat the tea industry faces.

In their study, Spanos and Lioukas (2001) examines manufacturing firms including food and beverages, wood and furniture products, chemicals, metal products, machinery, electric equipment and appliances. Performance is measured through profitability and market performance. Results of the study indicate that firm competitive strategy has a strong positive relationship with firms success in terms of market performance.

Yamin et al (1999) examine the relationships among competitive strategy, competitive advantage, and organizational performance in their research. Research, based on data obtained from 214 Australian manufacturers; employs ROI, Market Share, ROA, and Performance Ratios as measures of performance, and findings reveal that high and medium focus companies achieve higher financial performance than low focus companies do. Moreover, medium level cost leader companies exhibit higher level of performance compared to low level cost leader companies.

Porter asserts that competitive strategies are mutually exclusive, nevertheless, there are many studies which contradict to this assumption (Mosakowski, 1993; Panayides, 2003; Wright et al., 1991; Bush and Sinclair, 1992). For instance, the study of Mosakowski (1993) contradicts Porter's (1985) assertion that adopting solely the focus strategy does not generate above normal returns. In his study, Mosakowski (1993) questions the relationship between the focus and differentiation strategies and economic performance of entrepreneurial firms by adopting a resource-based perspective. Net-income (profit after tax) and sales revenues are selected as performance measures and data of the study is collected from 86 entrepreneurial software firms. Findings of the study support that firms adopting the vertical markets focus strategy, the customer-needs focus strategy, the customer service differentiation strategy, or the R&D differentiation strategy outperform firms those that do not.

Similarly, Panayides (2003) suggests in his study that ship management companies should adopt a combination of generic strategies rather than adopting solely one of them. The study argues out the competitive strategy-performance relationship in terms of ship management. Results of the study point out that companies that employ competitive strategies achieve higher performance, and economies of scale, differentiation, market focus and competitor analysis are factors that bring on higher performance for ship management companies. Likewise, the work of Wright et al. (1991) denotes that the adoption of both low cost and differentiation strategy can lead to highest performance. The study investigates the performance level of firms adopting different business strategies through employing return on investment (ROI) and growth in relative market share as performance variables. Six different business groups are analyzed in the study; businesses competing successfully with the low cost strategy and competing unsuccessfully with low cost strategy, those competing successfully with the differentiation strategy and those competing unsuccessfully with differentiation strategy, competing successfully with low cost and differentiation strategies and competing unsuccessfully with these strategies. Results of the study point out three types of strategic profiles: unsuccessful low cost businesses with the lowest performance, unsuccessful differentiated businesses with the second lowest performance, and successful businesses that adopt both low cost and differentiation strategies with the highest performance.

Study of Bush and Sinclair (1992), conducting a field research in hardwood lumber industry, supports that overall cost leadership is not satisfactory in a mature industry. Whereas, the study reveals that successful companies are those that combine cost leadership with differentiation.

A recent study of Kaya et al. (2004) examines the relationship among advanced manufacturing technologies (AMT), competitive strategies, and firm performance. The study, which is conducted in manufacturing firms, located in Gaziantep, reveals that AMT usage and adoption of Differentiation Strategy are both positively and significantly influential on firm performance. Another significant finding is that Implementation of a

dual strategy (combination of cost leadership and differentiation) has a positive impact on performance especially when AMTs usage is higher.

The findings of the other researches, which examine the relationship between Competitive Strategy and Firm Performance, existing in strategic management literature, are summarized in Table 1.

Tablo1: Findings related to Competitive Strategy and Firm Performance

Contributors	The topics that Studies Address	Major Findings
Ngyuen et al, 1990	<ul style="list-style-type: none"> Diversification strategy and its effects on performance 	<ul style="list-style-type: none"> Degree of technologically related diversification is positively associated with firm performance
Gomez- Mejia (1992)	<ul style="list-style-type: none"> The extent to which a match between compensation and diversification strategies affects firm performances 	<ul style="list-style-type: none"> Empirical support is not found only for the second hypothesis.
Zahra and Covin, 1993	<ul style="list-style-type: none"> The search identifies how business strategy, technology policy, and firm performance interrelate at the bivariate and multivariate levels. 	<ul style="list-style-type: none"> Hypothesis is supported. Business strategy moderates the relationship between technology policy and firm performance.
Guthrie and Datta, 1998	<ul style="list-style-type: none"> The study examines the relationships among corporate strategy, executive selection and firm performance. 	<ul style="list-style-type: none"> Results indicate significant support for improved performance among non-diversified firms in case of selecting CEOs with lower levels of firm-specific experience
Richard, 2000	<ul style="list-style-type: none"> The study examines the relationships among cultural (racial) diversity, business strategy, and firm performance. 	<ul style="list-style-type: none"> Positive results for the interaction of racial diversity and growth strategy are found in terms of productivity, return on equity, and market performance. Results demonstrate that cultural diversity contributes to firm competitive advantage.
Alpkan et al. , 2003	<ul style="list-style-type: none"> The paper aims to investigate the market-related antecedents and performance impacts of key manufacturing strategies, namely cost reduction, quality improvement, and flexibility, and also the direct effects of market-related factors on the performance of manufacturing firms. 	<ul style="list-style-type: none"> The positive relationships among market-related factors, manufacturing strategies and performance are partly confirmed in this study on Turkish manufacturing firms in the Gebze Region/ No relationship is found among cost reduction as well as flexibility strategies and firm performance. The existence of the direct positive effects of the market-related variables of competitive power and market attractiveness on the firm performance, independent from manufacturing strategies and the other market-related variables, is found.
Wisner, 2003	<ul style="list-style-type: none"> The study searches whether positive linkages between supplier management strategy, customer relationship strategy, supply chain management strategy, and firm performance. 	<ul style="list-style-type: none"> Findings support that supplier management and customer relationship strategies are correlated and together impact supply chain management. Immediate and second-tier supply chain management strategies all impact firm performance either directly or indirectly.
Geiger et al., 2006	<ul style="list-style-type: none"> The impact of industry structure on the relationship between strategy/structure fit and performance is examined. 	<ul style="list-style-type: none"> Firms with strategy/Structure fit have lower performance/ Firms with fit that operated in more concentrated industries, performed better than firms without fit.

CONCLUSION

According to the result of the study, there is an important the relationship between competitive strategies and firm performance. To obtain and improve firm performance and get sustainable competitive advantage, determining firm's competitive strategies are one of the most important issues for managers. Because, the formulation and implementation of competitive business strategies that will improve performance are one of the efficient methods to attain firm's sustainable competitive advantage. Also, the impact of competitive strategies on firm performance is a major issue of concern to the policy makers and has been playing important role for improving firm performance for a long time.

For competitive strategies have positive impact on sustainable competitive advantage and firm performance, there are some important stages. Firstly, the goals, functional policies and the position of the firm in the market are defined clearly. Secondly, the consistency between the organization's strengths and weaknesses and the external opportunities and threats in the industry is analyzed. Finally, the firm's distinctive competences are discovered.

Consequently, it can be said that both The Positioning approach and Resource-Based View (RBV) have an important affect on firm performance. However, firms prefer generally the cost leadership strategy and differentiation strategy in their actions.

THE ART OF PUBLISHING IN SCHOLARLY JOURNALS

Refik Culpan
Canakkale Onsekiz Mart University, Turkey

ABSTRACT

This paper discusses important issues and processes of publishing in scholarly journals in a systematic manner. After defines some guidelines, it summarizes necessary skills, knowledge, and experiences needed for preparing quality research papers for publishing at refereed journals. It includes useful suggestions for potential authors in preparation, development, and submission of their research works scholarly journals.

INTRODUCTION

Many academicians and researchers at various academic institutions are required to publish their research outcomes in scholarly refereed journals. However, this publication process often involves frustrating endeavor, especially for beginners, because of journals' tiresome and stringent requirements. This paper addresses an important issue of publishing in scholarly journals by defining some common processes and guidelines, and necessary skills, knowledge, experiences in handling such publications in a successful manner. In doing so, it provides a road map for researchers for preparing their high quality research manuscripts and publishing them in referred journals by describing common norms and procedures, and by giving specific examples. It concludes with suggestions for potential authors to prepare, develop and position their works successfully in refereed journals.

PUBLICATIONS IN REFEREED JOURNALS

Recently increasing number of higher educational institutions requires their faculty members conduct research and present their research in academic conferences and furthermore publish them in scholarly journals. They do that for a couple of reasons. First and foremost, they usually required by a higher central institution. For example, in Turkey, Higher Education Board has develop certain standards and guidelines for admission and promotion of all academic personnel, which every university both public and private universities in the country should follow. The basic notion behind such requirements is that it would build and maintain academic rigor and quality at universities so education quality will be kept and improved. Second, increasingly competitive educational market, universities in order to gain and sustain their competitive edge they require their faculty to be active in conducting research and even more bringing some research funds to the university. As a result, faculty members at universities have been under constant pressure to do research and share their findings by participating in scientific/academic conferences and seminars and eventually publishing them in scholarly journals (Bnece & Oppeheim, 2004). For instance, "publish or perish" is often heard cliché at some western universities. Therefore, academicians have been forced or encouraged to conduct research and communicate their research findings through printed or electronic media. Summer (2001) claims that a primary mission of institutions of higher learning is the generation and dissemination of knowledge.

TYPES OF RESEARCH PAPERS AND THEIR REQUIREMENTS

My descriptions and analysis focus on social sciences but many of my observations and assessments could apply to other disciplines. In social sciences, particularly in management discipline, there are primarily three type papers that academicians can produce. Below each one of them will be described briefly then essential components of a high quality research reports will be outlined.

- Theory Development and Conceptual Papers: Some papers may include theory and conceptual model developmental. Although these are challenging task, scholars with original ideas could challenge existing theories and then offer their new theories and models. To do so, potential researchers should be in command of current theories and be able to criticize the extant theories and

develop new ones or modified versions of old theories. These papers provide new insights in understanding of certain concepts, processes, and relationships.

- Empirical Research Papers: Many researchers collect primary data (e.g., surveys) or use secondary data (e.g., already recorded and published statistics) to test some hypotheses that they develop. Researchers need to pay attention to reliability and validity of their research instruments and the hypotheses to be drawn from extant literature. Such papers report their findings and discuss implications of those findings.
- Case Study and Analysis: Another type of papers could analyze specific cases and report their findings. They provide in-depth analysis of a particular business event, industry, or company (Eisenhardt, 1989). They are considered qualitative studies and increasing number of journals now welcome such papers. Even there are specific journals publishing only case studies.

ESSENTIAL COMPONENTS OF A HIGH QUALITY MANUSCRIPT

In this section, I will identify the essential components of a high quality paper. Table 1 summarizes these essential components. Let me go through each one of them and describe these ingredients. Although the following items are defined in reference to an empirical research paper, they, with some modifications, can equally apply other types of papers (e.g., conceptual and case studies). The quality of manuscript determines its chance of publication in reputable journals. Summer (2001) pointed out “the low acceptance rates at the leading research journals in marketing, typically in the single digits to low teens, suggests the need to increase the quality of the research manuscripts produced.” Toward this end, I will define the fundamental characteristics of a quality paper below.

- 1) Issue(s) studied: The author(s) should clearly define what the issue or issues are to be examined in the current study. At the outset, readers would like to know what the core issue, problem, or subject that the paper is addressing. This should come in the first or second paragraph of the paper and be explicitly expressed. It should spell out the objective, scope, and implications of the subject undertaken for the study.
- 2) The significance of the topic: The author also should clearly spell out why this particular study is important and define the reason of its impact. If the subject has already been
- 3) The contribution of the current study to the literature: This aspect is closely related with the previous one, the significance of the topic. More specifically the paper should attempt to answer one or more of these questions: Is it offering something new or additional? Is it testing previous theories models? Is it developing a new perspective or model? Is it nullifying an existing theory or model?
- 4) Review of extant literature: A thorough review of extant literature is a must. Authors must go through all the relevant previous worthwhile writings on his/her subject and point out their support of the current study or shortcomings of those previous publications. Authors should have such literature review at least one third of the paper at the beginning. Thanks to the current digital technology and wide spread of use of the Internet, many databases containing many book and journal publications are easily accessible nowadays. Google Scholar, for example, is a free source and available worldwide.
- 5) Methodology / Approach used: Another significant part of a quality paper is the methodology section where the authors should clearly explain their data collection and analyses. For a theoretical paper, first showing the shortcomings of existing theories and modes and then offer consistent and sound conceptual explanations filling a void. For an empirical research that involves choosing the research instrument (previously used questionnaire or newly developed questionnaire, population and sample selection, subjects and their characteristics, administration of survey, methods of analyses of collected data. For a case, a thorough information gathering about the important case event including its history, actors, milestones, and problems and accomplishments.
- 6) Findings of the study and conclusions: For a theoretical paper, it would be construction of new theory or conceptual framework showing essential components and their relationships and probably development of some research propositions based on the new theory or model which could be tested with subsequent empirical studies. For empirical research, it would include listing of research findings usually presented in tables and displaying hypothesis acceptance or rejections. For case

studies, the current state of the case with failure or success or special situation emerged related with the case.

- 7) Discussion of limitations of the current study and suggestions for future research avenues: It would be a good idea to include a section in which the authors discuss the both theoretical and practical implications of his/her study's findings. It is also recommended for authors to modestly accept the limitations of their studies and how future studies can be improved by taking into account the shortcomings of the current study.

Table 1. Essential Components of a High-Quality Manuscript

Issue(s) studied	<ul style="list-style-type: none"> • Defining the issue studied in the paper • Refer to other studies have made similar research
Significance	<ul style="list-style-type: none"> • Describe increasing importance placed on the subject • Explaining why studying this particular subject is important
Contributions	<ul style="list-style-type: none"> • Explain if there is a void in studying the subject; if so, how the current study fills it • Explain the limitations of previous studies and how this study overcomes them
Literature Review	<ul style="list-style-type: none"> • Review of relevant previous studies • Ensure current literature covered (most recent ones) • Link the previous studies to your study
Method/Approach	<ul style="list-style-type: none"> • Explain the methodology used • Justify the appropriateness of methodology
Findings/Conclusion	<ul style="list-style-type: none"> • Summarize the findings of the research • List conclusions drawn from the research
Limitations/Future research	<ul style="list-style-type: none"> • Describe the limitations of the current study • Make recommendations for future research that the current research not addressed or how it can be expanded

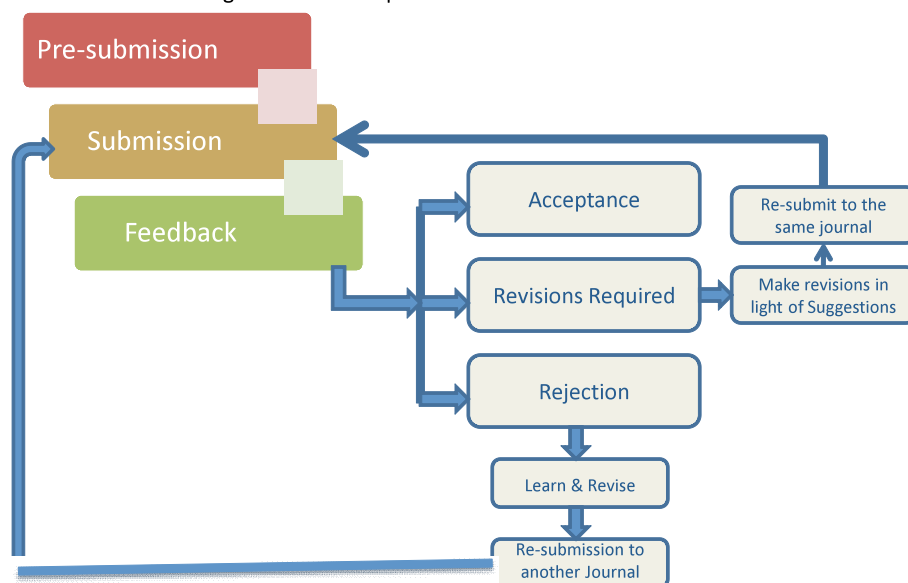

MANUSCRIPT SUBMISSION AND REVIEW PROCESS

Once the research paper is ready for journal submission, the author still needs to do some ground work in selecting an appropriate journal for his/her manuscript and go through certain process, which can be summarized below as depicted in Figure 1.

- 1) Pre-Submission Search and Choose of Appropriate Journal: It is advisable for potential authors do some ground work even before finishing their work in terms of target journals. Authors can scan some potential journals which have already published similar work with that of the authors.
- 2) Submission Guidelines: It is necessary to follow guidelines of target journal and prepare the manuscript accordingly. Often manuscripts are either rejected because the authors do not follow the guidelines of the journal submitted or ended up with a long review process to make necessary changes later. Every journal has its own unique requirements in terms of style and content conditions (Laband & Piette 1994).
- 3) Review Process: Follow up: A review of a submission may take a long time (three to six months) depending on the popularity of journal and reviewers' diligence. After all most reviewers do not usually get any compensation for their services, except professional service and satisfaction. Usually it involves at least double blind reviews. If the review process takes longer than expected, the authors may send kind reminder to the editor of the journal to speed up the process (Varadajan, 1996).
- 4) Reviewers' Feedback:
 - a. Acceptance of manuscripts: Signing and sending copy right agreement; minor editing
 - b. Meeting the Revision Requests: Paying attention to the points of recommendations and addressing the concerns of reviewers.
 - c. Rejected Papers (a new cycle): Benefiting the feedbacks of the reviewers and repositioning the enhanced paper

- 5) Resubmission: The authors ending up with major revision requirements have an option either go along with those suggestions and make the necessary revisions or if they disagree with reviewers' suggestions look for another journal to submit their work. Assuming they go for revision, the authors need to modify their paper in light of reviewers' criticisms so that they are able to improve their paper and resubmit it. In re-submission, it important for authors to explain and justify what changes are made and what is kept in its original form (Markland, 1996). This is re-learning process provide that the rejecting reviewers provide valuable insights. Of course, a re-submission does not been acceptance of the manuscript but the paper would be more likely accepted after all necessary and appropriate modifications.

Figure 1. Manuscript Submission and Review Process

RECOMMENDATIONS FOR PROSPECTIVE AUTHORS

Following the discussion above, I have presented a set of guidelines for researchers aspiring to do scholarly research in management field. Being aware of the process and preparing their paper systematically would help a lot their chances of acceptance. In addition to above guidelines, I would like to emphasize another important aspect that is networking. It is extremely important to establish some network among your colleagues who are working in the same research question and have already published articles on the same subject. Those researchers could help you in two ways. First, they could provide important suggestions in formulation and development of your research project and paper. If you find such an expert, you can send your paper for his/her reaction prior to submitting a journal. Second, they might join you for research collaboration. Working with someone who has research experience and reputation is always beneficial. The question is how to build such contacts and develop a network. To do that, it is recommended that you attend academic conferences and socialize with scholars who are experts in your area of research. Always exchange business cards and keep those business cards in a database for a future reference. Another way is to write emails to such experts to solicit their cooperation or opinions on the important research questions. You would be amazed that most of them would respond to you and make valuable suggestions.

CONCLUSION

In this paper, I have tried to define the essential components of a high quality paper and outline the process of submitting scholarly papers to refereed journals within a conceptual framework. In addition, I have included some recommendations for prospective authors in developing their research project and paper. I hope that authors would find these suggestions useful.

Publishing in scholarly journals could be a frustrating process for authors. However, being aware of the whole publishing process and paying attention to some basic ground rules would increase the chances of acceptance of scholarly papers. By doing so, I hope the researchers/scholars would be productive and satisfied rather being perished.

ICT INVESTMENTS AND FIRM PRODUCTIVITY: A CASE STUDY IN INDUSTRIAL SITES IN TURKEY

**Nurdan Colakoğlu
Serkan Dilek
Fatma Atigan
Beykent University, Turkey**

ABSTRACT:

The purpose of this study is to search the contribution of Information Communication Technology (ICT) investments for productivity of small and medium sized industry firms. To this end we conducted a survey, which investigates this contribution, to the administrators of small and medium sized manufacturing firms in two industrial sites in Beylikdüzü. Firms use ICT for managing their business processes, communication with suppliers and customers, production processes. There are two different results about the effects of ICT investments to the firm productivity. First empirical results did not find any significant relationship between them and build the infrastructure of ICT productivity paradox which is defined by Solow's aphorism "You can see computers everywhere but in productivity statistics". Second, empirical results found new evidences that show the positive contribution of ICT investments to productivity statistics. The efficiency of ICT investments depend on organizational factors such as new strategies, new business processes, new organizational structures. The results of this study will be a foundation for the next researches about the contribution of ICT investments for firm productivity in Turkey.

Keywords: Information Technology; New Economy; Firm's Productivity; ICT Investments

INTRODUCTION

Today, productivity is an important strategic objective for firm management and subject for micro economic theory. By the revolution of Information Communication Technology (ICT), developed countries changed all of their economic infrastructure. This change can be called as ICT revolution. Although ICT evolution seems to cause productivity increase, empirical studies could not find evidences that support this hypothesis until the second half of 1990's. So many scholars searched why the effects of computers could not be seen in productivity statistics and finally many empirical studies found evidences that view the increase in Total Factor Productivity (TFP) after 1995 (Brynjolffson, 1996; Colechia, 2001; Bosworth and Triplett, 2003; Gretton, 2004; Baldwin, 2004; Hempel, 2002; Maliranta and Rouvinen, 2004; Atrostic and Nguyen, 2002; Falk, 2001; Gretton and others, 2004; Mateucci and others, 2004).

This paper aims to measure the contribution of ICT to firm productivity in Turkey. Therefore we conducted survey on enterprises that are located on industrial sites. We evaluated and interpreted them by using SPSS 16.00 statistical package programme.

COMPUTER AGE

There are three waves in socio-economic development process. Agricultural revolution is the first one, Industrial revolution is the second wave, finally last wave is information revolution (Emiroğlu,2007,334; Kocacık, 2003,1). Approximately twenty thousand years ago some hunter and gatherer groups came together, then started agricultural activities. Generally it is accepted that agricultural revolution formed basis for human civilization. The invention and use of steam engines were a milestone that changes agricultural society to industrial society. The production had been done in houses or farms in agricultural society, but after industrial revolution, production was started to be done in factories (Erkan,1998;4). Because of increasing returns to scale, factorial production and fordist methods like assembly line provided an increase in productivity (Leijonhufvud,1989).

During Second World War US Army used ENIAC and Mark1, which were the first computer, to calculate ballistic fire tables and hack German codes. Although they were very huge machines, their calculating capacity was very limited (Flamm,1988;29). After the invention of transistors, the capacity of computers has been increased. Gordon Moore, who was co-founder of chip producer Intel, told that the transistor *density* on integrated circuits would double every two years (Aslan,2005;48). Empirical studies that were done after 1965, confirmed Moore (Özgüler,2003). The development in Computer industry caused computer age. Computer age is characterized by the ability of individuals to obtain information easily, and to have instant access to knowledge that would have been difficult or impossible to get previously. Eventually, ICT—computers, computerized machinery, fiber optics, communication satellites, Internet, and other ICT tools—became a significant part of the today's economy. Microcomputers were developed, so many industries were greatly changed by ICT (Dura and Atik,2002; Kutlu and Taban,2007; Dilek and others,2009). Because of this evolution, the rules of economy changed.

PRODUCTIVITY

Productivity measures are key factors of economic performance and there is strong interest in comparing them internationally. Generally economists and policy makers quantify firms productivity by two methods which are labor productivity and Multifactor productivity. Labor productivity is the ratio of output to the labor productivity. Multifactor productivity is the ratio of output to the input of both labor and capital (Lipsev and Carlaw,2004;1119).

Although today's computers are smaller than ENIAC, their functions and transaction capacities are higher. So it is estimated that firms which use ICT, will work with higher productivity. Empirical studies belong to 1960-1980 era found limited data about the correlation between firm productivity and usage of ICT. From 1948 to 1973, multi-factor productivity increased 1.9 percent per year in the U.S., and labour productivity grew at the rate of 2.9 percent; after 1973, these productivity growth rates were 0.2 percent and 1.1 percent (Triplett,1999;310). According to Schrage (1997) firms are wasting billions of dollars by believing the big lie of Information Age, but they don't try to solve structural problems. Generally empirical studies could not find significant relationship between ICT investments and productivity, so Solow said his famous aphorism "you can see computers everywhere but in statistics ..." (Solow,1987; Pilat,2004). This aphorism is called as Solow Paradox in literature. In the second part of 1990's, scholars such as Bresnahan, Brynjolfsson searched about Solow Paradox and asked why contributions of ICT on productivity could not be seen in statistics. After Brynjolfsson's (1996) study, many scholars tried to explain why the effects of computers can not be seen in statistics (Colecchia,2001; Bosworth and Triplett,2003; Gretton, 2004; Baldwin, 2004; Hempel, 2002; Maliranta and Rouvinen,2004; Atrostic and Nguyen,2002; Falk,2001; Gretton and others,2004; Mateucci and others,2004).

There are five main reasons that explain Solow Paradox.

1-) Traditional productivity metrics are inadequate for measuring ICT contributions on firm productivity, because the reason of ICT investments are not only reducing costs. Also managers want to improve quality, increase product variety, speed up responsiveness, enhance customer service. However these benefits are intangible and largely ignored by traditional productivity metrics (Brynjolfsson,1996;380). For example; Automated Teller Machines (ATM) are providing convenience in financial services, but they are only counted as an improvement in the quality of financial services (Pilat,2004;44). The other example is internet retailing firms that can offer convenient access to a larger selection of products than can brick-and-mortar retailers (Brynjolfsson and others,2003;1581). Shortly, According to scholars such as Brynjolfsson (1996;2000), Bresnahan and others (1999), statistics may not find this relation without calculating the increase in good quality that is realized by computers. Griliches (1994) told that if consumers were aware of increase on good quality, they would be ready to pay more. Therefore firms which invested on ICT will get competitive advantage in especially in F.I.R.E (finance, insurance, real estate) service sector. The reason of post-1973 slowdown on productivity is service sector. It is observed that productivity in service industries grew more slowly than productivity in manufacturing industries after the late 1960s. Therefore services sector acted as a brake on US productivity growth (Bosworth and Triplett,2003;1).

2-) A second reason for the difficulty in observing ICT's impact on productivity is time. Benefits of ICT took a considerable time to emerge. In other words the results of ICT investments can be seen after a time lag. It is seen that key technologies like electricity, diffused slowly. Even in the period between 1890-1913 (Electrical Age), slowdown in industrial and aggregate productivity growth was observed in Britain and US. But the

horsepower capacity of all electric motors installed in manufacturing establishment in country is less than five percent of factory mechanical drive (David,1990;356). Adjustment of firms to new technologies takes a long time. Firms have to change their organisational arrangements, upgrade the workforce and invent effective business processes to benefit from new technologies. Also ICT raises productivity with the help of Networks. But building networks, that are sufficiently large to have an effect on the economy, takes a long time. ICT diffused very rapidly in many economies over the 1990's and recent empirical studies typically find a larger impact of ICT on economic performance than studies that were done with data for the 1970's or 1980's (Pilat,2004;44).

3-) The empirical studies, that were based on relatively small samples of firms, drawn from private sources. They are not reliable enough also not representative because the data were poor quality. Recent studies that were based on large samples of data and covering several industries were more likely to find an impact of ICT on firm productivity than earlier studies (Pilat,2004;44).

4-) The firms, that have introduced innovations and new technologies in the past, will reap the potential benefits of ICT (Maliranta and Rouvinen,2004;606). They will perform better than other firms because of several reasons. Firstly managers are likely to have learned from past mistakes. They are aware of possible reactions of their employees and traditional customers. In other words they have more experience about the optimal speed of innovation of their firm. Secondly innovative firms know to implement innovations. Generally, complementary changes of organizational structures and processes are necessary for efficient introduction of ICT. They can train and motivate their employees more successfully. Thirdly, innovative firms have higher share of employees that accept an intensive use of ICT. Finally innovative firms, which have gained "innovative reputation", will adapt new customers to innovations easier than other firms (Hempell, 2002;7).

5-) Firms have to substantial complementary investments in learning, organizational change, training employees. So the payoff in terms of measured output may be long delayed, also firms, that don't invest on these items, will not profit from ICT investments (Basu and others, 2003;4). ICT have great contributions on recordkeeping, remembering, simple calculating, comparing and similar tasks. Computer decisionmaking is a substitution of human decisionmaking on clerical (similar routine) work (Bresnahan and others, 1999;6). Another complementary investment is decentralization of decisions. Today decentralization is important, because it allows quick and well informed reactions, also takes into local, specific conditions. Therefore firms can get competitive advantage against their competitors (Grenan and Guellec, 1998;314).

Computers can effect productivity in two ways. First, They may be used directly as inputs to the production process, as a specific form of capital. For instance in today's economy producers generally use computers in processes such as production, shipping, maintaining a database of customers etc directly. Second they may be used in organizing business processes. When computers are linked to networks, standard business processes such as accounting, order taking, inventory control can be made more effectively (Atrostic ve Nguyen, 2002;4).

In Turkey many surveys, that search about the contribution of ICT investments for firm productivity, were done (Turunç,2005; Altınöz,2008; Dilek and others,2009; Sayılır and others,2007). Most of these studies show how ICT investments enhance labor and multi factor productivity. As a result there is a common belief that computers are useful tools which increase labor productivity.

METHOD

We collected necessary data by conducting survey to executives of manufacturing firms that are located in two industrial sites which are located in Istanbul. Items in this survey were prepared by the help of previous studies that want to measure the contribution of ICT to firm productivity (Turunç,2005; Altınöz,2008; Dilek and others, 2009; Sayılır and others, 2007). In other words our study is the follower of these previous studies. *Population and Sample:* Although we tried to reach all of the firms in these industrial sites, most of the firms did not want to participate our survey. Therefore we reached 189 executives of firms. 167 survey came back correctly. Our population is 530 firms which are active in Pirinççiler and Bakırçılar industrial sites in Beylikduzu. In other words survey is conducted nearly one third of the total firms in these industrial firms. The results are evaluated with SPSS 16.00 Statistical Package Programme. As a result of the reliability tests, Cronbach Alfa coefficient is %65. According to Nakip (2006;146) survey is reliable enough to study on it.

The survey has two parts. First part is about demographic and general questions. Second part investigates the opinions and thoughts about the contribution of ICT to a firm. Five Likert Scale is used in second part. Our scales are

- I strictly disagree=1
- I disagree=2
- I have no idea=3
- I agree=4
- I strictly agree=5

FINDINGS

At first we obtained results about the demographic structure from the survey. As we mentioned, the first part of the survey is about demographic characteristics such as sex, age, education level of participants and general questions about the firm and economic situation. 134 (%80,2) of the executives, who participate to survey, are male while only 33 (%19,8) of the participants are female. This is not a surprising result, because survey is conducted on industrial sites. Generally females do not prefer to work or they are not preferred by employer.

Table 1. Sex of The Executives

	Frequency	Percent
Male	134	% 80,2
Female	33	%19,8
Total	167	% 100,0

The education levels of the participants according to their sex is given by Table 2. It is seen that most of the participants (%60,5) have at least bachelor degree. Only %29,3 of them are graduated from Lycee and %10,2 of them are graduated from Primary or Secondary School. So we can say that persons, who graduated from Universities, generally are more succesful than others. Also females have higher education level than males. %63,6 of the females and %59,7 of the males have at least bachelor degree. This is an expected result, because women have to work hard in business world to get higher position. Women who graduated from only primary or secondary school have no chance to get high position in business world (there is no executive woman who graduated from primary or secondary school).

Table 2. Education Level According to Their Sex

Education Level	General		Female		Male	
	Frequency	Percent	Frequency	Percent	Frequency	Percent
Primary-Secondary	17	10,2	0	0	17	12,7
Lycee	49	29,3	12	36,4	37	27,6
Bachelor or more	101	60,5	21	63,6	80	59,7
Total	167	100	33	100	134	100

The ages of the participants are given in Table 3. Most of the participants (%41,9) are in the 30-39 years group. %24,6 of them are younger than 30 years and %22,2 of them are between 40-49 years. It is seen that % 88,7 of the executives are younger than 50 years old. We can say that after 50 years old, executives generally leave their position to young employees.

Table3: Distribution According To Their Age

Age	Frequency	Percent
Less than 30	41	24,6
30-39	70	41,9

40-49	37	22,2
50-59	15	9,0
More than 60	4	2,4
Total	167	100,0

The question “Which amount of firm’s ICT capacity is used by employees” is asked and the results of this question is shared with Table 4. According to 57 executives (%34,1 of whole), employees are using %41-60 of firm’s ICT capacity. It is nearly average number. This means that if barriers are removed employees can use ICT more effectively. 35 executives said that their employees used less than %40 capacity of firm’s ICT infrastructure while 75 executives said that their employees used more than %60 capacity of firm’s ICT infrastructure. So %44,9 of employees are using ICT effectively and %21 of them are using ICT inefficiently.

Table 4. ICT Capacity Usage Ratio of Employees

Capacity Usage Ratio (%)	Frequency	Percent
0-20	18	10,8
21-40	17	10,2
41-60	57	34,1
61-80	50	29,9
81-100	25	15,0
Total	167	100,0

In our survey we asked to executives if their firm reached goal in Global Financial Crisis. The results are given in Table 5. Most of the executives (%64,1) mentioned that their firm could not reach goals during Global Financial Crisis. Only %35,9 of the firms could reach goals. This result showed that 2007 Global Financial Crisis hit the real sector in Turkey.

Table 5: Could Firms Reach Their Goals

	Frequency	Percent
Yes	60	35,9
No	107	64,1
Total	167	100,0

We asked a second question to 60 executives, who said that their firms reached goals in Global Financial Crisis. This question is about the ratio of ICT investments on reaching goals of the firms. The results are given in Table 6. It is seen that %80 of the participants said that ICT investments have an important role (have ratio more than %40) on achieving the goals of the firms. This is because of the productivity increase effect of ICT investments.

Table 6. The Ratio Of ICT Investments On Achieving Goals of Firm.

Ratio	Frequency	Percent
0-20	9	15
21-40	3	3
41-60	20	33,33
61-80	16	26,66
81-100	12	20
Total	60	100,0

The questions, which measure the contribution of ICT investments to firm productivity, are given in Table 7. Also frequencies are defined in Table 7. Question 13 and 14 are about the negative effects of ICT’s. Some of the questions are organized to measure the perception of executives about the contribution of ICT on productivity of employees. Also we suggested that advanced communication systems will help on achieving high productivity level. There is no item that disturbs reliability level.

Table 7. Second Part of Survey

	I Strictly disagree		I disagree		I have no idea		I agree		I strictly agree	
	f	%	f	%	f	%	f	%	f	%
1. ICT decreases production time.	2	1,2	13	7,8	6	3,6	136	81,4	10	6
2. Employees can get information easily by the help of ICT.	1	0,6	4	2,4	3	1,8	133	79,6	26	15,6
3. ICT helps employees in making decisions fastly and easily.	1	0,6	4	2,4	5	3	128	76,6	29	17,4
4. ICT facilitate communication between employees.	1	0,6	3	1,8	4	2,4	136	81,4	23	13,8
5. ICT effects communication of firm with outside positively.	1	0,6	5	3	5	3	126	75,4	30	18
6. ICT facilitate communication with customers.	1	0,6	4	2,4	4	2,4	122	73,1	36	21,6
7. ICT facilitate communication with suppliers.	1	0,6	3	1,8	6	3,6	128	76,6	29	17,4
8. ICT helps firm in finding new markets.	1	0,6	4	2,4	7	4,2	126	75,4	29	17,4
9. ICT enhances quantity of goods.	2	1,2	9	5,4	15	9	115	68,9	26	15,6
10. ICT increases the capacity of firm.	1	0,6	4	2,4	8	4,8	129	77,2	25	15
11. ICT organizes the studying conditions of firm.	1	0,6	8	4,8	10	6	128	76,6	20	12
12. ICT decreases the costs of firm.	1	0,6	11	6,6	14	8,4	119	71,3	22	13,2
13. ICT effects communication between employees negatively.	9	5,4	57	34,1	11	6,6	78	46,7	12	7,2
14. ICT produces new problems because of infrastructure inability.	2	1,2	35	21	10	6	106	63,5	14	8,4

When Table 7 is analyzed, it is seen that most of the participants agree with the items defined in survey. For example; %81,4 of the participants agree with the statement which is “ICT decreases production time” and %79,6 of the participants agree with the statement which is “Employees can get information easily by the help of ICT”. But 13th statement has some different result. Although % 46,7 of the participants agree with this statement, the number of the participants (%34,1) who disagree with this statement is not low. This is true for also 14th statement. %21 of the participants disagree with the 14th statement. Both 13th and 14th statement is about the negative effect of ICT. As a result of these analysis, executives have no doubt about the contribution of ICT on productivity. They are aware of the importance of ICT.

We analyzed demographic characteristics of the participants and their opinions about the contribution of ICT to firm productivity. The results in Table 1,2,3 and 4 is used on our relationship analysis. Here are our hypotheses about the contribution of ICT on productivity.

H₀: There is no difference on thoughts of participants about the contribution of ICT investments on productivity according to sexes.

H₁: There is difference on thoughts of participants about the contribution of ICT investments on productivity according to sexes.

A surprising result is obtained after t test (Newbold,2006; 396) is conducted($t = -2,491$, sig.:0,016). Males and females have different perspectives about the contribution of ICT investments on firm productivity, in other words H₁ is accepted. Females’ thoughts are more optimistic about the contribution of ICT investments.

H₀: There is no difference on thoughts of participants about the contribution of ICT investments on productivity according to education level.

H₂: There is difference on thoughts of participants about the contribution of ICT investments on productivity according to education level.

This analysis is done with Anova test (Orhunbilge,1997,188; Kalaycı,2008,131). As a result of this test it is found that the executives who have different education levels have no different thoughts about the contribution of ICT on firm's productivity ($F= 0,887$ sig.: 0,414). H_0 is accepted. We hoped that high educated executives will be more optimistic about the contribution of ICT, therefore this result is surprising, too.

H_0 : There is no difference on thoughts of participants about the contribution of ICT investments on productivity according to ages.

H_3 : There is difference on thoughts of participants about the contribution of ICT investments on productivity according to ages.

As a result of Anova test we found differences ($F=3,285$ sig.:0,013). The executives who are older than 50 years old are more pessimistic about the contribution of ICT on firm's productivity. H_3 is accepted. The adaption of older executives to new technologies is more difficult so the result is what we hoped before the study.

H_0 : There is no difference on thoughts of participants about the contribution of ICT investments on productivity according to efficiency of ICT usage.

H_5 : There is difference on thoughts of participants about the contribution of ICT investments on productivity according to efficiency of ICT usage.

The firms which use %0-20 of the ICT capacity is %10,8; The firms which use %21-40 of the ICT capacity is %10,2; The firms which use %41-60 of the ICT capacity is %34,1; The firms which use %61-80 of the ICT capacity is %29,9; The firms which use more than %81 of the ICT capacity is %15. As a result of Anova test, we obtained that they have not different opinion about contribution of ICT investments ($F=1,109$ sig.:0,337). All executives agree about the contribution of ICT investments on firm's productivity. This will be a signal which shows that ICT investments will go on increasing.

CONCLUSION

After computer revolution the rules and structure of economy has changed radically. Employees found opportunity to do their jobs effectively. However the researches can not find significant evidences about the contribution of ICT on productivities before 1990's. Many scholars such as Brynjolfsson, Bresnahan found necessary evidences about the contributions of ICT on productivity after 1990's.

We conducted a survey on the executives of the firms in two industrial sites, which are located on İstanbul, to reveal the bias about the contribution of ICT's on productivity. The results of surveys are evaluated by using SPSS 16.00 statistical package programme. Five point likert scale is used in this evaluation process. All necessary statistical reliability analysis were done to measure the reliability of questions. Frequency distributions and mean tests were used during analysis of data.

Important solution is most of the executives agree that "ICT decreases production time", "Employees can get information easily by the help of ICT", "ICT helps employees in making decisions fast and easily", "ICT facilitate communication between employees", "ICT effects communication of firm with outside positively", "ICT facilitate communication with customers", "ICT facilitate communication with suppliers", "ICT helps firm in finding new markets", "ICT enhances quantity of goods", "ICT increases the capacity of firm", "ICT organizes the studying conditions of firm", "ICT decreases the costs of firm". Shortly executives thought that ICT investments help in achieving the goals of firms and increase the productivity.

Also we obtained other solutions below.

- a) Females are more optimistic about the contribution of ICT investments on firm's productivity than males. They thought that ICT investments have critical role on achieving firm goals.
- b) The thoughts of high educated executives and low educated executives about the contribution of ICT investments on firm's productivity is not different.
- c) Older executives have pessimistic thoughts about the contribution of ICT investments on firm's productivity. They don't think that ICT realizes productivity increase.
- d) Also the executives of firms, which use ICT efficiently and inefficiently, don't have different thoughts about the contribution of ICT investments on firm's productivity.

Nowadays scholars achieved to reveal the effects of ICT investments on productivity. As a result of our analysis we found that most of the executives have optimistic thoughts about the contribution of ICT investments. So we can estimate that ICT investments will go on increasing and this will be an important step for transforming Turkish economic structure. Finally Turkish firms will be more competitive because of the ICT investments.

A NEW APPROACH TO MENU ANALYSIS; 3P METHOD: HOW TO ANALYZE A MENU BY USING PROFITABILITY, POPULARITY AND PERFORMANCE OF MENU ITEMS

**Mehmet Sariisik
Muhsin Halis
Oguz Turkey**

Sakarya University, Turkey

ABSTRACT

In last three decades, a limited number of researchers have designated some menu-engineering models to evaluate the menu's offerings and try to optimize them. Most of those models have two variables, for instance Kasavana and Smith, Miller, and Pavesic's matrix models; hence they could only examine the item's costs and sales velocities. In 1990's, some menu researchers as LeBruto and Cohen, Mesika and Schwartz, have conceptualized multidimensional approaches consisted of food cost, labor cost, price, and sales velocity. There were three main problems about how to compute them, how to discuss the results and if other variables needed to analyze a menu.

Against the background briefly presented above, the purpose of this study is to develop a new three-dimensional model that includes profitability, popularity, and also performance called as 3P Model (it has adopted first by Sariisik et al., 2008) and to test it within some menu items of a restaurant's menu. This new model has developed with the inspiration gained both by of Kasavana and Smith's matrix and LeBruto's three-dimensional models.

Keywords: *Menu, menu analysis, menu engineering, menu planning, food*

INTRODUCTION

The food and beverage industry is the dominant one and is faced with numbers of challenges today. Changings in technology, consumers' trends and socials (demographic changes, new lifestyles and family patterns, healthy living, etc) put pressures on managers to improve their plans and compete with the others in the future. Menu is one of the most important subjects that managers (or owners) should pay attention. It should be well planned and professionally analysed.

The menu is not simply of a list of offerings with prices attached (Gee *et al.*, 1989), it is also a major marketing and cost control tool that influences whether an operation will maximize check averages, lower its food cost percentage and realize an adequate gross profit return (Lewis *et al.*, 1989), the foundation for the control process (Ninemeier, 1987), and one of the important aspects for the success of any food service establishment (Mifti, 2000). The menu is a key factor in influencing the guest's first impression of the facility, the menu selections they are likely to order, and sets expectations about the food and beverages they are about to receive (Antun and Gustafson, 2005). The primary objective of the menu is to sell the public what a restaurant wants to sell (Bowen and Morris, 1995), and to attract the customers and revenue (Professional Chief Association, 2003) and to set up effective communication with the market. Most importantly, the operator's success ultimately depends on how the restaurant offsets the costs of its offerings through an associated pricing scheme that returns a profit (Reynolds and Taylor, 2009). The menu is central to the food service concept; it defines the product offering, establishes key elements of financial viability, namely priced and contribution margin, and provides a powerful marketing tool. It is therefore not surprising that effective management of the menu can have a significant impact on operational success. (Jones and Merrics, 2006, 204).

Many restaurants undertake menu analysis only when they change menus. They do comparative analysis and they might even do a build up (Terry, 2002). Several menu analysis methods have been developed and used by operators and researchers. Menu analysis is the systematic evaluation of a menu's cost and sales data

(Professional Chefs Association, 2004), and it is often a module of other back office applications (Terry, 2002). The principle of the analysis is for the food service operator to identify the restaurant's primary dishes which both sell well and yield high profits and those that do not (Kwong, 2005). Horton (2004) described menu engineering as an accounting tool designed to facilitate the gathering of key pieces of information. Despite the considerable research work done on menu engineering many catering operators are still accustomed to thinking of menu item's gross profit as revenue minus food cost (Chan and Au, 1986).

LITERATURE REVIEW

It should be remembered that the philosophy of menu analysis is not new. Skilled chefs de cuisine in pre-Second World War kitchens regularly identified those dishes that were performing well and encouraged their sale. They also removed items from the menu that were not selling or were having an adverse effect on gross profit performance (Jones and Merricks, 2006, 204). Several sophisticated menu analysis methods have been described in the literature; have been proposed to analyze the menus and the most of them based on mathematical formulas and computations. such as menu engineering, goal value analysis, marginal analysis with using two or more criteria (Linda *et al.*, 1999). Menu analysis models help operators to decide which item is successful and which one should relocate or remove from the menu.

Menu analysis has been defined by a few researchers in the review. According to Lewis *et al.* (1989) it has largely used either food cost percentage or item contribution margin to define an optimum sales mix and helped operators choose what to feature (Terry, 2002). Menu analysis defined as a method that helps the menu function smoothly like a machine through processing or maneuvering Yang (1996), the systematic evaluation of a menu's cost and/or sales data to identify opportunities for improved performance (Linda *et al.*, 1999), a technique and procedure that makes more effective decision making possible with respect to marketing and management of the menu (Lee, *et al.*, 2003), a method to analyze existing menus or to plan and develop new menus for the purpose of improving the existing menu (Lee and Yang, 2005).

A variety of menu analysis methods were discussed in hospitality literature over the last 30 years. Despite the fact that they offer different approaches and focus on different characteristics, they all have a common goal of finding a strategy that will help restaurant managers reveal more profitable menu items and possibly increase menu profitability (Annaroud, 2008). The early methodologies for menu analysis are mean-based matrix approaches including Miller's matrix (1980), Kasavana and Smith's menu engineering (1982) and Pavesic's cost margin analysis (1985) (Kwong, 2005). Subsequently, more methodologies (with a variety of approaches) have emerged as attempts to refine the process of menu analysis, including: Hayes and Huffmann's goal value (GV) equation (1985); Bayou and Bennett's hierarchical profitability analysis (1992); Atkinson and Jones' micro-marketing mix (1994); Beran's graphical economic approach (1995) and LeBruto et al. and LeBruto et al. three-dimensional matrix (1995 and 1997) and Cohen, Mesika, and Schwartz's multidimensional approach (1998). Few menu analysis techniques have been embraced so readily and institutionalized as quickly as menu engineering. Menu engineering has been widely reported and discussed in the hospitality literature and has been frequently adopted as an integral part of the food service curricula in hospitality education worldwide.

In 1980, Miller developed the first matrix (that was called as Miller's Matrix) about menu analysis consisted of food cost percentage and popularity. He took notice of averages about those two variables. By using averages for two variables, four quadrants have been occurred and each menu item can be placed on them depending on four alternatives. Miller called some menu items as "winners" that were with low cost percentage and high popularity and also called some as "losers" were with low popularity and high cost percentage. He considered about the food cost percentage, so the main aim of that matrix was to decrease those percentages for all menu items

Kasavana and Smith (1982) developed a similar matrix as Miller's and they called their new model as "Menu Engineering". It was based on contribution margin (CM) as known profitability and popularity of each menu item that based on selling numbers. The main aim of that matrix was to point out items which both sold and provided profit well. Kasavana and Smith classified menu items with four quadrants, as Miller by replacing them depending upon four alternatives. Each dish's unit sales are divided by the total number of entrée sales to determine that menu item's sales percentage (Ninemeier, 2001). Based on the scores in the menu mix percentage and the contribution margin categories, each entrée is then placed into one of the four quadrants of the matrix: "Stars", "Plowhorses", "Puzzles" or "Dogs".

Pavesic (1985) considered the profit factor by comparing an individual menu item's CM with the weighted average contribution margin of the menu. He reasoned that promoting the sale of a menu item which

contributed to a large proportion of sales and had a low cost percentage, would be counter-productive if the item had a low selling price relative to substitute products on the menu (Morrison, 1996). The model was shortly called “Cost-Margin Analysis” in the literature. Depending upon Pavesic’s model, an item with a profit factor of 100 percent or higher was called as “high” label. The benefit of computing the profit factor is that it allows for another dimension of analysis, rather than relying on only “high” or “low” profitability labels. It informs the operation of how much the contribution margin exceeds or falls short of the weighted average contribution margin as a percentage (Raab and Mayer, 2007).

Uman (1983) identified four kinds of menu items, namely, "Signature", "Lead item", "Hard to sell", and "Losers" by using total cash contribution and the unit contribution margin. This method is different from others in that it considers only the total cash contribution. Merricks & Jones (1988) uses simple cash contribution (SCO) instead of total cash contribution (TCC) for each menu item. However, they do not give a name to each category (Lee and Yang, 2005).

Hayes and Huffmann (1985) have challenged the inherent flaw of the early matrix approaches. They point out that since the axes on the matrix are determined by an average value, by definition some dishes will always fall above the mean and some below it, thus falling into the less-desirable categories. Hayes and Huffman avoid a matrix approach with its inherent problem of comparing averages and propose individual profit and loss statements for each competing item within each menu category. All direct costs are deducted from revenue and each dish is evaluated on its merits. As individual contribution to profit is only one of many factors to consider when designing a menu, Hayes and Huffman stress the need to monitor sales volume and consumers’ perceptions of product quality. They emphasize that the objective of menu analysis should be to complement the strategic goals of the total operation (Morrison, 1996).

Bayou and Bennett (1992) developed a profitability analysis model designed to assess the profitability of menu items, which included the consideration of labor. They stated that the profitability analysis of a product should be stratified and a specific product should refer to an indivisible service. They proposed a method of analyzing profitability suitable for a table service restaurant. Beran (1995) suggested a marginal and cumulative approach in order to solve the problem of menu engineering in which the average can be affected by distortion or an ideal point. Jin (1998) developed a menu analysis model that compared the percentage of sales volume of a menu item and food cost with total profit and net margin. LeBruto (1995) developed a menu engineering method, which look account of labor cost as well as food cost (Lee and Yang, 2005).

Subsequently, more methodologies (with a variety of approaches) have emerged as attempts to refine the process of menu analysis, including: Hayes and Huffmann's (1985) goal value (GV) equation; Bayou and Bennett's (1992) hierarchical profitability analysis; Atkinson and Jones' (1994) micro-marketing mix; Beran's (1995) graphical economic approach and LeBruto et al (1995) and LeBruto et al (1997) three-dimensional matrix, Cohen *et al* (1998) mutidimensional approach. Hayes and Huffman, Bayou and Bennett and LeBruto *et al.* have each addressed the question of improving the variable cost weakness but have tackled the refinement of the matrix models in different ways (Morrison, 1996). Each menu analysis framework incorporates its own set of variables to evaluate menu item performance, thus interpreting the outcome from different perspectives. Dougan (1994) recognized the importance of using menu engineering as a management tool, and contributed a spreadsheet example to help facilitate operators in the use of menu analysis. But menu engineering by itself is not enough to produce the desired results effectively.

LeBruto *et al.* (1995) expanded the menu engineering model by adding a labour component. They stated that rankings and labelling of a high and a low labour classification should be a judgement call made by professional food managers or through employing the technique of a jury of executive opinion, which is a method commonly utilized in qualitative forecasting models (Schmidgall, 1997). The LeBruto *et al.* (1995) model changed the matrix to a three by two model by adding the classification of each menu item as high or low in labour effort, relative to the entire section of the menu being engineered. LeBruto *et al* (1995 and 1997) suggest that linear regression analysis can clearly distinguish the fixed costs from variable costs and argue that all variable costs should be included in order to compute the “true” net profit for individual dishes (Morrison, 1996). LeBruto *et al.* (1995) designated labour as either high or low in the menu engineering worksheet, and incorporated this label into the existing model. Ranking the labour effort required for each menu item relative to the other menu items in the grouping resulted in a label of “high” labour cost for the menu items in the top one half of the rankings and a “low” labour cost label to each menu item in the lower one half of the group.

Loft (1989) recognised the need to consider labour in menu engineering and suggested than an exercise in determining the actual labour effort that Ashley (1995) concluded that there is variability of demand of each item sold on a daily basis and stated that linking a dollar amount of labour to a particular item would be inaccurate because situations exist where the labour and customer count is the same on two successive days,

but the sales mix differs. They recommended dividing the menu items into high labour and low labour, adding a new dimension to the menu-engineering model, a three by two matrix.

Horton (2001) expanded on this point, noting that labor is not a differential cost. Reynolds and Biel (2007) argued that, in assessing the functionality of various aspects of a restaurant operation, including the menu, critical items that lead to profitability must be considered. Finally, matrix models assume incorrectly that all indirect costs are equally related to all menu items (Morrison, 1996). Raab and Mayer (2007) adapted a menu engineering model that includes activity-based costing methodologies in an attempt to trace all costs to individual menu items. Each of these models solved many of the traditional matrix-model issues, but introduced a new problem: difficulty in gathering the requisite data. Such analyses, while interesting from an empirical perspective, were not practical because the information analyzed is not readily available to operators. These menu management and analysis models share the common and irremediable shortcoming of variable interdependency, in which the central intersection between vectors in a matrix is dictated by the means for the associated variables. Equally problematic, it is mathematically impossible to represent all menu items in the same matrix quadrant. (Taylor *et al.*, 2009)

METHODS

The purposes of this study were to: (a) develop a new menu analysis model with a three-dimensional-that was applied in a research by Sariisik *et al.* (2008)- and (b) to test it in a restaurant menu items. The model was designed and developed by being inspired both LeBruto's three dimensions philosophy and also Kasavana and Smith's matrix. As known, Kasavana and Smith classified each menu item into one of four categories as determined by a matrix of popularity (high and low) and average contribution margin (above or below) and five years later LeBruto expanded the menu engineering model by adding a labour component to them. This new model developed the matrix two a three by two model by adding the classification of each menu item as high or low in sales number as called here "performance" month by month and the method has called as "3p's model" (Sariisik *et al.*, 2008) and is shown in Figure 1.

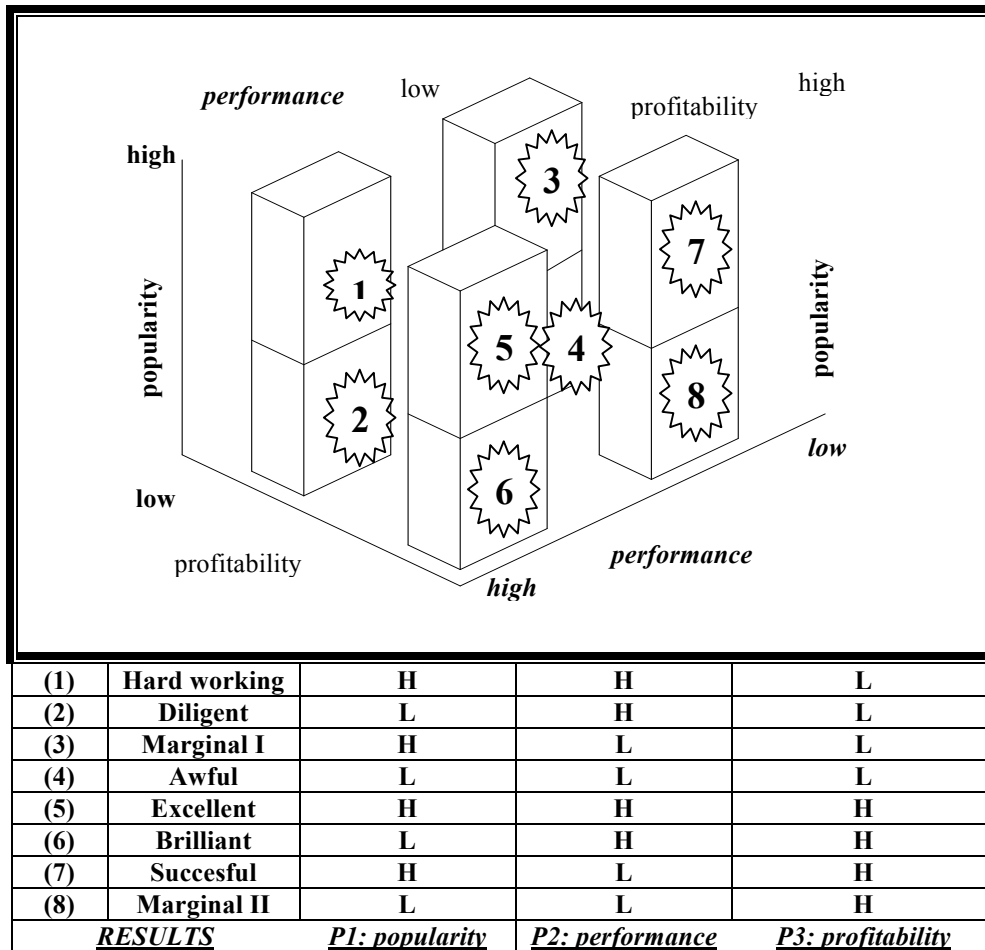

The key term here is "performance", has defined in this study as differences in selling numbers of menu items as high or low depending on an average sales number of a menu group month by month. Shortly, performance shows the changes in sales in a given periods (especially by month). Profitability is defined as the difference between sales price and costs of raw material while popularity is shown as sales number of a menu item. By using three variables, a three-dimension technique has been developed (Sariisik *et al.*, 2008)

Many restaurant managers recognized that the menu analysis was an important tool to evaluate the restaurant's success and to make decisions about the future. It is vital to know each menu item's selling prices, food cost and also quantity sold to make decisions about cost control or income analysis. It is also important to know the differences selling number changes of a menu item –especially new placed in a menu- in a given period while comparing with the others.

For instance, a menu item has low selling number with a given average number as classified "not popular" and low contribution margin in the group (selling price minus food cost) to the weighted average contribution margin of all menu items. According to the Kasavana and Pavesic's matrix, it has classified as dogs and should be removed from the menu. But the item has gone forward month to month and its selling graphics are increased while comparing others. In this point, a chance should be given to this item for the future. The model has considered that factor of a menu item. While developing this model, a student has no good marks but tries to pass the class, has been brought to mind. Depending upon three variables, a model has been illustrated in Figure, has created. There are eight alternatives that an item can be placed by using 3 variables in this method as LeBruto's three-dimensional method.

A qualified restaurant located in Kocaeli (a city with 200 thousands population, 90 km far away from Istanbul) with 200 seats have chosen to collect data in order to use for 3p Menu Analysis Method. At the beginning of March 2009 to April 2009, data about menu items were replaced in main dishes group (meat) have been collected on the unit price, sale price, food cost, and sales volume of each individual menu item. 2-month period was selected because the method also depended on comparing items during different terms in order to determine their performance. The number of items sold depending on March and April, cost per item, menu price per item, contribution margin per menu item, total contribution, and food cost of items will be analyzed in this research are shown in Table 1.

Figure 1. 3p menu Analysis Method with its variables and implementation.

After collecting data, contribution margin (CM) for each menu item, their selling performances month-to-month, and also item's menu mix (MM) were calculated and placed on the table in order to examine menu items depending on the method.

The rule of 70% of MM was calculated from the formula of 100% divided by the number of menu items x 0.7 formula for March and April. By the way for menu mix, April data will be used as item's popularity. The standard for the mean MM was 7,0% of each menu item. 7,0% was obtained by dividing 100 by 10 the number of menu items, and then multiplying by 0.7.

Contribution Margin (CM) for per menu item has calculated by dividing total contribution to 10, the number of menu items. As a result of formula, the average contribution margin has found as 618 € for each menu item and accepted that 10% was average percentage of CM by dividing 100 to 10 menu items.

And last, variations between selling numbers depend on two periods (March and April) were calculated as a percentage of each menu item and placed on the table. The average variation was calculated as 6,3% and it was compared with the all 10 menu items.

After calculating the average of MM, CM, and variation, each menu item has been analyzed according to the average numbers in order to place for each in 8 alternatives.

As it can be seen in Table 2, each menu item was classified in 8 categories. Menu items meatball, mixed grill and lamb sauté were identified as "excellent" because of their high percentage of menu mix, high average variation and high contribution margin. Those were the best of all menu items. Steak with pepper was called as "awful" with low popularity, low performance and also low contribution margin. That item should be removed from the menu and new one should be placed. Menu items such as beefsteak and shishkebab were identified as "successful", which had a high percentage of menu mix and high contribution margin but low performance while comparing with the average performance.

Table 1. The data of 10 menu items placed in main dishes group of a restaurant's menu (March-April 2009)

Menu Item	Number of sold (March)	Number of sold (April)	% of MM	Differences April - March	Difference (%)	Item selling price	Item food cost	Total food sales	Total food costs	Total CM per menu item	% of CM
Meatball	345	390	19,1	45	13,0	4	2	1560	780	780	12,6
Mixed grill	210	240	11,8	30	14,3	8,5	4	2040	960	1080	17,5
Beef straganof	120	135	6,6	15	12,5	7	3,5	945	472,5	472,5	7,6
Shnitsel	90	120	5,9	30	33,3	6	3	720	360	360	5,8
Lamb saute	180	195	9,6	15	8,3	6,5	3	1267,5	585	682,5	11,0
Steak with Pepper	120	105	5,1	-15	-12,5	7,5	3,5	787,5	367,5	420	6,8
Roasted meat	120	135	6,6	15	12,5	6	3	810	405	405	6,6
Beefsteak	195	180	8,8	-15	-7,7	6,5	3	1170	540	630	10,2
Chopsteak	180	210	10,3	30	16,7	5	2,5	1050	525	525	8,5
Shishkebab	360	330	16,2	-30	-8,3	6	3,5	1980	1155	825	13,3
TOTAL	1920	2040	100,0	120				12330	6150	6180	100
Average	*				***					**	
	<i>134,4</i>	<i>142,8</i>	<i>7,0%</i>		<i>6,3</i>					<i>618</i>	<i>10</i>

* total number of sold /10 (number of menu items) X %70 (elasticity) – popularity

** total contribution margin (CM) / 10 (number of menu items) – profitability

*** Variation ratio of menu items accordind to March and April – performance

Menu item chopsteak was belonged to the category “hard working” which had a high percentage of menu mix, high performance level but allow contribution margin. Its menu price may be increased or its cost can be reduced in order to put it in excellent category. And menu items beef stroganoff, shnitsel, and roasted meat were classified as “diligent” because of their low contribution margin, low percentage of menu mix but high performance. Those are identified as “dogs” depending on Kasavana and Smith’s matrix, and normally had to be removed from the menu. As a result of using performance variable, managers would let them to stay on menu for the future. Because it can be seen that those might be more better if they had enough chance for the next period.

Table 2. Evaluations of 10 menu items using the 3p Menu analysis model

Menu items	Popularity (7,0%)	Performance (6,3%)	Profitability (10,0%)	Results
Meatball	H	H	H	Excellent
Mixed grill	H	H	H	Excellent
Beef stroganoff	L	H	L	Diligent
Shnitsel	L	H	L	Diligent
Lamb saute	H	H	H	Excellent
Steak with Pepper	L	L	L	Awful
Roasted meat	L	H	L	Diligent
Beefsteak	H	L	H	Successful
Chopsteak	H	H	L	Hard working
Shishkebab	H	L	H	Successful

CONCLUSION

Menu analysis models have been developed since the 1980's depending on some variables such as contribution margin, sales number, food and labor costs in order to analyse menu items and also to evaluate restaurant's success. As generally known quantitative analyses have been employed with relation to the average numbers. 3P model was developed with a three-dimensional approach consisted of profitability (CM), popularity (MM) and performance. Each menu item has been identified by using three variables and placed in one of 8 different categories. As a result of using “performance” factor, an item that's sales number

has been increased month to month, and/or year to year, has a chance to stay menu inspite of having low CM and low percentage of menu mix. Thus, menu can be analysed in more objective manner by using one more criteria that has called performance.

The issue of “how to analyse a menu” has been discussed by many researchers in the past. Most of them have been considered average numbers in their models by using restaurants’ data. Some of them have argued wether there was an average number, some of menu items had to be either below or above. If the manager tries to improve an item placed below of average, another one with a higher score may be dropped. The main disadvantage of all models has not considered other conditions as weather, ambiance, service quality, season and so on.

3P model has consisted of the averages of three variables as others and has quantified. While developing this model, objectivity has been tried to increase by adding one more variable to previous matrix. Also, none of the menu analysis models has regarded the variations of a menu item in a giving period. This model maybe discussed in the future researches by some researches; however it is believed that it may be an alternative for restaurant managers to evaluate their menus.

A STUDY ON THE IMPACT OF FLEXIBLE MANUFACTURING SYSTEMS ON BUSINESS PROFITABILITY

Mustafa SOBA
Tunga BOZDOĞAN

Uşak University, Turkey

ABSTRACT

Competition conditions today are passing through constant and rapid changes. In this context, businesses must accommodate with these changes in the shortest time possible and rearrange their operations. In order to provide this, businesses need to have a flexible structure. Thus, flexible manufacturing becomes for them a strategic decision for gaining competitive advantage.

The performance of a business can be evaluated and analyzed according to various criteria such as market share, quality, efficiency and profitability. Flexible manufacturing activities of businesses must also be measured, evaluated and analyzed in the long run in terms of the business itself and the sector it operates in. The present study aimed to evaluate the performance of three ceramic manufacturers, which are assumed to use flexible manufacturing systems, in terms of profitability within the past twelve years.

Keywords: *Flexible Manufacturing System, Financial Reports, Profitability, Ceramic Sector*

INTRODUCTION

As the consumer possessed the power of determining the market structure, classical manufacturing systems have begun to be replaced with automated, technology-intense more flexible systems currently. Differentiation of products and sustainability of customer satisfaction create the foundation for competition. The product diversity increase in this context and its change according to demand has brought on the agenda the flexibility of production. Currently, enterprises have tended towards Flexible Manufacturing Systems as a strategic decision due to multitude of product varieties, and need for high quality and customer-orientedness. As technology is commonly used at the enterprises which apply flexible manufacturing system as a modern production system, the share of labor costs, among the elements which constitute the finished product cost decrease, while the share of production costs increase. This study considers the enterprises which implement a flexible production system within the axis of these changes, and the enterprise is tried to be evaluated according to profitability criteria as the enterprise's performance indicator. For this purpose, the activity reports of the enterprises operating in ceramic sector in the Western Anatolia Region of Turkey have been inspected, and the impact of the changes in the last ten years on profitability within the framework of flexible production system tried to be outlined. The study includes three stages. First the literature review on the subject was conducted, then the data on the subject were collected from the ceramic production enterprises operating in Western Anatolia Region of Turkey, and the activity reports were examined in comparison and analytically. In the final stage, the findings and the results of the analysis were presented. The application of this study at other enterprises which apply flexible manufacturing systems in Turkey, mainly in automotive and textile industries by considering other performance criteria may be suggested.

LITERATURE REVIEW

Flexible manufacturing systems have drawn the attention of researchers, enterprise managers and owners especially from the beginning of 80's to the present. As flexible manufacturing systems create a strategic

decision for management on behalf of the enterprises, they are included in many researches and literature and they receive interest on a large scale (Elango, 1994). In addition, production flexibility on a system level, can be critical factor in the process of strategy modification (Llorensa, 2005). Performance measurement of enterprises started with the measurement of performance on units level in 70-80's. The researches on measuring the performances of the subjects in flexible manufacturing systems followed it from mid-80's. Certain researchers examined various aspects of quality, cost, time and flexibility from a strategic point, while some others developed structures for the functional or departmental performance in relation with the overall business performance. The studies were mainly concentrated on how the factory systems were associated with and affected the business performance. In time, a conclusion was reached that production system performance was influential on the overall business performance (Kabadayi, 2002).

Flexible production, which is the main basis of the study, was studied before regarding its impacts on businesses' profitability, sales revenues and cost items. (Olhager, 1993, Bayuk, 2008). Flexible production can be taken into consideration with various elements such as the set up time, capacity utilization, multi-functional labor force, modular product design; however, flexibility cannot be quantified like profitability. The quantification of profitability can be expressed as the ratio of the difference between sales and cost to assets. In addition, in order to identify the impact of flexibility on profitability, the impacts on capacity, sales quantity and costs should be considered separately (Olhager, 1992). At the businesses which implement flexible production systems, the intensity of production costs also vary. In this context, production expenses increase, while labor costs decrease significantly (Atkinson et al. 2004) and reductions on direct materials costs also occur (Karcioğlu, 2000). According to D'Souza; cost, quality and distribution of finished products in time can also be three fundamental measures of production performance. Certain researches indicate that flexible production is a major indicator of business performance and production performance (Newman, 1992). Studies which associate the relation between business performance and flexible production with financial and growth performance were conducted by; Swamidass and Newell (1987), Parthasarthy and Sethi (1993), Gupta and Somers (1996), Vickery et al. (1997), and the studies which associated it only with the financial performance were conducted by Ward et al.(1995) and Fiegenbaum and Karnani (1991).

Complex nature of manufacturing flexibility requires further studies to explain its entire structure more comprehensively. For example, studies which show the correlation between the environment and strategic, corporate and technologic changes, which provide the enterprise with a competitive edge and performance increase can be made.

METHODS

In addition to content, method and design are also as much important for the studies conducted in relation with flexible manufacturing. In the ongoing research processes, the existence of limits and the identification of Data Collection, Sample Range, Unit of Analysis, Metod, Item Scales in the studies is important.(Vokurka,2000) Conducted studies are listed according to; Data Collection (I-Interview, Q-Questionnaire. Arc.-Archival), Sample Range (S Ind.-Single Industry, Cr Ind.-Cross Industry), Unit of Analysis (SBU-Strategic Business Unit, Plant-PL.), Metod, Item Scales (SI-Single Item Measures, MI-Multiple Item Measures). Accordingly;

- Fiegenbaum and Karnani (1991) (Archival, Cr Ind., SBU, Data Base, SI),
- Das et al. (1993) (Archival, Cr Ind., Industry, Data Base, SI),
- Ward et al. (1995) (Q, Cr. Ind., SBU, Survey, MI),
- Gupta and Somers (1996) (Q, Cr Ind., SBU, Survey, MI),
- Safizadeh et al. (1996) (Q, Cr Ind., Plant, Survey, MI, SI),
- Parthasarthy and Sethi (1993) (Q, Cr Ind., SBU, Survey, SI),
- Dixon (1992) (Q, S Ind., Plant, Survey, MI),
- Gupta and Somers (1992) (Q, Cr Ind., SBU, Survey, MI),
- Boyer et al. (1997) (Q, Cr. Ind., Plant, Survey, MI),

- Swamidass and Newell (1987) (I-Q, S Ind., SBU, Survey, MI),
- Suarez et al. (1996), (I-Q, S Ind., Plant, Survey, MI, SI).

The study considers the enterprises in ceramic sector in the Western Anatolia Region of Turkey and the Companies being traded in İstanbul Stock Exchange, and Archival, S. Ind., SBU, Data Base, SI are adopted.

TRANSITION TO THE FLEXIBLE MANUFACTURING SYSTEM AS A STRATEGIC DECISION

On the global markets, which are subject to constant changes and development, the market structure, its variety and the product quality are determined by the consumers. Consumers constantly desire new and different products which results in a flexible and fluctuating demand environment. Accordingly, flexibility and speed in production gain importance. The only way for businesses to react to this demand will be to adapt to new production technologies (Soba,2006:23).

While the flexible manufacturing system offers several strategic and operational advantages compared to conventional manufacturing systems, its efficient management ensures solutions for complex product management-related problems (Chen,2004:957).

In order to adapt to changes in a rapid and efficient manner, businesses today employ modern information technology and production techniques throughout the entire production process starting with the design phase through to planning, production and sales in an attempt to increase flexibility, quality and productivity. One of the greatest advantages that the flexible manufacturing systems provide is the use of high technology machines. The use of FMS's is also effective in terms of efficiency and capacity utilization, which is seen in the increase of the labor force and the current output as well as in the decrease in cost (Durmuş, 2007:9). In order to react to the customer's demand in time, shorten the production time, increase the quality and decrease the cost, businesses seeking competitiveness on the market prefer flexible manufacturing systems.

In an attempt to react to the fluctuating demand which is a result of changing consumer needs, businesses today have developed significant systems that provide manufacturing with a flexible structure. One of the most important systems is the "Flexible Manufacturing System" (Coşkunşap,1998:77). Flexible manufacturing systems are specific manufacturing systems which are able to react to new situations and adapt to the changes on the market rapidly involving the notion of flexibility and an intensive use of technology (Berruet, 2000:227).

A great number of definitions are available for flexible manufacturing systems in a variety of sources (Atalay *et al.*,1998:19), (Monks,1987:128), (Parrish,1990:16), (Maleki,1991:8), (Ronald and Charles,1993:125), (Siper and Bulfin,1997:45). Based on the common aspects of all definitions, the flexible manufacturing system can be described as a computer controlled manufacturing system composed of machines connected to one another that aims at reacting to the changing consumer needs in time.

The increasing customer needs caused by the heated competitive environment resulting from the demand of differentiation and change led many businesses toward a flexible and innovative attitude (Garavelli,200:39).

In this context, the importance of flexible manufacturing system as a strategic decision becomes visible. In our age, all manufacturing establishments that are able to employ flexible manufacturing systems gain competitive advantage and increase their market share.

High machine utilization, ability to produce different high-quality products in a short time, less plant area, decrease in labor costs, decrease in storage costs, easy programming and expanding and increased operation control can be named among the advantages of flexible manufacturing systems which have a synergistic effect (Özgen,1996:87).

Today, the flexible manufacturing activities of businesses are regarded positively by a great number of people (Olhager, 1993:69). There are many methods available for determining flexibility. Nevertheless, it is quite difficult to express flexibility in quantitative terms such as profitability (Olhager, 1993:76). The present study will examine plant, machine and equipment, an item which comprises a significant part of the tangible fixed assets included in the yearly financial reports of businesses and causes significant changes in the manufacturing system, as a sign of flexibility.

THE LINKS BETWEEN THE TERMS BUSINESS PERFORMANCE AND PROFITABILITY AND THE FLEXIBLE MANUFACTURING SYSTEM

Business performance can be defined as the extent, to which a business reaches its goals and fulfills its duties. In this sense, performance can be evaluated based on different aspects. The different aspects of performance can be named as quality, efficiency, budget price, profitability, innovation and efficiency. Determining the performance criteria to be applied in order to increase the existing performance and to sustain it in a business and providing successful performance measurement and auditing systems will only be possible, when the aspects of performance are determined accurately and the relation between them is established in a well balanced manner (Dağdelen,1997:50). It is the duty of the business management to implement this in accordance with the business strategies on a long-term basis.

In order to measure performance, firstly the aims need to be determined and secondly the criteria need to be selected within the scope of these aims. Then, measurements are carried out based on these criteria to find out the reasons behind the current performance situation. Subsequently, the required measures are taken and the results are observed. The performance evaluation process is then completed (Çetin,1997:46). The criteria of performance are rather quantitative terms showing whether or not the objectives were reached. Taking into consideration the rapidly growing competitive environment, however, it is not enough to compare the particular business with other businesses of equivalent type or with businesses which operate in the same branch of industry while measuring and evaluating the business performance. Whilst taking into account the aspects of performance and the customer satisfaction, the business does not only have to have an edge on its competitors, but it also has to be compared with the innovations it accomplished by exceeding its own pioneer targets (Çetin,1997:46).

The criteria applied in performance evaluation can be divided into two types: Qualitative and quantitative criteria (Hatiboğlu,1993:198). Examples for qualitative criteria can be named as hierarchical relations or personnel trainings whereas examples for quantitative criteria can be named as costs, divergence from standards, current output and quality, sales amount, sales revenues, profitability, market share and growth. In the present study, the criteria of profitability will be applied which is among the widely used criteria in evaluating businesses that use flexible manufacturing systems.

Criteria of Profitability

The main objective of all private establishments which are legal entities pursuing economic activities is to use the resources invested effectively in order to maximize the profit rate and to reach the maximum profit. In other words, the main objective of businesses is to generate profit. Indeed, no matter what perspective one approaches it from, private establishments which are legal entities doing business activities have to pursue economic activities in order to maintain their existence. To put it in another way, they have to operate in a profitable and efficient way (Uragun,1993:709). Profit is a substantial criterion of success. However, it is not enough by itself for measurements. In order for profit to be useful, it needs to be determined whether or not it is sufficient for the business and it needs to be connected with the factors that play a role in the formation of profit. In addition, the comparison between the growth of income and the growth of expenses as well as factors such as the income that the capital will provide in alternative fields of use, the change in profit within the past years and the profit targets of the business need to be taken in account (Akgüç,1987:375).

While interpreting rates of return as rates used in measuring the success of business activities, they have to be compared with those of other business operating in the same sector and their development during the course of the year has to be observed. The rates of return are used to determine whether or not the profit generated is proportionate, sufficient and permanent (Sevim, 2008:177). Usually, there are two types of rate of return: One is the profit in relation to the sales and the other one is the profit in relation to the capital (Sevim, 2008:177). In the present study, rates of return with regards to the profit in relation to the sales were addressed. Furthermore, their relation to the flexible manufacturing systems was explained. The rates used and their explanations are given below.

Gross Profit of Sales / Net Sales X 100

This ratio which is expressed in percentage indicates the importance level of the proportion of the gross profit on sales as the difference between the sales and the cost of goods sold in relation to the net sales revenues. In manufacturing establishments, it is expected to amount to nearly 50%. Based on the past years, it has to show an upward trend and needs to be evaluated within the particular sector. In businesses using flexible

manufacturing systems, this ratio is expected to be high. In businesses with a high ratio, a sufficient profit of the period can remain after covering operational, financing and other expenses (Sevim, 2008:178; Akdoğan, 2003:635).

Operational Profit / Net Sales X 100

This ratio indicates what percentage of net sales the operational profit corresponds to. This ratio shows the businesses' level of success with regards to the main activity. It is expected to be high. In businesses using flexible manufacturing systems, the corresponding ratios of other businesses operating in the same sector have to be examined and their development during the course of the years has to be observed on a long-term basis in order to understand whether or not this ratio is sufficient. Taking into account that it indicates the profit generated from the main activities of the business, it plays a major role in the analysis (Sevim, 2008:178; Akdoğan, 2003:635).

Net Profit of the Period / Net Sales X 100

This ratio indicates what percentage of net sales the net profit of the period accounts for. It is expected to come out as high as possible. A low ratio indicates that the business is unsuccessful in its activities and the activities do not contribute to the financial structure in a positive way. In such a situation, the performance of the strategic business cannot be interpreted in a positive way (Sevim, 2008:179). However, while evaluating this ratio, the tax related calculations as well as other expenses of the business have to be taken into consideration. Accordingly, it is more useful to analyze the operational profit in relation to net sales than to analyze the net profit of the period in relation to net sales while evaluating businesses using flexible manufacturing systems.

Operational Expenses / Net Sales X 100

The operational expenses made in order to generate revenues are comprised of research and development expenses, sales and distribution expenses and management related general expenses. Up to a certain percentage of sales, it is considered as reasonable. This ratio is higher in manufacturing establishments than in trade establishments and also plays a major role in interpreting the operational profit. While evaluating this ratio, the sectoral average ratios and the ratios from the past years should be taken into consideration (Sevim, 2008:179; Akdoğan, 2003:636).

In the present study, following ratios were addressed and analyzed besides of the rates of return used in evaluating business performance.

Asset Turnover = Net Sales / Total Assets

This ratio is expected to be high. It shows how efficient a business uses all the assets it possesses and what multiple of total assets corresponds to the sales generated. A business with high total asset turnover will accordingly have a high rate of return. Businesses with high total asset turnover can be considered as low risk businesses (Sevim, 2008:176). This also applies for businesses using flexible manufacturing systems. An increase of the total asset turnover indicates an increase of the capacity utilization (Ceylan, 2000:48)

Tangible Fixed Asset Turnover = Net Sales / Tangible Fixed Assets (Net)

This ratio indicates what multiple of tangible fixed total assets corresponds to the sales generated. It shows how efficient the tangible fixed assets are used. It also reveals information on the capacity utilization of businesses using flexible manufacturing systems. Especially after the years, in which an intensive investment was made in technology and machines, the development of this ratio needs to be observed on a yearly basis. It is expected to be high which has a positive effect on the profitability. In case of a revaluation, the ratio may come out low (Sevim, 2008:175).

ANALYSIS

The decision of flexible manufacturing systems as a strategic decision requires intensive investments in technology and thereby causes significant changes in the financial structure of a business. Therefore, it is necessary to analyze this process. The present study aims at depicting the relation between the business performance criteria and the profitability as well as evaluating the success of businesses.

Data Preparation

The objects of the present study are three joint stock companies operating in the ceramic sector which are listed on the Istanbul Stock Exchange. The analysis covers a period of 12 years beginning from 1997. The data used in the analysis were obtained from their yearly financial reports. In addition, corresponding

departments of each of the companies were contacted to gather subject-related information. In the present study, graphics on yearly basis were drawn up using the ratio analysis, and the businesses were evaluated correspondingly.

Evaluation and the Findings

In the first stage of the present study, the corresponding departments of each of the companies were interviewed. As a result of the interviews, it was observed that each three of the companies had been making intensive investments in production technologies and purchasing computer aided machines within the last twelve years.

In this context, the relations between the investment in machines which is regarded as a sign of flexibility in production as it was mentioned before and the operational profits generated from the main activities of the business are given below in graphics for each of the companies on a yearly basis. Due to a decision in 2003 however, the companies started to apply current-cost accounting. Accordingly, they recalculated the value of their assets and substituted the new figures with the old ones on their financial reports. This can also be seen in the graphics given below.

Graphic 1: Company A

Graphic 2: Company B

Graphic 3: Company C

Examining the plant, machine and equipment, an item which forms a part of the tangible fixed assets, it can be stated that in each of the three companies the operational profit generated from main activities was affected by the intensive investment in technology and machines and that they are linked to one another. Especially with regards to the company C, it was observed that the company made intensive investments in technology after 2005. It was further observed that the operational profits increased in parallel with the increase of investments. However, this relation may not only be the result of the investment in machines, but also the result of factors such as an increase in sales or decrease in cost. Extra analyses are needed to determine this.

Examining the rates of return of businesses on a yearly basis, following conclusions were made:

Table 1:

Table 2:

Table 3:

According to the conclusions made above, it is observed that especially the company C has been making intensive investments in technology and machines within the last years. It is further observed that due to the utilization of flexible manufacturing system, the company's profits have increased. In case of other companies, however, it is hardly possible to derive the conclusion that the change in profit showed a positive trend based on only these ratios. Talks with the company C revealed that they have been purchasing a substantial amount of machines since 2005 and increased the product variety. It can be seen in the conclusions that operational expenses comprised of research and development expenses, sales and distribution expenses and management related general expenses showed no significant change after the investments. Accordingly, it can also be seen in the conclusions that the operational profits show an upward trend. However, an evaluation of the flexible manufacturing system based on its development only within the last three years would be insufficient. The future development should also be monitored on a long-term basis.

With regards to the rates of return, the asset turnover and the tangible fixed asset turnover were also calculated within the scope of the present study in order to analyze the subject more thoroughly.

Table 4:

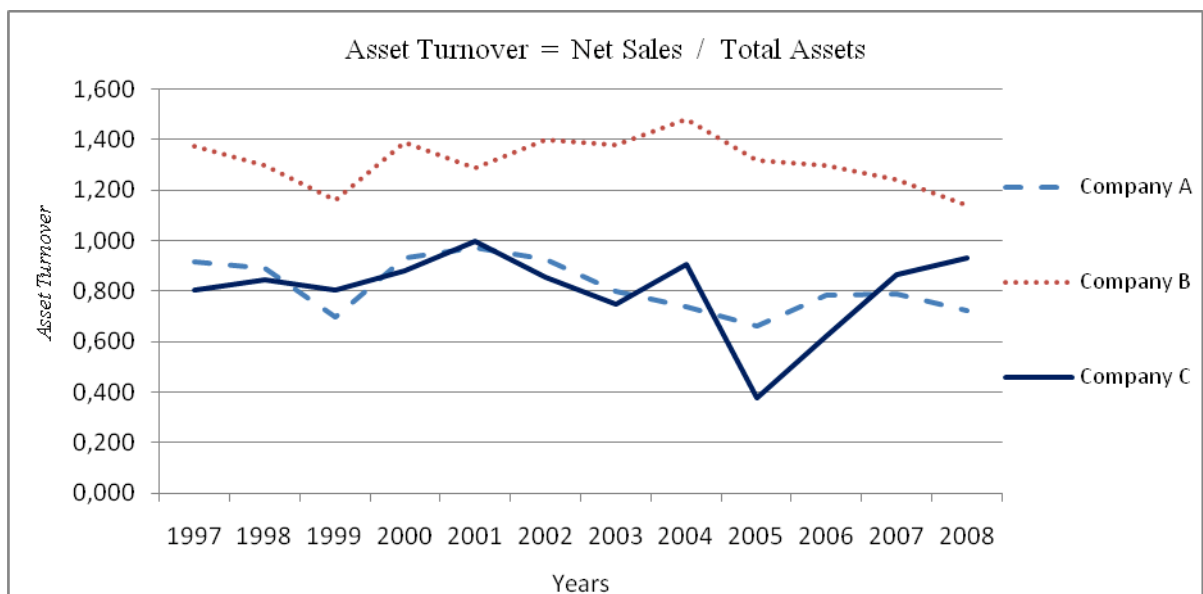

Table 5:

From these ratios which not only show the rates of return but also indicate the efficiency of the assets of a business and its capacity utilization, following conclusion can be derived: As in case of the company C, the asset turnover and the capacity utilization increase in parallel with the profitability, the use of flexible manufacturing systems in this company can be interpreted positively. With regards to the sector it operates in, it can be stated that the company will achieve a larger market share in comparison to other companies and be able to gain competitive advantages. In case of other companies, however, the profitability shows a downward trend. It can be stated that this situation indicates problems such as the unprofitability of economic activities, the capacity utilization, and the inefficient use of tangible fixed assets.

CONCLUSION

The factors impeding a clear identification of the links between the flexible manufacturing systems and the profitability can be named as follows: The existence of many different definitions of flexibility, the requirement of several difficult methods for expressing flexibility in quantitative terms, the financial crisis environment and the different financial policies applied by the companies. As a result of the analysis conducted, it can be stated that from the three manufacturing establishments operating in the same sector, the company C's profitability, which is one of the most widely used performance criteria, shows an upward trend due to the investments made and the introduction of flexible manufacturing systems. In terms of both the capacity utilization and the efficient use of assets, this situation can be interpreted as a positive development for the company. However, evaluating the introduction of flexible manufacturing systems on a yearly basis could provide a much better understanding as by doing this, the long-term performance would be portrayed more accurately. In addition to the rates of return, other analysis methods such as the Du Pont Analysis can be carried out yearly in a contrastive manner in order to monitor the process and thereby achieve more accurate results. Taking profitability as the only criteria in determining the business performance may not always be enough. In addition to profitability, other criteria such as the quality and the sales amount can be added to the analysis.

In conclusion, the flexible manufacturing systems become a strategic decision that needs to be considered by the companies so that they can gain competitive advantages under current circumstances, generate the maximum profit from the desired activities and increase their business efficiency. Similar studies can be carried out in other branches of manufacturing such as textile, furniture and automobile as well.

EVALUATING THE QUALITY OF CORPORATE MISSION STATEMENT

**A. Dabbaghi,
Tehran University, Iran**

**A.M. Malek and A.R. Aulizadeh,
Islamic Azad University, Iran**

ABSTRACT

Strategic management contexts usually define a couple of activities including preparing a mission statement, which is one of the most essential parts in developing the strategic plan of an organization. Since the mission statement is designed to be viewed by majority of stakeholders, its quality seems to be of great importance. This research is supposed to study the mission statement quality, based on the components that should be a part of the discipline. Therefore, first and foremost, the attributes to be considered in the evaluation of the statement quality (mission components) are determined through the literature review. Secondly, since traditional methodologies cannot easily deal with numerous qualitative attributes, a multi criteria decision analysis based on Grey Theory is to employ to identify the importance of each attribute. At third step, the selected methodology has been applied and the numerical results specified the most important components to be considered in evaluating the quality of corporate mission statement.

Keywords: *Mission statement quality, Multi attributes decision analysis, Grey theory*

INTRODUCTION

Managing the evolution of mission statements is one of the most important responsibilities of senior management [Fitzroy, 2005]. Strategic management contexts include a process of strategic management that incorporates mission as one of the vital tasks in the strategic planning process [Thompson, 2001; Hill & Jones, 2001; Wheelen & Hunger, 2000]. Numerous articles point out the value of mission statements and suggest that almost every firm should have one (e.g., see [Bailey, 1996]).

Whether developing a new business or reformulating direction for an ongoing company, the basic goals, characteristics and philosophies that will shape a firm's strategic posture must be determined. The company mission statement will guide future executive action plans. The company mission is defined as the fundamental, unique purpose that sets a business, apart from other firms of its type and identifies the scope of its operations in product and market terms [Pearce & Robinson, 2005].

This paper is seeking to 1) determining the components that should be included in a mission statement which in fact are attributes to be considered in the evaluation of the statement quality and 2) identifying the importance of each attribute and specifying the most important ones.

After introduction, the article is organized into the following four parts: the First and foremost, the literature review is summarized. Secondly, the research methodology is identified. Thirdly, the identified methodology is applied and analyzed. In the fourth and final step, the conclusion of the research is presented.

LITRATURE REVIEW

Regarding the importance and vitality of mission statement in the strategic management context, there is no need to mention that the definition, the benefits and the specifications has been cited in nearly all referenced materials. In this research the judgment required for evaluation of mission statement quality is based on determining whether the statement satisfactorily included the given set of components. In addition, this research tends to propose a general methodology which is applicable to evaluating statements of different kind of organizations. Therefore, the references explicitly cited the general components of the mission statement are chosen and summarized in table1.

References Component	Description	[Pearce]	[David]	[Fitzroy]	[Finlay]	[Johnson]	[Olsen]	[Thompson]	[Pearson]	[Bryson]	[Dobson]

METHODOLOGY

In this paper, the Grey Theory which is a new well-known Multi Criteria Decision Analysis technique is utilized. MCDA includes a set of concepts, methods and techniques that seek to help individuals or groups to make decisions, which involve several points of view in conflict [Belton & Stewart, 2002].

The Grey theory can resolve the problem of incomplete information requiring only a small amount of data to be effective [Pai & Hanaki & Hsieh, 2007]. Due to the presence of incomplete information and uncertain relations in the evaluation of the current system, it is difficult to analyze it by using ordinary methods. On the other hand, grey system theory presents a grey relation space, and a series of nonfunctional type models are established in this space so as to overcome the obstacles of needing a massive amount of samples in general statistical methods, or the typical distribution and large amount of calculation work. Grey Theory can be effectively utilized to calculate the attribute weights from incomplete information gathered from subjective judgments of DMs. This procedure that can be employed instead of pair-wise comparisons (common in Analytic Hierarchy Process) will decrease the number of questions that should be answered by DM. Therefore, consider a large number of qualitative attributes the Grey based techniques are more efficient in comparison to the traditional MADM techniques such as AHP. In fact, The Grey Systems Theory and

Geometrical Mean for Grey numbers are employed in this paper. The process of evaluating the corporate mission statement quality is shown in Fig. 1.

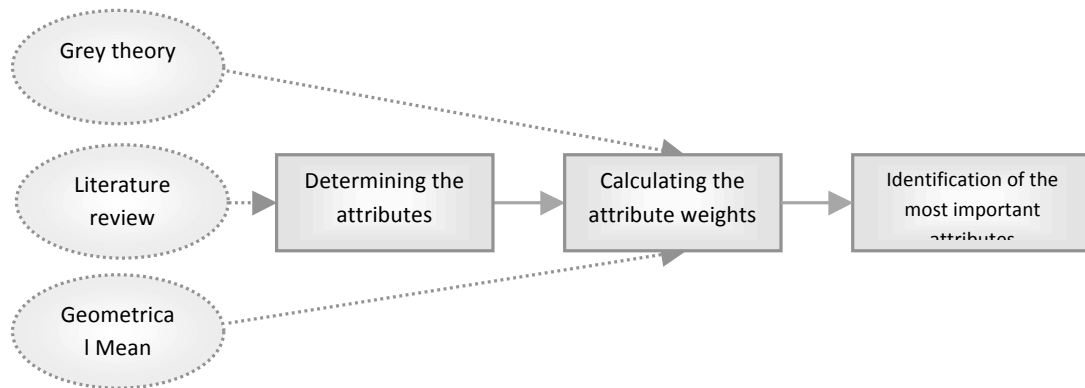

Fig. 1- The framework for corporate mission statement evaluation

An introduction to Grey theory

Grey theory, proposed by Deng in 1982 [Deng, 1989], is an effective mathematical means to deal with systems analysis characterized by incomplete information. Grey theory is widely applied in fields such as systems analysis, data processing, modeling and prediction, as well as control and decision-making [Chen & Tzeng, 2004; Zhang & Wu & Olson, 2005].

Using grey number to calculate attributes weight

Each grey system is described with grey numbers, grey equations, grey matrices, etc. A grey number is such a number whose exact value is unknown but a range within that the value lies is known. In applications, a grey number in general is an interval or a general set of numbers.

Grey number operations are the operations defined on sets of intervals, rather than real numbers. Definition 1 identifies the four basic grey number operations on $\otimes G_1 = [\underline{a}_1, \bar{a}_1]$ and $\otimes G_2 = [\underline{a}_2, \bar{a}_2]$.

Definition 1:

- (1) $\otimes G_1 + \otimes G_2 = \left[\underline{a}_1 + \underline{a}_2, \bar{a}_1 + \bar{a}_2 \right]$
- (2) $\otimes G_1 - \otimes G_2 = \left[\underline{a}_1 - \bar{a}_2, \bar{a}_1 - \underline{a}_2 \right]$
- (3) $\otimes G_1 \times \otimes G_2 = \left[\min \left(\frac{\underline{a}_1 \underline{a}_2, \underline{a}_1 \bar{a}_2, \bar{a}_1 \underline{a}_2, \bar{a}_1 \bar{a}_2}{\underline{a}_1 \underline{a}_2, \underline{a}_1 \bar{a}_2, \bar{a}_1 \underline{a}_2, \bar{a}_1 \bar{a}_2} \right), \max \left(\frac{\underline{a}_1 \underline{a}_2, \underline{a}_1 \bar{a}_2, \bar{a}_1 \underline{a}_2, \bar{a}_1 \bar{a}_2}{\underline{a}_1 \underline{a}_2, \underline{a}_1 \bar{a}_2, \bar{a}_1 \underline{a}_2, \bar{a}_1 \bar{a}_2} \right) \right]$
- (4) $\otimes G_1 \div \otimes G_2 = \left[\underline{a}_1, \bar{a}_1 \right] \times \left[\frac{1}{\underline{a}_2}, \frac{1}{\bar{a}_2} \right]$

The proofs of these basic operations can be obtained from [Li & Yamaguchi & Nagai, 2007].

The linguistic variables are used to represent imprecision of spatial data and DMs' preferences over the attributes in the evaluation process. In this paper, the attribute weights are considered as linguistic variables. These linguistic variables can be expressed in grey numbers by the 1–7 scale [Li & Yamaguchi & Nagai, 2007] shown in Table 2.

VH	H	MH	M	ML	L	VL	scale
[0.9,1.0]	[0.7,0.9]	[0.6,0.7]	[0.4,0.6]	[0.3,0.4]	[0.1,0.3]	[0.01,0.1]	$\otimes W$

Table 2- the scale of attribute weights

In order to endow the results with a higher value, it is advisable to have several experts take part in solving the problem of prioritization; these specialists are going to act as "decision-makers". Assume that $Q = \{Q_1, Q_2, K, Q_n\}$ is a set of n attributes of mission statement and the attributes are additively

independent. $\otimes w = \{\otimes w_1, \otimes w_2, \dots, \otimes w_n\}$ is the vector of attribute weights. Suppose that the decision group consists of K persons. According to Geometrical Mean for Grey numbers, the weight of the j th attribute can be calculated as:

$$(5) \quad \otimes w_j = \sqrt[k]{\otimes w_j^1 \times \otimes w_j^2 \times \dots \times \otimes w_j^k}$$

Where $\otimes w_j^k, (j = 1, 2, \dots, n)$ is the subjective judgment of the k th DM over the j th attribute described by grey number $\otimes w_j^k = [\underline{w}_j^k, \overline{w}_j^k]$, where $\otimes w_j^k \neq 0$.

Focusing on the most important attributes facilitates the evaluation process. In order to remove the attributes those are not essentially important we suggest and employ the following definition.

Definition 2: The j th attribute will be removed from the evaluation process if the following condition is satisfied:

$$(6) \quad \otimes w_j(\overline{G}) < \otimes w^{MH}(\underline{G})$$

, Where $\otimes w^{MH}(\underline{G}) = 0.6$.

APPLICATION AND ANALYSIS

The attributes to be considered in the evaluation of the mission statement quality as expressed in section 2, are as follows:

Q_1 : Principal business aims and main activities	Q_{11} : Philosophy, Key beliefs and values
Q_2 : Stakeholders	Q_{12} : Public image
Q_3 : Guiding principals	Q_{13} : self concept
Q_4 : Natural resources	Q_{14} : Concern for employees
Q_5 : Technology	Q_{15} : Strategic goals
Q_6 : Product/service	Q_{16} : Standards
Q_7 : Market/market segment	Q_{17} : strategic pathway
Q_8 : Customer needs	Q_{18} : Quality
Q_9 : Customers	Q_{19} : Core competencies
Q_{10} : Purpose of the organization / Company goals: Concern for survival, growth and profitability	

Calculating the weights of attributes Q_1, Q_2, Q_3 to Q_{19} , a questionnaire was designed to collect the preferences of twelve experts ($k=12$) as DMs: D_1, D_2, D_3 to D_{12} . These preferences and the calculated attribute weights based on Eq. (5) are shown in Table 3.

Q_j	D_1	D_2	D_3	D_4	D_5	D_6	D_7	D_8	D_9	D_{10}	D_{11}	D_{12}	$\otimes w_j$
Q_1	VH	VH	H	VH	H	H	H	H	VH	H	VH	H	[0.777 , 0.940]
Q_2	MH	VH	M	MH	VH	MH	M	ML	H	MH	H	MH	[0.581 , 0.721]
Q_3	M	VL	L	MH	H	M	ML	L	H	H	H	M	[0.284 , 0.516]

Table 4- Ranking decision makers' preferences and removed inefficient attributes

CONCLUSION

The most important components to be considered in evaluating the quality of corporate mission statement are concluded in this research as: (1) Principal business aims and main activities; (2) Stakeholders; (3) Technology; (4) Product/service; (5) Market/market segment; (6) Customer needs; (7) Customers; (8) Philosophy, Key beliefs and values; (9) Public image; (10) Self concept; (11) Concern for employees; (12) Strategic goals; (13) Quality; (14) Core competencies.

A multi attribute decision making procedure based on grey systems theory can be proposed based on the above mentioned concluding attributes and the resulting grey weights. Such a procedure can be used by corporate managers to evaluate and benchmark their mission statement in comparison to a set of similar companies effectively.

A COMPARATIVE RESEARCH ON WHETHER EMPLOYEES PARTICIPATE IN THE PROCESS OF VISION DETERMINATION

Harun Demirkaya
Kocaeli University

Gürol Özcüre
Ordu University

ABSTRACT

This study investigates vision building, a fundamental starting point in strategic management. Whether national or multinational, vision building is critical for all strategically managed companies. The position responsible for building vision in a business is equally as important as enabling employee participation in the vision building process. This is why the study investigates the various managerial levels involved in the process of building vision, mission, objective and targets. The assessment of questionnaire forms developed for this purpose suggest that there is a similarity between building vision, mission, objective and targets, and employee participation. However the response coming from national and multinational companies to the question “Who builds vision?” returned different results.

Keywords: *Strategic formulation; vision; mission; objectives; employee participation.*

INTRODUCTION

Vision could be described as the sum of opinions, appearances, dreams of experienced and future related dreams, visions, and a road map to reach these visions, expectations, values, expressions, responsibilities, objectives and targets.

Through this perspective vision could translate as the expression of the past, the present and aspired future destination and a road map that ensures reaching this destination. This expression reflects an argument. Ambitious visions not only expose difference (Pearce II and Robinson: 1991:54) but also motivate stakeholders. Such motivation contributes to sharing business values, creating positive expectations amongst stakeholders and concentrate the business on the objective as a whole. If people really share a vision they interconnect with each other with a common desire. Such dedication transforms approach to the company, creating a feeling of being “our company”.

Such qualities make a vision to safe keep the future of the business. It is a manager’s compass directing them to guaranteed success. It is also a source of trust amongst customers, employees and stakeholders. Vision is by no means a secret declaration. It gains value the more it is shared and endorsed. It is especially important that vision is endorsed, discussed and shared amongst employees. Including employees in vision building process makes the vision a common vision. It will no longer be considered corporate vision, but rather perceived as “our vision”. Moreover, vision building requires a broad perspective. Vision builders without depth of perspective cannot be expected to develop successful visions. Ensuring participation of creative employees in the vision building process presents the potential of overcoming such risks.

Employee participation is an integral part of corporate governance. European corporate governance model is concentrated on “stakeholder value” and includes the protection of employees interests and employees have right to be represented at company management in the European Union (EU). But, some Multinational Companies (MNC) limiting this for transnational issues (Kluge, 2005:164). Employee participation is defined in the EU legislation as “*the influence of the body of representatives of the employees and/or the employees’*

representatives in the affairs of a company by way of 1-) the right to elect or appoint some of the members of the company's supervisory or administrative organ or 2-) the right to recommend and/or oppose the appointment of some or all of the members of the company's supervisory or administrative organ". It is clearly noticed that employees right to elect or appoint their representatives to companies supervisory or administrative organs in the EU. Although, there is a clear divergence of opinion and different options of employee participation. For instance, Attitudes towards employee participation demonstrates clear divergences in Germany, the UK and Spain (Veersma and Swinkels, 2005:193-199). Some times "involvement of employees" also used by same meaning which is described by Council Directive supplementing the Statute for a European Company, approved by the Employment and Social Affairs of 8 October 2001, "*any mechanism, including information, consultation and participation, through which employees' representatives may exercise an influence on decisions to be taken within the company*" (Article 2, h) (Blanpain, 2002:xv).

In practice, visions are generally the work of a leader (Kantabutra, 2009:1). Leadership is a process by which a person influences others to accomplish an objective (Kalpana, 2009:24). Besides the leader, executive managers are also known to effectively participate in vision building. However, these days the idea of sharing this responsibility with employees other than executive managers is gaining support all the time. It is argued that the most effective method of vision building is involving employees (Ülgen and Mirze, 2007:182). This contributes to employees thinking it being easier to reach ambitious visions that are shared. Additionally, visions reached with employee participation are judged to be more motivating. It is for these reasons that vision determination is a critical issue for businesses of all sizes. This basic research will attempt to reveal the managerial levels that are effective on this issue by examining the matter level of domestic and international businesses.

LITERATUR REVIEW

Businesses are financial entities composed of a coherent merging of production tools (Tosun, 1990:5) which create products and services to meet human requirements (Mucuk, 2008:6), provide profit to shareholders or owners and income to its employees, have social responsibility towards society, aspire to continue their existence and grow (Özgen and Yalçın, 2009:6).

Behind the conception of every business are the decisiveness, courage and effort of entrepreneur(s) who amalgamate production tools and take on the risk. In large businesses these entrepreneurs, who are simultaneously the owners or shareholders of the business, also constitute the general board of shareholders. This board assigns the authority of decision making to a self-elected board of directors (Eren, 2005:43). As they grow businesses require professional managers to execute their operations.

These managers are people who execute the task of management, in return for a specified fee, in order to effectively and efficiently reach objectives (Ülgen and Mirze, 2007:23) in a setup where the risk and profit belongs to someone else. In other words a manager is someone who participates in the management process by planning, organizing, leading, and controlling the resources of the organization (Bovee et al, 1993:5). Whilst managers can be elected from amongst business owners they can also be appointed from a selection of professional managers (Ülgen and Mirze, 2007:24).

Professional managers have the objective of ensuring that the business reaches long-term objectives. However, businesses require strategic management in order to continue existence in the long term, ensure sustainable competitiveness and generate above average income.

Strategic management is that set of managerial decisions and actions determining the long-run performance of a corporation. It includes environmental scanning, strategy formulation, strategy implementation, and evaluation and control (Whelen and Hunger: 1992:7). These aspects play a fundamental role in the business reaching its objectives. This allows the manager to understand and concentrate on internal and external factors affecting the business. It also enables being flexible enough to adapt to rapidly changing environmental conditions (Eren, 2005:8).

Strategic management is an organic process (Farjoun, 2002:588). This process starts with the notion of strategic consciousness. Strategic consciousness develops as a consequence of business owners and managers contemplating the reality that other businesses and competitors are perpetually creating and practicing new strategies. Such thoughts increase consciousness about how to build effective strategies in response to changing environmental conditions, new opportunities and threats.

Selecting a strategist or a strategic team from people with such level of consciousness is fundamental for the effectiveness of strategic management process. Whilst such strategists are selected from managers of different levels, they can also be procured within or out of the business operation.

Strategic planning must be a priority for strategists. To plan, one must first have a clear vision of the desired future organization (Steinbcaher and Smith: 2009:31).

Appointed strategists play an important role in several stages including strategic internal and external environmental analysis; vision, mission, objective and target determination in scope of strategic guidance; strategy selection, practice and monitoring. This perspective emphasizes the role of decision makers (Papadakis, et al, 1998:117). In all these processes decision makers are the top management and board of directors. But the vision of the TMT does not appear to be a sufficient condition to enable companies to obtain better results (Camelo-Ordaz, et al., 2008:632).

It is a well-known fact that the board of directors has a dominant role in determining vision, mission, objective and targets, which shed light on the direction of a business. Nonetheless, in practice founders, bosses, CEOs, CSOs, managing directors, upper management and specialists from within or out of the business operation can also undertake this responsibility.

The exact sequence and combination of steps differs from author to author, although the following seven element are usually present: (1) Analyse company's future environment, (2) Analyse future competition, (3) Analyse the company's resources and core competencies, (4) Clarify organizational values, (5) Develop vision statement, (5) Contrast vision with the present state of the organisation, (7) Use vision to develop strategic objectives, goals and options (O'Brien and Meadows, 2000:37).

There is a limited employee participation system in Turkey. Some legal change and adaptation of the EU legislation will support and allow to establish system for wider issues related to work organization in Turkey. Employee participation will also, enhance Turkish companies and subsidiaries of MNCs' competitiveness and stability operating in Turkey, in the EU and in the global markets (Özcüre-Demirkaya, at al., 2008:1025).

RESEARCH DESIGN

The study will look into the managerial levels effective in determining vision, mission, objective and targets in large-scale companies established in the Marmara Region of Turkey. Foremost the study will try to provide an answer to the question "who determines vision?" In this scope the study will investigate the extent employees participate in the vision building process.

The study will include domestically owned companies as well as multinationals. A Multinational Company (MNC) is a firm that has operations in more than one country, international sales, and nationality mix of managers and owners (Hodgets et al, 2006:6). Multinational companies conduct in depth domestic and international analysis. Objectives may vary according to geographical territory or the type of strategic business unit (SBU). We can mention of four different predispositions in these businesses: Ethnocentric, polycentric, regiocentric, geocentric predispositions (Rugman and Hodgets, 2003:217).

The study will initially test whether there is a significant difference between the presence of corporate vision, mission, objective and targets and if the company is national or multinational. Secondly, the study will test whether there is a significant difference between national and multinational companies in terms of players active in vision building. Thirdly the study will test whether there is a significant difference between national and multinational companies in terms of ensuring employee participation in vision building. Lastly, the study will test whether there is a significant difference between national and multinational companies in terms of methods to enable employee participation in vision building. The study will also investigate whether ethnocentric and geocentric approaches have an effect on the vision building process. Concisely, the study will compare predominant factors involved in vision building practiced at national and multinational companies

The questionnaire forms developed for this purpose were sent electronically to 500 large industrial companies. Questionnaire forms were sent to an additional 500 companies since returns from the first batch were inadequate. Meanwhile face-to-face surveys were also conducted with the help of Gebze Vocational Collage. The number of questionnaires sent electronically was 1000. We understand that approximately 200

of them did not reach relevant persons/departments. 182 questionnaires were completed and returned electronically. The study took into account 144 electronic questionnaires and 210 face-to-face surveys. The sum of evaluated questionnaires was 354. 313 of the questionnaires were from national companies whilst 41 were from multinational and global companies.

DATA ANALYSIS

Table 1 indicates the presence of predetermined written vision, mission, objective and targets at a national and multinational company level according to questionnaire results. Examining Table 1 we see that 83.4% of national companies and 90.2% of multinational companies express the presence of vision, mission, objective and targets.

Table 1: State of vision, mission, objective and target building at companies

	National Company		MNC		Total	
	Frequency	%	Frequency	%	Frequency	%
There is Vision	13	4,2	3	7,3	16	4,5
There is Mission	1	0,3	0	,0	1	0,3
There is Objective and Targets	15	4,8	0	,0	15	4,2
There is all three	261	83,4	37	90,2	298	84,2
There is Vision + Mission	19	6,0	1	2,4	20	5,7
Vision + Objective and Targets	4	1,3	0	,0	4	1,1
Total	313	100	41	100	354	100

Hypothesis for performed chi-square test were established as follows:

H_0 : The difference between having predetermined written vision, mission, objective and targets at businesses and the company being national or multinational is insignificant.

H_1 : The difference between having predetermined written vision, mission, objective and targets at businesses and the company being national or multinational is significant.

In this context the Chi-square test statistics at a 0.01 significance level is 4.471, with a p value of 0.484. Under these circumstances we can say that the H_0 hypothesis is acceptable.

Table 2 presents results concerning the effective person in vision building within the company.

Hypothesis concerning the effective person in vision building are as follows:

H_0 : The difference between national and multinational companies in terms of the effective person in vision building is insignificant.

H_1 : The difference between national and multinational companies in terms of the effective person in vision building is significant.

Table 2: Who is active in vision building at your company?

	National Company		MNC		Total	
	Frequency	%	Frequency	%	Frequency	%
Boss or Owner	52	16,6	2	4,9	54	15,3
Board of Directors	81	25,9	9	22	90	25,4
CEO	6	1,9	6	14,6	12	12
Managing Director and Vice Directors	20	6,4	3	7,3	23	6,5
Entire Managerial Team	123	39,3	16	39	139	39,3
Outsourced Specialist or Organisation	9	2,9	0	0	9	2,5
Boss + Board of Directors	5	1,6	1	2,4	6	2,5
Boar of Directors + Managerial Team + Outsourced Specialist	10	3,2	2	4,9	12	3,4

Board of Directors + CEO + Vice Managing Director	6	1,9	2	4,9	8	3,4
No reply	1	3	0	0	1	0,3
Total	313		41		354	

In this context the Chi-square test statistics at a 0.01 significance level is 24.008, with a p value of 0.004. Under these circumstances we can say that the H_0 hypothesis is unacceptable, signalling the presence of a significant difference between national and multinational companies in terms of the effective person in vision building. As a matter of fact, looking at Table 2 we see that whilst 16.6% of national companies express the dominance of boss or owner in vision development, this ratio remained only at 4.9% for multinational companies. We determined the ratio of companies expressing the dominance of the CEO in vision building to be 1.9% for national companies and 14.6% for multinational companies.

We asked whether employees were allowed to participate in corporate vision building. We reached the results in Table 3 according to responses. The following hypothesis were established in this context:

H_0 : The difference between national and multinational companies in terms of ensuring employee participation in corporate vision building is insignificant.

H_1 : The difference between national and multinational companies in terms of ensuring employee participation in corporate vision building is significant.

Table 3: Do employees participate in vision building?

	National Company		MNC		Total	
	Frequency	%	Frequency	%	Frequency	%
Employees participate	194	62	30	73,2	224	63,3
Employees do not participate	119	38	11	26,8	130	36,7
Total	313		41		354	

In this context the Chi-square test statistics at a 0.01 significance level is 1.953, with a p value of 0.162. Under these circumstances we can say that the H_0 hypothesis is acceptable, signalling the presence of an insignificant difference between national and multinational companies in terms of ensuring employee participation in corporate vision building. Looking at Table 3 we see that whilst 62% of national companies express the presence of employee participation in corporate vision building, this ratio was 73.2% for multinational companies.

Table 4 was prepared according to responses concerning how employee participation is enabled in vision building at businesses. Respective hypothesis were established as follows:

H_0 : The difference between national and multinational companies in terms of methods of enabling employee participation in vision building is insignificant.

H_1 : The difference between national and multinational companies in terms of methods of enabling employee participation in vision building is significant.

Table 4: How is employee participation enabled in vision building?

	National Company		MNC		Total	
	Frequency	%	Frequency	%	Frequency	%
Through syndicate	6	3	2	6,7	8	3,5
Through employee representatives	35	18	6	20	41	18,3
Through suggestions of appointed employees	61	31,5	7	23,3	68	30,4
Through suggestions of all employees	92	47,5	15	50	107	47,8
Total	194		30		224	

In this context, the Chi-square test statistics at a 0.01 significance level is 1.583 with a p value of 0.663. Under these circumstances we can say that the H_0 hypothesis is acceptable, signalling the presence of an

insignificant difference between national and multinational companies in terms of methods of enabling employee participation in vision building. Looking at Table 4 we see that whilst 3% of national companies indicate the use of a syndicate to enable employee participation in vision building, this ratio rose to 6.7% for multinational companies. According to results, 18% of national companies and 20% of multinational companies said they used employee representatives as a method.

On the other hand 37 out of 41 multinational companies answered the question regarding approaches to vision building. Answers are presented in Table 5.

Table 5: Vision Building at Multinational Companies

Approach to vision building	Frequency	%
Ethnocentric	3	8,1
Polycentric	7	19,0
Regiocentric	2	5,4
Geocentric	25	67,5
Total	37	

According to results, we see that a majority of multinational companies (67.5%) adopt the geocentric approach in vision building. Hence, it would not be wrong to say that vision building is shaped by global trends.

CONCLUSION

Results from the study indicate similarity between national and multinational companies in terms of the presence of vision, mission, objective and targets. The entire managerial team and board of directors are dominant in vision building in both national and multinational companies however, boss or owner ranks third in dominance (16.6%) in national companies. Third in dominance at multinational companies is the CEO (14.6%). We believe that this outcome is due to national companies generally having a “family run business” identity whereby boss-owner tendencies have a direct influence on corporate visions. The reason behind the dominance of CEO in multinational companies is thought to be due to the professionalization of management. Although a little greater in multinational companies, both business models ensure the participation of employees in vision building. Participation in both business models is mainly based on listening to the suggestions of the entire workforce. We can say that the geocentric approach dominates vision building in multinational companies. This is followed by the polycentric approach (19%). Companies adopting the ethnocentric approach stand at 8.1%. The least popular approach in vision building is regiocentric.

ABSTRACT

In global hospitality and tourism industry, hotel businesses endeavour more to develop a competitive strategic intent than businesses in other sectors. It is believe that strategic intent plays a considerable role in the formulation and implementation of hotel strategies and in determining performance, but its influence has tended to be neglected in the hospitality management literature. The purpose of this study is to analyze the moderating role of perceived environmental uncertainty in determining the effects of strategic intent and organizational ambidexterity on firm performance for hotel businesses. The results of research indicate that strategic intent and organizational ambidexterity were significantly correlated with firm performance. According to the findings of regression analysis, strategic intent had a positive effect on firm performance. However, organizational ambidexterity had a positive but non-significant effect on firm performance. The findings of this study show that perceived environmental uncertainty moderated the relation between strategic intent and firm performance. Practical implications and directions for the future research were discussed.

Keywords : *Perceived environmental uncertainty, Strategic intent, Organizational ambidexterity and Performance*

INTRODUCTION

The key strategic consideration for hotel businesses is to leverage internal competencies and manage uncertainties in the decision whether or not to collaborate with other hotels in national and international markets. It is expected that in today's turbulent environment, hotel businesses which are capable of developing national and international networking ties to cope with environmental uncertainty, are likely to attain greater success in service and enjoy better performance. In that, environmental analysis is considered an important step in the strategic management process for hotel businesses. If hotel businesses wish to build, sustain or improve their competitive position, they must have the ability to cope with uncertainty in their environment.

So far, few researches have been done on how hotel business managers perceive today's dynamic environment (Harrington and Kendall, 2007). Moreover, little is known about the strategic behavior of hotel businesses in reaction to environmental uncertainty. Particularly, it is likely that in a competitive and uncertain environment, strategic intent and organizational ambidexterity contribute more to an increase in performance than in a less uncertain environment.

In this research therefore it examines the effects of strategic intent and organizational ambidexterity on firm performance for hotel businesses in a turbulent environment.

Perceived Environmental Uncertainty

The concept of environmental uncertainty has been widely discussed in strategic management literature (Milliken, 1987; Brouthers et al. 2002; Freel, 2005). Milliken (1987) defined environmental uncertainty as 'the perceived inability of an organization's key manager or managers accurately assess to the external environment of the organization or the future changes that might occur in that environment'. In other words, Tsamenyi and Mills (2003: 22) defined environmental uncertainty as 'unpredictability in the actions of customers, suppliers, competitors and regulatory groups that comprise the external environment of the business unit'.

Shortly, environmental uncertainty is explained as 'the difficulty in making accurate predictions about the future' (Sahadev, 2008: 183).

Perceived environmental uncertainty (PEU) occurs when decision-makers perceive the environment of their organization as unpredictable (Ondersteijn et al. 2006). PEU can be divided into two kinds of uncertainty: environmental uncertainty and behavioral uncertainty. Environmental uncertainty refers to changes in the external environment that are exogenous and largely unaffected by the business' actions. The changes in the external environment resulted from developments in technology, competition, regulations and other external factors that shift the conditions in which decisions are made. Behavioral uncertainty refers to the inability of managers to predict the actions and plans of potential partners or members within the business. Behavioral uncertainty arises from opportunism and is presented when firms depend on or share decisions with others (Akhter and Robles, 2006: 106).

PEU is usually conceptualized as a multidimensional construct including environmental volatility, environmental munificence, competitive intensity, market turbulence, and environmental hostility (Jekanyika Matanda and Freeman, 2009: 92). PEU results from the inability of individual managers to predict changes in the environment (resulting from changes in technology, markets, and income volatility), due to lack of knowledge necessary to distinguish data needed for decision-making. When environmental uncertainty increases, various types of inter-functional expertise are required, as more diverse skills and knowledge are required to develop solutions and to remain competitive (Jekanyika Matanda and Freeman, 2009: 91). Thus, management consultants use strategic intent and strategic ambidexterity as tools to overcome barriers, manage uncertainty and build competitive advantage in periods of rapid change in global markets.

Perceptions of high levels of environmental uncertainty may lead to a lack of interest in investing for the long term sustainability of the relationship. This may result in greater levels of opportunism and lack of trust (Sahadev, 2008: 183). Environmental uncertainty can be managed as long as firms have the requisite resources. Only those organizations with limited adaptive capacity or resources are negatively affected by environmental uncertainty.

A few researches have identified that perceived environmental uncertainty may a critical determinant of strategic ambidexterity and strategic intent. Moreover, most of previous studies have examined its effect on manufacturing firms. So, in highly uncertain environments where conditions change rapidly, strategic ambidexterity and strategic intent are needed for business' success.

Previous studies stated that the uncertainty of the environment could influence firm performance (Parnell et al. 2000; Bacha, 2010: 30). However, Tsamenyi and Mills (2003) investigated the relationship of perceived environmental uncertainty and organizational culture on budget participation and managerial performance in Ghana. The results found limited support for the hypothesis that environmental factors influence firm performance. Similarly, Choe (2003) argued the effect of environmental uncertainty and strategic applications of IS on firm performance. An excessively low level of strategic applications were decreased a firm' performance in stable environment. However, there are limited numbers of studies on the relations of perceived environmental uncertainty and firm performance for hotel businesses in Turkey.

Strategic Intent

Strategic intent as something different from strategic management is an important distinction for describing the behaviors of firms in an uncertain environment. Strategic management emphasizes mainly the general processes of decision-making in strategy formation. Strategic intent provides direction to these processes. This direction of intent specifically regards a given firm's focus on leveraging resources in its pursuit of strategic advantage over its competitors (Chambers, 1991: 30).

Strategic intent is a useful concept in accounting for purposes and continuity of goals in an organization adapting to internal and external developmental pressures. The managerial role of strategic intent is to go beyond environment-sensitive strategic planning to represent objectives "for which one cannot plan" (Mantere and Silince, 2007: 406-407). Managers should develop a long term 'strategic intent' and 'compete for the future' by becoming 'rule breakers' instead of 'rule takers' (Stoelhorst and Van Raaij, 2004: 467).

Strategic intent is defined as the planned direction and destiny to be pursued by the firm (Landrum, 2008: 127). In other words, strategic intent can be defined as "a [sustained] obsession with winning at all levels of the organization". Strategic intent represents a proactive mode in strategizing, a symbol of the organization's will about the future, which energizes all organizational levels for a collective purpose. Strategic intent reflects the 'corporate context' in which bottom-up business ideas are weighed. It directs the accumulation of necessary competences, giving the intra-organizational evaluation processes a common target, "something to 'aim' for" (Mantere and Silince, 2007: 407).

Strategic intent is crucial for a firm to achieve goals which one cannot be planned. It is important to separate that orientation (strategic intent) from strategic planning or strategies (Mantere and Silince, 2007: 408-409). Strategic intent also includes an active management process to focus the entire organization on the essence of winning (Rui and Yip, 2008: 216), but it is also stable over time while allowing reinterpretation as new opportunities emerge. Similarly, it helps to set a target that deserves personal commitment and effort. Strategic intent allows for a firm to build layers of competitive advantage painstakingly, to accomplish long-term goals. From strategic intent to core competences, firms have been forced by dynamic and intense competitive pressures to re-evaluate almost every aspect of their approach to conduct business.

Strategic intent envisions a desired leadership position and establishes the criterion that the organization will use to chart its progress. Komatsu set out to 'Encircle Caterpillar'. Canon sought to 'Beat Xerox'. Honda strove to become a second Ford—an automotive pioneer. All are expressions of strategic intent (Smith, 1994: 67).

A vision is defined as a set of desired goals and activities. It has connotations of encouraging strong corporate values in the strategy process and so is similar to strategic intent in its emotional effects (Mantere and Silince, 2007: 408-409). It also allows the firm's stakeholders to coordinate their activities to maximize firm value as established by the firm's strategic intent (Beasley et al. 2009: 87). The most striking difference between visions and strategic intents is the degree of collectivity, as many authors ascribe strategic intent as a phenomenon diffused at multiple organizational levels, while vision is a more clearly top management leadership tool, often ascribed to a single visionary leader (Mantere and Silince, 2007: 408-409). Strategic intent implies a particular point of view about the long-term market or competitive position that a firm hopes to build over the coming decade or so. Hence it conveys *a sense of direction*. A strategic intent is differentiated; it implies a competitively unique point of view about the future. It holds out to employees the promise of exploring new competitive territory. Hence, it conveys *a sense of discovery*. Strategic intent has an emotional edge to it; it is a goal that employees perceive as inherently worthwhile. Hence it implies *a sense of destiny*. The three concepts (direction, discovery and destiny) are the attributes of strategic intent (O'Shannassy, 1999: 17-18).

Unlike an organization's mission, which relates to the organization's values, core purpose and current strategies, strategic intent is about the future outcomes. It is the 'obsession with winning at all levels of the organization', but is greater than solely obsession – it 'captures the essence of winning', is 'stable over time'

and sets a target that ‘deserves personal effort and commitment’, motivating managers and employees throughout the organization (Haugstetter and Cahoon, 2010: 31).

A fundamental expectation is that the firm’s strategic intent should drive both architecture and business performance (Fawcett et al. 1997: 411). To enhance the customers’ prospects for competitive success, firms cannot expect to select appropriate strategic capabilities that will lead to their own long-term competitiveness. Thus, strategic intent guides the firm in its efforts to develop and utilize key resources to achieve desired objectives within uncertain and dynamic environment. However, the researches relevant to the effects of strategic intent and performance are limited in hotel businesses.

Organizational Ambidexterity

Organizational ambidexterity has emerged as a new research paradigm in strategic management theory, yet several issues fundamental to this debate remain controversial.

Ambidexterity is usually defined as the ability of individuals to use both of their hands with equal skill; individuals who are neither “right-handed” nor “left handed.” Moreover, ambidexterity refers to how an organization “wears the hat” of the job it does today while at the same time “wearing the hat” of the job it will do tomorrow (Bodwell and Chermack, 2009: 4).

Organizational ambidexterity is a dynamic capability that creates valuable new configurations of exploratory and exploitative innovation by generating and connecting previously unconnected ideas and knowledge or recombining previously connected knowledge in new ways (Jansen et al. 2009).

Achieving ambidexterity creates paradoxical situations because the short-term efficiency and the control focus of exploitative units are at odds with the long-term experimental focus and decentralized architectures of exploratory units. When differentiating exploratory and exploitative efforts, organizations subsequently need to establish certain integration mechanisms to coordinate and integrate operational capabilities developed at spatially dispersed locations. Hence, to resolve these paradoxical situations, the mobilization, integration, and deployment of operational capabilities at exploratory and exploitative units are a necessary step in appropriating value and achieving ambidexterity (Jansen et al. 2009: 797-811).

Exploration is about search, discovery, autonomy, innovation, embracing variation (O’Reilly III and Tushman, 2008: 189), risk taking, flexibility. Instead of creating reliability, these practices are aimed at the creation of variety. Finding new ways to deal with changing technologies, emerging markets or altered demand require flexibility of organizational routines (Van Olffen, 2006: 6). Exploratory is activities aimed at expanding the organization’s competences beyond its current range by the development of new products or services or by meeting demands of emerging markets or customers. That is, discussion of this strategic orientation usually focuses on issues such as developing innovative products, discovering new technologies, and finding untapped markets. These activities require knowledge that deviates from what is already known (Van Olffen, 2006: 7). The key idea is that by maintaining loose linkages, firms can remain flexible and adapt to a dynamic environment, as well as seize opportunities or avoid distant threats that lie on the market’s periphery (Judge and Blocker, 2008: 918).

Exploitation is about efficiency, increasing productivity, control, certainty, variance reduction (O’Reilly III and Tushman, 2008: 189), execution and implementation. Exploitation enable organizations to focus on their current competences refine their capabilities and leverage the advantages they have. Through exploitation organizations become more capable of and more efficient in their existing practices, but they may also engage in activities oriented at discovering new, deviating practices (Van Olffen, 2006: 6). Through these activities it is aimed at improving efficiency and refinement of skills and build upon the knowledge and competences already present in the organization (Van Olffen, 2006: 7).

Organizational ambidexterity is about doing both (O’Reilly III and Tushman, 2008: 189). Combining exploration and exploitation not only helps organizations to overcome structural inertia that results from

focusing on exploitation, but also refrains them from accelerating exploration without gaining benefits (Jansen et al. 2009: 797-811). Successful organizations maintain an appropriate balance between exploration and exploitation in the face of scarce resources and limited management attention (Venkatraman et al. 2007: 5).

Organizational ambidexterity as a dynamic capability is not itself a source of competitive advantage but facilitates new resource configurations that can offer a competitive advantage (O'Reilly III and Tushman, 2007: 31). Gibson and Birkinshaw (2004) identified a decentralized structure, a common culture and vision, supportive leaders and flexible managers, worker training and trust in relationships with management as the key sources of ambidexterity. Exploring and exploiting at the same time requires that senior management articulates a vision and strategic intent that justifies the ambidextrous form (O'Reilly III and Tushman, 2008: 189-192).

Organizational ambidexterity should be a key driver of business unit performance over the long term. To support these arguments, some studies have suggested that the combination of exploration and exploitation is associated with longer survival, higher sales growth, better financial performance, higher profits and revenue, lower costs in the delivery of products and services, higher customer satisfaction, improved learning and innovation (He and Wong, 2004; Van Olffen, 2006; Venkatraman et al. 2007; O'Reilly III and Tushman, 2007; Sarkees, 2007; Judge and Blocker, 2008). Further, the performance of existing products was higher in ambidextrous organizations (O'Reilly III and Tushman, 2007).

Judge and Blocker (2008) investigated the relationship between organizational capacity for change and strategic ambidexterity. The results showed that a relatively new dynamic capability, organizational capacity for change, is the primary antecedent of strategic ambidexterity and that this relationship is moderated by environmental uncertainty and organizational slack.

Firm Performance

Firm performance has become an important component of empirical research in the field of strategic management. Firm performance, or effectiveness, is a multifaceted phenomenon that is difficult to comprehend and measure (Snow and Hrebiniak, 1980: 318).

The goal approach seeks a definition based upon explicit goals or goals which can be implied from the behaviour of organizational members. The systems resource approach provides a framework to assess firm performance in terms of the key internal and external factors upon which the organization's survival depend on. The constituency approach views the organization as existing to benefit numerous 'constituencies', both internal and external to the organization, with firm performance assessment focused on fulfillment of constituent needs (Dess and Robinson, Jr., 1984: 273).

Generally, the term "performance" brings to the forefront measurements such as costs, profitability, sales growth, capacity utilization, and market share (Avci et al. 2010: 1-3; Leskiewicz Sandvik and Sandvik, 2003: 359). However, performance should not be treated only as a financial concept. Thus, it is suggested that particularly in the service sector, non-financial performance should receive serious consideration so that managers can survey performance in several areas simultaneously to enable efficient strategic decision-making. In addition, some management experts recommend the use of non-financial performance measures based on the fact that hotel businesses are labor intensive and customer-oriented in uncertain environment (Avci et al. 2010: 1-3).

Strategic intent and organizational ambidexterity can lead to superior resources and capabilities becoming positional advantages, which in turn leads to better organizational performance. But little empirical research actually demonstrated the correlation between strategic orientation and firm performance in hotel businesses. Choe (2003) argued the effect of environmental uncertainty and strategic applications of IS on firm performance. He showed that an excessively low level of strategic applications decreased firm performance

in stable environment. Similarly, Venkatraman et al. (2007) undertook the impact of strategic ambidexterity on sales growth. They found that sequential ambidexterity significantly predicted sales growth as main effect, as well as jointly with a set of contingency effects. On the other hand, Avci et al. (2010) discussed the relationship between strategic orientation and performance for tourism firms. The results showed that there was a difference in both financial and non-financial performance based on the strategic orientations followed by tourism firms. Generally, prospectors were found to outperform defenders, whereas analyzers showed a comparable performance to prospectors. But in hotel businesses, the studies associated with strategic intent and firm performance are rather few in number.

Therefore, the research objective of this study is to analyze the moderating role of perceived environmental uncertainty in determining the effects of strategic intent and organizational ambidexterity on firm performance for hotel businesses.

In the light of these findings, the hypotheses have been developed as follows:

H1: Strategic intent is positively related to firm performance.

H2: Organizational ambidexterity is positively related to firm performance.

H3: Perceived environmental uncertainty is negatively related to firm performance.

H4: Perceived environmental uncertainty will moderate the relationship between strategic intent and firm performance.

H5: Perceived environmental uncertainty will moderate the relationship between organizational ambidexterity and firm performance

-Figure 1 about here-

METHODOLOGY

To test the hypotheses developed in the study, data was collected from hotel managers in the province of Nevsehir in Turkey. That is, the sampling consists of managers in hotel businesses licensed by the Tourism Ministry in the Cappadocia Region, Turkey. Questionnaires were distributed to hotel businesses by the interviewers. The questionnaires were sent to all 208 subjects in the sample. 76 questionnaires were returned resulting in a satisfactory response rate of 36.5%.

Firm performance was designated as the dependent variable in this study while strategic intent and organizational ambidexterity were considered as the independent variables. Besides, perceived environmental uncertainty was used as a moderator variable in the relationships between dependent and independent variables.

Environmental uncertainty has been considered as an important variable in the strategic management literature. Environmental uncertainty was measured using the scale adopted by Jekanyika Matanda and Freeman (2009). The scale includes a set of 14 statements that describe together the various dimensions of environmental uncertainty (1= strongly disagree, 2= disagree, 3= neither agree nor disagree, 4= agree, 5= strongly agree). This scale is reliable (0.92). Notably, the coefficient alpha is larger than 0.70, the threshold generally proposed in the literature (Hair et al., 2006) for the constructs.

Strategic intent was measured with six-item Likert-like scale ranging from 1 “not at all flexible” to 5 “very flexible”, taken from the works of Hamel and Prahalad (1989), Lado (1992), and Wonglimpiyarat (2005). The instrument had reliability (Cronbach’s alpha) of 0.96.

Many studies were used to design a scale of organizational ambidexterity (Gibson and Birkinshaw, 2004; He and Wong, 2004; Jansen et al. 2006). It consisted of 12 items, scored on a 5-point Likert scale with an

agree/disagree continuum (1= strongly disagree, 2= disagree, 3= neither agree nor disagree, 4= agree, 5= strongly agree). It was used a two-step approach to measure organizational ambidexterity. First, organizational ambidexterity was classified in terms of the dimensions of exploration and exploitation. Second, the multiplicative interaction between exploration and exploitation as a measure of ambidexterity was computed by considering the studies of Nemanich and Vera (2009). The 12-items organizational ambidexterity instrument had reliability (Cronbach's alpha) of 0.88.

As to firm performance, four items the financial performance scale and four items non-financial performance scale adopted from Avci et al. (2010) were used. All performance items assessed the average level of firm performances within the preceding three years, using five-point scales anchored at much worse than competition (=1) and much better than competition (=5). Then, the scale reliability was evaluated by calculating Cronbach's alpha. The coefficient was 0.79 for firm performance.

THE RESULTS

The sample consisted of 76 respondents including 12 CEO, 34 department manager, and 30 division manager. 59.2 percent of the respondents were married and 40.8 percent were single. The male/female ratio of the sample was 63.2% and 36.8%, respectively, and the age ranged from 26 to 40. The executives had a mean age of 35.25 years (standard deviation = 6,65) and a mean hotel tenure of 12.48 years (s.d. = 7,26). 61.8% of those responding had more than 10 years of job experience.

In terms of education levels, 7.9% of participants had graduated from primary school, 30.3% from secondary school and 21.1% from high school. 32.9 % of the participants had a bachelor's degree and 7.9% had a master's degree or higher. Moreover, the executives were employing in a wide range of departments covering front-offices (30.3 percent), storey services (17.1 percent), food and beverage (15.8 percent), accounting (14.5 percent), sales & marketing (17.1 percent) and technical (4.0 percent) in these hotels.

The hotels which responded to the survey included personal hotels (75.0%), hired hotels (3.9%) and franchise hotels (21.1%). The hotels were categorized into three groups, five-star (21.1%), four-star (44.4%) and private hotels licensed by the Tourism Ministry (34%). 65.8% of these hotels had 100 and more room capacity. Respondents included owners (42.1%) and professional managers (57.9%).

Means, standard deviations, correlations and reliabilities of the variables in the study are presented in Table 1. Pearson correlation analysis of the variables extracted and the results indicate that strategic intent ($r=0,551$, $p< 0.01$) and organizational ambidexterity ($r=0,370$, $p< 0.01$) were significantly correlated with firm performance. This provides support for hypotheses **H1** and **H2**. However, perceived environmental uncertainty was found to be negatively and significantly correlated with firm performance ($r= 0,490$, $p< 0.01$). **H3** was supported by the results.

-Table 1 about here-

This study proposed a research framework to test the relationships among the constructs based on perceived environmental uncertainty. Moderated regression analysis was used to determine whether or not perceived environmental uncertainty had a moderator effect on the relationships between strategic intent, organizational ambidexterity and performance. This procedure involved the comparison of three regression models.

Table 2 presents the results of the regression analyses for this study. To examine multicollinearity, we calculated variance inflation factors (VIFs) for each of the regression equations. The maximum VIF within the models was 1.54, which is well below the rule-of-thumb cutoff of 10 (Şimşek et al. 2009). The lowest tolerance value was 0.648, which is far from the common cut-off threshold value of 0.10 (Hair et al. 2006).

-Table 2 about here-

To assess the effect of strategic intent and organizational ambidexterity on performance, a three-step procedure was followed. The baseline model (Model 1) contains the control variables. Model 2 includes the main effect of strategic intent and organizational ambidexterity on firm performance for hotel businesses. Model 3 adds perceived environmental uncertainty as a moderator.

In Model 1, control variables were entered in the analysis. The results in Table 2 suggest that the overall model was insignificant ($R^2=0.039$; $F_{(4,71)} = 0,715$; $p>0.01$). That means that only 3.9% of the variance in firm performance was explained by the control variables.

In Model 2, strategic intent, organizational ambidexterity and perceived environmental uncertainty were entered in the analysis. Model 2 was statistically significant for firm performance ($R^2=0.417$; $F_{(7,68)} = 6,959$; $p<0.01$). As shown in Model 2, the regression coefficients representing the main effects of strategic intent on firm performance are positive and significant ($\beta= 0.320$; $p< 0.01$). That is, strategic intent had a positive effect on firm performance. However, perceived environmental uncertainty was negatively related to firm performance ($\beta= -0.162$; $p< 0.05$). Moreover, organizational ambidexterity had a positive but non-significant effect on firm performance ($\beta= 0.025$; $p> 0.01$). Finally, in model 2, strategic intent, organizational ambidexterity and perceived environmental uncertainty explained additional 37.9 percent of the variance in firm performance.

In Model 3, the interaction effects of independent variables and moderator on firm performance were analyzed. The results showed that Model 3 was significant ($R^2=0.455$; $F_{(9,66)}=6,112$; $p<0.01$). As shown in Model 3, the interaction of strategic intent and perceived environmental uncertainty was negative and significant on firm performance ($\beta= -0.171$; $p< 0.01$), providing support for H4. Perceived environmental uncertainty moderated the relation between strategic intent and firm performance. However, the relationship between organizational ambidexterity and performance became insignificant when moderating variable was added ($\beta= -0.003$; $p > 0.01$). Thus, H5 was not supported. Shortly, perceived environmental uncertainty did not moderate the relationship between organizational ambidexterity and firm performance. The interaction term explained additional 3.7 percent of the variance in firm performance.

CONCLUSION

Through the findings of this study, we contribute to a greater clarity and better understanding of how hotel businesses may effectively pursue exploration and exploitation simultaneously to achieve ambidexterity. Particularly, development of strategic intent scale in the study provides possibly a quite influential finding for the strategic management discipline and a foundation for the future researches.

The originality of this study lies in the fact that it provides an actionable focus on strategic intent and organizational ambidexterity for the hotels managers in their pursuit of a competitive advantage. We conclude that the long-term success of hotel businesses in competitive markets is essentially determined by its strategic intent and organizational ambidexterity. However, it is important to recognize that perceived environmental uncertainty is a predictor of firm performance. Therefore hotel businesses must constantly strive to develop and maintain their core competences in uncertain environments.

The results indicated that strategic intent and organizational ambidexterity were significantly correlated with firm performance. However, perceived environmental uncertainty was found to be negatively and significantly correlated with firm performance. These results are consistent with many studies (He and Wong, 2004; Van Olffen, 2006; Venkatraman et al. 2007; O'Reilly III and Tushman, 2007; Sarkees, 2007; Avci et al. 2010).

According to the results of regression analysis, strategic intent had a positive effect on firm performance. However, organizational ambidexterity had a positive but non-significant effect on firm performance. In this

study, the differences we found are surprising. In contrast to the studies of Tsamenyi and Mills (2003) and Choe (2003), the findings of this study show that perceived environmental uncertainty moderated the relation between strategic intent and firm performance. Shortly, perceived environmental uncertainty is a relevant moderator in the context of the proposed model. Consequently, hotel managers should be used strategic intent and organizational ambidexterity as a tool to manage uncertainty and build competitive advantage in crisis periods. But when organizations effectively do not perceive environmental uncertainty, it is observed that strategic intent and organizational ambidexterity had a limited effect on firm performance. Namely, environmental uncertainty can be managed as long as hotel businesses have the requisite resources. Only hotel businesses with limited adaptive capacity or resources are negatively affected by environmental uncertainty. Furthermore, hotel businesses were not maintained an appropriate balance between exploration and exploitation in the face of scarce resources and limited management attention for this sampling. Thus, organizational ambidexterity did not a positive effect on firm performance.

As with any research, some limitations should be taken into consideration in generalizing the results of this study. First, although the sampling method used in this study was adequately suited to its purpose, the generalizability could be enhanced if future research systematically sampled from more diverse industries. Because, this study has been conducted in hotel businesses in a single-city setting (Nevşehir). Second, we developed on a new scale to assess strategic intent. The reliability of the scale used at the research has not been proven in many different settings/countries. As with any new measure; further tests in additional samples would help to establish our confidence in it.

The scope of this study includes the effects of strategic intent and organizational ambidexterity on performance for hotel businesses. Future research is needed to determine whether transformational leadership and strategic intent influence ambidexterity positively or negatively. Also, it is available to investigate the effect of the strategic posture and organizational ambidexterity on employee satisfaction in different industries.

DEVELOPING STRATEGIC FORESIGHT FOR STRATEGIC TRANSFORMATION

Gary J. Stockport
University of Western Australia, Australia

ABSTRACT

The recent Global Financial Crisis (GFC) including the general global recession has focused attention upon the importance of developing strategic foresight for strategic transformation. This paper develops elements of a conceptual framework with practical implications to help organisations to become better at strategic transformation. Consequently, there is a direct link from this paper to the Conference Theme, 'Searching for strategies out of the global recession'. Data was gathered by collecting in-depth secondary data about two organisations, Amazon.com (Amazon) and GE. These examples provide contrasting case histories about when and how to strategically transform. This paper argues that what senior managers can do is to use both theory and practice to help them build their judgment, foresight and wisdom. Any decision to strategic transform an organisation must be based upon past data, assumptions about the present and future combined (and intertwined) with the continual building up of judgment, foresight and wisdom. Key elements of the conceptual framework include; strategic thinking; strategic scenarios; customer centricity; strategic resources, and bold leadership.

Keywords: strategic foresight, strategic transformation, sigmoid curve, market signals, strategic leadership, Amazon, General Electric

INTRODUCTION

Should organisations have foreseen the Global Financial Crisis (GFC)? Could they have been more proactive in developing strategies to better deal with its consequences? Why is it that organisations are better in hindsight? How can they better develop foresight? These questions are rhetorical in nature but they emphasise the importance of organisations being able to better adapt to their changing strategic context. Volberta and Rutges (1999) argued that most of the strategic management literature was rooted in stability rather than change. Consequently, an important question for organisations to consider was how they can manage for today whilst at the same time prepare for the future (Liebl and Schwarz in press). Vanderwerwe (1995;79) concludes "At some time or another all corporations must go through transformation" and Stockport (articles in press) outlines the strategic transformation of Google and Semco. Pearce and Robbins (2008) added that strategic transformation could even be the essential last step in the process of business turnaround.

LITERATURE REVIEW

Handy (1994) argued that the sigmoid (S-shaped) curve was a useful conceptual model for identifying when the most appropriate time might be for an organisation (and even a person) to strategically transform itself. Handy (1994;24) noted "No matter how wise and benevolent they may be, the leaders of the first curve must be wary about their own futures when their curve begins to die. Only if they can move onto the second curve will they have a continuing life in the organisation. If they cannot join that second curve they should leave, but it requires great foresight..." Andy Groves from Intel (quoted in Vandermerve 1999;79) concludes "There is at least one moment in the history of any company when you have to change dramatically to reach the next level of performance. Miss the moment and you start to decline."

Stockport (2000) discussing the examples of Marks and Spencers and Intel (using the S-shaped curve) noted that organisations tended to be either reactive or proactive to the need for strategic transformation. He concluded that identifying what might be the right time for strategic transformation required considerable judgement and foresight and he developed a Strategic Transformation Framework to help senior managers in this regard.

Koch and Niewenhuizen (2006) argued that there are internal market signals and external market signals which should be pointing to the need for a new strategy. However, they pointed out that an organisation is typically 'confused' about how to interpret these market signals. When discussing internal market signals they noted that an organisation's "Profitability is slipping – and no-one knows precisely why or how to restore it" (2006;147). On the other hand, with external market signals "Shifts are evident in the marketplace, but there's no consensus on how important they are or how the business should react to them" (2006;148).

Nevertheless, Tabrizi (2007), noted that organisations could foresee the need for strategic transformation and Jackson (2008) pointed out that predicting changes in industry structure was essentially a very creative process. Sull (2003;72-73) presented a number of questions within scenarios to help organisations determine whether there was a need to strategically transform. These included:

- Are your current customers demanding change?
- Have your most finicky customers already migrated to new rivals or incumbents who altered their success formula?
- Can you spin a scenario in which the change bankrupts your company?
- Can you picture an alternative scenario in which the change proves irrelevant?
- Of the two scenarios, which disturbs managers more?
- What do the investors or creditors think?
- Has market value shifted toward entrants with a different model?
- Are investors comparing your company unfavourably to such entrants or to traditional adversaries who have already transformed their success formula?

Similarly, Vandermerve (1995;84) put forward a number of activities and exercises which were designed to create 'strategic discomfort' about continuing with the status quo. These were:

- Surveys to highlight / substantiate problems
- Different / creative analyses of data
- Reconfiguring / anticipating new customer segments, trends and demands
- New ways of defining / viewing / mapping competition
- Interpretations of potential competitive moves
- Comparisons of past results and future capabilities

Sull (2009) argues that organisations can compete through organizational agility which he defines as the capacity of an organisation to identify and capture strategic opportunities more quickly than its competitors do. Roberts and Stockport (2009) pointed out that strategically flexible organisations were both able to respond to market signals in both a proactive and a reactive way. Lee, Beamish, Lee and Park (2009) add that an organisation's competences can help it in this process by enabling an organisation to quickly switch its competences from one strategic context to another.

METHODOLOGY

Data was gathered for this paper by collecting in-depth secondary data about 2 organisations, Amazon.com (Amazon) and GE. Amazon, under Jeff Bezos, has had a much shorter history but is still seen as an organisation who has continually transformed itself (Stockport and Street, 2002; Stockport, 2005; Stockport, 2008; Stockport, 2010). GE, on the other hand, is commonly regarded as being effective at managing strategic transformation over a long period of time under different CEOs and contrasting styles of strategic leadership (Bartlett 2006; Bartlett and Wozny, 1999 revised 2005; Nohria, Mayo and Benson, 2007; Ocasio and Joseph, 2008; Thornhill and Mark 2008). Both organisations provide interesting and contrasting examples about strategic transformation.

FINDINGS

Amazon

Amazon – essentially shows an organisation which has continually strategically transformed itself through the roll-out of its global strategy and the development of its resources and strategic capabilities. Amazon has achieved global dominance through the development and use of technology to offer an increasing array of products and services and continually enhancing customer experience.

The vision behind Amazon had progressively changed since it began in 1995 by CEO Jeff Bezos. What began as the goal to become the world's biggest and best online bookstore developed into a store where

customers could buy ‘anything with a capital A’. It also wanted to become the world’s most ‘customer-centric’ company. Bezos added: “Our goal is to be Earth’s most customer-centric company. I will leave it to others to say if we’ve achieved that. But why? The answer is three things. The first is that customer-centric means figuring out what your customers want by asking them, then figuring out how to give it to them, and then giving it to them. That’s the traditional meaning of customer-centric, and we’re focused on it. The second is innovating on behalf of customers, figuring out what they don’t know they want and giving it to them. The third meaning, unique to the internet, is the idea of personalisation: redecorating the store for each and every individual customer. If we have 10.7 million customers... then we should have 10.7 million stores.”

The core of what defined Amazon as reflected in the 1997 Letter to Shareholders, had remained over the years. This letter contained a series of core commitments such as their emphasis on longer term market leadership. Extracts from it are reproduced in the Appendix.

From originally serving just website retail customers, Amazon in 2009 served 3 distinct groups of customers:

- Consumer customers: through their retail websites, Amazon provided a wide range of merchandise, low prices, and convenience to their consumers;
- Seller customers: sellers that sold their products either on Amazon’s websites or on their own brand websites and fulfilled their orders using Amazon’s fulfilment facilities;
- Developer customers: customers that used Amazon Web services which provided access to Amazon’s technology infrastructure that enabled them to create virtually any type of business.

Central to Amazon’s strategy and business model was growth. Figure 1 shows Amazon’s approach of achieving growth through being ‘customer-centric’ and continually improving the customer experience by offering lower prices and wider selection. This in turn fed back to the increasing use of Amazon’s websites (traffic) by customers and sellers, which again fed back to growing resources for innovation for improved customer experience, and so the ‘virtuous’ cycle continued. Amazon’s brand mantra was to relentlessly serve the customer by shaping the customer experience.

Figure 1: Amazon’s Strategy (originally drawn by Jeff Bezos in 2005)

Amazon had built a 3 pillar strategy to guide and reach Bezos’ vision. These pillars were selection, price and convenience, with its foundation on innovation.

- Selection: Amazon offered the widest selection of products, from its vast selection of retail products to Amazon’s software and Cloud Computing offerings;
- Price: Amazon was committed to price leadership and to consistently and continuously offer this with no sacrifice to quality. For example, Amazon offered free shipping offers to customers along with their guarantee of on-time delivery;

- Convenience: Amazon continually strived to 'please' their customers. For example, Amazon dedicated much resources to understanding what their customers wanted by offering customer review and feedback forms on all of their products.

These 3 pillars were supported by Amazon's continual commitment to innovation and investing in the future. Bezos concluded: "There's more to innovation ahead of us than innovation behind us." Underpinning innovation was the emphasis upon technology. Despite the progressive change in their vision, Bezos' typical response about the main difference between conventional retail and his business was "The three most important things in retail are location, location, location. The three most important things for our consumer business are technology, technology, technology. That's what takes the place of real estate in our business."

Amazon believed the continual investment in technological innovation helped Amazon to achieve two complimentary goals. Firstly, it improved efficiency, ultimately lowering operating costs and enabling them to offer lower prices to customers. Secondly, their heavy investment in research and development enabled them to find new ways to improve customer experience. With its advanced technology, Amazon had no need to segment customers based upon the more traditional marketing methods such as demographic or human behaviour. Customer search patterns and purchasing behaviour were tracked almost instantaneously as soon as a customer accessed their website. Furthermore, Amazon's website made intelligent recommendations of what other customers purchased after a new customer found a product they were interested in. In many ways, Amazon had built the ultimate virtual salesperson right at the customer's fingertips, by leveraging off information from millions of customer transactions and online window-shoppers. This competency was very powerful and other organisations had failed to produce similar market data on such a large scale. Amazon's continual emphasis upon technology led to a number of major outcomes between 2007 to early 2009 including Kindle, improving Amazon Web Services, offering digital contents and enhancing accessibility:

Kindle - Amazon developed and marketed an innovative wireless electronic reading device called Amazon Kindle under the Amazon brand.

Amazon Web Services - The most disruptive technological innovations released by Amazon between 2007 – early 2009 were through Amazon Web Services (AWS). AWS products were examples of Cloud Computing, a model whereby IT vendors host hardware and software in their own data centres and make them accessible via the internet. The trend in Cloud Computing has been compared to the development of the electricity network more than a century ago, whereby companies stopped having to produce their own power and instead plugged into a national electric grid. In the same way, individuals and organisations can now connect to a 'cloud' of computing resources to fuel their information and processing needs on the internet. The benefit of this approach was that companies with access to huge economies of scale can sell their hardware or software processing power to users on a 'pay as you use' basis at a far cheaper cost than a user could individually. If the internet community could facilitate this disruptive technology, personal computers as we know them today may become obsolete and products such as Kindle or 'dumb terminals' could take their place.

Digital Contents - Another significant expansion for Amazon between 2007 to early 2009 was in its digital contents offerings. During 2007, Amazon launched a MP3 Music Store, a digital music downloads store.

Amazon's emphasis on technology and innovation enabled it to quickly roll-out its activities across the world. During 2007, it launched a number of new sites that served customers with specific needs. In early 2007, Amazon launched Endless.com which focused on shoe and handbag items. Amazon continuously expanded globally via its international network. After the initial success of Amazon Jewellery, Amazon launched its Jewellery & Watches Store in the UK, Germany, France and Japan. During 2008, Amazon launched its Office Supplies Store, a single shopping destination that offered competitive prices on products for the classroom, home office, small office, corporate office 'and everything in-between'. This new store included a selection of more than 500,000 products from thousands of manufacturers. Amazon also diversified into auto parts, launching its Motorcycle Store as a single shopping destination for motorcycle and parts, accessories and protective gear. The store showcased a selection of more than 300,000 products from over 500 manufacturers, including top brands like Alpine Stars, Fox Racing, Harley Davidson, Suzuki and Tour Master.

Over the 2007 to early 2009 period, strategically aligned acquisitions and alliances remained a key way for Amazon to pursue technology development, applications and extend products or services. These alliances benefited Amazon's partners through, for example, access to capital, management expertise and Amazon's huge customer database. For example, in June 2008, the company acquired Fabric.com, a leading online

store that offered custom measured and cut fabrics, as well as patterns, sewing tools and accessories. This acquisition enabled Fabric.com to further expand its selection of fabrics and accessories while enabling Amazon.com to offer its customers a wider variety of products in the sewing, craft and hobby segment. In October 2008, Amazon acquired Reflexive Entertainment, a PC casual game distributor and developer. Amazon.com also completed its acquisition of AbeBooks, an online marketplace for books, with over 110 million primarily used, rare and out-of-print books listed for sale by thousands of independent booksellers from around the world.

General Electric (GE)

GE - essentially shows an organisation that has been effective at managing strategic transformation over a much long period of time (compared with Amazon) under different CEOs and contrasting styles of strategic leadership.

A most interesting period in the history of GE was at the time of change in leadership from Reg Jones from Jack Welch. Under Reg Jones GE was seen as a Strategic Planning organisation whether at the level of the 43 Strategic Business Units (SBUs) or the 6 Sectors. Ocasio and Joseph (2008;262) pointed out that 'What was fundamentally different under Welch was the focus on corporate initiatives rather than SBU or Sector plans as a centre of strategic planning attention.'

Shortly after Welch took over, he tried to quickly build a Strategic (stretching) Thinking organisation through, for example, setting a new Vision for each of the business units i.e. to either be #1 or #2 within their competitive space or fix, close or sell. Welch conceptualised GE through drawing a 3 circle concept to represent GE comprising core, high technology and services business units. Welch also realised "You can't set an overall theme or a single strategy for a corporation as broad as GE." He moved his Business Heads to real-time strategy and each had to compile their 5 page strategy playbooks which comprised their:

- Current market dynamics
- Rival's key recent activities
- GE's business's response to these activities
- The greatest competitive threat that faced them over the next 3 years
- GE's business's planned response

Jack Welch used a number of corporate initiatives such as Work Out and Best Practices to help GE staff to brainstorm possible solutions for the strategic issues and challenges facing their business units. Furthermore, under Welch, GE's leaders were developed and rated not only on their performance against quantifiable targets but also on the extent to which they 'lived' the GE values. Welch concluded 'In our view, leaders, whether on the shop floor or at the top of our business, can be characterised in at least four ways. The first is one who delivers on commitments – financial or otherwise – and shares the values of our company. His or her future is an easy call. Onward and upward. The second type of leader is one who does not meet commitments and does not share our values. Not a pleasant call, but equally easy. The third is one who misses commitments but shares the values. He or she usually get a second chance, preferably in a different environment. Then there's the fourth type – the most difficult for many to deal with. That leader delivers on commitments, makes all the numbers, but doesn't share the values we must have.'

Under Welch, GE's profits from services increased from 16.4% in 1980 to nearly 60% in 1995. Furthermore, between 1991-1995, operating margin improved from 8.92% to 14.4%. The importance of GE developing a Strategic Thinking organisation can be seen from 9/11 happening just 4 days after Jeff Immelt had taken over the reins from Welch.

DEVELOPING A CONCEPTUAL FRAMEWORK

There is never one right answer or solution in strategy. In reality, it is extremely difficult (if not impossible) to determine when is the most appropriate time to strategically transform. Indeed, the Amazon and GE examples provide contrasting examples as the organisations operate in very different strategic contexts. Therefore, any conceptual framework designed to help organisations must consist of a number of generic elements. The usefulness and relevance of each of these elements must be assessed by organisations on a case-by-case basis. This paper argues that the most important elements include:

- Strategic Thinking – this involves continually spending time thinking creatively about the present and the future. Continually question your assumptions about your existing and future market space as well as your competitive positioning within it. Vandermerve (1995;84-85) concludes 'The object

is to challenge people to think about how they think, the assumptions they consequently make, and the impact their behaviour and actions have / will have on the firm's ability to sustain its competitiveness.”

- Strategic Scenarios - use strategic thinking to help develop worst case and best scenarios for your business. In reality, how many organisations had developed scenarios for the GFC happening? Perhaps, even more importantly, for thinking through strategies within the GFC.
- Customer centricity – the Amazon example shows that continual strategic transformation is based upon enhancing customer experience through continual innovation. How are you continually enhancing your customer's experience? Does your business model have your customers in its centre?
- Strategic Resources – clearly, Amazon has leveraged off its resources and strategic capabilities to roll-out its products and services across the world. Technology has enabled Amazon to be more strategically flexible. What are your strategic resources and how are you building them? Are they helping to roll-out your products and / or services?
- Bold Leadership – both Jeff Bezos and Jack Welch were bold and decisive leaders. Welch used a stretch Vision to ‘push’ GE to strategically transform. What is your vision? How bold are you?

CONCLUSION

Strategy is an art rather than a science. There is never one right answer or solution when choosing a strategy. In reality, it is extremely difficult (if not impossible) to determine when is the most appropriate time for an organisation to strategically transform. It seems that both Amazon and GE were continually strategically transforming themselves over different strategic contexts. What senior managers within any organisation can do though is to use both theory and practice to help them build their judgment, foresight and wisdom. Any decision to strategic transform an organisation must be based upon past data, assumptions about the present and future combined (and intertwined) with the continual building up of judgment, foresight and wisdom. However, the strategic risk around trying to identify the right (or any) time to strategically transform might be mitigated through an organisation developing a customer centric business model based upon continual innovation. Having a business model which is embedded with strategic resources and capabilities may also help an organisation to be strategically flexible in both a proactive and a reactive way. It is true, as the Amazon example shows, that an organisation should create in a proactive way its own future. However, it should also be reactive to unforeseen events such as the GFL. Having both will help an organisation search for strategies through any global recession (or, for that matter, any strategic context).

APPENDIX

EXTRACT OF 1997 AMAZON LETTER TO SHAREHOLDERS REPRINTED IN THE 2002 AND SUBSEQUENT ANNUAL REPORTS

1997 LETTER TO SHAREHOLDERS

From the 6th Paragraph:

Because of our emphasis on the long term, we may make decisions and weigh tradeoffs differently than some companies. Accordingly, we want to share with you our fundamental management and decision-making approach so that you, our shareholders, may confirm that it is consistent with your investment philosophy:

- We will continue to focus relentlessly on our customers
- We will continue to make investment decisions in light of long-term market leadership
- We will continue to measure our programs and the effectiveness of our investments analytically, to jettison those that do not provide acceptable returns, and to step up our investment in those that work best. We will continue to learn from both our successes and our failures.
- We will make bold rather than timid investment decisions where we see a sufficient probability of gaining market leadership advantages. Some of these investments will pay off, others will not, and we will have learned another valuable lesson in either case.
- When forced to choose between optimising the appearance of our GAAP accounting and maximising the present value of future cash flows, we'll take the cash flows.

ORGANIZATIONAL CHANGE FOR THE ENVIRONMENTALLY SUSTAINABLE AIRPORT MANAGEMENT

Vildan DURMAZ
Anadolu University, Turkey

ABSTRACT

Air transportation industry is a globally growing industry. As an inseparable part of this industry, airport management is also becoming more crucial issue to be dealt with. Airports offer economic and social benefits to the society, but also environmental impacts of airport operations are increasing due to high traffic growth. While airport capacity is increasing, airport operators are being responsible for mitigating environmental constraints. Today to implement airport environmental management system is seen as a critical way of solution. To ensure effective implementation of this system, an organizational change with definite roles, responsibilities and structure are needed. This study illustrates a way of organizational response to market forces and national regulations guiding the achievement of sustainable airports by determining the structure and the roles in an airport organization.

Key Words: *Airport management, sustainability, organizational change*

INTRODUCTION

Today's business environment produces change in the workplace more suddenly and frequently than ever before. The ability to adopt the changing environment is a key for organizational survival (FNL, 2009). Explaining how and why organizations change has been a central and persistent theme among scholars in public administration, sociology, psychology, and other social science disciplines. Many researchers have examined the organizational change theories; organizational and environmental factors; capacity of organizations to readily and successfully change (Kasten, 2006). Competitive pressures caused by globalization, deregulation, and discontinues technological changes seem to have forces many organizations into considering radical change as a way of surviving and growing (Huy, 2002). Although much research has been done on organizational change, little has been done on changing organization to reach environmentally sustainable airport management.

ORGANIZATIONAL CHANGE

Every organization needs to change to survive in a developing and competitive environment.

In the past, managers aimed for success in a relatively stable and predictable world. However, in the hyper turbulent environment of the 21st century, managers are confronting an accelerating rate of change. They face constant innovation in computing and information technology and a chaotic world of changing markets and consumer lifestyles. Today's learning organization must be able to transform and renew to meet these changing forces (Oswick et.al., 2005)

Organizational change can simply be defined as *new ways of organizing and working* (Dawson, 2002). The concept of organizational change is in regard to organization-wide change might include a change in mission, restructuring operations (e.g., restructuring to self-managed teams, layoffs, etc.), new technologies, mergers, major collaborations, "rightsizing", new programs such as Environmental Management System, Total Quality Management, re-engineering, etc. (McNamara, 2009).

As a growing area of study, organizational change consists of elements both within and outside an organization. Some of the main *external factors* are; government laws and regulations (world agreements and

national policies on pollution and the environment), globalization of markets and the internationalization of business (the need to accommodate new competitive pressures both in the home and overseas), major political and social events (for example, September 11), advances in technology (new generation aircraft), organizational growth and expansion (increasing air travel demand causes the need for increasing capacity and expansions). Four *internal triggers* to change that are generally identified as; technology (computerization of management accounting, scheduling, and information systems), primary task (for example, in shifting away from the main service of a company into a new major field of core business), people (development of new human resource management or training programmes), and administrative structure (restructuring authority relationship and responsibilities) (Dawson, 2002).

Change management becomes increasingly important for organizations in an environment where competition and globalization of markets are ever intensifying. It could be argued that many organizations face a problem situation in which they either “change or die” (Cao & McHugh, 2005). Changing could have two meanings; first the changes to be managed lie within and are controlled by the organization. The second, is the response to changes over which the organization exercises little or no control (e.g., legislation, social and political upheaval, the actions of competitors, shifting economic tides and currents, and so on) (Nickols, 2007).

During the last decade, researchers concerned with organizations and the natural environment have investigated why firms respond to ecological issues. Several studies have identified motives for corporate greening such as regulatory compliance, competitive advantage, stake pressures, ethical concerns, critical events and top management initiative (Bansal & Roth, 2000).

SUSTAINABLE AIRPORT MANAGEMENT

Growing travel demands have resulted in many airports reaching capacity, leading them to initiate expansion plans. It is, however, becoming increasingly difficult to secure planning approval for new infrastructure airports because of the many conflicts with the requirements of environmental regulators and concerns of local residents. Growth in airports means more pollution and energy consumption, leading to greater operating costs and new emerging capacity threats. Hence, it is necessary to look for new measures to reduce the environmental impacts and improve energy efficiency for future developments (Avail Corporation, 2008).

Congestions, attributed to airport capacity constraints, result in extra energy consumption and generate unnecessary increases in aircraft emissions. Expansion is often fraught with additional costs such as relocation compensation, environmental degradation and land limitations etc. Hence, apart from meeting future growth in air traffic, good long term planning is necessary to minimize the impact and costs of current and future expansions, especially on the environment. Thus, cost efficiency and addressing environmental needs share a common platform where strong correlation amongst the two entails that success in either goals is not mutually-exclusive, but rather, is mutually reinforcing (CAI, 2008).

Sustainable airport development is an exercise in balancing the demands of the varied strands of sustainability – i.e. economic, social, environmental and ecological. It falls within the overall concept of sustainable transport, can be defined as ‘satisfying current transport and mobility needs without compromising the ability of future generations to meet these needs’. It is a concept that broadly applies to all areas of effectively running an airport – including finance, operations, human resources, community and investor relations, the environment *et cetera*. To attain its goals, sustainability as applied to transport has to meet the following basic conditions: (1) the rates of use of renewable resources not exceeding their rates of generation; (2) the rates of use of non-renewable resources not exceeding the rate at which sustainable renewable substitutes are developed and (3) the rates of pollution emission not exceeding the assimilative capacity of the environment (Amaeshi & Crane, 2006).

Airport sustainability practice is a broad term that encompasses a wide variety of practices applicable to the management of airports. Such as: (ACRP, 2008)

- Protection of the environment, including conservation of natural resources.
- Social progress that recognizes the needs of all stakeholders.
- Maintenance of high and stable levels of economic growth and employment.

The growth of air travel and the consequential need for expansion of many airports, together with heightened press and public awareness of environmental issues mean that the aviation sector is under heightened scrutiny; day-to-day activities as well as more ambitious projects often become high profile. However, the industry has proactively responded through individual activities as well as through the development of the

sustainable aviation initiative, which is an industry endorsed comprehensive program to reduce aviation's negative impacts (AOA, 2006).

Airport operators around the world share the same business goals – to provide a safe, secure and sustainable operational efficient environment. On the one hand they want the capability to detect and respond to threats more quickly; to mitigate risk. On the other, they want to drive productivity improvement and reduce costs. Regardless of location and size, airport operators share the same business agenda - how to do more with fewer resources? (HAS, 2007)

Airports are now aware of the importance of being environmentally friendly. The major forces driving the environmental programmes at airports can be divided into three categories –*community*, *government* and *internal*. And although all are very different, none can really be viewed without taking into account the context of the others and different pressures tend to act on different environmental issues (Oh, 2008).

Neighbouring communities: In some regions, communities and society at large can have a very keen sensitivity to environmental issues and may take a proactive stance against developments perceived to make a significant contribution to an environmental issue. Such environmental pressure on an airport operator is usually most prevalent when planning permission is required for infrastructure development, such as a new terminal or runway. Recent developments, such as anti-climate change protesters may adversely affect airport operations (ACI, 2009).

Aircraft noise when it comes to environmental pressure from the community; it remains the primary concern for most people living near airports in all regions of the world. Most airports have dedicated call lines for noise complaints and many have dedicated staff and sophisticated noise management schemes. The community is an important stakeholder and a level of partnership must be fostered on an on-going basis. Internet tools were also developed to allow residents to examine flight patterns and noise levels in fine detail.

The importance of neighbourhood and properly informed community are more likely to take into account the benefits of aviation when it comes to assessing aviation infrastructure proposals (Oh, 2008).

Government pressure: Mandatory requirements and other regulation can take a variety of forms from international agreements and national legislation to conditions attached to local planning permission permits. At the time of writing, regulations in many jurisdictions are evolving and substantial development should be expected in upcoming years. A range of regulatory requirements mandates an airport operator to tailor the airport's program according to international, national and sometimes local requirements (ACI, 2009).

As regulators, governments often target airports for environmental effects that are not apparent to the public. Pollution of the air, water and soil are generally in the forefront of concern and are subject to standards and laws on local air quality and water and soil contamination. Governments can require that airports demonstrate compliance with local pollution limits, impose penalties for non-compliance and require the implementation of mitigation programmes (Oh, 2008).

Internal pressure: Airports operating under a responsible business model also set their own environmental targets and strive to achieve them. Saving energy and the associated emissions can be a direct cost saving and the implementation of smart building technology might mean reductions in whole-life-cycle costs. In many cases there is a strong economic case for using environmentally friendly technologies. Wildlife mitigation and water management programmes, equipment modernisation and habitat land-care work can require significant spending without financial returns. These may be needed as a result of government requirements or as environmental conditions attached to a planning consent, but in today's environmentally conscious world, an ever-increasing number of airports are volunteering such mitigation programmes as an integral part of a project proposal (Oh, 2008).

RESEARCH

The goal of this paper is to make airport operators to understand the role of air transportation in a sustainable society. This paper could be a guide to the achievement of environmentally sustainable development at air transportation by setting a standard for airports in relation to environmental issues; stimulating further improvements in environmental performance by determining the roles and responsibilities in an airport

organization. The aviation sector has been relatively free of major environmentally driven regulation, in part because the sector is considered a key contributor to driving the global economy and the only mode of rapid trans-national travel on offer to customers. Projected growth in air travel and the associated environmental impacts mean that policy makers are turning their attention to the aviation sector (AOA, 2006).

In this study, data were collected via semi-structured interview with the responsible person at State Airport Authority and the İstanbul, Atatürk Airport executive. Questions were try to evaluate how much the airport operators aware the changing world needed organizational adaptation and to illustrates the structure of organizational change for environmentally sustainable airport either mandated by legislation or market forces.

Management of Turkish airports and mission of regulation and control of Turkish airspace are performed by General Directorate of State Airports Authority (DHMI). DHMI that has to perform its undertaken tasks according to international civil aviation rules and standards is in this sense a member of International Civil Aviation Organization (ICAO), which was launched according to Civil Aviation Agreement that entered into force to ensure safety of life and property at international aviation and to provide regular economic working and progress (DHMI, 2010).

Directorate General of State Airports Authority (DHMI) provides necessary terminal and passenger services to about 35 million domestic and international flights passengers preferring airway for their travels, and air traffic services to local airline companies as well as more than 361 foreign commercial airline companies. As part of air navigation and airport management services by General Directorate of State Airports Authority (DHMI), traffic of airplanes and passengers, which are offered service, has increased significantly in recent years. Especially, there has been significant progress at international flight airplane and passenger traffic of the international airports. DHMI operates 40 airports, as seen in Exhibit 1, İstanbul/Ataturk Airport is among the leading airports of Europe due to increase in the international traffic (DHMI, 2010).

EXHIBIT 1 Airports Operated by DHMI

Source: www.dhmi.gov.tr

The research results show that, airports under the control of DHMI does aware of the importance of to be environmentally sustainable. However, today they focus on economic prosperity, quality improvement; in the future they are planning to identify environmental sustainability and corporate social responsibility practices.

As environmental issues are voluntary and airports have monopolistic power in their region, internal factors are not encourage the airport operators to change their organizations structure focusing on environmental practices. If they are affected to change by internal factors the changes can be under the control of the organization. The external factors, especially government regulations, may force the airport operators to the organizational change for the environmental performance.

Airport operators do not have a department specifically responsible for the environmental programs. Aircraft noise, wildlife protection, water and soil resources protection issues are accomplished under the different departments' responsibilities. The implementation of sustainability practices at airports is needed to be determined for each operation and given under the responsibility of a department with specialized personnel.

The answer for the question of the reasons behind the no/slow implementation of environmentally sustainable practices are given as; first lack of funding, then lack of management support and the lack of trained personnel. As a result of this situation the organization does not train its staff and tenants yet. Additionally, they do not have environmental (annual) report for the airport operations' environmental performance.

It is found that the regulatory adoption is the key factor for the organizational change at airports for the environmental performance implementation.

CONCLUSION

The global trend of privatization and commercialization rises the growing awareness among airports of the concept of sustainable development with environmental programs.

It is found that organizational response to environmental impacts of the airport operations including the market forces on organizational change mandated by national /international regulations. Organizational change driven by regulatory agencies is relatively easy to accomplish because of the direct effects of policies on organizations. Organizational resistance to change may be caused by poorly planned implementation of change initiatives, funding barriers, lack of staff, lack of environmental culture, time and technology.

For the future, not only regulatory forces but also global issues, community/stakeholder pressures, ethical concerns and top management initiatives will be the motives for organizational change with responsible roles at appropriate departments. When the airport operators have a department with overall responsibility for environmental sustainability they will have environmental manager, environmental program, environmental culture, environmental training program, environmental reports to the stakeholders and research and development contributions. These changes are essence for the environmentally sustainable airport management.

STRATEGIES TO RESPOND TO CHANGE: AN EXPLORATORY STUDY

**Bella Butler,
Carolyn Dickie,
Marita Naudé,**

Curtin University of Technology, Australia

ABSTRACT

In this paper, focused on Western Australian organizations affected by the global financial crisis and their responses to the changing environment, there are significant practical and theoretical outcomes from an exploratory study. Theoretically, it has identified a deeper understanding of how organizations respond to, and manage, change in times of uncertainty; it complements existing literature by extending discussions about decision-making, re-allocation of resources, communication strategies and management of concerns and attitudes of employees within specific workplace contexts. Similarly, it contributes to extant literature on the change process and, potentially, assists in the development of a framework to inform the completion of successful change events. Practically, it is significant that participating organizations receive aggregated data that help identify elements of successful change practices that can be implemented to assist managers. The paper comprises two parts; the first highlights relevant literature which provides the context for subsequent discussion and in the second part the research methodology, findings and overall conclusions are discussed.

INTRODUCTION

The purpose in this paper is to explore the role of dynamic capabilities of firms in their ability to respond to environmental turbulence so as to sustain a competitive advantage. The study began with investigation of the role of dynamic capabilities in assisting firms to deal with external complexity and uncertainty. It was continued by exploring the role of learning approaches and, in particular, the ability of firms to develop new capabilities and acquire resources in making effective responses to environmental pressures for change. Consequently, in the paper the approach to organisational learning used by a large public sector organisation in a South-East Asian country was examined. Finally, conclusions were suggested as a result of evidence from the selected case study on how environmental responsiveness of firms can be achieved by ongoing learning and training, consultancy and collaboration with key stakeholders, thereby co-creating services for major customers, promoting customers' involvement and fostering knowledge exchange.

SEARCHING FOR STRATEGIES TO RESPOND TO CHANGE

Nowadays corporations are challenged by dynamic environments with a rapid speed of changes, burgeoning complexity and increased uncertainty. Firms must be able to cope with unplanned situations which cannot be predicted in advance. As Tsoukas (1996, p.22) describes it, "firms are faced with radical uncertainty: they do not know, they cannot know, what they need to know". Hence, organizations are engaged in discovering the unknowable and their strategy has to assist them in this process in order to enable their firms to manage crises.

Management scholars are trying to understand how companies cope with environmental changes, what do firms learn from the changing environment and how the environment affects the firms' learning processes (Hitt et al., 1998; Hong, Kianto & Kyläheiko, 2008; Minzberg, 1994; Powel, 1990; Stacy, 1991). Extant studies have shown that turbulent environments do not remain in the same state long enough for an organization to be able to find a favourable competitive position and exploit it (Eisenhardt & Brown, 1998; Fines, 1998). The limited timeframe challenges firms to respond quickly and with resilience to external changes. As Hamel and Valikangas (2003, p.53) assert, "in a turbulent age, the only dependable advantage is

a superior capacity for reinventing your business model before circumstances force you to. Achieving resilience is not easy". This view is supported by Eisenhardt (1998) who believes that to survive in such a fast-paced environment, firms must embed flexibility into their strategic actions. Undoubtedly, flexibility in resource deployment may explain why some firms move into new niches (Eisenhardt & Martin, 2000). In addition, flexibility in response actions enables firms to develop and sustain their own competitive advantage, as well as erode the advantages of competitors (Eisenhardt, 1998; Young et al., 1996). Strategic flexibility also refers to the ability of organisations "to jump from one opportunity to the next, going with the flow of the market" (Cunha 2004, p.275). Consequently, "turbulent environments call for organisations to be able to detect and create new opportunities and then select those that are worthy of actual resource allocation in order to be exploited for the firm's benefit" (Cunha 2004, p.278) and the ability of firms to benefit from new opportunities requires them to develop new resources and dynamic capabilities over time rather than protect their unique resources.

The dynamic resource-based view of the firm and dynamic capabilities

The resource-based view (RBV) of the firm emphasises that the competitive advantage of firms is based on their ability to possess valuable, rare, costly-to-imitate and non-substitutable resources and capabilities (Barney, 1986; Penrose, 1959; Rumelt, 1984; Wernerfelt, 1984). Understanding this version of 'competitive advantage' promotes the deployment and protection of unique resources rather than the need for resources and competencies to progress over time (McEvily, Eisenhardt & Prescott 2004; Døving & Gooderham 2008). Rapid, unpredictable environmental changes and market complexities require firms to accumulate competitive advantage through a knowledge learning process able to respond rapidly to such dynamics. Therefore, the need to respond to the transforming environment is related to the view of strategic ambidexterity (Dos 2007; Judge & Blocker 2008).

There is an extensive body of literature on the implications of dynamic capabilities and accumulation processes (Bierly & Chakrabarti 1996; Eisenhardt & Martin 2000; Luo 2000; Savory 2006; Teece, Pisano & Shuen, 1997; Tripsas 1997). Dynamic capabilities of firms are related to process, position and path (Liu, 2005). Teece, Pisano and Shuen (1997) stress that firms need to pay closer attention to the paths of behaviours and activities, and depend on paths of influence as possible future orientations. Boisot (2007) continues by pointing at future orientations of a capability as "a strategic skill in the application and integration of competences". This view is supported by Savory (2006, p.1055) who stressed that "competences are potential components of higher level capability" and capabilities are built around groups of competences.

Savory (2006) distinguished among the terms resource, competence and capability. He defined resources as factors that are owned and controlled by the organisation or available through alliances and other external relationships, whereas competence is "the ability to use the resources to an acceptable level of performance towards a desirable purpose" (Savory 2006, p.1055). Further, he defined capabilities as "the ability to operate a specific configuration of an organisation's set of resources" (ibid.) and dynamic capabilities as "the ability to reconfigure both the use and coordination of a specific configuration and the development of new configurations of resources, according to changes in the organisation's environment and strategic direction" (ibid.).

Previously, Teece, Pisano and Shuen (1997, p.516) defined dynamic capabilities as "the firm's ability to integrate, build, and reconfigure internal and external competencies to address rapidly changing environment". This argument was developed further by Eisenhardt and Martin (2000, p.1106) who stressed that the "value [of dynamic capabilities] for competitive advantage lies in the resource configuration, not in the capabilities themselves." Lansiti and Clark (1994) added to the early understanding of dynamic capability by referring to it as the firms' ability to regenerate its knowledge base (cited in Døving & Gooderham 2008). Eisenhardt and Martin (2000) emphasised that dynamic capabilities consist of specific strategic and organisational processes that transfer resources into new competencies and that renew old ones; furthermore, they stress the role of dynamic capabilities as "the organisational and strategic routines by which firms achieve new resource configuration as markets emerge, collude, split, evolve and die" (Eisenhardt & Martin 2000, p.1107).

Winter (2000) notes alternative differences between dynamic capabilities; e.g., those indicated by routines sometimes can be invisible and unknown to the management, whereas control levers and deliberate outcomes of other dynamic capabilities are well-known. Døving and Gooderham (2008, p.845) refer to dynamic

capabilities “as enduring routines, systems, and processes that are visible, known, and managerially intended as a means to achieving new resource configuration”.

Jansson (2007) argues that the turning of organisational routines into organisational capabilities means that there is an expectation for organizations, managers and employees to act, make decisions and respond to the environment in a regular fashion. The word ‘routine’ is an expression of repeated behaviour; it means certain behaviour has been established, and the probability is high that it will be repeated in future. The reason for this is that routines contain codes for replicated behaviour, so that a routine through its code expresses an ability to behave in a certain way. An example of such a code is a thought style in the form of shared perceptions of daily practices. Thus, an organisational routine is either a capability to act repeatedly in a certain way, or a capacity to make certain decisions repeatedly based on specific knowledge (know-how) and in accordance with a certain style thereby confirming the basic code behind the behaviour. It is argued, therefore, that organisational routines that lead to competitive advantages in markets by creating customer value can be defined as a social organisational capability.

Dynamic capabilities and organisational learning

According to Leonard (1995), technological competences and capabilities of an organization are related to dynamic capabilities and consist of four interrelated ‘key innovation activities’: viz., problem solving, implementing and integrating, experimenting, and importing knowledge from outside the organisation. Savory (2006, p.1058-9) argues that “for many innovations the key process is not discovery of new knowledge but the use and modification of existing knowledge.” Thus, knowledge may exist within the organization or may be acquired from the outside of it. Further, Savory (2006, p.1059) emphasizes the role of social dimensions of dynamic capabilities, whereby the “social dimension means that learning is a more complex process than individual learning ... which can be a social activity, particularly with respect to tacit knowledge”. In the current study, it is argued that the learning of new knowledge and rediscovery of existing knowledge is happening in social networks.

From an industrial network perspective, interacting with others is the most fundamental activity of a company. Interaction among firms creates awareness of the rules, routines and procedures that actors should follow in order to learn from each other and the market (Dyer & Wujin 2000; Gulati et al. 2000; Huemer 2004). The key research on the ability of firms to integrate in strategic business nets - *Managing Strategic Nets: A Capability Perspective* - was published by Möller and Svahn (2003), who identified the characteristics of the task organisations try to achieve through forming a specific strategic net; they defined strategic nets as “intentional structures that firms try to design deliberately for specific purposes” (Möller & Svahn 2003, p.213). They continued by stating that “many strategic nets may also involve, at least temporarily, governmental organisations and university based research institutes” [and that the term ‘net’ is used to an intentional] “restricted group of actors” (Möller & Svahn 2003, p.213).

Following the brief discussion of previous literature and for the purpose of this paper, the authors have accepted the following assumptions:

Under uncertainty organizations reconsider their traditional way of doing business and challenge their business model.

Uncertainty of the economic environment fosters organizational learning and creates favourable conditions for developing new capabilities by organisations.

Under uncertainty, organisations re-create their knowledge base and develop new capabilities by collaborating intentionally created “safety nets” – strategic nets.

From the assumptions, it was evident that organizations need to implement specific strategies to overcome and/or at least manage the impact and effects of changes in the business environment. Indeed, global financial crisis and economic uncertainty which followed after the crisis placed many organisations in the situation of re-assessment of their strategies and business models. Some business partners and actors of business nets were affected more than the others and were unable to survive. As opposite, those who survived managed to identify new opportunities in a new –after the crisis- business environment, for example, an increased demand on higher quality products and decreased demand on a wider range of products;

preparedness of contractors to negotiate decreased profit margin in order to maintain their customer base; higher involvement of customers in making specific requirements with regards to the ordered products etc.

On the basis of this logic, a set of research questions arose for the authors; these included:

How has the global financial crisis affected participating organizations?

What changes have organizations made in response to the global financial crisis?

How do participating organizations deal with employee emotions during times of uncertainty and change?

Consequently, in order to gain insight into the research questions, the main overall aim in this exploratory study was to develop a greater understanding of the dynamic capabilities of organizations; capabilities which firms develop in response to the external environment and, generally, lead to a smoother reconfiguration of an organization's structure and resources (including human resources).

METHODOLOGY

A case study design was selected for the study because the researchers aimed to gain an in-depth insight and understanding of the way that the changing environment affected organizations and their response to these changes within the context of a once-only case within a particular context and time as a starting point. The case study method had the value of enabling the authors to explore the content under study and, as argued by Yin (1984), retain the holistic characteristics of real-life events in fields such as organizational and managerial processes. He notes that while the results are not generalizable to populations, the case study compares to an experiment, where what is generalizable are the theoretical propositions.

Purposeful sampling (Creswell 2003, p.27; Creswell 1998, p.49) was used to select participants able to understand the overall aim of the study, its research questions and have experience of the research topic. Participants were invited through their association with the Change Management Institute in Western Australia, with various business managers and directors of organizations acting as contact persons. Participants were employees involved in, or impacted by, the strategic or implementation phases of the change process within their organization. A group of ten professionals formed the participants of the case study.

The current study, implemented within a context of discovery to gain evidence, used a phenomenological approach similar to that of Giorgi and Giorgi (2003); a method that has used an average sample size of 8.3 cases across seventy-six published studies (Russell 2006). Therefore, the use of ten purposefully selected cases was considered appropriate.

Within the case study research framework, a survey containing different sections was used as a collection tool. In Section A, biographical data such as gender, age and experience was collected through a range of closed questions to provide a context for the analysis and discussion of the findings. A combination of closed and open-ended questions was used in Section B; open-ended questions resembled a written narrative in asking participants to provide in their own words their personal perceptions, thoughts, ideas and approaches to provide richer data for analysis. According to Jabri (2006, p.364) understanding the culture of an organization is dependent largely on understanding the narratives from the employees on how they experience their workplace. Narratives provide knowledge on the environment within the context of the organization and are essential knowledge needed to understand policies and practices responsive to the needs of employees.

Section A was analysed through the SPSS quantitative data analysis package and reflected in tables and figures (basic quantitative, descriptive data). For the analysis of Section B, the researchers read through all the narratives and used 'thematic analysis' (Aronson 1994) to identify relevant tags (key words), links (codes) and categories (main themes).

A most significant ethical issue in the study was the need to ensure participant anonymity and confidentiality as some data might contain sensitive or strategic information. Therefore, no identifying information appeared on or was requested in the survey and participation was voluntary. Consent to participate was assumed when an employee returned the survey and all hard-copy or e-mailed surveys were returned directly to the researchers. The Curtin University Human Research Ethics Committee had approved the study as being managed according to its guidelines.

RESEARCH FINDINGS

As shown in Exhibit 1, the research participants comprised both females and males with more males as expected in senior positions in organisations. The ages of participants was spread from the twenties to over fifty years of age with the largest group being in the 40-49 years range.

EXIHIBIT 1. PARTICIPANT' GENDER AND AGE.

Characteristic	Variable	Number
Gender	Female	3
	Male	7
Age	20-29	1
	30-39	3
	40-49	4
	50+	2

Similarly, there was a range of industries represented in the survey, as shown in Exhibit 2, the advantage being that, in an exploratory study there was the potential for a variety of relevant responses. Exhibit 3 was used to present specific information regarding the participants' position and time employed in their organisation. A strong majority of participants held upper management positions and had been in their current job for less than three years, even though they had spent from less than three to more than 10 years in the organisation.

EXIHIBIT 2: PARTICIPANT' INDUSTRY

Industry	Focus	Number
Mining	Iron Ore	1
Electricity, Gas, Water & Waste Services	Water & Waste	1
	Water, Waste & Drainage	1
	Energy Logistics	1
Construction	Concrete Manufacture	1
Retail Trade	Hardware	1
Transport, Postal & Warehousing	Rail Engineer	1
Financial and Insurance Services	Banking	1
	Retail Banking	1
Health Care & Social Assistance	Aged, Disabled, Ill & Infirm Care	1

EXIHIBIT 3: PARTICIPANT' POSITIONIN ORGANISATION

Characteristic	Variable	Number
Organisational Level	Supervisory	1
	Middle management	2
	Upper management	7
	Executive	0
Time in Organisation	Less than 3 years	1
	3-5 Years	4
	6-10 Years	2
	10+ Years	3
Time in Current Job	Less than 3 years	6
	3-5 Years	2
	6-10 Years	1
	10+ Years	1

When asked about the effects of the global financial crisis on their organisation, all respondents reported a degree of 'downturn'. However, they reported that the 'downturn' varied; e.g., it was Slight (3), Moderate (4) or Significant (3). As shown in Exhibit 4, the economic downturn factors tended to be evenly divided between the categories of finance and work performance, although 20% of the participants' responses related to effects related to 'customers'.

The types of decisions used by the organisation in responding to the economic downturn were posited as being strategic (long-term), improvisation (short-term) or a combination of both. The initial response by participants indicated that no organisation used strategic or improvised decisions alone; i.e., all ten organisations used a combination of decision types to maximise their outcomes. Moreover, the respondents' answers indicated an equal number of specific decisions in the 'strategic' (6) and 'improvisation' (6) categories. In addition, there were 9 action decisions nominated regarding a 'staff' category (Exhibit 5). The suggestion is that staffing was a central area of operational change in the organisation's response to the economic strictures.

EXHIBIT 4: ECONOMIC DOWNTURN FACTORS

Links	Categories
Revenue inflow Cost of money Loan defaults Reduction in opportunities Cash-based deposits Funding opportunities Sales Government funding External funding	Finance
Vigilance Efficiencies Urgency Slowdown Nowhere near peak Trouble with suppliers Necessary maintenance Building downturn Contracts	Work Performance
Customer impact Demand for care services Consumer confidence Use of company facilities	Customers

EXHIBIT 5: CATEGORIES OF DECISIONS

Links	Categories
Borrowing of funds Credit/lending policies Longer-term impacts Quality human resources Rethinking core business Divisions joined together	Strategic
Moratorium on new equipment Moratorium on investments Reduced duplication of services Budget cuts Retail prices reduced New equipment orders on hold	Improvisation

Reduce staff numbers Staff reduction More accountability Retrenched staff No replacement of staff No overtime Staff forced to take leave Conditions of employees reduced	Staff
---	-------

Exhibit 6 presents specific actions that were effected by organisations in responding to the financial crisis; some organisations used more than one response, so the total number of responses does not add to ten. ‘Downsizing’ was the most common response by organisations, though the ‘Form alliances’ and ‘Restructure’ actions were used by more than one organisation; the use of a ‘Merger’ involved only one organisation. However, in addition to the four categories suggested, participants listed six ‘Other’ responses, as shown in Exhibit 6.

EXHIBIT 6: ORGANISATIONAL RESPONSES TO DOWNTURN

Action	Number	Details
Downsize	4	‘Other’ responses included: * Business improvement * Use of suppliers * Replacement of staff by natural attrition * Rethink core business * Reduce duplication of Services * Conservative expansion to take advantage of lower costs
Restructure	2	
Merge	1	
Form alliances	3	
Other	4	

When asked about what had triggered the organisation to make decisions for change, fourteen different items were linked from the key words provided by participants (Exhibit 7). The links were placed into one of the three categories of internal or external pressures or standard organisational practices.

EXHIBIT 7: REASONS FOR ORGANISATIONAL DECISIONS

Links	Categories
Need to stay in business – no other way Self-protection & survival State government decision	External pressures
Financial sustainability Desire to maintain service levels Monthly profit figures Efficiency measuring Amount of work in progress	Internal pressures
Constant review Constant monitoring Shareholder input Management review Review of needs of workers Focus on business opportunities	Standard practices

When asked if there was a generally accepted procedure to deal with chosen strategies in their organisation, only eight of the ten replied in the affirmative. Nevertheless, twelve different links were identified from the participants’ responses (Exhibit 8). The three categories of organisational procedures were identified as arising from management processes, factors related to decision-makers and a number of non-formal procedures.

EXHIBIT 8: PROCEDURES TO IMPLEMENT WITH STRATEGIES

Links	Categories
Standard management processes Strategic planning processes Industry codes and explanations Clear strategic plan Always reviewed and followed	Management processes
Enhanced to take account of factors specific to alliance partners Decisions made by the Board Decisions by senior staff	Decision-maker factors
Very quick decisions Knee jerk reactions Not much planning	Non-formal

Participants reported five information sources that were used by the organisation in order to investigate the need for changes to strategy (Exhibit 9). Most organisations used more than one source, which accounts for the tally of sources exceeding ten. In addition, the 'other' category had two items, each of which was nominated by only one person. The responses indicate that external market analysis and the driving vision of top management are the two major information sources for prosecuting change.

EXHIBIT 9: INFORMATION SOURCES FOR STRATEGY CHANGE

Information Sources	No. x/10
Executive network contacts	3
Driving vision of top management	5
Analysis by organisation's marketing department	4
External market analysis	6
Low level (bottom up)	5
Other – mining slowed government policy	2

Another aspect of effecting change in an organisation relates to the need for effective communication of the change decision and operational imperatives (Results are reported in exhibit 10). In the current study, 9 out of 10 participants reported that use of 'meetings' was essential. At the next level, each nominated on seven occasions were use of 'email', 'intranet' and 'employee training sessions'. In retrospect, the item 'employee training sessions' may have been better listed as 'employee information sessions'. Another feature of interest was that 5 out of the 10 respondents identified the 'informal grapevine' as being an important communication type in relation to organisational change.

EXHIBIT 10: ORAGNISATIONAL CHANGE COMMUNICATION

Type of Communication	No. x/10
Meetings	9
Email	7
Intranet	7
Internal newsletter	3
Internal memorandum	4
Employee training sessions	7
Informal grapevine	5
Other – CEO message	1

As indicated in Exhibit 11, there were nineteen links specifically related to employees' reaction to the uncertainty that resulted from changes to organisational strategy associated with the global financial crisis. From the links developed from the key words used in participants' responses, three major categories of reaction were identified; viz., categories based on opinion, assumption and principle which defined the level of intensity of employee reaction.

EXHIBIT 11: EMPLOYEE'S REACTION TO UNCERTAINTY

Links	Categories
Not too bad for business Limited uncertainty Effects moderate Awareness of environment/changes Employees reacted well overall Open & transparent organisation	Consciousness
Unsettled by redundancies Some concern but staff understood and accepted necessary changes A little stressed Not happy about salaries – all staff had financial commitments	Concern
Staff feel threatened Nothing safe Uncertainty about industry as a whole Uncertainty about keeping jobs Worried about jobs A lot of unrest Threat of industrial action Friction & trouble over lost jobs Some in union disrupted operations	Reaction

The three categories match three levels of awareness as a basis for action. At the 'consciousness' level, one is aware of the existence of uncertainty without it creating a strong emotional response; i.e., there is a balanced, if not positive approach. At the 'concern' level, one's consciousness of the situation is rather more serious and one feels more engaged emotionally. Finally, the 'reaction' level of one's emotional connection to the issue is strong and critical to the stage of creating serious stress and a negative response, even in association with others.

Similarly, participants' were asked about their own, personal reaction to the uncertainty that resulted from changes to organisational strategy associated with the global financial crisis. Again, the same three categories were used (Table 12). In this case, no research participants indicated that they were in the 'reaction' group. Judging from the links in the other two categories, it may be argued that, as senior officers in their organisation, they were aware of the uncertainty, but not threatened directly by it.

EXHIBIT 12: PARTICIPANTS' REACTION TO UNCERTAINTY

Links	Categories
No problems Heavy workload caused fatigue Knew job was safe Needed time to reassure staff Needed time to keep staff up-to-date Not really affected – some workload increase Didn't feel threatened myself	Consciousness
Limited uncertainty Some concern Accepted necessary changes Mostly worried about having to retrench people Was worried then relieved when I didn't lose my job	Concern
[No responses]	Reaction

Finally, participants were asked to describe how their organisation coped with employee responses caused by the uncertain economic climate of the crisis. Fifteen different links were identified from key words used in the responses (Exhibit 13). One means of categorising the responses was to separate them into positive (Plus), negative (Minus) and neither plus nor minus (Interesting) groups using the PMI model (De Bono 1993).

EXHIBIT 13: ORGANISATIONAL SUPPORT FOR EMPLOYEES

Links	Categories
Retain open dialogue Honesty Consultation with union reps Uses an inclusive, consultative model	Plus
It doesn't Not much concern shown really Predominant culture is 'avoid' Respond aggressively Not well done Little support offered Uncertain business No specific action to handle employee reactions	Minus
Management surveys – feedback loops Numerous 'open-space' meetings to allow wide-ranging contributions Managers mainstay for employee relations	Interesting

DISCUSSION OF FINDINGS AND CONCLUSION

Although, no research participants indicated that they were in the reaction to the crisis group or they were threatened by crisis and uncertainty (this can be explained by our sample characteristics, e.g. location in a wealthy state of Western Australia which was not significantly affected by the 2008 financial crisis), all of them admitted their awareness of the crisis and uncertainty. All respondents expressed an urgent need for improved communication both within and outside organisations, e.g. having meetings with key stakeholders and with other staff members in order to integrate and exchange knowledge from outside the organisation. This is aligned with previous studies (e.g. Savory, 2006) which reported that challenges of the economic environment require not so much discovery of novelty, rather, such environment requests rationalization and reconfiguring of existing knowledge. Our data demonstrates that the learning of new knowledge and rediscovery of existing knowledge is happening in collaboration with business associates and other actors of organisational nets. This finding also supports the previous literature on the role of strategic nets intentionally created by organisations and particularly intensively used in time of uncertainty as “safety nets”.

This study investigated how organisations can identify new opportunities by prompt response to the challenges of the dynamically changing environment and flexible movement towards the market demand. This study is adding to the dynamic resource-based view of strategy by incorporating the assessment of the business networks of the chosen organisation and investigating how the organisation is learning from its clients and other network participants. Our finding is that in time of crisis and uncertainty organisations source the knowledge both within and outside. Our data highlights that uncertainty promote organisations' quest for ongoing learning, consultancy and collaboration with key stakeholders, closer customer and supplier involvement in product and service specification for major customers, and fostering knowledge exchange.

The results provide insight into the organisational learning in networks and developing dynamic capabilities in response to the changes in the external environment. Because organisations learn from the environment, including through their business networks, they can foster their internal knowledge transfer and organisational learning. This flexibility and speedy response to the market enable organisations to develop new sources of a competitive advantage and sustain existing competitive advantage. Organisational learning and knowledge are key drivers of dynamic capabilities which allow organisations to respond to the challenges of the complex and dynamic environment.

THE ASSUMPTIONS BEHIND STRATEGY THEORIES AND ISSUES ADDRESSED AND THE ALTERNATIVE VIEW OF COMPLEXITY

Sithulisiwe Mazwi
Northumbria University

ABSTRACT

Various strategy theories exist and this paper seeks to examine issues addressed by strategy theories and looks at alternative ways to view strategy. This is done by a review of literature on strategy theories by Ansoff, Porter, Mintzberg, Prahalad et al and complexity theories. It is found that there is a need for a holistic approach to strategy as existing strategy theories approach the phenomena of strategy by design or by using a reductionist approach.

INTRODUCTION

Strategy has been defined and explained in many different ways. This paper seeks to give an overview of the different strategy theories as purported by various authors like Ansoff, Mintzberg, Porter and Prahalad. Many of strategy theories are based on a few assumptions and this paper asks the question ‘Are these theories different perspectives of the phenomena of strategy? Do we then need a more holistic strategic approach?’ The paper also goes on to draw comparisons between how these strategy theories view the organisation and how complexity theories view the organisation.

Ansoff’s View on Strategy

In making an analysis of strategy theories it makes sense to start with Igor Ansoff who is hugely accredited/billed as the father of strategy. According to him, strategic decisions ‘assure that a firm’s products and markets are well chosen, that adequate demands exist, and that the firm is capable of capturing a share of demand’ (1986; 25). Ansoff’s strategy formulation model follows the search procedure to arrive at a strategy which is then accomplished through a ‘cascade approach’. Ansoff purports that the first step in strategy formulation is an analysis of the firm’s current position i.e. what kind of business the firm is in and what kind of business it should be in. From such analysis the firm can come up with objectives and then formulate a strategy to arrive at those objectives. After objectives (goals) have been set, a gap analysis is to be carried out and this analyses the difference between where a firm is and where it aims to be. Different courses of action (i.e. strategies) are proposed and tested for their ‘gap-reducing’ properties and the best one is selected. If the selected strategy fails to close the gap then an alternative approach is tried. Also, the course of action being effected is evaluated against any new information that may come in; this may result in modification of that strategy or a new strategy being implemented instead.

Ansoff’s model of strategy formulation is based on a few assumptions. Ansoff’s model of strategy formulation, it seems, limits the broader concept of strategy to ‘position’ in the sense that, using that model, the strategists seeks to move the firm’s position from where it is to where it should be. Ansoff defines strategy as a position. Another assumption is that Ansoff’s model follows is that structure follows strategy. According to this theory, internal structure is determined by what the strategy seeks to achieve, that is, structure is a means by which strategy is arrived at. Does that then mean that the structure has to be reconsidered with the launch of each strategy? It also means that the strategy of a company is driven by the external environment.

Ansoff’s view of strategy formulation addresses a few issues. He addresses the importance of positioning of an organisation within the environment. His view also addresses the importance of planning how to close the gap between where the organisation is and where it wishes to be, and the choices made in closing that gap.

Porter's View on Strategy

Michael Porter has a different opinion to strategy. Porter views strategy as position i.e. 'what's our position, how are we going to be unique and how will we sustain that over time' (Leaders in London). Porter (1996) defines strategy as 'the creation of a unique and valuable position, involving a different set of activities'. He views strategy as that which distinguishes an organisation from the rest (Porter, 1980), i.e. that which gives an organisation sustainable competitive advantage. Porter also articulates the model of strategy formulation in a few steps. First the strategist needs to assess the forces affecting competition in an industry; identify the organisation's strengths and weaknesses. The strategists devise a plan of action to position the organisation in such a way that its capabilities either provide the best defence against the competitive forces; influence the balance of competitive forces to the improve organisation's position or anticipate shifts in environment with the hope to exploit changes that may occur as a result.

Porter also identifies determinants of a successful strategy. He argues that it is important that strategy is seen as a way of integrating activities of diverse functional departments within a company and should be viewed as an over-arching agency that ensures consistency of vast actions. Successful strategy should exploit the company's core competencies and should provide a dynamic balance between a company and its environment (company and environment alignment).

Porter's views of strategy is only limited to organisation's positioning within the environment. He also argues that there are environmental forces that shape strategy (Porter, 1979). In this view then Porter views strategy as a reaction to environmental forces or anticipation to these forces. Strategy is then driven by external structure. It may also seem that like Ansoff, Porter views that internal structure of the organisation are re-adjusted to satisfy intention.

Porter's view on strategy formulation addresses some important issues. Like Ansoff, he highlights the importance of positioning of an organisation relative to its environment and competitors. Porter also focuses on creation of competitive advantage as a strategy.

Resource Based View on Strategy

The next view of strategy to be discussed is the resource based strategy. This view takes an inside out approach to strategy. Organisation's internal capabilities drive strategic decisions. Prahalad (1990) argues that creating strategy is creating a chasm between ambition and resources. Resources in this case are defined as input that enables the organisation to perform its activities. Prahalad (1990) a proponent of Resource Based Strategy argues that leadership's real responsibility is to articulate a strategic architecture that guides competence building where strategic architecture is a 'road map of the future that identifies which core competencies to build and their constituent technologies' (Prahalad, 1990). The strategic roadmap then provides a template for allocation of decisions by top management. Consistency of resource allocation and development of an administrative infrastructure appropriate to it breathes life into a strategic architecture. The architecture reveals the broad direction without giving every step.

Grant another proponent of resource based strategy devised a framework for formulating the resource based strategy. First, the strategist needs to identify the organisation's resources and appraise its strengths and weaknesses, then identify organisational capabilities. The next step is to appraise the potential the resources and capabilities for competitive advantage and appropriability returns. Grant (1991) then suggests the strategists to select the best strategy to exploit the company's resources and capabilities relative to external opportunities then identify resource gaps that need to be filled in order for that strategy to be a success. Grant argues that the essence of strategy formulation is to design a strategy that makes the most effective use of core capabilities of the company. He also points out that the most important resources in this case are those which are 'durable, difficult to identify and understand, imperfectly transferable, not easily replicated and in which the firm possesses clear ownership and control'.

The resource based view of strategy addresses the issue of competitive advantage arrived at by analysing the core competencies of the organisation and exploiting them. In this essence, structure drives strategy.

Mintzberg's View on Strategy

Mintzberg (1987, 1999) defines strategy as a plan, ploy, position, perspective or pattern. A plan is some sort of consciously intended course of action; a ploy a manoeuvre to outwit an opponent; a position a means of locating the organisation within its environment; perspective is shared concept its content consisting of an

‘ingrained way of perceiving the world’ and a pattern in this case is a consistency of behaviour whether intended or not intended.

Mintzberg identifies two main types of strategy: deliberate and emergent strategy. Deliberate strategies are realised as intended and for that to happen a few conditions have to be met. Ansoff’s model of strategy formulation falls under the deliberate strategy category, strategist(s) determine the goal and set out a path on how to achieve it, and it is assumed that the results are then achieved as expected. For deliberate strategies to be successful three conditions have to be satisfied; precise intentions (goals and the way to achieve them) have to be articulated explicitly and in detail; intentions should be common to all involved and intentions should be realised as intended i.e. organisation is in full control of its environment or organisation can fully predict the environment perfectly (Mintzberg, 1985). The current economic downturn and its effects is a perfect illustration that organisations cannot always predict the environment precisely; neither can they have full control of the environment.

Emergent strategy is realised without any intention attached to the strategy. The strategy is as a result of patterns and consistencies in the absence of intention. Pattern formation is evident in Ford when they released their T Model only in black or when Picasso released paintings in blue for a time. For emergent strategy to be successful, just like deliberate strategy a few conditions have to be met. First, there has to be a consistency in action over time in absence of intention. However, very rarely are perfectly emergent and deliberate strategies found, strategies ‘walk on two feet, one emergent and one deliberate’ (Mintzberg, 1985). Mintzberg insists that emergent strategy is not chaos but unintended order, emergent strategy gives an opportunity for learning strategy (leaders are open and willing to learn).

Mintzberg goes on to identify different types of strategies i.e. planned, entrepreneurial, ideological, umbrella, process, unconnected, consensus and imposed strategies. Planned strategy occurs when organisation leaders formulate intentions and articulate them as precisely as possible (to minimise distortion) and strive for their precise implementation. This is only possible if the environment can be controlled or fully and precisely predicted beforehand. In entrepreneurial strategy, the force for pattern or consistency is based on an individual vision, this is particularly common among small or start up businesses. It can also happen in large organisations in a crisis where people are willing to follow one person’s vision. The difference with planned strategy with this is that intentions are less specific. In umbrella strategies, those who have the vision do not control its realisation. They set the vision and let other actors to manoeuvre through them, within a set of boundaries. If actors are found outside the boundaries then central leadership can either stop them, ignore them to see what will happen (a beneficial pattern may emerge) or adjust the boundaries. In process strategy, leadership does not content of strategy but rather control the process of strategy. Leadership designs the system that allows actors the flexibility to evolve patterns within it. This is done by maybe by controlling the staffing thus controlling who makes the strategy. Consensus strategy is when natural actors naturally converge on the same theme or pattern without the need for central leadership direction or control. Finally, imposed strategy is another type of strategy mentioned by Mintzberg, where strategy can be imposed by the environment or external environment. An example is when Canadian government forced Air Canada to buy a particular air craft.

Mintzberg’s view addresses important issues including those addressed by other theorists. Mintzberg highlights the importance of strategic learning through emergence.

CONCLUSION

Strategy theories take different perspectives and address very important issues. However, one wonders if those are theories in their own right or different perspectives to the phenomena of strategy, an opinion that is analogous to the mythical story of the elephant and the blind men. All the theories focus on design and Mintzberg’s view on strategy is closest to a holistic view. Mainstream strategy theories view organisations as systems by design with a few assumptions about what an organisation is.

First, the theories have a reductionist view on the organisation i.e. an organisation is a sum of its parts. This is evident in that these theories are confident in assuming that a strategist can predict the outcome of their actions e.g. if a strategists chooses a strategy it will close the gap between where the organisation is and where it wishes to be, or it will position the organisation desirably. Strategy theories are also based on objective knowledge. Knowledge is relative to what we see and is not absolute (as these views to theory assume). This is evident their view that strategists can analyse where the organisation is and where it should be and make decisions well enough as to how to get the organisation to its desired position. Mintzberg addresses this by the concept of emergence which leaves room for strategic learning.

Organisations are complex and dynamic systems. As such complexity theories view organisations as being greater than the sum of its parts and emergence is a learning experience. Organisation can also exhibit chaotic behaviour. Organisations are highly interconnected as a result minor differences may cause major results. Sometimes these minor differences may be so minute it is hard to notice them, and hence it is impossible to predict. With this view in mind, the planning process (especially detailed planning) can be of value but can be futile and time consuming.

Mintzberg recognises the importance of emergence. Seel (2003) goes even further than Mintzberg and talks about factors that are conducive for emergence. However, there is no strategy theory that has a view of organisations as complex systems. Maybe we need an approach to strategy that can take account of complexity. What will strategy be defined as then?

Research into insight to strategy that views organisations as complex systems could consider an investigation of factors that affect emergence. Seel (2003) identified such factors as connectivity of interaction networks within the organisation; organisational diversity; quality of interactions within the organisation among others.

THE STRATEGIC PRAGMATISM OF CENTRAL ASIAN STATES

Oskar Kayasan
European Research Centre, UK

ABSTRACT

This paper explores the regional leverage patterns of Central Asian States (CAS) from a global perspective. CAS countries, including Kazakhstan, Kyrgyzstan, Azerbaijan, Tajikistan Turkmenistan and Uzbekistan, have rather generic geopolitical settings which might have an impact on their globalisation progress. We examined the issue with particular focus on answering whether the globalisation of Central Asian States can reshape geopolitical strategies and efforts to enhance sustainable advantages. Regional integration stands at odds with the conventional wisdom of political science. Waltz (1979), Grieco (1988), and other neo-realists have argued that international cooperation is difficult to achieve in the anarchic state of globalisation. Although literature on regional integration and globalisation is available, general theories of regional integration within globalisation are still at the nascent stage. This paper's understanding of globalization is rooted in Held's (1995: 20) argument that globalization denotes the stretching and deepening of social relations and institutions across space and time (North D.C, 1990; Porter M., 1990). The lack of regional process between Central Asian States questions the priorities of regional integration. This research focuses on four levels of complex national and regional influences: (1), geopolitical complexities, (2); country-specific strategies; (3); resource based regional advantages; (4), globalisation; challenges and complementary'. The results suggest that primary challenges for CAS's new geopolitics of regional strategies are creating a diverse effect towards the globalisation progress.

Keywords: Globalization, regionalisation, competitiveness advantage, sustainability, strategies, Central Asia.

INTRODUCTION

The aim of this conceptual paper is to provide a typology of regional models which can provide an integrated approach to the understanding of Central Asia's regional strategies. The model persists of strategic pragmatism of the region by overwhelming influence of regional powers. There are, however limitation of this approach where national advantages are relatively dependence of regional involvement. The recent activities of the regional powers such as Russia, Turkey, as well as China's regional policies was examined. Complex geopolitics of the USA activities towards regional connivance strategy in Central Asia (CA) are creating extra dimension to the region. The overall aim of the paper

Even in advanced economic regions, there notably is an over-emphasis on region underlying structural economic changes and institutional frameworks (Rath and Kloosterman, 2000: 667; Kloosterman and Rath, 2003: 6). The model can be used to assess the viability of sustainable Central Asia's regional strategies. It will also discuss whether the competitive advantage and sustainability of Central Asia as a region can be achieved within the dominance of regional powers. Today, region energy policies and security issue are relatively under the Russia's influence. Despite the active involvement, Russia still lacks an overall regional strategy for the Central Asia. Nevertheless it seeks to engage collectively geological, security, and socio-economic policy goals.

As we are aware that, China has a real desire to expand its regional influence and territorial authority in the Central Asia's region. Furthermore, China, with its comprehensive regional security and economic interest, has been rather effective within the region in recent years. Specially, within the countries bordering China there are concerns about its long term interests. Turkey, the emerging new power, has increased its regional socio-economic interests. Since its deep rooted historical links with most Central Asian States, Turkey has now strengths their regional ambitions. Furthermore, socio-political and economic turmoil in Russia's domestic situation has given China and Turkey the chance to increase its share of influence in the region.

The USA and Europe have not taken the opportunity to the same extent due to other regional conflicts, such as those in the Middle East and East Asia. It is also argued that regional collaboration is not a significant aspect of the US policy, which consequently may persuade a competitive regionalist agenda on the part of

other attracted major powers like China and Russia. However, it does not necessarily mean a zero-sum game for the USA Central Asian regional strategy.

Over the years, most CA states have realized that there are no benefits by engaging one dominant power such as Russia. Despite the differences in their approach to regional as well as global powers most CA states are trying to diversify its regional stability. Although, most states are constraints by the fact that even Russia, Turkey or China would be the ideal power to dominate the region. Through an examination of the incomplete data from over last ten years, we can shed some lights on the complex inter- relationships and regional imbalances' of Central Asia. The future of regional pragmatism is still not clear in terms of regional and broader powers to further socio-economic collaboration.

COMPLEX GEOPOLITICS OF THE REGION

The future prospect of Central Asian region

One of the unsettled questions in the emerging field of regional competitive advantage and sustainability is the degree for regional pragmatism. In this paper we examine this issue with a particular focus on regional powers and whether the current state of globalisation can reshape Central Asia's (CA) regional strategy. This paper's understanding of globalization is rooted in Held's (1995: 20) argument that globalization denotes the stretching and deepening of social relations and institutions across space and time (North D.C, 1990; Porter M. 1980, 1985, 1986, 1990). The theory of globalization resonates with the notion of transnational spaces, understood as 'constituted by the various forms of resources or capital or spatially mobile and immobile persons, on the one hand, and the regulations imposed by nation-states and various other opportunities and constraints on the other' (Faist, 2000: 200).

The recent global financial market turmoil shows that global firms are to face the biggest challenge of restructuring to move business and society towards competitive advantages and sustainability. Striving for competitive advantage and sustainability suffers from overuse and overexploitation (Olson, 1965; Ostrom, 1990; Hardin, 1982). Societies need to abstain from overexploiting communal firms' resources and to practice self-control (Schelling, 1984, 1960) towards solely individual rent seeking behaviours. The earlier analysis of Buckley and Casson (1986), Hennart (1982), Rugman (1980), Caves (2007, 1971) broadly touched upon the public good nature of firms' advantages and knowledge, although these studies did not forge a clear link between global firms and globalisation of societies. Collective ownership of the network requires co-operation between actors in either formal or informal settings, where the actions of the actors are interdependent (Olson, 1965; Hardin, 1982, 1997; Sandler, 1992).

The Great Game of Regional Pipeline Politics

Increasingly Central Asia seems to be the stage for an improved version of the Great Game, in which the main dominant players today are China and the USA rather than the old powers of Russia and Great Britain. Current volatile situation of the Central Asia goes back to 19th century Anglo-Russian rivalry for the regional hegemony (R. Kipling). Since the region is to describe the 'great powers' various endeavors to fill the strategic void, and ranging from their military ventures to more competition for its energy resources. We are now experiencing that the age-old 'Great-Game' is entering a new and more complex phase. The conspiracy is still continues today, with new powers of hostility over the oil and gas resources of the Caspian Basin, with new indication of Islamic influence has increased its geopolitical potential. Despite its historical contexts there is no clear explanation by scholars what specifically is the Central Asia today.

The pace at which China is locking energy supply seems to only be increasing. And it is effective doing it without much of hostility by historical regional powers such as Russia. After reviewing some of the public deals that China has been making, it is rather obvious that its appetite to buy and secure more sources of oil and gas is creating long term strategic regional hub.

Although Russia still holds a failing grip over the region, the USA on the other hand has a diversified interest in the region. In recent years, the importance of Central Asia has increased to become an integrated part of Chinas tributary arrangement. Today, complementary arrangement of China and Russia challenging the US attempt to enhance influence over the region. The security aspect of regionalism and regional structures in Central Asia is limited by Russia's influence as a regional power, as well as by various constraints particular to the region and country specifics.

The Shanghai Cooperation Organisation (SCO) active involvement in the region has created priorities to engage China in the security discussion on Central Asia. Particularly, the Central Asia's regional pipeline politics was one of the important agenda beyond the security issues. Russia vs. China episode of Pipeline's interest may be very problematic from a regional perspective. Russia at times behaves as a strategic competitor when the regional authority is at stake. This none collaborative episode does interplay in Kazakhstan-China pipeline operation¹. China's first international Pipelineistan venture was the China-Kazakhstan oil link. Russia recently sealed more than \$5 billion in deals with China, advancing the agreement on a gas pipeline that will deliver up to 70 billion cubic meters of gas a year from Russia to China (Gasprom: 2009). Central Asia will, via Turkmenistan, defiantly be China's major suppliers of gas, but on the oil front it is more complex to find the common agreements. The most important rationale behind current activities is to increase and protect China's growing desire for energy resources. In addition, due to investment, trade and martial collaboration, there seems to be important security reasons for China to attempt to construct a traditional mutual relationship between China and the Central Asian counties. Energy and natural resources 'such as oil and gas' have emerged as the most important finical reasons for China to engage with Central Asia. It is with greatly diverged agendas that the Central Asian countries engage with China. For instance, Kazakhstan has been the most positive country towards further economic cooperation with China. However, the smaller economies in the region are less optimistic as they perceive that emerging pattern of Chinas dominance in the region. The ever increasing international dependence on gas and oil and the hard-bitten competition regarding these resources, will make more important to control Asia, as it is both a produce and a transit region. Recently China has taken further steps when they bought several oil and gas fields in Central Asia. The actual output that the oil fields will generate is difficult to estimate, specially for the fields which are under construction.

Exploring the Regional Relevance

Central Asian countries are trying to consulate their efforts for implementation of regional agreements for ensuring socio-economic wellbeing and prevention of regional conflicts. The region has its share of new opportunities and increasing problems. They hold an enormous deposit of natural resources to supply to the global economy and a wild eco system to support the environmental sustainability. Despite rich oil and gas fields, water conflicts are on the agenda as the Aral Sea basin is increasingly facing serious water shortages. Most of the Central Asian states have a rather weak civil society to improve governance and society well being.

Due to increasing conflicts amongst Uzbekistan, Tajikistan, Kazakhstan, and Kyrgyzstan over access to water resources, the existing pacts and agreements between and among countries have not been implemented or acted upon smoothly. Tajikistan and Kyrgyzstan even had a diplomatic confrontation. The recurring "Ketmen War"⁴ demonstrates the harm caused by the struggle for water. In April 2009, the five countries in Central Asia held a summit in Almaty on protecting the Aral Sea. The summit was supposed to resolve conflicts among the upstream states (Tajikistan and Kyrgyzstan) and downstream states (Kazakhstan, Turkmenistan, and Uzbekistan) over the distribution of water resources and the establishment of new hydropower stations. However, the region is experiencing various complex disagreements within and between regional powers. The cooperation level is determined by the following four actor linkages: the relationships between Kazakhstan, Kyrgyzstan, Tajikistan, and Uzbekistan, the Russo- Sino relationship, and the four countries' relationships with Russia and China. Presently there are, due to several reasons, problematic relationships between the four Central Asian countries. One of them is the lack of necessary transportation infrastructure. If this situation could be changed, the cooperation quality could be highly improved.

Table: 1: The role of the Energy and Transport Infrastructure

Key Issues	Outline
Geopolitics-prevail	<input type="checkbox"/> Divergent governance, successions and conflict. <input type="checkbox"/> Economic Growth, cooperation and stability
Asymmetric market strategic-deter	<input type="checkbox"/> .State driven monopolies and open markets <input type="checkbox"/> Demand transit and producer state interest
Evolving investor – host government relations-shift	<input type="checkbox"/> Opening windows of opportunity in Turkmenistan <input type="checkbox"/> Limits to investment and export options elsewhere

Source: Author own, 2010

The above table shows, that there are rather complex integrated energy infrastructure in the region. The key issues are geopolitical settings of the Central States requires regional coordination to resolve current dilemma between themselves and the regional powers. Although divergence and conflicts between countries are undermining future prospects and needs rather radical solution. Since there is a increasing conflict of national interest to share of integrated energy resources.

The Caspian & Central Asian oil pipeline and future projects

The map (Map: 1) below shows the Caspian & Central Asian oil pipeline and future projects. The issue has received global interest and has created a variety of tension between the West and regional powers. Today, the issue is still causing a very complex diplomatic tension between US, Europe and Russia. Caspian & Central Asian Oil: China has become an increasingly important player on the regional scene since the start of the 2000. Central Asian governments have endeavoured to deal constructively and pragmatically with China over territorial and other disputes. The map below shows that there currently are three ongoing gas and oil pipelines between Central Asia and China. The Turkmenistan – China Gas pipeline opened already on Dec, 14, 2009. This was the first transnational Pipelineistan project between China and Kazakhstan oil link while others are still under construction (see picture image 1 below).

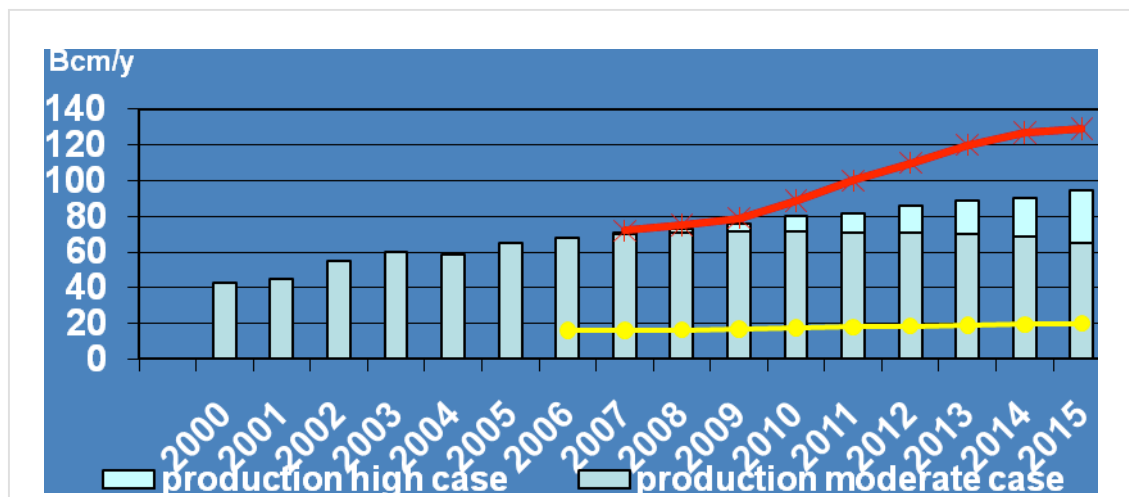

Map: 1 Pipeline Image:

Source: Pipelineistan, 2009

The pipeline runs for more than 1,800 kilometres from Turkmenistan’s Bagtyarlik gas fields (on the right bank of the Amu Darya River, near Uzbek border) via Uzbekistan and Kazakhstan to Horgos, the entry point to China’s Xinjiang Region, where the Central Asia-China pipeline connects with China’s internal supply network. The Uzbek and Kazakh sections run for some 550 kilometres and approximately 1,300 kilometres, respectively (Interfax, December 11). The gas will then be pumped for another 7,000 to 8,000 kilometres to cities on China’s Pacific Coast, including Shanghai and Hong Kong (Xinhua, December 11-14).

RE-EMERGENCE RUSSIAN INVOLVEMENT

Russia's relation with China in Central Asia is in one of the most complex to analyse and can be evaluated in many ways. Central Asia was important to Russia for several reasons. First, it became a core supplier of raw materials. Not only were food and livestock important commodities in the region, but so were exportable industrial products. Minerals, coal, and timber from the northern parts of the region and cotton from the central and southern parts were integrated into the Russian economy. In particular, the shortage of cotton on the international market caused by the U.S. Civil War (1861-1865) and prompted Russian officials to expand cotton production in Central Asia for domestic use and for international trade purposes. Second, Central Asia was strategically important. As noted, Russia found it was competing with Great Britain over South Asian possessions in what was often dubbed "the Great Game." As Russia expanded its control over the steppes of Kazakhstan and into the settled regions of Turkmenistan, attention was directed southward. It was not until the negotiated border agreement of 1895 that Russia and Great Britain came to terms with their respective holdings in Asia-Russian territory being what is today "Central Asia," and British territory being the regions of Pakistan and India. Afghanistan was seen as a "neutral buffer state," albeit under British influence. Below some areas which may clarify Russia's relation with China:

- China's Asymmetric Deterrence: China with modernized military is ready to fight along its border without permit or third party to intervene.
- Instability inside China: Socio-economic crisis in Northern part of China causes vast emigration to Russia
- Islamic Fundamentalism: Xinjiang independence should be a bed for Islamic fundamentalism and a copy for Central Asia.
- Future of Relations: Russians don't know Chinese tendency after the economic growth and solving of regional problem:
 - Shift to the South, no threats on Russian borders
 - Shift to the North, tension increases in China-CIS borders.

CHINA'S INCREASING INFLUENCE IN CENTRAL ASIA

China's emerging strategy, rather complex and long term, could revitalize the historical route of the Silk Road to the Pipe Line Route. As regional gas and oil deposits are substantial, they could be a lifeline for the China's overwhelming demand. China's close regional neighbour Kazakhstan has 3% of the world's proven oil reserve and its main oilfield is close to the Chinese border. China perceives Kazakhstan as a new alternative oil supplier, with the development of Pipelineistan connecting Kazakh oilfields to Chinese refineries.

This paper argues that the future of the China-Central Asian relationship is deeply embedded in mutual problems and common interests. There has been constant apprehension of outside interference as China now in actively seeking to explore. China is rapidly emerging as a world power. Within two decades it might directly challenge the regional power of Russia and the supremacy of the United States, Japan and Europe. At the same time there is new emphasis to create a zone of agreeable and secure countries around the Chinese's borders, which increases their political foothold and economic leverage in the future. Today, the Chinese interference in the region has changed due to the ever increasing demand for natural resources such as oil and gas for its domestic and mining industries. China's interest in the CA countries, such as Kazakhstan, Turkmenistan, Tajikistan, is mainly found by its ever increasing demand for energy resources.

With 3.7 million barrels a day, China is the world's fifth-largest oil producer, just after Iran. With a consumption of just 3% in the 1980s, China now consumes around 10%. China is the world's second largest consumers, still way below the US's consumption of 27%, but overtaking Japan's consumption rate. If this trend continues, the International Energy Agency (IEA) predicts that China will account for more than 40% of the increase in global oil demand towards 2030.

The below table (2) is the manifestation of various agreements with a real purpose of regional authority. The authority of Chinese interests in Central Asia is extent from national borders to socio-political ideologies. The areas of overwhelming evidence including the political and geopolitical impact of Beijing's growing influence along with the economic implications of the Chinese presence in Central Asia.

Table: 2: China has specific regional objectives and interests in Central Asia

1	Borders and Security	□ Border stability has been central to Chinese development plans and foreign policy priorities. The borders with Russia, Kazakhstan, Kyrgyzstan and Tajikistan are very important part of its national security.
2	Regional Arrangement	□ China's diplomacy in Central Asia aims to prevent the region from becoming a distraction from China's internal progress and foreign policy objectives.
3	Economic Interests	□ To maintain sources of energy in the region. China requires vast amounts of oil and gas from Central Asian countries, especially Kazakhstan emerges as a promising neighbour.
4	Military Cooperation	□ Increasing US military presence and influence in Central Asia is a concern for China's strategic calculus in the region. Therefore, China's military cooperation is vital with Central Asian neighbours.
5	Socio-Political Ideology	□ Socio-Political Ideology is a vital component of China's national importance. Sharing of the socio-political ideology with Central Asian states is in its own national interest.

Source: Author own source

The above table content has also actively supported by countries cooperated with Central Asian Republics Economic Cooperation (CAREC). The cooperation level is determined by the following points under the CAREC commitments and possible agreements. Further integration of Central Asian Republics Economic Cooperation (CAREC): i) Various efforts to adopt the concept to CAREC conditions and assess its potential regional benefits, ii) By identifying contiguous regions that might benefit from institutionalized forms of closer cooperation within and between wider boarder, iii) Intention to activate a 'bottom-up' dimension of CAREC-led regional integration effort, iv) Developing various ideas for the areas to be included as Asiaregio-type cross-border cooperation which is supported by China, v) Setting new groundwork for a closer cooperation at central governmental level, vi) To establish a foundation for socio-cultural understanding and sharing benefits of rich regional natural resources by more open borders

China has become an increasingly important player on the regional scene since the start of the 2000. Central Asian governments have endeavoured to deal constructively and pragmatically with China over territorial and other disputes. The image below shows that there currently are three ongoing gas and oil pipelines between Central Asia and China. The Turkmenistan – China Gas pipeline opened already on Dec, 14, 2009. This was the first transnational Pipelineistan project between China and Kazakhstan oil link while others are still under construction (see picture map 1). The recent influx of Chinese Business in Central Asia is changing the region and establishes a new form of consumer market. Cheap Chinese products are available from market stalls and supermarkets, bringing the cries of Chinese traders to most of the busy local markets in Central Asian Countries.

The establishment of Chinese business in most of commercial districts in cities all over the region is very common. Actually, it is a recurring pattern at hundreds of Chinese markets across Central Asia. For example, the Ya-Lan bazaar in Almaty has become one of cities largest market places, attracting many shoppers to its market stalls and supermarkets. It offers most products from household appliances and clothes to consumer electronics. In recent years, the initial local traders have been replaced by an influx of Chinese tradesmen, who have established larger shops and have become a fixture in Central Asia's metropolitan existence. However, China's growing presence in the region has also developed at the higher levels of society activities. As Chinese officials and business leaders have been active in the region, with variety of deals in different industries and signing new agreements, contracts.

RE-EMERGENCE OF HISTORICAL TIES

Turkey's Central Asia policy objectives are defined by its history, geography and regional interests. Turkey was among the first countries to recognize most Central Asian independence. Since, there has been active socio-economic involvement and over time their relation has strengthened in many areas. The relationship has evolved since Turkey, like many other countries in the world, became more aware of the rich natural resources of Central Asian countries, Within the constraints of its own region, Turkey has established a wide range of relations with CA republics. However, Turkish relations with the Caucasus and Central Asia have

changed dramatically in recent years due to global events and its consequences to the region. There has been a shift from an agenda dominated by economical, cultural and social factors towards, due to ongoing complex global and regional events such as 9/11, disputes in Caspian sea and ongoing conflicts in the region, a more marked military character. Today, Turkey is one of the biggest investors in the Caspian region and it has close historical, cultural and economic ties with the Central Asian region. The interest is not only commercial and economic but also considers the historical responsibility to support the societies and their wellbeing. Turkey has sought, with the support of the US, to establish itself as the main Caspian export route. This important route was crucial for Azerbaijan, Kazakhstan and Turkmenistan which these countries now heavily dependent for socio-economic developments. Apart from the economic gain, this agreement increases Turkey's socio-political influence in the Central Asian region.

NEW BALANCE OF POWER IN THE REGION

The reflection of current position of the region in the U.S.'s foreign policy has not always clear from the outset. The U.S.'s engagement in all Central Asian republics has given way to various misperceptions and inaccuracies in defining and categorizing the region. However, what is important to note is that Central Asia appeared to be of strategic interests with regards to the U.S.'s Global War on Terror. Before 2001 programs focused on "democratization, economic liberalization, and human rights dominated the U.S.' engagement, with scant attention to security cooperation. Therefore, it was the US Central Asian Politics carefully thought and proceed accordingly, however with a relatively minimum affect.

India's growing balance of power in CA

There is a widely held assumption that India's growing contact and influence in Central Asia have made it a new player in the region's complex geopolitics. With its large and dynamic young literate population India has recently has emerged as a major player in Central Asia. However, it needs to be further examined to what extent the regional game lens captures the real dynamics of India's influence in Central Asia.

STRATEGIC PRAGMATISM CONCEPT

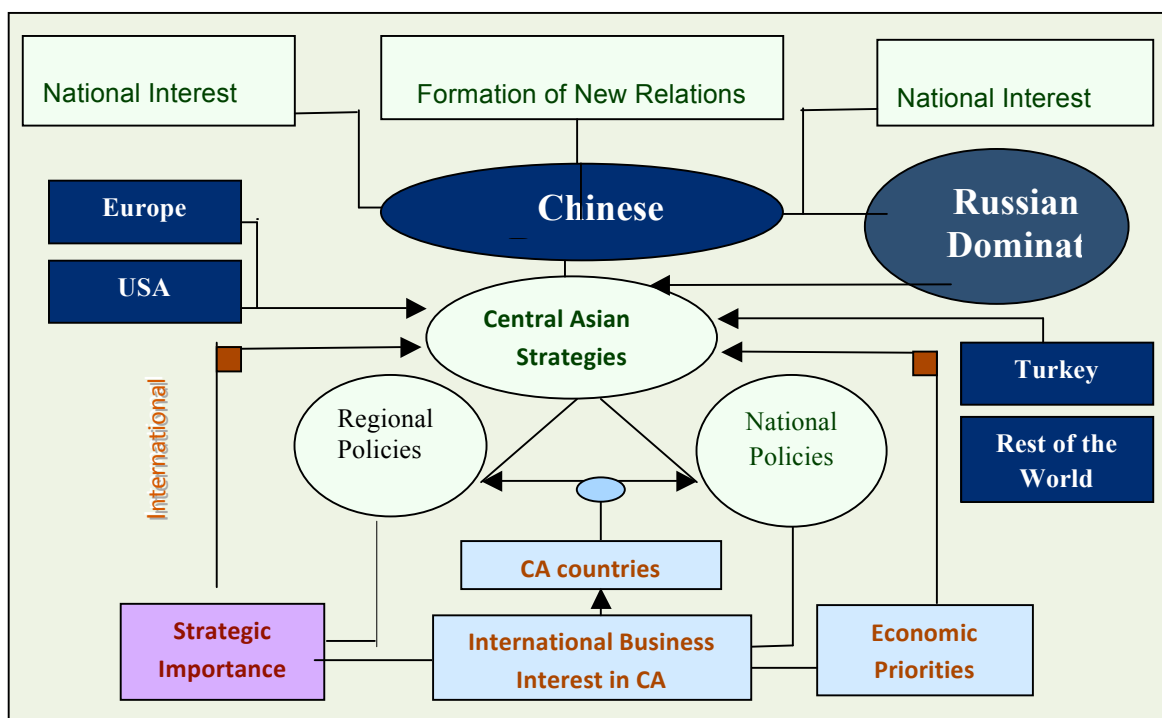

While the world, including the US, is watching, China is already having a clear energy strategy for Central Asia: the dragon strategy is already in action. As the West is hoping rather prematurely, in their analysis the Central Asian countries might not prefer dealing with their giant neighbour and favour Russia and West instead. Most Central Asian states are overestimated the Russian resistance to Chinese access to regional oil and gas resources. The complementary move does seem undermined the Russian long term strategic interest in the region. Although, these strategies are forthcoming, since China's engagement in Central Asia has been comprehensive and not restricted to gas and oil resources. In the last two decades, Central Asian countries have been looking for such contributions from global power leaders like Nazarbayev (Kazakhstan Premier) and Gurbanguly (Turkmenistan Premier) and other regional leaders highlighted over the years.

As Russia riles that with the commencement of China's Central Asia pipeline, Russia's post-Soviet control of gas exports from Central Asia has ended. The US's idea that China's gain would be turning out to be Russia's loss has been somehow over sighted. However, rationally, it is not a quite a zero-sum game, whatever it seems. There may be light at the end of the tunnel. Whether China is looked into competition with Russia over Central Asia's energy could be beneficial to the rest of the worlds energy prices, specially to larger users like the US and Europe.

Rules of engagement have changed in the mid 1990s from the three forces of "separatism, extremism and terrorism" to regional security, for which China has now taken up an enormous responsibility in the region. Somehow, the US were expecting that Russia and China would be at loggerheads in Central Asia, but this scenario has not materialized yet and is unlikely to happen soon. Russia has been part of the rules of engagement but has had relatively limited impact on the game itself. Accordingly haws in Moscow and Washington, there has been a growing argument that Russia seems favourable to China's investment in Central Asia.

The below model (2) is exploring the strategic shift of balance in the region between Russia, China, Turkey, Europe and USA. There are other newcomers such as India and Iran actively involving socio-economic relationship within Central Asian states.

Model 1: Strategic Analysis of Regional Complexities of Central Asian States

Author own construction: 2020

Central Asia and China have been closely entangled in history and today that relationship has begun to re-emerge at full speed. The increasing demand for natural resources shapes China's policies in Central Asia, but its interest goes beyond this. Despite the fact that China has emerged as one of the world's most powerful nations, it is relatively dependent on the Central Asian countries with regards to its energy resources. The partnership, acting through the various geopolitical "polygons", encourage other powers to try to develop their relation with both Russia and China up to the level of the current Russian-Chinese relations. Main conflicts will probably arise when competing for Central Asian oil and gas resources. Furthermore, there are ongoing territorial disagreements and Russia is concerned about the Chinese re-draw at the Russian Far East border.

The new type of relationship between two major powers has developed in the context of globalization and multipolarity. There is a changing trend of world powers: where the US is in decline, Russia and China are on the rise to have an impact in the new world order. Both countries are adapting to the realities of the globalized post-Cold War world and are discovering emerging areas of common interest and concerns. Hence these are areas where they are acting together. Their increasing presence in the world politics and socio-economic influences are clearly felt in the Central Asian states. Today's remarkable scope of cooperation with minimal differences should not be surprising, because cooperation is historically a more normal mode of Sino-Russian relations than the familiar China-Soviet split of the 1960s-1980s.

Sustainability of Regional Interests

Recent experience shows that Central Asian states have maintained a relatively good relationship with other countries outside its region. CA countries have experienced more difficulty in cooperating among themselves and so far have managed low levels of cooperation, especially in cross-borders agreements. Since their independence, water and territorial disputes have been the main obstacles to the improvement in the relationships among the Central Asian states. Despite some improvement, the the various form of disputes are still one of the ongoing obstacles for further regional integration. Currently, increasing conflict among Tajikistan, Uzbekistan, Kyrgyzstan and Kazakhstan over access to water resources, the pacts and various agreements within and amongst the CA states have not been implemented and put into practice.

There presently exists a rather problematic relationship between the CA countries, which are caused by reasons such as a lack of transport infrastructure, cross-border custom and sharing water resources. However

table three (3) shows that there are challenges, which when faced positively influence the future prospect for further integration between CA countries.

Table: 3 Current Observations of CA regional challenges and prospects

	Challenges	Prospects
1	Informal barriers are high in CA region	Adaption of new policies to formalize the barriers within CA region.
2	Current delays by other border agencies can be significantly more than Customs	Increasing supervision and contrail of border agencies to ease delays
3	Elimination of delays requires careful assessment	There has been some improvements in overall delays by new staff training and use of technology
4	Measurements should be continued on a systemic basis	International organisation are trying to establish a new measurement systems in CAC
5	Results should be disseminated in and outside the region	The impotents and results are gradually gaining international recognition
6	Further support from Governments and International organizations is needed	Various effort been made by national governments and international organisation but timing and credibly is still concern
7	Discrepancy between CA countries are still quite apparent in many areas of regional settings	There have been intergovernmental meetings to minimise the discrepancies' but national diversities are continue to be obstacles

Source: Author's own analysis, 2010

The challenges and prospects which is outlined at above table (3) are ongoing process and may take long time to establish for a stable forms of policies. Although there are various commitments to establish regional organisation by Central Asian states but still overwhelming difficulties to cooperate and how to go forward.

DISCUSSION AND RECOMMENDATION

Some of the forthcoming issues which Central Asian countries should be resolved to simultaneously negotiate at bilateral, regional and multilateral level: i) baffling web of commitments, ii) Slight involvement of business segments, iii) Inadequate human and financial resources for negotiation and implementation, iv) Lack of insufficient level of domestic market reforms to support regional trade agreements (RTA) and bilateral trade agreements (BTA), v) Deficient in of economic complementarities among countries, vi) Diverse political will to implement.

CONCLUSION

In conclusion, this paper has established that there is a need to consolidate, strengthen, integrate, expand and deepen the regional trade agreements in the region to reduce the spaghetti bowl effect. As we are aware: China is wary of alliances and prefers more flexible forms of regional relations. This also applies to Russia's involvement in Central Asia. Turkey has now become an emerging global power, which also has historical socio-economical ties with the Central Asian countries. This obviously complicates the CA into a more regional relationship puzzle. The level of strategic partnership in the region has full-fledged alliances and number of advantages. Unlike a coalition, the partnership does not make Russia responsible for any of China's actions in the region, nor does it involve significant commitments which could limit strategic partnership. The model (2) shows that the strategic shift of balance in the region between Russia, China, Turkey, Europe and USA is now creating new regional paradigm. The extent to which Geopolitical Empowerment are similarities at the global level, regional or national level represents the 'exposed orientation' of China to institutionalise a particular approach at the global scale or to adapt to the requirements of regional environment. In contrast horizontal axis is more a reflection of 'stated orientation', for instance, the extent to which Chinese leader view strategic decision making as a process concentrated in one local base, regional or global. The extent to which Geopolitical Empowerment are similarities at the global level, regional or national level represents the 'exposed orientation' of China to institutionalise a particular approach at the global scale or to adapt to the requirements of regional environment. In contrast horizontal axis is more a reflection of 'stated orientation', for instance, the extent to which Chinese leader view strategic decision making as a process concentrated in one local base, regional or global. The Significance of Chinas Geopolitical empowerment in Central Asia has redrawn the geopolitical landscape.

THE ALIGNMENT OF BUSINESS ENVIRONMENT SCANNING STRATEGY AND IT STRATEGY IN THE ENTERPRISE

Dorota Jelonek
Czestochowa University of Technology, Poland

ABSTRACT

This paper aims to confirm the thesis of positive impact of alignment between business environment scanning strategy and IT strategy on the business performance in large enterprises.

The article proceeds in the following manner. First, it briefly reviews the literature regarding alignment, business environment scanning strategy and IT strategy. Secondly, the notion of “alignment” was defined and presented against the background of chosen concepts of alignment of different areas of enterprise’s business activity. Furthermore, the conceptual model of strategic alignment between business environment scanning strategy and IT strategy was presented.

The results from the survey conducted among 96 large enterprises will be used for verification. Application of the methods of confirmatory factor analysis will allow for assessment of the effect of each factor on the process of alignment and business performance.

Finally, the research findings and their management-related and theoretical implications were discussed.

Keywords: *business environment scanning strategy, IT strategy, alignment, business performance, confirmatory factor analysis*

INTRODUCTION

Regarding the term “alignment”, there is no consensus between researchers. Numerous synonyms have been used, such as: strategic alignment (Henderson and Venkatraman, 1993; Chan and Reich 2007), fit (Porter, 1996), integration (Weill and Broadbent, 1998), harmony (Luftman, Papp and Brier, 1996), and linkage (Reich and Benbasat, 1996). However, no matter which word is used, it is essential that “organizational performance is a consequence of fit between two or more factors such as the fit between organization environment, strategy, structure, system, style, and culture” (Van de Ven and Drazin, 1985). In the subject literature the examples can be found to confirm the significance of the alignment of business strategy and IT strategy (Henderson and Venkatraman, 1993; Chandler-Wilde and McFadzean, 2004), considerations and researches concerning alignment between HRM and KM (Shih and Chiang, 2005), alignment between virtual enterprise and IT (Cao and Dowlatshahi, 2005) etc. However there is a lack of research concerning alignment of the business environment scanning strategy and IT strategy, especially the influence of the alignment on business performance. Therefore, the presented findings in this area are an attempt to fill this gap.

LITERATURE REVIEW

In this study, the main topics under review are business environment scanning strategy, IT strategy, business performance and strategic alignment.

Business environment scanning strategy

The references are still emphasizing new concepts of scanning and acquisition of information about business environment. Depending on the extent of the environment to be monitored and analysed, the following methods can be used: competitor intelligence (Porter, 1996), competitive intelligence (Attaway, 1998), business intelligence (Kwieciński, 1999), environment monitoring ([Jelonek, 2002](#)), e-business environment monitoring system ([Jelonek and Nowicki, 2002](#)) or strategic information systems (Newkirk and Lederer, 2006).

Early studies of the problem of business environment scanning were only of descriptive nature and they did not focus on any assessment of changes. This trend pointed to changes in the environment but it entirely ignored the problem of how the managers are expected to cope with the new uncertain situation (Xu, 2003;382). This was connected with the perception of the environment as a place to search for resources. Changes in approach to business environment from 'environment as a resource' to 'environment as a source of threats' caused that directions of business environment scanning shifted from passive and descriptive towards active and research-based ones. Research trend exhibited different activities toward exploring business environment, with particular focus on investigations of unknown areas of business environment and, what is even more important, on analysis of the reasons for the changes that occurred (Brown and Weiner, 1985).

The concept of business environment scanning will be presented in the present paper. The necessity of formulation of the strategies for business environment scanning and identification of factors which are essential for formulation of the strategies will also be legitimized.

Obviously, the initiatives at the strategic level and initiatives at the operational level are very difficult to be unequivocally distinguished. It is also pointless to separate them if business environment scanning in practice is supposed to produce the expected results. However, this division can be employed for research and development purposes. Therefore, this assumption was adopted for the investigations presented in the present study.

It was assumed for the purposes of further investigations that (Jelonek, 2009;25) business environment scanning is a quintessence of observers' searching for information in consideration of information needs among the managers at all levels of management. Its activities are aimed at development of the knowledge about business environment, sharing knowledge and promotion of the idea of enterprise's learning. It is difficult, yet essential, to balance the proportions between the scope of control by managers and the freedom of creativity for observers. Environment scanning is coordinated centrally, however, it is also an activity of scattered nature, where a number of groups and individual observers are involved in acquisition, collecting, processing and making information and knowledge accessible. Strategy of business environment scanning contains the guidelines for development of activities in terms of scanning for a longer period of time.

Information technology strategy

The third key expression included in the title of the present paper is the IT strategy in the enterprise. A number of publications emphasize the role of IT in the enterprise (Dewett and Jones, 2001), business management (Turban at al. 1999), support for all areas of enterprise's business activity, and scanning of the environment (Jelonek, 2002).

Considerations of strategic importance of IT in enterprises can be made from two standpoints: first of them is a strategic approach and planning, the other is a strategic application of IT. Strategic approach and planning of the role of IT in enterprises should make managers realize the importance of information to management of enterprises, with particular focus on information about changes that occur in business environment. Strategic application of IT means implementation of solutions which directly impact on getting a competitive edge in the market by the enterprise. This is possible through application of new technologies and those solutions which will facilitate functioning of the selected areas of enterprise's activities so that the enterprise strengthens its market positions and improves its performance.

An IT strategy that considers technology a mere support tool for delivery of business processes is no longer sustainable. IT strategy and architecture must reinforce IT as a key enabler for business growth—closely aligning with your business strategy. Analogically to the environment scanning variable, the factors connected with operational level of IT were not considered for the IT variable.

Initiatives connected with implementation and utilization of IT are implemented within longer time and should result directly from the developed IT strategy for the given enterprise. Great benefits from application of this approach include widespread knowledge of the plans of further development of IT, definition of the list of priority projects and the order of implementation of each solution, demonstrating usefulness of the proposed solutions e.g. in the area of knowledge management which is increasingly more important to managers. Formulation of IT strategies is a perfect opportunity to talk for managers from different divisions and levels with IT division managers and share information about the course of business processes or new information needs. Cooperation of managers from different divisions with employees from IT departments and consultation of the plans of IT infrastructure development are also of great importance.

One of the goals of IT strategies should be to properly select employees with specific skills (competence) and ensuring that employees have opportunities to improve their skills e.g. through participation in trainings.

To sum up, IT strategy defines vision, mission and objectives of the implemented solutions of information technologies in relation to the strategic goals of an enterprise, method of implementation and it identifies the resources and IT services necessary to create the value for the enterprise. In particular, IT strategy should concern:

1. technological infrastructure (equipment, web solutions, operating systems, databases, mobile technologies etc.),
2. information technology systems used during execution of business, information and decision processes,
3. development of knowledge and competence among employees in IT departments,
4. protection of integrity and safety of information resources,
5. propagation of utilization of new technologies (e.g. Internet and mobile technologies),
6. striving for integration.

Peppard and Ward (2007) identified the list of principles realizing benefits from IT. They emphasized among other things, that IT has no inherent value. Just having technology does not confer any benefits or create value; benefits arise when IT enables people do things differently; only business managers and users can release business benefits. In this context, it is of great importance to adapt IT strategies to business strategies and, in the case of the author's interests, IT strategy to the business environment scanning strategies, especially that there is some evidence that alignment IT-business has beneficial effects. Henderson and Venkatraman (1993), reported that the IT-business (IS-business) alignment is critical for enhanced performance in many types of organizations.

Business performance

The result of the operation of businesses is a complex and multi-aspect concept. Management research has defined business performance from a variety of perspectives (Venkatraman and Ramanujam, 1986). Thus, during assessment of the performance, a variety of factors should be taken into consideration while the answers to the question of how well the company realizes its market and financial goals should be replied.

During determination of market performance a dynamics of sales in each company in comparison to the value of this index for the whole branch will be used. Market position of a company can be concluded from the estimated shares of the company in the market. The market performance overview can be extended with the assessment of return on sales in relation to other companies of the same branch.

Financial results are typically assessed on the basis of the level of profits reached by a particular company throughout the year and indexes of cash flow in relation to their competitors.

Strategic Alignment

In the subject literature, considerations of alignment, fit or integration are made with different approach: conceptual definitions (Luftman, 2000), operational definitions (Luftman, 2000) model structure of strategic alignment (Henderson and Venkatraman 1993; Maes 1999), or models for measurement of maturity of strategic alignment (Luftman, 2000; Sledgianowski and Luftman, 2001). Conceptual definitions was presented by Luftman (2000) defines business-IT alignment as applying IT in an appropriate and timely way in harmony with business strategies, goals and needs. The same study contains also an operational approach. According to Luftman (2000), the operational definition of IS-Business alignment is the actual implementation of the following processes:

- set the goals and establish a team,
- understand the business-IT linkage,
- analyze and prioritize gaps,
- specify the actions (project management),
- choose and evaluate success criteria,
- sustain alignment.

The following definition of strategic alignment was employed for further considerations (Jelonek, 2009;107): Strategic alignment of business environment scanning and IT is a process, i.e. a coherent set of sequentially performed combined and interacting activities or actions, whose goal is to achieve the expected results in the form of support from information technology for implementation of business environment scanning (IT-BES adjustment) and the situation where appearance of innovative opportunities to utilize IT causes modification of the adopted strategies (BES-IT). The goal of the undertaken actions is to achieve the results which positively impact on the results achieved by the enterprise. The alignment is a dynamic and continuous process.

The business and IT performance implications of alignment have been demonstrated not only theoretically but empirically and presented case studies (Kearns and Lederer, 2003; Chan et al., 1997). The findings support the hypothesis that the companies which successfully align their IT strategies with their business strategies are achieving, year by year, even better market position compared to those which seek the success only in business strategies or believe that cutting-edge IT will equip them with competitive edge in the market. Furthermore, alignment leads to a more focused and strategic use of IT which, in turn, leads to increased performance (Chan et al., 2006).

In the context of these examples, the problem of whether alignment between business environment scanning strategy and IT strategy has positive impact on the business performance in large enterprises seems to be even more interesting. The attempts to solve this problem were made within the present paper based on the author's own results from the investigations.

METHODOLOGY

Research model

The model of strategic alignment of the strategy of business environment scanning and IT strategy in the enterprise used for verification of hypotheses H1, H2, H3, H4 will be presented.

H1: Business environment scanning strategy positively influences business performance.

H2: IT strategy positively influences business performance.

H3: Alignment between business environment scanning strategy and IT strategy positively influences business performance.

A corollary for H3 could be stated in terms of a new hypothesis as follows:

H4: Alignment between business environment scanning strategy and IT strategy influences business performance of the enterprise more significantly than does either the business environment scanning strategy or IT strategy individually.

Because the variable „alignment” is hidden, confirmatory factor analysis will be used in order to assess its impact on market performance of the enterprise.

Fig. 1. A conceptual model

Variables

In this model, strategic alignment is an emergent construct, resulting from the covariation of the two constructs: business environment scanning strategy (BESS) and IT strategy (ITS). As a latent variable considered as a second order factor resulting from a confirmatory factor analysis and any item is needed to measure this construct.

Business environment scanning strategy (BESS), IT strategy (ITS) and business performance (BP) are considered as first order factors measured with reflective constructs (observed variables: the items of the questionnaire).

For the purpose of the study, the construct of BESS was created in a multidimensional perspective and eight criteria were chosen for measurement. BESS structure is the author's own proposal, however, the studies by

(Choo 2001), (Kourteli 2000), (Beal 2000) were used to support development of this concept. Furthermore, to model BESS variable, the author used studies by Correia and Wilson (2001) who identified and analyzed the factors internal to the organization, which affect the activity of environmental scanning. These factors include individual factors and organizational factors such as information climate. BESS structure includes involvement of managers in initiation of scanning processes and their commitment to create information climate in the enterprise.

Eight criteria were selected to measure IT strategy (ITS) in this model. The IT strategy is focused on outlining the vision of how the organization's demand for information and systems will be supported by technology, where essentially, it is concerned with IT supply (Luftman, 2000; Luftman and Brier, 1999). The construct ITS was created based on literature models and author's own research. The basic IT strategy components were outlined by (Henderson and Venkatraman, 1993; Luftman 2000):

1. Scope technology: The important information applications and technologies.
2. System competency: The capabilities (e.g. access to information that is important to creation/achievement of business strategies) which distinguish IT services.
3. IT governance: How the authority for resources, risk, conflict resolution, and responsibility for IT is shared among business partners, IT management, and service providers. Project selection and prioritization issues are included here.

Five criteria to measure business performance (BP) adopted from (Seggie et al. 2006) and (Venkatraman and Ramanujam, 1986) were used in this model. The items of the survey instrument are presented in the table 1.

Table 1.
The items of the survey instrument

Construct: BESS	
Item [BESS_1]	Level of use of the information acquired about business environment for formulation of enterprise's strategy,
Item [BESS_2]	Scope of macroenvironment scanning,
Item [BESS_3]	Continuity of scanning,
Item [BESS_4]	Managers' commitment to initiate the processes of business environment scanning,
Item [BESS_5]	Managers' commitment to create information climate in the enterprise
Item [BESS_6]	Openness of managers to define their information needs.
Item [BESS_7]	Clearly defined rules for collection of data and information
Item [BESS_8]	Transparent rules for distribution of data and information within business environment
Construct: ITS	
Item [ITS_1]	Strategic planning of development of IT
Item [ITS_2]	Priority of IT projects
Item [ITS_3]	Strategic importance of IT
Item [ITS_4]	Planning of trainings for employees in IT divisions
Item [ITS_5]	Participation of IT division in selection of IT solutions for other divisions
Item [ITS_6]	High competence of employees in IT division.
Item [ITS_7]	Knowledge of business processes among IT managers,
Item [ITS_8]	Knowledge of information needs among managers in other departments,
Construct: business performance	
Item [BP_1]	Dynamics of sales as compared to the index throughout the branch
Item [BP_2]	Rise in market share
Item [BP_3]	Return on sales
Item [BP_4]	Rise in profits
Item [BP_5]	Cash flow

Data collection

The presented results are a part of the investigations conducted among 180 companies from manufacturing, trade and transport service sectors, carried out by the author at the turn of the year 2008/2009. The entire

questionnaire contained 52 questions. The survey was conducted by an entity which provides professional market survey services using Computer Assisted Telephone Interviewing (CATI) technique. A test group was selected randomly with consideration of the following criteria: an average-sized and large-sized companies; and manufacturing or trade or transport service sector industry. The respondents included senior managers and supervisors from the divisions closely related to the market, i.e. marketing, sales etc.

A 5-point Likert-type scale was selected (strongly disagree to strongly agree) for the business environment scanning strategy, IT strategy and business performance. This scale consists of items measuring BESS (8 items), ITS (8 items), and BP (5 items).

DATA ANALYSIS AND RESULTS

In consideration of the goal of the present study, hypotheses H1 to H4 will be subjected to verification only in the group of large enterprises (96 of them participated in the study). 21 questions were selected from the whole group. They concerned business environment scanning strategy, IT strategy and business performance. The following table presents the respondent's profile.

Table 2
Respondents' profile (N=96)

Characteristics	Frequency	Percentage
Sector industry		
Manufacturing	52	54,2
Trade	24	25,0
Transport Services	20	20,8
Type of ownership:		
Public	20	20,1
Private	76	79,9
Source of company's capital:		
100% Polish capital	70	72,9
Majority of Polish capital	10	10,4
100% foreign capital	9	9,4
Majority of foreign capital	7	7,3
Sales (in million PLN)		
0 - 40	41	42,7
> 40	55	57,3

Data examination

The research covered 96 respondents. Each of them answered 21 questions contained in the questionnaire that theoretically represented three constructs of variables. To confirm that each construct (BESS, ITS, BP) was measured accurately by the proposed items, the Exploratory Factor Analysis (EFA) method was initially used (to confirm the fit of the construct), and then the single-dimensionality of constructs was confirmed by means of Confirmatory Factor Analysis (CFA).

Standardized path coefficients reported on causal paths, associated t-value in parentheses;
individual items and corresponding factor loadings not included for simplicity
Significant at the p<0,05 level

Fig. 2 Results for research model

The Kaiser-Meyer-Olkin measure (KMO) is well (0,615) and value of Bartlett's Test of Sphericity is significant (Chi-square = 678,510; Ddl=210; p=0,05), therefore the data set of this research is adequate for factor analysis. Eigenvalue for all items was well: BESS (4,451), ITS (2,329), BP (2,021). Reliability of all the constructs was tested Cronbach-Alpha method. Cronbach-Alfa for all items was well: BESS (0,791), ITS (0,851), BP (0,770).

Table 3 presents the indices obtained for this model and illustrates how they compare to the recommended indices and to the saturated model (where all the latent variables are interrelated).

Table 3.
Goodness-of-fit measures

Goodness-of-fit measures	Observed value	Recommended
Chi-square	678,510	None
Ddl	210	None
Chi-square adjusted	3,231	<5 (Sagan, 2003)
GFI	0,882	>0,9 (Kefi and Kalika, 2005)
AGFI	0,869	>0,9 (Kefi and Kalika, 2005)
Root Mean Square Error of Approximation (RMSEA)	0,082	<0,08 (Kefi and Kalika, 2005)
RMSEA lower limit of 90% of confidence corridor	0,0724	
RMSEA upper limit of 90% of confidence corridor	0,0892	

The overall fit indices are good. Therefore, the research model presented in figure 1 is plausible in the population. The alignment variable is significantly correlated with both of the two independent variables of the model: business environment scanning strategy and IT strategy.

The path from alignment to business performance is 0,31 (t=3,70). This means that higher levels of alignment lead to higher levels of business performance. The path from BESS to BP is 0,12 (t=1,67), and the path from ITS to BP is 0,28 (t=2,70). All t-values were significant at 0.05 level. This indicated that all hypotheses were verified at the construct level.

DISCUSION AND IMPLICATIONS

The strategy of business environment scanning is one of a number of partial strategies, which should be developed in enterprises in consideration of the company's objectives defined by its business strategy. Review of available reference and author's own experience gained for many years of cooperation with enterprises (implementation of projects of Computer aided business environment scanning (Jelonek, 2002) and Strategic alignment between environment monitoring and information technology in a company. A methodological and empirical study (Jelonek, 2009)) allow for concluding that managers do not pay too much attention to the strategy of business environment scanning and typically limit the organization of scanning activities to operational level. On the other hand, lack of formal (in a paper form) formulation of strategy objectives does not mean that managers neglect this problem. Survey showed that a considerable number of respondents recognised the strategic importance of business environment monitoring and evaluated company's activity in this area at a very high level.

The list of the factors which can have impact on strategy of scanning of business environment can be very long. The specific nature of each business, the adopted strategy, environment disturbances, financial resources and any personal factors connected with managers and employees (knowledge, experience, vision) might either support monitoring of environment or cause that such actions do not have any effect.

The factors presented in the paper do not exhaust this long list. However, as confirmed by the results of the study, they should be included in the process of BESS-IT alignment.

Importance of IT strategies is exposed in a number of publications; these results also confirmed that each of the distinguished factors considerably affects IT strategies and must be taken into consideration in the process of alignment and it can be expected that the alignment process will positively impact on the company's performance. It is worth emphasizing that IT itself does not generate any value added for the

company. This value appears as the result of proper management of IT consistent with IT strategies and this value is created during the process of alignment.

While discussing the presented results, it is worth mentioning several general conclusions which can be formulated using the value of arithmetic mean for each question. The survey showed that the managers are willing to make use of the acquired information about the environment and show their commitment to initiation of the process of environment scanning. The attempts to extend observation over the selected segments of macroenvironment and care for continuity of observation were assessed relatively low. The lowest average score was assigned to managers' attitudes, particularly to their involvement in creation of information climate which would be conducive to information openness and knowledge share.

Analysis of arithmetic mean for ITS variables, one can assume that the companies plan development of IT in longer time, which can be deemed to be a strategic planning. The plans are usually not formalized; therefore, the level of this planning was not assessed too high. Competence of IT division employees was assessed relatively high, but opportunities of IT staff development and participation in training were assessed much lower. In the studied enterprises (large companies), which employ several IT specialists, assessment of participation of IT division in selection of IT solutions for other divisions was quite high (contrary to the results for medium enterprises (Jelonek, 2009). IT projects, from perspective of the average studied enterprise, do not have high priority.

In the context of selection of research sample in verification of the presented model (large companies) and positive verification of all the hypotheses H1 and H4, the results from similar investigations concerning e.g. manufacturing companies should be also emphasized. In the model of strategic alignment (using all 52 variables) in manufacturing companies (99 entities), a positive effect of strategic alignment on company performance was confirmed (hypothesis H3). However, impact of IT on company performance was even higher, thus hypothesis H4 was not confirmed (Jelonek, 2009).

CONCLUSIONS

As can be concluded from the findings of the present study, the process of strategic alignment of BESS and ITS is not a simple task. It requires company to be aware of many factors that can affect strategic alignment. It is hoped that the results of this research will provide companies with a better understanding of how they can align their business environment scanning strategy to their IT strategy, and provide the basis for further research into this important area of business.

Business environment scanning should be managed similarly to the activities of strategic importance, where investments are of long-term nature, but profits on these investments can be spectacular. Not only do these initiatives require expenditures but also commitment, competence and talent among the managers; the time must also be spared to develop the concepts, establish principles and procedures.

The study confirmed that BESS positively impacts on company performance (H1) and ITS positively impacts on company performance (H2). However, best results can be achieved if BES and IT strategies will be aligned (H3 and H4).

As mentioned before, separation of alignment of BES and IT into strategic and operational level is a theoretical operation, but the obtained results of the investigations can be used for solving the following research problems in the future:

Does alignment of BES and IT at operational level positively affect the performance reached by large enterprises?

Does alignment of BES and IT at the strategic level or at the operational level have greater impact on the performance reached by large companies?

Verification of full model (52 variables) of alignment of BES and IT in large companies.

How does impact of BES on business performance change in each of the abovementioned models?

How does impact of IT on business performance and on alignment change in each of the abovementioned models?

Is it possible to ensure synergy effect in each of the analysed models through alignment (hypothesis H4)?

Solving all these research problems can be a good base and starting point for creation of a set of good practices for achievement of strategic alignment of BESS and ITS in order for the enterprise to reach possibly highest results. There is an open problem for the future concerning the assessment, measurement methods and the methods to improve strategic alignment.

ABSTRACT

The purpose of this paper is to produce evidence about the correlation between (1) environmental scanning and firm performance and (2) planning flexibility and firm performance while examining the moderating effect of market dynamism on both environmental scanning and planning flexibility in small and medium sized enterprises (hereafter SMEs). Four hypothesized relationships are assessed with a sample size of 600 randomly chosen firms among 1200 manufacturing organizations carrying on business in Kocaeli by utilizing face-to-face questionnaire survey technique. 400 executives agreed to participate.

The outcomes of the statistical analyses of this research have exposed considerable conclusions on the effects of environmental scanning and planning flexibility over firm performance. The reliability analyses of the scales used in the research have suggested significant results. Research findings through the completion of regression analyses which have been conducted in order to test the hypotheses; are found to be concurring with literature. In addition to the statistical results, the findings have been conceptually discussed and concluded. Finally implications have been presented for future studies.

KEYWORDS: SMEs, environmental scanning, firm performance, planning flexibility, strategic planning, market dynamism.

INTRODUCTION

Adaptability and responsiveness to the dynamism and turbulence present in the rapidly changing marketplace are among the principal competitive superiorities of the firms competing for excellent positions. Managers and scholars look for better mechanisms as well as models that may contribute to this competitive position of the organizations by indoctrinating adaptive characteristics to their structures, techniques, strategies, plans, and implementations. Information collection to learn and flexibility to adapt are two of considerable core competencies that are proposed as their sources of sustainable competitive advantage by the recent literature on strategic management. Previous studies (e.g. Baker and Sinkula, (1999); Naman and Slevin, (1993); Barringer and Bluedorn, (1999); Slater and Narver, (1998)) indicate that the organizational performance is directly related to the combination of all relevant factors such as culture, climate, procedures etc. in order to adapt to rapidly changing market dynamics. The very nature of the change itself is thus based on the survival of not the strongest nor the largest but the most adaptive, which means change favors the smaller and also more knowledgeable and flexible.

According to Jansen van Vuuren (2002) careful monitoring of a firm's internal and external environments for detecting early signs of opportunities and threats may influence its current and future plans. In comparison, 'surveillance' is confined to a specific objective or a narrow sector. It helps to understand the organization's internal needs and assets and the external environment in which they are operating. Today the business environment is at the phase which it has become most complicated, most difficult to understand or analyze and most intricate due to internal and external –ever changing- influencers. In an environment of complexity in which gathering, analyzing, and disseminating information for strategic purposes has emerged

as a vital necessity for survival, the comprehensive scanning became one of the most important elements of organizational success. Authors, researchers such as Duncan (1972), Mintzberg (1973), Hambrick (1979, 1981, 1982), Bradley (1995) and many more have emphasized the importance of environmental scanning on the business performance of the organizations. Notable researches and studies therefore proved that the level of environmental scanning in organizations is positively related to their organizational performance.

Recent studies, however, investigating this well established scanning-performance relationship specifically in SMEs is surprisingly rare. Since SMEs are established and survive thanks to their ability to learn from and adapt to the external environment, scanning is very vital for their sustainable competitive advantage. There are various implications of environmental scanning. Therefore in this study, the level of performance of the SMEs that is directly contingent to their environmental scanning efforts will be tested. Our second emphasis in this study is on the claim that the level of planning flexibility in SMEs may have also a direct positive effect on the overall performance. To handle the burdens of a highly dynamic market the organizations must be responsive and adaptive to the ever changing market needs which puts forth the question of flexibility for consideration. The logic behind this is that the level of flexibility enabling the organizations modifying themselves will be a defining factor in the organizational success, as the complexity of the environment requires responsive change in the organizational structure or strategy.

Together with the direct effects of environmental scanning and planning flexibility on overall performance, the dynamism of the market can intervene in these relations, since the necessity of learning from and adaptation to the external environment and their performance impacts can be augmented in a turbulent market. According to Dess and Beard (1984) the market dynamism describes the rate and the unpredictability of change in a firm's external environment. Dynamism can also be described as the frequent changes in the industry, including changes of market elements such as customer demand, technology, competitor structure, etc. (Achrol and Stern, 1988; Jap, 1999), and is particularly important because of its influence on relationships between a variety of firm-level constructs and firm performance. Therefore it is inevitable to fully understand the factors that compose the market dynamics and their effects on organizational dynamics. Accordingly, in this study, we investigate moderating role of market dynamism on the performance impacts of environmental scanning and planning flexibility in SMEs.

The second section preceding the introduction section is on the background of the literature covering our research hypotheses. The third section of this paper is about the research methodology including data collection, measurement of constructs, measure validation and analysis. The final section provides the readers a summary of the findings and managerial and further research implications.

BACKGROUND AND RESEARCH HYPOTHESES

Environmental Scanning and Firm Performance

Environmental scanning emerged in 60s, when company executives began to speak about it openly and it became part of strategic planning (Russel and Prince, 1992). But it was only in the 1980s that its obvious impact on companies started to be proven, especially to the ones that are newly established and recently developing which needed more effective use of external information.

The environment was defined by Duncan (1972) as the relevant physical and social factors outside the boundary of an organization that are taken into consideration during organizational decision making. The environment, perhaps more than any other factor, affects organizational structure, internal processes and managerial decision making (Duncan, 1972; Pfeffer and Salancik, 1978; Galbraith, 1973).

Moreover, Miller's study (1988) on the relationship between strategy and the scanning activities by investigating the relationship between an information-processing dimension and Porter's (1980) generic business strategies aimed to understand the correlation between the environmental scanning and firm's performance. Miller investigated the amount of environmental scanning activities rather than the type of scanning activities. On their study, Hrebiniak and Joyce (1985) argued that (a) organizations employing either a defender or low cost would use environmental scanning activities that seek immediate solutions for lowering costs or improving profits, and (b) organizations using either a prospector or differentiation strategy

would employ environmental scanning activities in a non-directed manner, looking for opportunities rather than searching for immediate solutions to cost or efficiency problems.

Believing that environmental scanning eliminates uncertainty can cause executives to misunderstand the perception of security. It can lead them to neglect external signals. Scanning can help managers deal with uncertainty, if only they recognize that uncertainty can be minimized, not totally eliminated (Hambrick, 1981; Barringer and Bluedorn, 1999).

The idea that scanning contributes to firm performance base on empirical results of Boyd and Fulk (1996); Daft, Sormunen and Parks (1988). Bourgeois (1985) found that a firm which scans its environment with greater perceptual accuracy can achieve a higher economic performance compared to an average level competitor. Research by West and Olsen (1988) also shows that there is a high correlation between firm scanning behavior and performance in the industry.

Formal environmental scanning systems are an established business activity in some large corporations, which have the resources to conduct thorough, systematic environmental scanning and recognize the risks of not consistently monitoring their external environment. Smaller firms may not have the resources and the will to make a long-term commitment to have formal environmental scanning systems. Firms that do not have a market orientation do not have an external orientation and may not value external information. Firms emphasize centralized decision making, individualistic goals, and rigid chain of commands, and are often less than receptive to ideas from outside of the firm (Lauzen, 1995). Moreover Stoffels (1994) reminds us that environmental scanning has additional barriers that lessen its effectiveness: analysis performed on data may lack credibility, the cost/benefit ratio of environmental scanning is indeterminate, and the firm may have a bias toward immediate results. In total, this discussion leads to the following hypothesis:

H1: The level of environmental scanning in SMEs will be positively related to their firm performance.

Planning Flexibility and Firm Performance

Flexibility, as reflected in the literature, subsumes several aspects and dimensions (Sethi and Sethi, 1990; Volberda, 1998). Planning flexibility refers to the capacity of a firm's strategic plan to change as environmental opportunities/threats emerge. The notion of planning flexibility was first suggested to investigate how environmental and firm characteristics affect the design of strategic planning systems. In complex environmental settings firms maximize performance by adopting 'flexible' planning systems (Kukalis, 1989; Barringer and Bluedorn, 1999). Flexible planning systems allow firms to revise their strategic plans quickly to pursue opportunities and keep up with environmental change (Stevenson and Jarrillo-Mossi, 1986). Kukalis (1989) theorized that firms in highly complex environments need flexible planning systems because of the frequency of change in their business environments. Recently, flexibility has also been related to the capacity to change and develop products, and to such strategic issues as entering new markets or new industries (Harrigan, 1985; Ghemawat; 1991; Volberda, 1998; Fahy and Smithee, 1999).

Much of the theoretical discussion regarding the notion of flexibility is divided into four main types; operational flexibility (Tang and Tikoo, 1999), financial flexibility (Mensah and Werner, 2003), structural flexibility (Harris and Ruefli, 2000) and technological flexibility (Adler, 1988; Harris, 2002). However, an assessment of their respective impact on performance in a strategic planning context is absent from the literature.

Dreyer and Grønhaug's studies (2004) showed that it is difficult to give a high priority to financial flexibility without a careful investment policy, which implies giving lower priority to developing other necessary forms of flexibility, such as volume and product flexibility. Its competitive position, however, the firm must exploit opportunities and neutralize threats in its competitive environment and it is possible to achieve sustained competitive advantage in highly uncertain environments. The study of Alpan et al. (2007) demonstrates that planning flexibility exerts a negative effect on firm performance while market dynamism is higher.

Organizations, through strategic planning, anticipate environmental turbulence and allocate resources accordingly. By being flexible, alternative decision options are generated and considered, which may be deployed as and when particular opportunities or threats arise within the environment. As this process occurs prior to the impact of turbulence, flexibility in the organization is anticipatory and preparatory in nature

(Evans, 1991). In addition to that the studies of Rudd et. al (2008) supports the idea that flexibility mediates the relationship between strategic planning and performance. Both operational and financial flexibility mediate the influence of strategic planning on financial performance, while structural and technological flexibility mediate its influence on nonfinancial performance. In planning decisions under uncertainty, future plan feasibility/flexibility and economic risk are two important factors that have to be monitored and balanced against expected profit (Ierapetritou and Pistikopoulos, 1993).

From the earliest studies followed by Eppink (1978) to the most contemporary ones such as Wang and Cao's studies (2008), supports the main theory that making an organization less vulnerable to external change is easier by increasing external flexibility that will result as a boost up to the firms' performance. The empirical study done by Andersen (2000) provides evidence that strategic planning (that emphasizes elements of the conventional strategic management process) for flexibility is associated with higher performance in all the industrial environments studied. The performance effect of strategic planning does not vary significantly between the different industry groups. Hence, strategic planning for flexibility is an important performance driver in all industrial settings, and enhances both economic performance and organizational innovation. Strategic planning processes are essential to good performance in all industrial environments and should not be ignored (Andersen, 2000).

Therefore we propose the following hypothesis:

H2: The level of planning flexibility in SMEs will be positively related to their overall performance.

The Moderating Role of Market Dynamism in Environmental Scanning-Performance Relationship

As the ancestor of the planning approach in strategy, Ansoff (1979), suggests that the nature of the environmental change was altering and giving rise to strategic surprise. The basic effect of uncertainty is that it limits the ability of the organization to pre-plan or make decisions about activities in advance of their execution. The more uncertain the situation, the more an organization will need flexibility as a complement to planning which in these situations the use of planning strategies would be increasingly supplemented and sometimes replaced by preparedness or flexible strategies. Weitz and Anderson (1981) state that the key factor in determining the method for organizing and controlling the marketing function is the environment in which the marketing function is to be performed. Empirical research in marketing has been geared toward understanding the relationship between environmental turbulence and strategic market planning (Silverblatt and Korgaonkar, 1987) which lead the way of studies to show the interaction between market dynamism and environmental scanning.

The dynamism describes the rate and the unpredictability of change in a firm's external environment (Dess and Beard, 1984), and is particularly important because of its influence on relationships between a variety of firm-level constructs and firm performance. Firms facing turbulent business environments are more likely to manage such environments by developing long-term and complete plans. Decentralization of strategic market-planning activities are more common among companies facing turbulent environments than those facing stable environments (Silverblatt and Korgaonkar, 1987). Moreover, organization structures that are shaped according to adapt to a turbulent environment have better credibility and increasing performance (John and Martin, 1984).

The increasing complexity in the business environment has reached to the maximum level that ever has. This complexity derives in part from exponential increases in organizational information processing capabilities, an increasingly dynamic and global business environment, and increasing amounts of information about both the content and structure of this environment (Satish, 1997). Growing environmental complexity offers organizations both problems and opportunities (Neill et al., 2007). According to Boisot and Child (1999) organizations can either reduce or absorb this complexity. They can reduce complexity focus internally and attempt to buffer their internal systems from the distractions of environmental change. They consider multiple competing interpretations when formulating response to these complexities (Gell-Mann, 1994). As Weick (1995) interprets the success and adaptation to the changing environment surrounding the organizations is achieved by developing more varied images of the environment, with "engaging in sense-making that is more adaptive"

In the highly changeable and uncertain market in which they operate, it is important for new venture managers to invest in formal processes to acquire and use market information, regardless of whether the market is emerging or established (Song, Wang and Parry, 2009). The study of Quintas, Lefrere and Jones (1997) suggests that the management of knowledge, and its correlate intellectual capital, can be a key source of organizational advantage. Knowledge management in an organizational context does not mean managing everything that is known (assuming it could be gathered together in some way). It is concerned with creating and mobilizing certain knowledge (some of which an organization may not even know it has) for certain purposes (such as competitive advantage or greater efficiency). This debate supports the following hypothesis:

H3: The performance impact of environmental scanning in SMEs is moderated by market dynamism.

The Moderating Role of Market Dynamism in Planning Flexibility-Performance Relationship

Market dynamism refers to frequent changes in the industry, including changes of market elements such as customer demand, technology, competitor structure, etc. (Achrol and Stern, 1988; Jap, 1999). Frequent change in an industry decreases strategic certainty and increases the difficulty of accurate planning, forecasting and cost reductions (Sheth and Parvatiyar, 1992). In highly dynamic markets, frequent changes in customer demand, business practices, etc., require firms to quickly modify their products or services to remain competitive in the market (Jap, 1999).

A longstanding question in strategy and organization theory is how the amount of organizational structure shapes performance in dynamic environments. Given its fundamental importance, this question has been explored in a variety of research traditions, ranging from organizational studies (Burns and Stalker, 1961; Hargadon and Sutton, 1997) and competitive strategy (Rindova and Kotha, 2001; Rothaermel, Hitt, and Jobe, 2006) to network sociology (Uzzi, 1997; Owen-Smith and Powell, 2003) and, more broadly, the complexity sciences (Kauffman, 1993; Anderson, 1999).

According to Lau (1996), flexibility has become the most important factor in achieving competitive advantage. In order to remain competitive, however, flexibility in dealing with rapid change must not result in a loss of productivity and quality (Ahmed et al., 1996; Volberda, 1998).

One of the main problems facing managers with regard to flexibility is how to balance change and continuity (Dreyer and Grønhaug, 2004) i.e. face the consequences of market dynamism. Many issues have attracted more attention in strategy research than the relationship between the mode of strategic planning adopted by the firm and the economic performance of the firm. Decades of planning/performance research have yielded inconsistent findings (Brews and Hunt, 1999). One methodological explanation for the inconsistencies and perhaps the most serious indictment of early planning/performance research stems from the poor conceptualizations and measurement protocols utilized to operationalize the planning construct (Boyd, 1991). Following the inconsistent and often counterintuitive findings emerging from the first two waves of planning/performance research (Pearce et al, 1987) more sophisticated Guttman scaling techniques (Guttman, 1944) were employed to measure the planning construct of planning/performance research (Pearce et al., 1987).

The impact of environment on the type of planning employed by firms is seen as the second reason of the inconsistencies between firms' planning and market dynamism. Some studies (Eisenhardt, 1989; Goll and Rasheed, 1997; Hart and Banbury, 1994; Miller and Cardinal, 1994; Miller and Friesen, 1983; Priem, Rasheed and Kotulic, 1995) found that formal strategy making processes or planning are positively associated with firm performance in unstable, turbulent or dynamic environments. Other studies emphasize formal strategic planning is best suited to stable environments (Fredrickson, 1984; Fredrickson and Mitchell, 1984; Fredrickson and laquinto, 1989; Mintzberg, 1973) but recommend incrementalism for unstable, complex, dynamic environments facing high uncertainty, discontinuity and/or rapid change. Schwenk and Shrader (1993) found that formal strategic planning has a positive impact on firm performance. More recently, Coviello et al. (2000) reported that managers in small firms believed their firms would benefit from the use of formal planning processes. However, they did not examine the relationship between formal marketing processes and performance.

Following industrial developments, emphasis in academic research has turned to the use of manufacturing flexibility as a response to dynamic environments. Miles and Snow (1978) argued that a proactive approach is required of firms that operate in dynamic environments. Bourgeois (1985) argued against Thompson's (1967) view that "buffering the technical core" enables firms to deal with environmental dynamism. Bourgeois (1985) empirically demonstrated the pitfalls of such an approach by showing that reducing the need for flexibility by using long-term contracts and buffers would only be beneficial in stable environments.

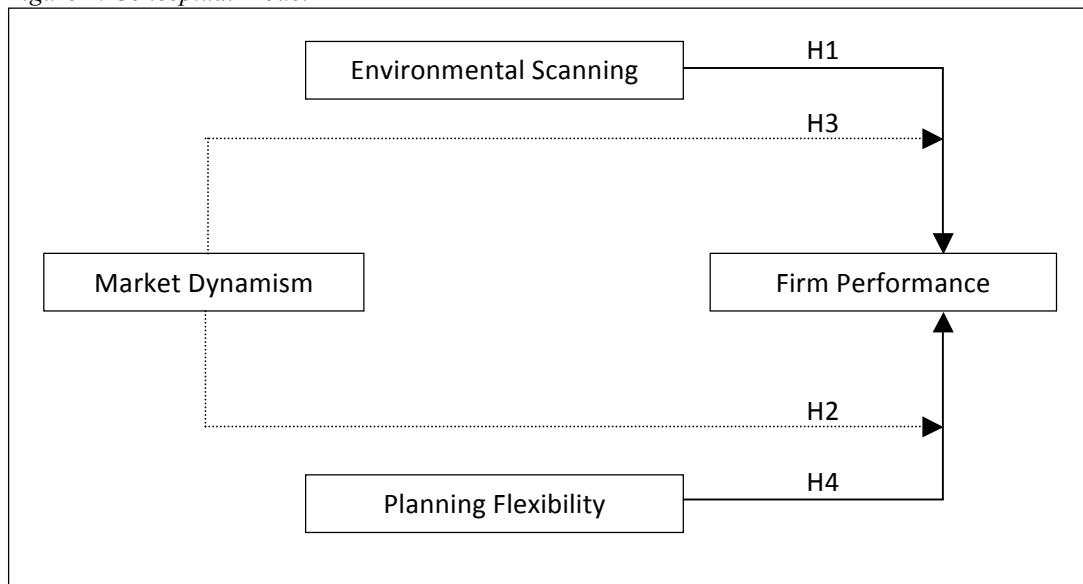

The literature describes a number of well-developed dimensions of planning strategies that describe different possible modes of variation (D'Aveni, 1994). Furthermore operations scholars have classified the ways in which production can be flexible (Gerwin, 1993). However the studies of Anand and Ward (2004) show that the market dynamism plays a crucial role in determining the types of flexibility strategies that would be suitable while it is very important to recognize the importance of environmental fit when considering flexibility. Moreover, Grant and Cibin (1996) argues that development of structures and systems which retain the scale and resource advantages of large organizations, while developing the flexibility and responsiveness needed to compete effectively within the dynamic and unpredictable market environments. The researches have included velocity (Eisenhardt, 1989), complexity (Gavetti, Levinthal, and Rivkin, 2005), and ambiguity (March and Olsen, 1976; Rindova and Kotha, 2001) as major dimensions of environmental dynamism. But though these dimensions have intriguing implications for strategy and performance (see below), only unpredictability influences optimal structure (Davis, 2009). This is also backed up by the studies of Dreyer and Grønhaug (2004) as he claims that it is possible to achieve sustained competitive advantage in highly uncertain environments.

As a result we hypothesize:

H4: The performance impact of planning flexibility in SMEs is moderated by market dynamism.

Based on the above mentioned literature discussion and proposed hypotheses we develop a conceptual model of relationships – depicted on Figure 1- to be tested empirically.

Figure 1. Conceptual Model

METHOD

Data Collection

Scope, hypotheses, research model, scales used in research and sample will be explained in this section. This study has been constructed on both theoretical and practical bases. Theoretical section has been prepared via extensive literature search and reported above. Data needed for field search has been collected through

face-to-face questionnaire technique with top executives of the SMEs in the Turkish manufacturing industry. The sampling frame consists of randomly selected 600 firms among 1200 manufacturing SMEs. As a result, the effective sample size of the study is 400. Gathered data have been analyzed in SPSS (Statistical Package for Social Sciences) software.

Measurement of Constructs

The constructs in our study are developed by using measurement scales adopted from prior studies. All constructs are measured using five-point Likert scales with anchors strongly disagree (= 1) and strongly agree (= 5). 6 items for measuring environmental scanning are adopted from Barringer and Bluedorn (1999) and additional 2 measures are self-developed. The planning flexibility scale (6 items) is also adopted from Barringer and Bluedorn (1999). Similarly, 2 items are taken from Homburg et al. (1999) to measure different aspects of firm performance which are market share and earning profits in addition to 3 self-developed measures. Lastly, 3 items are self-developed and another 3 items are selected from Appiah-Adu and Singh (1998) and Pelham and Wilson (1996) in order to measure market dynamism. Self-developed items are shown with an asterisk (*) symbol in Table 1.

Measure Validation

In this section we have first calculated the factor loadings of the items grouped under different factors via Principal Component Analysis by Varimax Rotation Method. When 400 executives are surveyed they provided numerical answers to the questions according to their perceptions. All scales with numerical answers representing the opinions of the executives were initially submitted to exploratory factor analysis with Varimax Rotation. The factor analyses produced totally four factors as anticipated as shown in Tables 1 - with a total variance explanation (TVE) of 54.80 %.

Table 1. Rotated Component Matrix for the questionnaire items

Items	Components' Factor Loadings			
	Environmental Scanning	Firm Performance	Planning Flexibility	Market Dynamism
Economic trends	,780			
Technological trends	,764			
Supplier strategies	,698			
Demographic trends	,686			
Distributor strategies*	,628			
Customer needs and preferences	,606			
Threats and opportunities*	,590			
Competitor strategies	,585			
Return on sales (ROS)*		,913		
Return on assets (ROA)*		,909		
Earning profits		,874		
Market share		,708		
Total volume of sales*		,654		

The emergence of an unexpected threat			,751	
Changes in governmental regulations			,750	
The emergence of an unexpected opportunity			,745	
The emergence of a new technology			,699	
Political developments that effect your industry			,693	
Shifts in economic conditions			,557	
Complexity, divergence and incomprehensibility of competitor behaviors*				,758
Complexity, divergence and incomprehensibility of customer needs*				,739
Constant changes in competitor's strategies/actions				,720
Rate at which products/services become obsolete				,670
Different and complex product combinations*				,666
Changes in customer needs				,642
Variance explanation ratios	15,538	14,089	12,931	12,242

Total variance explained: 54,800

Extraction method: Principal Component Analysis.

Rotation method: Varimax with Kaiser normalization.

Internal consistency or scale reliability is a commonly used psychometric measure in assessing survey instruments and scales. Internal consistency is an indicator of how well the different items measure the same concept. This is important because a group of items that purports to measure one variable should indeed be clearly focused on that variable. Internal consistency is measured by calculating a statistic known as Cronbach's coefficient alpha (Zhang, 2000; Cronbach, 1951; Nunnally, 1967). Specifically, the item-score correlations are used to determine whether an item belongs to the scale as assigned, to some other scales, or should be eliminated. The scale-score is obtained by computing the arithmetic average of the scores of the items that comprise that scale. The values of item-to-scale-correlations should be greater than ,7; those lower than ,7 do not share enough variance with the rest of the items in that scale. Therefore, it is assumed that the items are not measuring the same construct and it should be deleted from the scale. All scales exhibits adequate internal consistency with Cronbach alpha coefficients greater than ,7 (Nunnally, 1967). Our scores range from 79,79% to 88,77%. Consequently, each item contributes to the derived scale index and is therefore a valid indicator of the relevant construct. Cronbach's Alpha Scores (%) are provided in the Table 2.

Regarding to the results of the above statistical tests for validity and reliability, we assumed that our factors are sufficiently valid and reliable to test our hypotheses. Accordingly we produced four constructs to be used in the further tests, namely, environmental scanning, firm performance, planning flexibility and market dynamism.

Table 2. Reliability Scores of the Study Variables

Variables	Environmental Scanning	Firm Performance	Planning Flexibility	Market Dynamism
Cronbach Alpha Scores (%)	83,88	88,77	80,59	79,79

Analysis

Pearson Analysis

Table 3. Pearson Correlations

	Environmental Scanning	Planning Flexibility	Market Dynamism
Planning Flexibility	,341(**)		
Market Dynamism	,175(**)	,032	
Firm Performance	,280(**)	,122(*)	,083

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed). Two-tailed Pearson Correlations.

Pearson correlations are computed between the variables in Table 3. The correlation matrix shows statistically significant correlation in the expected direction between environmental scanning and firm performance ($p < 0.01$). Market dynamism is correlated positively with environmental scanning on a lower level ($p < 0.01$). However, one can easily perceive that there is an unexpected but strong correlation between planning flexibility and environmental scanning ($p < 0.01$) which leads us to perform further analysis for a possible mediator effect. There is also a positive correlation between planning flexibility and firms' overall performance ($p < 0.05$) however it loses its significance because of above mentioned strong planning flexibility-environmental scanning association that will be reported later on.

Hypotheses Tests

Direct Effects (H1-H2)

Table 4. Direct Effects

	Variables	Standardized Beta Coefficients	t	Significance
	(Constant)		6,816	,000
H1 (supported)	Environmental Scanning	,263	5,060	,000
H2 (rejected)	Planning Flexibility	,031	,605	,545
	Market Dynamism	,036	,730	,466
		R ²	,074	
		F	11,560	,000

a Dependent Variable: Firm Performance

Table 4 provides an insight of the direct effects among environmental scanning, planning flexibility and market dynamism by using statistical results of the analyses we have conducted. Our first hypothesis (supported) has a high standardized beta coefficient (,263) compared to our second hypothesis (,031 and ,036). From this outcome, we can commend that environmental scanning has a highly significant impact on the firm performance. However, the effect of planning flexibility on the firm performance is dramatically low that enables us to reject the second hypothesis. Moreover, market dynamism is found to be ineffective again on firm performance.

Moderating Effects (H3-H4)

Table 5 shows that product (multiplication / interaction) of environmental scanning and market dynamism exerts a significant impact (a standardized beta coefficient of ,275) on firm performance which provides support for the third hypothesis. Conversely, the interaction of planning flexibility and market dynamism

does not demonstrate a considerable effect on firm performance. That makes us to reject the fourth hypothesis. Accordingly, we accept that when market dynamism is high, the positive relationship between environmental scanning and firm performance is increasing. But, as for the planning flexibility-performance relationships such a moderating effect of market dynamism is not confirmed.

Table 5. Moderating Effects

	Variables	Standardized Beta Coefficients	t	Significance
	(Constant)		27,563	,000
H3 (supported)	Environmental Scanning * Market Dynamism	,275	2,751	,006
H4 (rejected)	Planning Flexibility * Market Dynamism	-,092	-,919	,359
		R ²	,035	
		F	8,269	,000

a Dependent Variable: Firm Performance

Test of Non-hypothesized Relations (The Mediator Role of Environmental Scanning)

Correlation coefficients uncover the existence of one-to-one relations among each of the variables except market dynamism. The planning flexibility is correlated to environmental scanning (,341**); and firm performance (,122*); and also environmental scanning is correlated to and firm performance (,280**). Furthermore, the regression analyses indicate that the correlation between planning flexibility and firm performance disappears when regressed together with environmental scanning. Though, we have decided to investigate an overshadowing effect of environmental scanning in the relationship between planning flexibility and firm performance. In order to do so, we initially regressed all the two independent variables together with firm performance in the first model; then we regressed just planning flexibility in the second. Results approve the mediator role of the environmental scanning, since the one-to-one correlation of planning flexibility to performance disappears due to the overshadowing effect of environmental scanning. In other words the effect of planning flexibility on firm performance follows a path through environmental scanning. Table 6 and Table 7 show those findings.

Table 6. Effects of Environmental Scanning and Planning Flexibility Together

	Standardized Beta Coefficients	t	Significance
(Constant)		7,387	,000
Environmental Scanning	,270	5,271	,000
Planning Flexibility	,030	,584	,560
	R ²	,075	
	F	17,095	,000

Table 7. Effect of Planning Flexibility Alone

	Standardized Beta Coefficients	t	Significance
(Constant)		12,460	,000
Planning Flexibility	,122	2,450	,015
	R ²	,012	
	F	6,002	,015

Based on the above mentioned findings about the relations among study variables, we can develop a final model. Findings show that, the direct effect of environmental scanning on firm performance (H1) and the moderating role of market dynamism in this relationship (H3) are supported. However the direct effect of planning flexibility on firm performance (H2) and the moderating role of market dynamism in this relationship (H4) are not supported. Furthermore, the results of the mediation analyses, it is also found that environmental scanning plays a mediator role in the overshadowed correlation between planning flexibility and firm performance. Thus the resulting model emerges as depicted on Figure 2.

Figure 2. Final Model

DISCUSSION

Summary of the Findings

The main aim of this study was to show the associations between the levels of environmental scanning and planning flexibility together with the moderator role of market dynamism on firms', especially SMEs' overall performance. In order to uncover the complex path of these relationships better adapt to the market environment and perform well; a large scale survey has been conducted with 400 SME executives in Turkey.

In order to provide answers and plausible explanations for this study's research questions mentioned above, we have developed and tested four related hypotheses parallel with the previous literature. The measures which were adopted from previous international studies and applied to a Turkish sample proved to be valid and reliable according to the findings of factor analyses and Cronbach's alpha scores.

Our first hypothesis "H1: The level of environmental scanning in SMEs will be positively related to their firm performance", is accepted; this is a finding which is parallel with the previous literature. For instance, Daft et al. (1988) in their studies have already showed that organizations that scan their environment effectively can have an information advantage over those that do not, and become better aligned with the external conditions. Moreover the studies of Hambrick (1981), Choo (1999), Saxby et al. (2002) Albright (2004), and Nastanski (2004) show consistent similarities with our findings.

Our second accepted hypothesis is the assertion that "H3: The performance impact of environmental scanning in SMEs is moderated by market dynamism". Dess and Beard (1984) describe dynamism as the rate and the unpredictability of change in a firm's external environment and is particularly important because of its influence on relationships between a variety of firm-level constructs and firm performance. Accordingly, we can infer that the interaction between the dynamism of the market and the firm's ability to grasp information and intelligence pertaining to this marketplace changes and developments better than the competitors will automatically produce better competitive outcomes. In other words, efforts of environmental scanning can turn the challenges of market dynamism to precious market opportunities, for instance as in the case of discovering latent or newly emerged customer needs.

Surprisingly, our two hypotheses especially related to planning flexibility; "H2: The level of planning flexibility in SMEs will be positively related to their overall performance" and "H4: The performance impact of planning flexibility in SMEs is moderated by market dynamism" are rejected. On the one hand, our

correlation results show that planning flexibility does indeed have a significant impact on the firms' performance; a finding which is parallel with the previous studies (e.g. Rhyne, 1986; Miller and Cardinal, 1994; Brews and Hunt, 1999; Andersen, 2000; Delmar and Shane, 2003). However, on the other hand, our regression analyses indicate that the correlation between planning flexibility and firm performance disappears when regressed together with environmental scanning. In other words, this finding led us to think of an overshadowing mediator role of environmental scanning in the correlation between planning flexibility and firm performance.

Before dealing with this mediation, we need to try to provide some plausible explanations for the rejection of H4 (the moderator role of market dynamism in the planning flexibility and firm performance relation). The studies of Ansoff (1979); Lorange (1980); Grinyer et al. (1986); Chakravarthy (1987); Hax and Majluf (1990) have already showed that organizations with flexible structures and processes are awarded by the notion of environmental uncertainty -or market dynamism- by means of showing better adaptation to external conditions. However, in our case of small firms in a developing nation, the combination of challenges coming from dynamism (rapid external changes) and planning flexibility (rapid internal changes) may lead in some firms with a strong strategic intelligence, direction and leadership to better performance, but in some other firms to a chaos and failure as well. In other words, efforts of continuously revising (whether corrective or damaging) the strategic plans to the challenges provided by the rapid changes of the dynamic marketplace, do not guarantee a better performance, perhaps because of the lack of scanning of the marketplace and accumulation of necessary market knowledge leading to not only reactive but also proactive and possibly corrective actions in the firm's strategies and tactics.

As for the examination of a possible mediator role of environmental scanning in the correlation between planning flexibility and firm performance, we conducted two more regression analyses and confirm a new path of relations which were not asserted by formal hypotheses. The resulting model of the relations among study variables show us that especially in the dynamic markets, firms that try to revise and adapt their plans to this dynamism and outperform the rivals should collect in depth market intelligence to turn challenges to opportunities.

Managerial Implications

According to the results of this study, we observe that environmental scanning is crucial for the organizations' success, especially for the SMEs.

Market Dynamism: our study indicates that market dynamism plays an important role in firms' performance by providing challenges that may function as hurdles or opportunities. Such as changes in customer needs, complexity, divergence and incomprehensibility, different and complex internal and external factors play a major role in the competition.

Environmental Scanning: With this study managers can observe how micro and macro factors influence the firms' performance. By successfully grasping of new developments in the task and general environments firms may survive through and even benefit from the challenges of the rapidly changing markets. Especially customer and competitor orientations are very critical for the generation of market intelligence and new product and/or venture ideas.

Planning Flexibility: With this study, managers can understand that planning flexibility alone is not sufficient enough to increase the firms overall performance in dynamic markets. Decisions to revise the plans should be supplemented by fresh and accurate market intelligence; and accordingly new or renewed business ideas and plans can flourish.

Limitations and Further Research Implications

The above implications suggest several directions for future research. However there are limitations in our study as this study was constructed in Turkey and Turkish firms are observed in order to have a result. This brings the importance of cultural effects into the consideration. It was intentionally omitted as culture itself is another subject for a detailed study. So the results may be biased according to the Turkish business culture and ethics. Also the number of the firms which was worked is limited to 600 over 1200 SMEs, since our time and budget was limited.

Future researchers may come up with different results than ours if the origins of the companies which will be worked differ than ours. Moreover, our results provide consistency with the previous studies and is believed to help managers on their decisions, however current changes in trends may create inconsistencies with the result.

We also look forward to future studies incorporating antecedents for planning flexibility studying its relationships with environmental scanning and firm performance by using a larger number of responding firms maybe more geographically divergent sample.

CONCLUSION

This paper trying to investigate the direct effects of environmental scanning and planning flexibility on firm performance in SMEs and also the moderating effects of market dynamism on both relations, provide some interesting findings and implications. Flexibility itself is not producing better performance especially when dynamism is high, but scanning is. While the combination of dynamism and flexibility is not so much fruitful. Beyond this discussion, another point is that, if supplemented with scanning flexibility turns to be impacting on performance. Therefore, environmental scanning moderated by the market dynamism is the missing link with on the long and difficult route from planning flexibility to firm performance.

Düzce University, Turkey**

ABSTRACT

Strategy formation is a subject that discussed over 30 years in strategic management literature and yet there isn't a consensus on it. The focus point of this subject is how organizations will form the strategies that they need. The perspectives that came to literature in strategy formation are deliberateness and emergentness. The views of strategic management schools on the subject of strategy formation have shaped around these two paradoxes. The aim of this study is to evaluate the views of strategic management schools on paradoxes in strategy formation and to analyze which perspectives related with which paradox based on the secondary data. The results of the study shows that whereas the perspectives of design, planning, positioning, environment and game based schools focused on the paradox of emergentness intensely, the perspectives of learning, power, cognitive and resource based schools are related with the paradox of deliberateness. However, it is observed that the entrepreneurial and configuration schools can be based on the integrated paradox that combined from the paradox of deliberateness and emergentness.

Keywords: Strategy, Strategy Formation, Paradoxes, Strategic Management Schools.

INTRODUCTION

One of the main questions in strategic management literature is that how the process of strategy formation can be made most effective. Many conflicting opinions have been reported on the best way of forming strategies. The most confusion has been between different definitions of strategy as it is pattern of decision to some scholar while it is pattern of actions to the others. To distinguish these two definitions of strategy, Mintzberg and Waters (1985) have proposed to refer to the former as intended strategy and the latter as realized strategy. According to them realized strategies could come about from the intended strategy as deliberate strategy and/or emergent strategy despite or in the absence of intentions. Hence the emergent strategy and deliberate strategy seems to contradictory and appears to be true at the same time emergentness and deliberateness could be viewed as paradoxes of strategy formation (De Witt and Meyer 1998).

Although, the views, opinions and definitions on strategy formation came around two paradoxes as deliberateness and emergentness, there is a strong need for interrelation of these paradoxes with strategic management schools. In this study it is tried to answer the question of which strategic management school's focus points are close related with the deliberateness and emergentness or both of them? In this context, by using a holistic approach the views of design, planning, positioning, learning, power, resource-based, environment, game-based and entrepreneurial schools on the subject of strategy formation are analyzed and interrelated. This study will contribute to the strategy formation both in the related literature and practice.

The main construct of the research, is to analyze and inter-relate the perspectives of strategic management schools with paradoxes in strategy formation. By taking the context and content of the study into consideration, the secondary data in the literature are analyzed. After generating a comprehensive framework on the subject it is offered some relational matrixes that correlate the perspectives with paradoxes. In

examining this, it is referred from the points of initiator authors of the schools. In this process books, papers and articles (both theoretical and empirical findings) are included to indicate the correlations.

PARADOXES IN STRATEGY FORMATION

There are different perspectives on what strategy formation is and which dimensions it contains. According to Mintzberg, (1978: 934) the literature on the title of forming strategies for private sector and making policy for public sector deals with the question of how strategies will form. Slater and et al (2006:1221) also stated that (with its focus point mentioned above) the subject of strategy formation was in the central of strategic management during three decade. From the different perspectives on the subject the main questions of strategy formation can be summarized as follows (Mintzberg, 1978: Blair and Boal, 1991):

- How strategies form in organizations?
- Are strategies must be planned previously or emerged during the time?
- What is the best way of forming strategies in organizations?

However, Sloan, (2005; 4) stated that strategy formation is related with the strategic alternatives, aims and directions of enterprises and based on which roads they will or should follow. In the field of strategy, strategic management schools set forth strategy formation with its merits and definitions. The views of the schools are shaped around two main paradoxes as deliberateness and emergentness (De Witt and Meyer 1998). The paradox of deliberateness is the first and most known approach on strategy formation as planning perspective. It is based on strategy formulation and implementation traditionally. According to this approach the process of strategy formation is rational, analytical, designable, certain and measurable and depth analyses can be done in the process and both planners and implementers are exist as it depends on mainly distinction between thinking and doing (Mintzberg, 1994). For example, the leader of a company determines and plans the strategy and middle managers implement typically (Aken and Opendakker, 2005:2; Slater and et al. 2006:1223). In contrast, in the paradox of emergentness the strategy formation is a simultaneous action (see the table below for the distinction between the two extreme positions). Mintzberg and McHugh (1985:162) described the roots of emergentness as enterprises can also follow their strategies without targeted and determined previously. According to authors strategy formation is a dynamic learning process. However from some studies (as in Bakoglu, 2000; Andersen, 2004), it can be emerged an integrative perspective by combining the two paradox. So beside the two main paradoxes the integrated perspective and its emerging conditions will be referred in the study. The findings in this study suggest a classification and categorization the views of strategic management schools to these three paradoxes.

Table 1: Planning versus Incrementalism Perspective

	Planning Perspective	Incrementalism Perspective
Emphasis on	Deliberateness over emergentness	Emergentness over deliberateness
Nature of Strategy	Intentionally designed	Gradually shaped
Nature of Strategy Formation	Figuring out	Finding out
Formation Process	Formally structured and comprehensive	Unstructured and fragmented
Formation Process Steps	First think, then act	Thinking and acting intertwined
Focus on strategy as	Pattern of decisions (plan)	Pattern of actions (behavior)
Decision -making	Hierarchical	Political
Decision-making Focus	Optimal resource allocation &	Experimentation and parallel

	coordination	initiatives
View of Future Developments	Forecast and anticipate	Partially unknown and unpredictable
Posture towards the Future	Make commitments, prepare for the future	Postpone commitments, remain flexible
Implementation Focused on	Programming (organizational efficiency)	Learning (organizational development)
Strategic Change	Implemented top-down	Requires broad cultural and cognitive

STRATEGY FORMATION PARADOXES FROM THE PERSPECTIVE OF STRATEGIC MANAGEMENT SCHOOLS

The two paradoxes in strategy formation and the one that is drafted by combining them are the main discussion topics related with how strategy formation should be shaped. In Mintzberg and et al (1998), there is a classification on strategic management schools and their basic premises. Before giving the findings about the perspectives of strategic management schools on paradoxes in strategy formation, it will be more functional to exhibit the main definitions of them on what strategy formation is (see definitions in the Table 2 below).

The perspective of *Design School* in strategy formation paradoxes will be evaluated firstly as it is the first school in strategic management literature and its keywords are the basics of strategic management courses and strategy implementations. The main perspective of strategy formation is, used as strategy formulation rather than formation in the school developing and implementing strategy is separate and different process as formulation-implementation. Beside this as seen also from the definition of it to strategy formation, design school sees strategy formation process as formal, controllable and as simple as possible (Mintzberg, 1990; 171–179). By taking these points it's understood that design school's perspective fits to the paradox of deliberateness by making a clear distinction between thinking and doing in strategy formation.

Table 2: Strategy Formation Definitions of Strategic Management Schools

School	Author(s)	Definition of Strategy Formation
Design	P. Selznick (1957) A.D. Chandler (1962)	Strategy formation is to provide appropriateness between internal power-weakness and external opportunities-threats.
Planning	H.Igor Ansoff (1965)	Strategy formation is a deliberate and mental process of developing strategies exactly and implementing them formally.
Positioning	Sun Tzu,(M.Ö. 2000) M. E. Porter (2008)	Strategy formation is a process of choosing a generic position based on analytical computation.
Entrepreneurial	J.A.Schumpeter (1934)	Strategy formation is a process that starts with the vision of a leader.
Cognitive	H.A.Simon & J.March	Strategy formation is a mental process in the mind of strategists.

Learning	M.Cyert and J.G.March (1963) Mintzberg (1985;1996)	Strategy formation is learning process generates during the time and don't separate from strategy implementation.
Power	J.Pfeffer G.R. Salancik, (1978)	Strategy formation is negotiation and bargaining process between different groups in an organization.
Environment	M.T.Hannan and J.Freeman. (1989)	Strategy formation is a reactional process to environmental changing's.
Configuration	A.D.Chandler, R.E.Milles and C.C.Snow	Strategy formation is a transformation process of the messages taken from other schools.
Resource-Based	J. B. Barney (1991)	Strategy formation is a choice in the context of firm resources and strategic alternatives.
Game Based	A. Brandenburger and B. Nalebuff (1995)	Strategy formation is making great leaps forward by seeing the integrity between the parts.

Source: Adapted from Mintzberg and et al, 1998 and Sarvan and et al. 2003.

The pioneer of *Planning School* is H. Igor Ansoff and the school is developed based on his book of *Corporate Strategy* in 1965. There are some similarities between planning and design schools in basic assumptions to strategy formation. (Sarvan and et al., 2003;75). The planning school advocates differently from design school that determining aims of firm in long-term and shaping firm recourses and decisions around the aims. However, Andrew (1994) also stated that the perspective of planning school to strategy formation is formulation-implementation as in design school. Namely, all optimum strategic alternatives define and an analytical process conducts before implementing firm strategy (Altunoğlu, 2001, 61–63). In conclusion the perspective of planning school is fit to the paradox of deliberateness.

Another strategic management school is positioning that its merits based the study of Sun Tzu “The Art of War” B.C. 2000. The focus points of *Positioning School* are the industry structure, competition conditions, and firm position in an industry. According to Porter (2008) five forces shape the structure and competitive conditions of an industry. These are competitors, suppliers, customers, substitutions and buyers. Porter (2008) stated that the start point of strategy formation understands these forces and their impact on competitive conditions of an industry. According to positioning school, strategy formation is an analytical process that focused on analyzing the data about the industry and choosing the optimum and comprehensive strategy. Acar and Zehir (2009: 411) stated that many academicians studied the Porter’s generic strategies and there are similar views on a well planned strategy will provide firm success among them. From the point of the discussions on the perspectives of positioning school to strategy formation, it is understood that the paradox of deliberateness is the approach of this school.

Entrepreneurial School is another strategic management school. According to its perspective on strategy, strategy formation process is focused on the vision of a leader. Some of the basic assumptions of entrepreneurial school are (Mintzberg and et al. 1998):

- Strategy is perspective of the vision that is determined by the leader for the future of an organization,
- Strategy formation process is semi-structured and shaped around the experiences of a leader.
- Leadership and vision are critical factors for strategy formation.

Form the assumptions above; the perspective of entrepreneurial school on strategy formation is overlap with the integrated paradoxes of deliberateness and emergentness. Because strategy formation is seen a semi structured process and can be adapted to changes and also the vision of a leader can be revised.

Cognitive school is another school in strategic management. It assumes that strategies thus emerge as perspectives - in the form of concepts, maps, schemas, and frames - that shape how people deal with inputs from the environment (Pelling, 2004). Cognitive school sees strategy formation as a cognitive process that take place in the mind of the strategist. Its other assumptions about strategy formation are as follow (Mintzberg and et al, 1998; Pelling, 2004):

- These inputs flow through all sorts of distorting filters before they are decoded by the cognitive maps.
- As concepts, strategies are difficult to attain in the first place, considerably less than optimal when actually attained, and subsequently difficult to change when no longer variable.

As noted above cognitive school sees strategy formation as in the perceptions and mental processes in the mind of strategists. These points' shows that strategy formation is a dynamic action because of perceptions and their resources can change easily. It can be interpreted that the perspective of this school overlaps with the paradox of emergentness.

Learning School can be considered as the milestones in strategy formation as its views are based on the criticisms of design and planning schools. The origin point of criticisms of the two previous schools arise from some studies on Mintzberg's *Patterns in Strategy Formation* (1979, 1985, 1994, 1996), Mintzberg and Mc Hugh's "*Strategy Formation In An Adhocracy*" (1985) and Quinn's "*Strategies for Change: Logical Incrementalism*" (1980). Some assumptions and criticisms of the learning school are (Altunoğlu, 2001, 61–63):

- Determining the aims of a firm by only top managers in certain striation isn't practical for real business world. There should be a consensus on the aims between different stakeholders.
- Strategies can't be developed because the future can't be predicted exactly and comprehensive analyzes can't be conducted in the light of the data on the future.
- Strategy formulation and implementation is simultaneous.

The views submitted by the pioneers of learning school are focused on the synchronicity of strategy formulation and implementations. Strategies should be formed during a dynamic learning process. From the points of views above it can be said that the perspective of learning school is one of the foundation of paradox of emergentness perspective.

Power School is another strategic management school. The power school is developed based on the approaches of contingency and resource dependence. The basic studies of power school are Hickson and Hinnings's "*A Strategic Contingencies Theory of Intraorganizational Power*" (1971) and Pfeffer and Salancik's "*The External Control of Organizations: a Resource Dependence*" (1978). According to power school there are two power factors as micro and macro in strategy formation process. Micro power is related with politics in organization whereas macro power related with the using the power that organization has. Strategy formation is shaped by using these powers and politics. On the one hand, micro power effect strategy formation in inside of organization as in the process of coalitions, bargaining, persuasion and power relations that arises between different groups. On the other hand macro power sees organizations as they maneuver to control or other organizations or collaborate with them (Mintzberg, and et al. 1998; Sarvan and et al. 2003; 95). Briefly, power school sees strategy formation as the interactions between the two powers. By taking these dynamic interactions it is concluded that the perspective of power school to strategy formation is related with the paradox of emergentness closely.

Environment School is another strategic management school and based on contingency theory and population ecology theory. The basic assumptions of power school related with strategy formation are like these (Mintzberg and et al. 1998; Koçel, 2003; 355).

- Environmental powers should be taken into consideration during strategy formation.
- Forming strategy is a reactional process to environmental powers and changing's.
- Strategies should be formed according to the structure of environment and effect of it on organization.

The structure and affects of environment on organizations force them to form different strategies and behaviors as, mergers consortiums, strategic alliances and interlocking directorates (Koçel, 2003; 355). The perspective of environment school is related with the paradox of deliberateness as it depends on distinction between thinking and doing in strategy formation, and the school prescribes strategy be formulated according to the environmental forces as being accepted environment has a deterministic effect on firm strategies, and it shapes the strategy.

Configuration School is another school in strategic management that assumes the strategy formation is the process of integrating different messages or inputs about the environmental conditions. Configuration school

describes the states of an organization as configuration and strategy making as transformation. Transformation is the inevitable result of an organization moving from one state to another. Mintzberg (1979) argues that “it all depends” approach of contingency theory does not go far enough, that structures are rightfully designed on the basis of a third approach, which is called the “getting it all together” or configuration approach by him. The basic premises of the school are as in the following (Marcus, 2009);

- Most of the time an organization is in some kind of stable configuration in terms of its characteristics and structure,
- The strategy making can take many different approaches depending on the configuration of the organization.
- The strategies may take the form of plans, patterns or perspectives depending on its time and situation.

It is seen that according to its basic premises there could be different configurations in strategy formation at different stages of the organization and environment. It can be stated that there is a strong emphasize on changeability in forming strategies when these premises of the school take into account. As a result, it is rather clear that the perspective of configuration school is come around the integrated paradox that combined from the two basic paradoxes.

Another school in strategic management is Resource-based view that mainly tries to answer the question of what is the source of firm’s competitive advantage. This school has been developed based on the studies of Barney (1991; 2001). According to the principles of Resource-based view, sustainable competitive advantage of a firm depends on having and using inimitable, important and scarce resources in an industry. Resource based view assumes there are strong relations between firm resources and strategic alternatives. Firms should regard a resource policy in strategy formation process for effective strategies.

There are different perspectives on relationships between resource based view and strategy formation. For example Sevicin (2006) stated that in the context of resource based view, firm strategies should be formed based on gaining competitive advantage by using resources effectively. According to this thought the competitive advantage of a firm is related with resources rather than external environment. Resource based view sees also firms as the actors that operate in an uncertain environment in which the rules aren’t defined exactly Bakoğlu, (2005; 3). From these points it can be interpreted that resource based view sees strategy formation as a work of counterbalancing between firm resources and external environment simultaneously. This case put forth a dynamic perspective on strategy formation. In conclusion it is understood that the perspective of resource based view school is related with the paradox of emergentness rather than deliberateness.

Game-based is one of the latest schools in strategic management literature. The roots of it date back to the book of *Theory of Games and Economic Behaviour* which is written by *John von Neumann* who is a genius mathematician and *Oskar Morgenstern* who is an economist. However Game based school brought a different perspective to strategy formation after the studies of Adam Brandenburger and Barry Nalebuff. The authors proposed a framework for strategy formation in their article of *The Right Game: Use Game Theory to Shape Strategy*. In this framework it is proposed that firms should take into account the impacts of main player in a business game. The players are the firm itself, its competitors, substitutions and complementors. According to game based school firms should determine their roles and relations with other player during strategy formation process. The main relationships related with strategy formation are as in the following;

- Changing the game,
- Changing the players,
- Changing the added values
- Changing the rules
- Changing perceptions (by using tactics)
- Changing the scope of the game

Game based school advised that successful business strategy is about actively shaping the game that firms play, not just playing the game they find (Brandenburger ve Nalebuff, 1995; 60–70). Although there is an emphasis on shaping the game actively in the game-based school, it could only be interpreted as the school as more dynamic in nature than planning school since the rules of the game calculated in advance, and player plays the right game thought beforehand. The distinction between thinking and doing in strategy formation might be more vague than planning school, but it still exists. For these reason the game based school can be interpreted as in line with the deliberateness perspective rather than emergentness or integrated perspectives.

CONCLUSION AND DISCUSSION

This study aims to evaluate the paradoxes in strategy formation from the perspectives of strategic management school. In the context of the study, the perspectives of design, planning, positioning learning, cognitive, environment, power, entrepreneurial, resource-based and game-based school's are examined. In conclusion which perspective matches with which paradox is determined. Table 3 summarizes these matches below.

Table 3: Categorization of Strategic Management Schools According to the Paradoxes of Strategy Formation

STRATEGIC MANAGEMENT SCHOOLS	<u>TYPE OF PARADOX</u>		
	Deliberateness	Emergentness	Integrated Paradox (Dual Perspective)
	Design School	Learning School	Entrepreneurial School
	Planning School	Power School	Configuration School
	Positioning School	Cognitive School	
	Environment School	Resource Based School	
Game Based School			

The main discussions and conclusions of this study can be summarized as in the following;

- Each of strategic management school shapes its perspective around one or two paradox depend on its evaluation of the factors effected strategy formation. This exposed that firms need to have a dynamic perspective in strategy formation that will enable them to form their strategies effectively.
- From the findings it is concluded that design, planning and positioning schools see strategy formation as the two-tier stage. This is a separate stage as the formulation and implementation of firm strategies.
- Design, planning, positioning, environment and game based schools emphasized the importance of external environment whereas learning; power, cognitive and resource based schools advocated the importance of internal factors as leader or strategists in organization.
- There is a distinction between positioning and resource-based view schools related with their perspectives on external and internal environment. Whereas the former focusing on opportunities and threats in external environment resource based view emphasized the importance of strengths and weaknesses in internal environment.
- The paradox of emergentness is raised based on the criticisms of Mintzberg and at al. to the paradox of deliberateness. After the criticisms and discussions related with two main paradoxes, the integrated paradox has been defined by combining them.
- Although there is a similarity in perspectives of environment and positioning schools in strategy formation, because of the contingency approach is the fundamental of environment it is concluded that they are different perspective in categorization of the paradoxes. The former is fit to the paradox of emergentness whereas the later fit to the deliberateness.
- Resource-based and game-based are the two latest schools in strategic management and their perspective in strategy formation fit the opposite paradoxes, the former being in line with the paradox of emergentness and the latter with the deliberateness.
- Another results is that the same approach can be the fundamental of different schools and their perspectives in strategy formation as in the example of resource-based theory is the fundamental of both environment and power schools.

- The learning schools emphasized that strategy formulation and implementation can't be separated. They must be evaluated simultaneously.

The general conclusion in this study is that one of the main questions within the field of strategic management is whether strategy formation is primary a deliberate process or more of an emergent one, and each strategic management school have ambiguous perspective on it apart from the established planning, positioning, environmental and design schools, and relatively new learning school. Most of the newly established schools can only be evaluated with the current knowledge and evaluation of what perspective on strategy formation they employ is relatively difficult for the time being. This difficulty may come from the fact that we are on the age of mixture of opposites like old-new, traditional-contemporary. From the different perspectives on paradoxes it is understood that how organizations should form their strategies and there is not only one best way to form them. Strategies can be formed by preferring the paradoxes of deliberateness, emergentness and integrated perspectives according to different factors, conditions and situations. As a last remark, it can be said that accepting different approaches as paradoxes means accepting the conflicts between two opposites, and strategist's main role is accommodating both factors, even though opposites, at the same time in our age. Today strategists should employee emergentness and deliberateness perspectives at the same time for gaining the benefits of both, and it should not be surprising if all the schools use the same perspective and developed in parallel with this perspective.

THE ROLE OF DESIGN IN BUSINESS STRATEGIES

Celal Hakan Kağnıcıoğlu
Anadolu University, Turkey

ABSTRACT

The main objective of this paper is to show the role and importance of design in business strategies. The importance of design in business strategies and the strategic role of design in helping companies to meet successfully the challenges posed by their differing market environments and competitive positions are the results of a literature review. So, the proposals collected at the end of an intensive literature review are conceptualized. . Moreover, some discussions are made to show the power and role of design in business strategies and the general goals of business strategy together with the objectives of design strategy that serve them and the tools of design management that follow from such objectives are set out. While some proposals are given to show the place of design in strategic decision making, real life examples are used from the industry. Companies must be very careful in setting their strategies for having competitive advantage and design is one of the effective tools to achieve it.

Keywords: Strategy; design; design management; value creation; design strategy.

INTRODUCTION

The purpose of the present study is to show the relationship between business strategy and design and effect of design in business strategy. Besides, design's contribution to strategy formulation is investigated and the opportunities for design in value creation is tried to be identified. Business strategy aims to identify and secure a long-term competitive advantage for the company. The four essential purposes of the strategy are setting direction, concentrating effort, providing consistency and ensuring flexibility. In the fast changing technological and market environments of today, the design has the potential to contribute to strategic goals. When the strategy is seen as a flow of commitment decisions, it is easy to define the role of design. The created designs give some raw materials to the decision makers for making some decisions and also open the doors of opportunity. By the help of these designs, alternative futures are explored. As a process which bridges the desires of the market with the potential of production, design clearly has a strategic dimension like providing niche through unique styling, identity and product innovation to secure distinctive international niche for small firms in consumer electronics market.

In this paper, firstly, the aims, function and importance of business strategy is stated. Then, design's contribution to strategic goals is indicated by the real life examples and the role and effect of design in business strategies are stated. Finally, design's contribution to future strategic challenges is presented. Moreover, some proposals are given to companies about the strategy and the related design activities and it is indicated how to use design strategy as a competitive weapon according to their changing conditions.

LITERATURE REVIEW

In the 1990s most texts on business strategy advocated a technocratic approach. It was claimed that it was necessary to conduct an exhaustive study of markets, competitors, core competences and the like. In the case of any opportunity, resources are allocated to provide the right product at the right price in the right position at the right point in time.

According to Hamel (2000), the responsibility for strategy making must be broadly distributed. Top management must give up its monopoly on strategy creation. In this sense you can't have innovation in business models without innovation in political models. Weick (1995) claims that when we see strategy as a flow of commitment decisions it becomes easier to define the roles of those who design products and services. Designers help decision makers to explore alternative futures. Their task is to invent, discover and communicate ways to advance the collective sense making of the firm about what to do next. Nakamoto (1996) pointed out that designs are not isolated and firms like Sony develop design styles. Sony's house styles are more than a clever embodiment of a marketing brief. In the design personality of the firm, its enduring story, lies a direct communication with the customer. In these cases, the firm's strategy has found

its fullest expression in the enduring experience of the product. Rickards (1999) stated that designers, visualisers, concept developers and creative people are the Cinderellas of strategy.

Lili (2009) introduces a new model of design leadership strategy in firms. The paper describes what design leadership strategy and the benefit of the strategy are. According to Shaughnessy (2007), having access to the CEO Office and a design champion at the most senior levels of strategic decision making was a success factor common to all. The companies have embraced the fact that design offers business a different perspective on the challenges they face in an increasingly competitive and global marketplace. In the article of "The Business of Design". Breen (2005) focuses on the statement issued by Roger Martin, dean of Rotman School of Business of the University of Toronto in Ontario, on design-influenced economy. The companies will continue to prosper only if they innovate or create refined products and services. The emergence of the design economy is the successor to the information technology. Design-influenced companies understand their customers at a profound level and mobilize around that insight. Organizations that embrace a design-based strategy employ the practice of rapid prototyping. Design's powerful impact on business strategy will require a new way of thinking. Fitzsimmons, et al (1991) emphasizes the need for strategic management of design activity instead of relegating design to a traditional reactive role. In this respect the framework is a significant step towards reducing the existing gap between design and the other business functions, and can help corporate strategists use design as a competitive weapon. Turner (2000) realizes, that design has to redefine its relationship with business-not in terms of design strategy versus business strategy, but at a much more fundamental level. He suggests that design take the role of coordinator, facilitator and interpreter, rather than that of the leader it often aspires to. Companies need to integrate design into their DNA – or treat design as infusion which means everyone in the organization understands and values the contribution design can make.

STRATEGIC MANAGEMENT

Strategic management can be defined as the art and science of formulating, implementing, and evaluating cross-functional decisions that enable an organization to achieve its objectives. As this definition implies, strategic management focuses on integrating management, marketing, finance/accounting, production/operations, research and development, and computer information systems to achieve organizational success. The purpose of strategic management is to exploit and create new and different opportunities for tomorrow; long-range planning, in contrast, tries to optimize for tomorrow the trends of today (David, 2009, 36).

Strategic management consists of the analyses, decisions, and actions an organization undertakes in order to create and sustain competitive advantage. Therefore, there are three ongoing processes in the strategic management of an organization: analyses, decisions, and actions. That is, strategic management is concerned with the analysis of strategic goals (vision, mission, and strategic objectives) along with the analysis of the internal and external environment of the organization. Then, leaders must make strategic decisions. Within the context of these decisions, two basic questions arise: What industries should we compete in? How should we compete in those industries? And last are the actions that must be taken. Decisions do not have any meaning if unless they are acted on. Firms must take the necessary actions to implement their strategies. This requires the allocation of the necessary resources and the design of the organization to bring the intended strategies to reality (Dess, Lumpkin, Eisner, 2008, 9).

The essence of strategic management is the study of why some firms outperform other firms. Thus, it must be determined how a firm is to compete so that it can obtain advantages that are sustainable over a lengthy period of time. The firms try to find some ways to compete in order to create competitive advantages in the marketplace. Besides, they must look for the competitive advantages that are not only unique and valuable but also difficult for competitors to copy or substitute.

There are four key attributes of strategic management. First, strategic management is directed toward overall organizational goals and objectives. The effort of the organization must be directed for achieving the best for the total organization, not for a specific functional area. Second, strategic management must take into consideration multiple stakeholders in decision making. Stakeholders are the people and groups including owners, employees, customers, suppliers, the community at large, and so on. The decisions must not focus on one specific stakeholder. Third, strategic management must include both short-term and long-term perspectives. Thus, the decisions taken must maintain both a vision for the future of the organization and a focus on its present operating needs. Fourth, strategic management involves the recognition of trade-offs between effectiveness and efficiency. Many trade-offs are made for the practice of strategic management.

Decision makers must focus both on the efficiency in the short-term and also the firm's product-market scope in order to anticipate opportunities in the competitive environment.

Top executives provide the context for strategy formulation and implementation through the vision and mission that they not only espouse, but that they also model through their own actions. They sometimes are the originators of the vision and mission and also try to sharpen the employees' shared understanding of the vision and mission. Vision can be defined as a simple statement or understanding of what the firm will be in the future. It identifies the firm's desired long-term status. However, mission is a declaration of what a firm is and stands for – its fundamental values and long-term purpose. When visions and missions of the firm are clearly and widely understood, it will be easy to make strategic decisions entailing difficult tradeoffs. A shared understanding of the firm's direction and values helps guide both executives and employees in their daily decisions and actions. Therefore, vision and mission reinforce and support strategy; conversely, strategy provides a coherent plan for realizing vision and mission. Then in order to be effective, visions and missions must be spelled out in terms of specific quantitative or qualitative goals and objectives for directing strategic actions. After all, one individual or a group of individuals can cope with only so much complexity in a problem. Vision and mission statements provide all employees with strategic purpose: a simplified, widely shared model of the organization and its future, including anticipated changes in its environment (Carpenter, Sanders, 2007, 39).

DESIGN AND STRATEGY

Design can be active at three levels within an organisation. Firstly, at the level of corporate strategy, design expresses the vision, values and beliefs of the organisation, for example in its corporate identity. At the business-unit level, design is used tactically to help achieve business-unit goals, for example, the organisation might conduct a design audit when entering new markets to benchmark the competition. Thirdly, at an operational level, design is present in the day-to-day operations, and in the refining of the product or service development process (Best, 2006, 92). Design processes strengthen the brand, add value and create competitive advantage by the certain support of the organization. The end of this process can be an outcome that gives a finished form to the business strategy. Besides, since design is a problem solving process, it can support organisation to shape the business strategy.

Designers, visualizers, concept developers and creative people are the unknown heroes of the strategy. In the case of crisis, strategy setters are sometimes in difficult position to decide on what to do and how to do it. The strategy must be decided in such a way that supports the company to overcome the difficulties. It is the designers to present new ideas for the companies by new product concepts and show how new technologies could be woven into a product concept. Designers by their new ideas are the real originators of a new strategy. Decision makers and the creators must build an equal partnership for the company strategies, especially in the period of crisis. Strategy development is demanding on the imagination. Intangibles as concepts, intentions, meanings, logic and futures are a vital part of the mix. Therefore, designers need to see that they are on the strategic team. The following seven guidelines show the designers the strategic significance of their role (Bruce, Bessant, 2002, 71):

1. Realize that, sometimes designer can be an idea leader in the company. Although top managers are very experienced people, they might not be as good as the designer in visualizing the products and services.
2. The designer must have set-backs; otherwise, the designer is not being sufficiently radical. Strategies emerge through conflict; two steps forward, one back. The process can be long, painstaking, difficult and exhausting. The designer must be strong enough to resist the difficulties.
3. Designer must be thorough. The ideas coming from the designer must be carefully examined and all the research alternatives must be elaborately evaluated before taking any action.
4. Designer must listen to everybody in and around the company. Customers, employees at every level and suppliers are source of information for the designer. The task of the designer is to harvest idea as well as generate them.
5. Designer must be the person who thinks the unthinkable. Designer should bring their beliefs, values and assumptions into question and be self-critical. Questioning is necessary since every correct belief has the weaknesses of the strengths.

6. Designer should have the ability of persuasive. Designer must convince people in the company and be political and friendly to have their support. If the importance of politics and personality are underestimated good work can be weakened.
7. Designer must be flexible. The products to be designed should be flexible enough to respond changing situations. Due to uncertainty about the future, products should be designed in such a way that changing them must be fast and simple.

Designers should try to support their companies to win competitive races. The competition among the companies is like a race without a finish line. However the company has market research about its rivals and customers, the future is vague and it is impossible to predict the future clearly. Therefore, the companies try to do their best about their activities and manage this vagueness according to their benefits. The design process is essential in this atmosphere in order to be ready for the unexpected situations.

DESIGN'S CONTRIBUTION TO STRATEGIC GOALS

All the firms in the market without taking into consideration what they supply need strategy. Strategy generates advantages to gain competitiveness. It is usually impossible to know precisely how competition in an industry will evolve, and so it is rarely possible to determine for sure that a firm is choosing the right strategy. This is why a firm's strategy is almost always a theory: It is a firm's best bet about how competition is going to evolve, and how that evolution can be exploited for competitive advantage (Barney, Hesterly, 2008, 5).

Globalization makes the market more competitive and more segmented than before. Customers in the market are becoming very complicated in their requirements and demanding more product differentiation. Technology is changing rapidly and causes many improvements in the area of product concepts and production systems. While production systems try to meet the desires of the market with the improved systems, the design of the product and the system are essential by their dimensions.

If the strategic role of design can be used effectively, firms have a lot of advantages of it. Moreover, there are many contribution of design to strategic goals. These strategic goals can be achieved successfully as the necessity of design is to be well understood. The followings are the main cases of indicating how the design plays a part in contributing to strategic goals.

Small to medium sized competing firms in some markets like electronics, have often managed to secure a market niche through the use of design. These firms have employed design-led strategies to gain a distinctive market presence. For example, among all European countries Denmark has the strongest national design identity. Because of the small domestic market, there is less opportunity to manufacture on a large scale. Denmark has tended to wed its craft traditions to modern technology and thereby winning high quality niche markets. One firm that typifies this strategy is Bang and Olufsen. The well engineered, sleek designs of Bang and Olufsen, exploiting wood and metal finishes rather than plastic mouldings, became the design icons of the 1970s. The firm's innovation is clearly based on design rather than technological research and development. These kinds of firms try to implement design-led strategies in order to have international market niches that avoid head-on competition with mass manufacturers.

Textile is one of the most mature industries in the world and in order to survive in this industry, continuous innovation in production technology and design is a requirement. Due to low cost production in some undeveloped countries, textile producers try to find niche through greater integration of design as a means of meeting the needs of fashion-based markets. This is done by buying in fabric and applying design appropriate to national consumer needs, or developing long-term relationships with fashion designers, who provide the main market for fully manufactured and finished material. Leading designer Issey Miyake developed laser printing techniques and introduced computer driven looms to craft weavers. Benetton illustrates the flexible design-orientated strategy that has gained a future for Italy's clothing and textile sectors.

For transnational manufacturers with diverse world markets, the strategic role of design can take on new dimensions by offering a means of integrating and providing a coherent focus for diverse corporate activities. Industrial design is central to the public perception and thus success of any manufacturing company: The product is the most important statement a company can make about its image. As an example, Philips' design director, Robert Blaich, changed the design strategy of the company in 1980s and increase the efficiency of Philips' large design group. Overall, the new approach to design has enabled Philips to bring more, higher quality products to the market more quickly and efficiently than before and more carefully designed to meet

specific market requirements. Philips has found design to be critical process in tailoring their products to particular national or regional requirements while continuing to exploit those truly global markets that do exist.

While there are many industrial, economic and social factors that account for Japan's success, the strategic status of design and the evolving mechanisms of its management play a crucial role. Product innovation is always recognized by Japanese companies. Japanese companies regard design as a key process within innovation and at the heart of the company itself. However design is structured organisationally, there is invariably a very close link between design and marketing. Marketers are wedded into the design process to ensure that market factors inform design decisions. Although, in some companies, designers are briefed with the specific job of coming up with creative ideas, and then given to engineers to develop technologically, most companies try to build an environment that can exploit ideas that originate from anywhere. Japanese companies use new ways of managing and speeding up product development by new philosophies of design appropriate to flexible manufacturing for the diverse lifestyles of global consumers. Improved methods and processes in design make products of Japanese companies more tailored, adaptable and desirable to the consumer. Japanese companies show how design can be used strategically as a visionary tool to provide direction and often as an integrating element within the entire product development process. The core technologies developed in Japan are adapted to culturally specific lifestyle needs by design process for gaining demand worldwide.

DESIGN STRATEGIES

Design is about doing things consciously and not because they have always done in a certain way, it is about comparing alternatives to select the best possible solution, it is about exploring and experimenting. Design is a potent strategic tool that companies can use to gain a sustainable competitive advantage yet most companies neglect design as a strategic tool. What these companies do not realize is that good design can enhance products, environment, communications and corporate identity.

The strategic role of design in helping companies to meet successfully the challenges posed by their differing market circumstances and competitive positions have been considered in the previous section.

Design strategy is a discipline which helps firms determine what to make and do, why do it and how to innovate contextually, both immediately and over the long term. This process involves the interplay between design and business strategy, forming a systematic approach integrating holistic-thinking, research methods used to inform business strategy and strategic planning which provides a context for design. While not always required, design strategy often uses social research methods to help ground the results and mitigate the risk of any course of action. The approach has proved useful for companies in a variety of strategic scenarios (http://en.wikipedia.org/wiki/Design_strategy).

Design strategy can play an integral role in helping to resolve the following common problems:

- Contributing the growth of the adoption of a technology (Example: Toyota designing the hybrid Prius to resemble the conservative Echo instead of making the Prius look high-tech and adventuresome)
- Determining the real focus groups for a company's products and services (Example: John Rheinfrank of Fitch Design showed Kodak that its disposable cameras didn't exist to replace traditional cameras, but instead to meet specific needs, like weddings, underwater photography and others)
- Changing insights into actionable solutions (Example: Jump Associates helped Target turn an understanding of college students into a dorm room line designed by Todd Oldham)
- Assigning a priority in the order in which a portfolio of products and services should be launched (Example: Apple Inc. Laid out the iPod+iTunes ecosystem slowly over time, rather than launching all of its pieces at once)
- Making connection between the design efforts and business strategy of the company (Example: Hewlett-Packard's global design division is focused most intently on designs that simplify technology experiences. This leads to lower manufacturing costs at a time when CEO Mark Hurd is pushing for cost-cutting.)
- Integrating design as a fundamental aspect of strategic brand intent (Example: Tom Hardy, Design Strategist, developed the core brand-design principle "Balance of Reason & Feeling" for Samsung Electronics, together with rational and emotional attributes, to guide design language within a

comprehensive brand-design program that inspired differentiation and elevated the company's global image (http://en.wikipedia.org/wiki/Design_strategy).

A well-planned and executed design strategy is essential for success. A design audit would inform MWS about their brand in the marketplace, regionally and nationally. It would identify possible scenarios and implications for different approaches to design. The design strategy process looks at all aspects of communication with customers. Sophisticated and consistent communications – both internally (newsletters, memos, etc.) and externally (letters, e-mails, invoices, faxes, brochures, website, ads, etc.) – can make a small company look big. The process anticipates needs and helps companies to develop and execute consistent communications systems. Design strategy is a planning process. It should be ever-sensitive to changes in dynamic marketplaces, trends and industry influences. Nor is it limited to the marketing department or the creative services; it touches every stakeholder group and department in a company. It assesses and makes recommendations on features, packaging and other product-related issues to create a seamless integration of brand and corporate image. Design, in its least effective form, is little more than aesthetic remodeling. But used effectively, it provides a stabilizing framework of culture, product and image that supports and enhances each and every activity within a company. And when used strategically, it's another management tool – as important and useful as accounting, value-chain/supply-chain management, resource management and marketing (<http://business.mainetoday.com/smallbusiness/littlefish/050907demo.shtml>).

Design strategy is the effective allocation and coordination of design resources and activities to accomplish a firm's objectives of creating its appropriate public and internal identities, its product offerings, and its environments (Olson, et al., 1998, 56). Appropriate design strategy implementation can lead to the creation of sustainable competitive advantages through the delivery of superior customer value.

Three distinct areas of design activity for the success of the company have been identified by Cooper and Press (1995) and associate specific design strategy issues with each: managing the company's communications and identity, the design of saleable products/services and the design of operating environments.

Design strategy decision-making in the area of corporate communications and identity involves understanding the corporate values and what should be communicated, the relationship between corporate image and corporate goals, whether the focus is on corporation, division, or product line, the necessary design competencies and the intangible messages that corporate environments carry.

Design strategy decision-making in the area of the design of saleable products and services involves understanding the relationship between the factors involved in product or service design (price, quality, standardization) and corporate goals, price point constraints and production costs and capacities, features valued by customers, the competencies necessary to design and deliver the planned products and the intangible messages that designed products and services carry.

Design strategy decision-making for environmental (place) design involves understanding the relationship between corporate values, image, environment, and goals, the competitive strategy adopted by the firm or division, how work is conducted within the firm and the critical interrelations between functions, consumer shopping preferences, the competencies necessary to design corporate environments and the intangible messages that corporate environments carry (Olson, et al., 1998, 58).

Setting direction through a clear vision that motivates employees and attracts consumers and investors is enabled through a design strategy that aims to visualize and communicate corporate objectives. As a design management tool, corporate identity which is focused through a potent symbol of the company's values and applied to environments, information and products, is particularly important in cases where a company's products are relatively undifferentiated from those of its competitors. For the manufacturing companies the product is the image. Quality which is a key priority of design can be used for the strategic goal of design to communicate corporate objectives and values. Bang Olufsen is successful in the market by its premium quality product design. These premium quality products have given this small company a distinctive identity in the market.

Some companies concentrate on what they have done instead of trying to do something they know very little about. Design strategy is clearly essential in ensuring that companies concentrate their efforts on products

that play to corporate strengths, rather than spread out resources and identity. Clear objectives which is associated with a company's internal and external environment: its market, the technology used, resources to investment and so on can be developed by a design policy. As an example, Bang Olufsen's design policy provides a strategic focus for design by identifying the parameters of the company's market and capabilities together with the design criteria for which the company has become known. In order to be effective by this policy it is very important to have appropriate integration within the culture and organization of the company. However design fits into corporate structures, many companies have used it to provide vision and direction, integrating it with other functions to maximize creative interaction and focus in the new product development process. For example, Philips is able to balance centralised design resources with the geographical and product diversity of a large transnational by an appropriate design management structure (Cooper, Press, 1995, 135).

In order to ensure consistent development and application of design policy concentration over time, which is a corporate strategy goal, requires a forward looking design strategy. The definition of design standards, monitoring of design and effective design leadership are design management tools to provide consistency. Sony and Canon design is regularly reviewed at Board level.

Since today market environment is changing rapidly, flexibility is an effective strategic goal for the companies. Therefore, design must be arranged in such a way that is able to adaptable, opportunistic and forward looking. Culture of innovation must be generated within the companies and design departments must be outward directed to develop new ideas. Today, many Japanese companies use external consultant designers together with their in-house design teams to achieve this.

Design strategy of a company can be a competitive weapon in the market. Design can be used as a powerful tool to compete with the rivals. Good product design strategy help the company have a good company image, continuous product improvement and market-led orientation. Moreover, the company can easily adapt its product designs to changing market situations.

DISCUSSION AND CONCLUSION

Designers are the people who help shape the strategy of their companies. They create ideas, products and product positions for the market where customers' buying decisions are affected by emotion, fashion and context. The fundamental contribution of the designer to the market of the company is the design of the product itself.

In 1990s, strategies were set only by top level managers according to exhaustive study of markets, competitors, core competencies and the like. Windows of opportunities could be found, assessed, and if promising, resources allocated to provide the right product at the right price in the right position at the right point in time. These types of strategic processes help many companies to be focused and effective. However, it doesn't continue too long due to real life problems such as wrong assumptions of top managers about average people they know very little. Top management must stop its monopoly on strategy creation and the responsibility for strategy making must be distributed in some extent. Otherwise, the companies do not have innovation in business models and do not compete in the market with their competitors.

Strategies are the reflections of the future for the companies. Futures cannot be predicted precisely by analysis alone. Strategy is a set of decisions that create the future under a basic logic. Strategy requires the commitment of resources in such a way that these commitments change the nature of the business in ways that would be difficult to reverse. Strategy is not what is said but what is done, so there is a vague line among strategy, innovation and operations.

They are the ones who play a key role in supporting companies with raw materials for making decisions. When the designers are at their jobs, they open doors of opportunity for the companies and help decision makers explore alternative futures. Weick (1995) says that "Their task is to invent, discover and communicate ways to advance the collective sense of making of the company about what to do next".

When designers open doors of opportunity for the companies they have three roles:

- Designers enhance the idea of managers what can be done and how can be done.
- Designers verify the possibilities by making a flash of an idea into a proposal.

- Designers struggle for the acceptance of their ideas and try to change the company's decision making processes.

Designers help a firm to make sense of customers' requirements, needs and even expectations. They are very successful when they design some products that are not desired until the customers see it in the market. One of the most important tasks of the designers is to create distinctive products to sell in the market and generate excitement, admiration, desire and loyalty. Whether the designers are aware of it or not, but they are on the strategy team of the company.

Designs are not isolated from the company's image; on the contrary, the design of the product shows the personality and life time story of the company, in addition provides communication with the customer. The products give some messages to the customers and the customers feel themselves close to the company each time they use the products. Therefore, the company's strategy has found its fullest expression in customers' enduring experience of the product (Bruce, Bessant, 2002, 66).

Competitive strategy requires the design to keep the product in superior value, while having satisfied customers with low cost. The timing of this is essential for the success of the competitive strategy to survive and deliver advantage. The design process must be implemented properly in order that the designed product must be perceived very well in the market and the cost of this designed product must be reasonable.

In some instances, design is the source of the strategy for the company. The design of the product guides the company about the strategy of the company or the success in the market. For example, the strategy of a computer game company can be to design and distribute a game with attractive concept or the strategy for the writer of a novel can be an attractive subject. Some strategies can arise in real time. Therefore, decision makers have strategies according to the changing conditions. The strategies can be changed through the flow of information and inspiration. In this situation, creativity is crucial for the enrichment of the planning.

In this paper design's strategic role in gaining market share and competitive advantage in companies and the contribution of design to broaden the responsibilities through defining the objectives are tried to be examined. While strategy is to meet the challenges of the future, design is the assistant visionary tool to respond to the changing values of the market. Designs or in other words products are powerful and competitive tools for the companies to direct the market. The products give ideas about the policy of the company, as well. Moreover, design can contribute through its intermediary role bridging economy and culture in strategic issues for business, as the example of the green market shows.

Since the world is changing rapidly, the requirements, needs and thoughts of the customers are changing. The companies have difficulty in responding these changes and solving the problems rapidly. Here, the design is the powerful weapon in meeting these changes by the support of the strategic decisions taken. Design can take a wider view of problems, with concerns ranging from designing a car through to concepts for urban transport systems.

It can be concluded that designers bring energy to strategy and help the decision makers to look forward. They use the possibility and practicability of the ideas with wide scope. Strategy definitely requires creativity and imagination and this creativity and imagination can be emerged from the design activities. Due to the high competition and frequently changing conditions in the market, the top management and the designers of the company must develop a relationship to contribute to industry more effectively for reflecting the changing value of the age.

THE PERFORMANCE ANALYSIS OF BANKING COMPANIES

Gökhan Özer
Gebze Institute of Technology, Turkey
Metin Uyar
Beykent University, Turkey

ABSTRACT

Performance evaluation is a necessary part of financial controls. Not only can it be used as reference in decision-making, but also the basis of any improvements. Therefore, how to measure efficiency becomes an important and broad-scope subject. Managers, economists and others researches have attempted to accurately measure the efficiency of the financial sectors for many years. Conventionally, research uses ratio analysis as indicators of performance. But, it isn't enough. So, we used to DEA. The purpose of this study is to examine the financial efficiency pattern of listed banking companies for the years, 2008 and 2009. The last credit crisis in the mortgage market has led to tremendous turmoil in the global industry. As a result, during the last twenty four months, we have seen a substantial decline in the profitability and liquidity of the banking companies in the World. In this paper, we will analyze the financial statements of banking firms in ISE (Istanbul Stock Exchange) to evaluate their relative performance in the industry. We illustrate the use of data envelopment analysis, an operations research technique, to analyze financial statements of banking firms by benchmarking financial ratios of a company against its peers. Data envelopment analysis clearly brings out the firms that are operating more efficiently in comparison to other firms in the industry. Data envelopment analysis also points out the areas in which poorly performing firms need to improve.

Keywords: *Banking Sector, Performance Analysis, Data Envelopment Analysis*

1. INTRODUCTION

Efficiency in the banking sector is a significant topic in Turkish Economy. As leader activity in national trade banks have a top role in the changing Turkey's future. On that account, investigation of banks' performance has a critic value for investor, creditors, clients, Banking Regulation and Supervision Agency – BRSA (in origin language, Bankacılık Düzenleme ve Denetleme Kurumu), Saving Deposit Insurance Fund – SDIF as well as IMF. It is also important from the point of view of the banks' management to evaluation of own performance and benchmarking with other competitor. The performance analysis of the banking sector has been analyzed using ratios. But recent times, a nonparametric technique namely data envelopment analysis used successfully in hospitals, manufacture companies, educational institutions and banks.

The banking system contributes to economic growth by mobilizing financial resources and channeling them to activities with higher expected rates of return for a given level of risk. It provides transaction and payment services, which increase the efficiency of economic activities. The banking industry is expected to grow in the direction of improved productivity, profitability, lower intermediation costs and enhanced customer service. The growth and solvency of a bank would depend, inter alia, on banks being profitable, well managed and sufficiently well capitalized to withstand adverse shocks arising from measured and non-measured risks. Banks that adopt the most cost-efficient size and product mix with respect to a manageable portfolio risk are better placed to exploit the relative cost advantages (Das and Ghosh, 2006, s. 194).

The purpose of this study is to examine the efficiency pattern for the years, 2008 and 2009. We use Data Envelopment Analysis (DEA) to obtain the efficiency of listed commercial banks. Inefficiency is widely conjectured to be an important contributing factor to the cost of Turkish banking sector. The lack of efficiency in resource use in turn engenders low productivity as reflected in high spreads. However, owing to

problems in measuring bank outputs, efficiency measurement is fraught with difficulties. More importantly, banks may not be homogeneous with respect to the types of outputs actually produced. While several attempts have been made to examine the issue of efficiency of banks in developed countries, studies analysing the efficiency of banks in developing countries have been limited. The present paper examines the efficiency of Turkish banks using Data Envelopment Analysis (DEA) approach over the period 2008 to 2009. DEA is a methodology for estimating the relative efficiency and managerial performance of productive units, having the same set of inputs and outputs. Additionally, it enables comparison of the relative efficiency of banks by determining the efficient banks, which span the frontier.

The rest of the study is structured like follow: Part 2 explain a short overview Turkish Banking Sector. Part 3 with related literature review. Part 4 explains conceptual framework of DEA method. Description of banks inputs, outputs and data. Part 5 argues the findings and consequents.

2. The General Outlook Turkish Banking Sector

National banking structure of Turkey occur the commercial banks, investment, and development banks. The commercial banks can be grouped as state's banks, private part's banks and foreign' banks. They work as universal banks. In other words, they engage in financial activities from providing traditional depository and lending services, financing foreign trade activities and maintaining capital market transactions as well as investment banking activities. Starting of 2010, there were 49 banks operating in the Turkish banking industry. Of these, 32 were commercial banks, and 13 were development and investment banks and 4 participation banks. Of the commercial banks and participation banks, 3 were state-owned, 33 were privately-owned banks, 17 were foreign banks² and 16 were banks in the national fund (BRSA, 2010).

Generally, following the crises in 2001 and the restructuring process, the banking sector showed a rapid growth performance in 2002- 2008 period. The total assets rose from USD 130 billion to USD 465 billion, their ratio to GDP from 57 percent to 77 percent. The numbers of branches and staff rapidly increased. In this period, the financial structure of the sector also became stronger. The shareholders' equity of the sector increased from USD 16 billion to USD 54 billion and its free equity from USD 3 billion to USD 40 billion. The capital adequacy ratio which was 18 percent as of December 2008, continued to grow and reached 19.4 percent in the first half of 2009. In addition, the risk management systems improved and public supervision became more effective in this period. The positive developments recorded by the banking system in 2002-2008 period have several reasons, including the favorable domestic and international economic situation and the change in the risk management conception. Another important reason is the success of the "Banking Restructuring Program" (BRSA, 2010).

3. Literature Review

Previous studies illustrate the use of data envelopment analysis to evaluate the performance of the banking industry. Halkos and Salamouis (2004) explore the efficiency of Greek banks with the use of a number of suggested financial efficiency ratios for the time period 1997-1999. They show that data envelopment analysis can be used as either an alternative or complement to ratio analysis for the evaluation of an organization's performance. The study finds that the higher the size of total assets the higher the efficiency. Paradi and Schaffnit (2004) evaluate the performance of the commercial branches of a large Canadian bank using data envelopment analysis. Using the nonparametric technique on a cross-section of 427 banks in eight developed countries, the mean efficiency value was of the order of 0.86 with a range of 0.55 for the UK to 0.95 for France (Pastor, Pe' rez, and Quesada, 1997). Bergendahl and Lindblom (2008) develop principles for an evaluation of the efficiency of a savings bank using data envelopment analysis (DEA) as a method to consider the service orientation of savings banks. They determine the number of Swedish savings banks being "service efficient" as well as the average degree of service efficiency in this industry.

Howland and Rowse (2006) assess the efficiency of branches of a major Canadian bank by benchmarking them against the DEA model of American bank branch efficiency. Berger and Humphrey

² There are 24 commercial, development and investment banks in which a majority of shares, excluding public shares, are held by residents abroad or which have entered into strategic partnership agreements with residents abroad. The controlling shareholders in those banks are resident in the USA (3), France (3), the Netherlands (2), Belgium (2), Germany (2), Greece, Portugal, Luxembourg, Iran, Pakistan, Israel, Bahrain, the United Kingdom, Saudi Arabia, Italy, Kazakhstan and Libya.

(1997) found that depository financial institutions/banks experienced annual average technical efficiency ratios of around 77% (median 82%). Most bank efficiency studies based on DEA approach focused on the banking sector in developed countries. Subsequently, Mukherjee, Ray, and Miller (2001) in their study of productivity growth in 201 large US commercial banks covering the initial post-deregulation period (1984–1990) uncovered the evidence that productivity grew, on an average, by 4.5% per year, with a significant decline in the initial years; banks with large asset size in fact experienced higher productivity growth. A study on cost and profit efficiency for a sample of 14 countries of the European Union, as well as Japan and the US, revealed wide inequalities of profitability between countries, which could be considerably reduced if inefficiency was eliminated (Maudos and Pastor, 2001).

4. Methodology

4.1 Analysis Tool

Ratio analysis has been used extensively in the finance industry for normative and positive purposes (Al-Shammari and Salimi, 1998). The normative approach compares a firm's ratio to a benchmark such as an industry average to judge its performance. The positive approach uses ratios to predict future performance such as earnings and also to assess the firm's risk. Two main reasons for using ratios as a tool of analysis are to allow comparison among different sized bank and to control for sector characteristics permitting the comparison of individual bank's ratios with some benchmark for the sector. The use of these accounting-based financial ratios to measure bank performance has been criticized. For instance, accounting data ignores the current market value of the bank and does not represent economic value-maximizing behavior (Kohers et al., 2000). Additionally, these financial ratios do not consider the input price and the output mix (Berger and Humphrey, 1992) while the selection of the weights of financial ratios is subjective. Due to these difficulties, Berger and Humphrey (1997) conclude that efficient DEA approaches seem to be superior compared to traditional financial ratios analysis in terms of measuring performance. They claim that the DEA approach offers an overall objective numerical score and ranking, and an efficiency proxy together with the economic optimization mechanism.

DEA is a linear programming formulation that defines a nonparametric relationship between multiple outputs and multiple inputs (Charnes et al., 1978). It basically identifies an efficient frontier, which consists of the most efficient decision making units (DMUs) such as banks. Efficient banks are those for which no other banks or linear combination of banks can generate at least the same amount of each output (given inputs). Model (1) below is the BCC fractional programming problem.

$$\begin{aligned} \text{maximize } h_0 &= \frac{\sum_{r=1}^s u_r y_{r0} - u_0}{\sum_{i=1}^m v_i x_{i0}} \\ \text{subject to } \frac{\sum_{r=1}^s u_r y_{rj} - u_0}{\sum_{i=1}^m v_i x_{ij}} &\leq 1, j = 1, \dots, n \\ u_r / \sum_{i=1}^m v_i x_{i0} &\geq \varepsilon, \\ v_i / \sum_{i=1}^m v_i x_{i0} &\geq \varepsilon, \end{aligned}$$

where,

h_0 the performance rating sought for firm “0” which is the one member of the reference set, $j=1, \dots, n$, that is to be evaluated relative to the others,
 v_i the variable weights for each type of input “ i ” which will be determined by solving model (1),
 u_r the variable weights for each type of output “ r ” which will be determined by solving model (1),
 u_0 the variable for identifying returns to scale,
 x_{i0} the known amount of input “ i ” used by firm “0” during the period of observation,
 y_{r0} the known amount of output “ r ” produced by firm “0” during the period of observation,
 x_{ij} the known amount of input “ i ” used by firm “ j ” during the period of observation,
 y_{rj} the known amount of output “ r ” produced by firm “ j ” during the period of observation,
 ε A non-Archimedean infinitesimal constant that effectively allows the maximization.

As can be noted from model (1) above, DEA is an external methodology that identifies a frontier of entities that are the best performers as defined by the reference set of organizations and variables included in the model. DEA assesses multiple independent and multiple dependent variables simultaneously in developing a single aggregate measure of performance that captures the multiple interactions between variables. Thus, common financial performance measures such as return on assets (net income/total assets) and asset turnover (sales/total assets) can be combined into a single comprehensive measure, which identifies the best performers via DEA. Referring to model (1) for example, to include return on assets in the model, profit would be included as an output (y_r) and assets would be included as an input (x_i). Asset turnover can be included by entering sales as an output. Other measures can be added similarly. The resulting comprehensive scalar measure of performance can then be used for statistical comparisons (Banker, 1993). Finally, DEA optimizes on each individual observation and thus permits different production functions or relationships between the variables for each organization. Furthermore, DEA will place the greatest weight (u_r and v_i) on the variables on which the entity does best. Thus, each organization under evaluation is placed in the best “light” possible. These are important considerations for this study because other studies (Antle and Smith, 1986; Ely, 1991) identified inter-industry differences in the financial variables that are most important in assessing the financial performance of a firm. That is, the significance of a specific performance measure was dependent on the industry the firm was in—indicating different production functions for different industries. DEA can readily handle the confounding effect of inter-industry differences because it does not assume any particular production function a priori.

The purpose of DEA is to empirically characterize the so-called efficient frontier (surface) based on the available set of DMUs and project all DMUs onto this frontier. If a DMU lies on the frontier, it is referred to as an efficient unit, otherwise it is labelled as inefficient. The data are enveloped in such a way that radial distances to the frontier are minimized. In practice, efficiency scores are calculated by solving a linear programming problem (Appendix A). The analysis under DEA is concerned with understanding how each DMU is performing relative to others, the causes of inefficiency, and how a DMU can improve its performance to become efficient.⁸ In that sense, DEA calculates the relative efficiency of each unit in relation to all other units by using the actual observed values for the inputs and outputs of each DMU. It also identifies, for inefficient DMUs, the sources and level of inefficiency for each of the inputs and outputs. The DEA is carried out by assuming either constant returns to scale (CRS) or variable returns to scale (VRS).

4.2 Identification of Inputs and Outputs for Banking Companies

Three approaches dominate the literature: the production approach, the intermediation approach and more recently, the modern approach (Das and Ghosh, 2006, p. 200). The first two approaches apply the traditional microeconomic theory of the firm to banking and differ only in the specification of banking activities. The third approach goes a step further and incorporates some specific activities of banking into the classical theory and thereby modifies it. In this investigation, we used production approach.

Under the production approach, banks are primarily viewed as providers of services to customers. The input set under this approach includes physical variables (e.g., labor, material, space or information systems and others physical assets) or their associated costs, since only physical inputs are needed to perform transactions, process financial documents or provide counseling and advisory services to customers. Interest costs are excluded from this approach on the grounds that only the operational process is of relevance. The output under this approach represents the services provided to customers. So, four indicators were using for inputs; number of employees (NOE), total assets (TAS), interest expenditures (INTEX), operating expenditures (OPREX) and two indicators using as outputs: interest income (INTINC), net profit (NETPRF).

4.3 Data Gathering

The Istanbul Stock Exchange has compiling these data starting from 2008/1 to 2009/12. There are 13 banks that listed ISE. Total assets of listed companies are 595.580.000.000 TL at end of 2009. Table 1 and Table 2 present dataset of inputs and outputs of research.

5. Empirical Findings and Analyses

In this study is examined the Turkish commercial banking performance in terms of their ability to provide outputs with minimum input consumption. They are the total efficiency scores, which are reported for the individual banks under constant returns to scale (CRS) assumption. Table 3 details these results. The DEA efficiency scores can be interpreted to show how much each bank could reduce its input usage without reducing output if it were as technical efficient as the best practice banks. For example, if a bank has an efficiency score of 70%, this implies that that particular bank needs to reduce its inputs by 30% in order to achieve 100% efficiency (see appendix 2 for reference value inefficient banks and projections in reference set).

The DEA results show that the listed commercial banking features high efficient in 2008 and 2009. The standard deviations of this analysis are 0.03 for 2008 and 0.06 for 2009. The efficiency scores of the banks in the sample ranged from 0.88 percent to 100 per cent in 2008 and 0.81 percent to 100 percent in 2009 that very high and a good indicator for finance sector. Among the 13 private banks, 7 banks are fully efficient at 2008, 8 banks at 2009. But Bank5, Bank7, Bank8, Bank11 and Bank13 are inefficient in 2008 and Bank5, Bank7, Bank8, Bank11 and Bank13 are inefficient 2009. Bank8 is most inefficient in listed banks (0.88 and 0.81).. Average efficiency is 0.965 at 2008 and 0.960 at 2009 (see Table 4). Generally, the financial performance of listed companies is very well. This good development for Turkish Banking Sector. Also, performance of inefficient banks isn't very bad.

Conclusion

This paper has examined the efficiency in Turkey's listed banking companies. The DEA approach was applied to measure the efficiency of listed banks in ISE. The data used in this study involved observations from balance sheet and income statements of banks are stay ISE web address. It should be noted that this study measures the relative performance of the listed banks in different inputs required for producing a given output. This study does not consider the quality of outputs and inputs, such as profit quality and technical characteristics of banking sectors, and other factors such as the historical development of banking sectors.

According to DEA results, seven banks in 2008 and eight banks in 2009 are efficient. On the other hand, six banks in 2008 and five banks in 2009 are inefficient. Generally, listed banks in Turkey have over

performance compare with European banks and US banks. So, profitability and financial performance of listed bank very well, according to DEA scores. Turkey Economy' has developing and crisis effect on the economy so weak, especially banking companies. Between 2002-2009 years, banking sector have powerful position in the Turkey' finance section and dominant role in Turkish business life. This trend will continues in 2010, 2011 and 2012. The results of this study indicate that the performance of banking sector is very strong. In general, after a period of rapid growth in investment and number of brunches, perhaps it is time for the banking sector to consolidate and to put more emphasis on internet based growth. It should be emphasized that this study compared only the relative efficiency performance of the banking companies of ISE. Finally, for future research studies, the efficiency performance of Turkish Banking sector can be compared with that of their counterparts in other countries. The results from the studies will provide information about the relative performance of Turkey in the global finance market. This analysis reveals quite wide non-variation in efficiency.

ABSTRACT

Balance scorecard is a widely recognized tool to support manager in performance of work. Balance Score Card (BSC) has many advantages but it also suffers from some drawbacks. In this paper, we develop a new balancing approach based on game theory. We propose an interaction method among different strategic agents of scorecard as players providing a methodology for collaboration among different players to reduce any inconsistency. We implement four-person cooperative game theory to balancing in BSC.

Keywords: Balanced Scorecard (BSC), Cooperative game theory, performance measurement

1. INTRODUCTION

During the past few years, balanced scorecard (BSC) has been widely used among academicians and researchers involved in strategic management and managerial accounting. The BSC, designed by Kaplan and Norton in 1992, uses four perspectives which reflect firm value creation activities: Learning and growth perspective, internal/business process perspective, customer perspective, and finally financial perspective.

The BSC methodology creates an infrastructure for strategic management activities and introduces four new management processes contributing to linking long-term and short-term strategic objectives separately and simultaneously and use tools for doing balance in organization. BSC helps managers understand numerous interrelationships and causal effects in among perspectives (Huang, 2009:209). This understanding can help managers to choice best strategy for organization to reduce barriers and ultimately improve decision-making and problem solving. Strategy and execution reviews can help management teams review the strategic plans, the review of planning process, including BSC metrics and strategy maps (Kaplan, Norton, 2004 and Leung, Lam & Cao, 2006:682). Although BSC has proven a powerful tool for strategic planning and communicating strategy that assists in strategy implementation but there are some limitations on using this method. One basic issue to be surmounted is the difficulty of determining Balancing among different BSC perspective (Yuksel and Dagdeviren, 2009). In this article, we use cooperative game theory to make predictions about four-person corporation games.

The rest of this article is organized as follows. In the following section, we provide an introduction to balance score card and the cooperative game theory. In Section 3, we present methodology for combine game theory and BSC. In Section 4 one balancing system defined by the use of game theory and Finally, the conclusion remarks are given in section 5 to summarize the contribution of the paper.

2. LITERATURE REVIEW

2.1 Literature on the balanced scorecard (BSC)

First devised by Kaplan and Norton, the balanced scorecard approach comprises four perspectives: learning and growth perspective, internal process perspective, customer perspective, and financial perspective which seeks to offer managers a system that would help them turn strategy into action (Wong, Lam & Chan, 2009:369). Presently, a large number of organizations are currently successful using BSC. In fact, Koning in 2004, mentions that recent estimates suggest that 60% of the 500 largest Fortune Organizations use BSC and also Gumbus in 2005 years, mention that 64% of American Company using BSC for performance evolution. There is considerable evidence that organizations are increasingly adopting BSC in their strategic process. BSC have benefits for organization that there are some advantages:

1. Just a few numbers or performance indicators need to be checked (Neely, 1998).
2. Serves as a bridge between different fields (financial and non-financial fields) (Kaplan and Norton, 1996:75).
3. Drawing causer loop diagram for improve strategic plan (Kaplan and Norton, 1996:75).
4. Integrate simple plans for reduce contact in doing strategies (Li, Gu & Liu, 2009:2918).
5. Improve information management in organization (Bobillo , Delgado, Romero and Lopez, 2009).

But it must be noted that there are some limitations:

1. Unidirectional causality too simplistic: The use of causal-loops alone is seen as problematic (Richmond, 2001).
2. Does not separate cause and effect in time: The time dimension is not part of the BSC (Lee, , Chen & Chang, 2008:96).
3. No mechanisms for selected best measures for performance: The BSC concept provides any mechanism for to best defined measures (Leung, Lam & Cao, 2006:682 and Cebeci, 2009:8900).
4. Don't selected chain value for organization: BSC cannot define chain value in strategies operation (Yuksel and Dagdeviren, 2009).
5. BSC don't dynamic for control online (Akkermans and Oorschot, 2002:932).
6. Balancing in BSC isn't actual (Pfeffer and Sutton, 2000).

In this paper, we using of a new approach (game theory) to solve limitation of BSC.

2.2 Background of the evolutionary game and the model

Game theory is often described as a branch of applied mathematics and economics that studies situations where multiple players make decisions in an attempt to maximize their returns (Myerson, 1997). Generally, the publication of the theory of Games and Economic Behavior by Morgenstern and Von Neumann in 1944 symbolizes the foundation of Game Theory system (Shapley, 1953). The modern game theory developed from 1950s- 1960s, and in 1970s the modern game theory became popular economic theory and behavior politics (Suijs , Borm , Waegaenere & Tijs, 1999:195). The basic concept of game theory includes: player, action, strategy, information, income, equilibrium. Initial of game theory concept is a basic modeling for function payoff for any players. The basic model of formal game theory (Tijs, 2003):

σ_1, σ_2 Are the actions of player1 and player 2; P is the payoff function of every player in different strategy association. Set is the set of players' strategies. If $\{\overline{\sigma_1}, \overline{\sigma_2}\}$ satisfied the following:

$$\begin{cases} P^1(\overline{\sigma_1}, \overline{\sigma_2}) = \max_{\sigma_1 \in S^1} P^1(\sigma_1, \sigma_2) \\ P^2(\overline{\sigma_1}, \overline{\sigma_2}) = \max_{\sigma_2 \in S^2} P^2(\sigma_1, \sigma_2) \end{cases} \quad (1)$$

Then strategy set $(\overline{\sigma_1}, \overline{\sigma_2})$ is Equilibrium. For game set $(\overline{\sigma_1}, \overline{\sigma_2}) \in V$, if there is no strategy set (σ_1, σ_2) satisfying the following at the same time:

$$\begin{cases} P^1(\overline{\sigma_1}, \overline{\sigma_2}) \geq P^1(\sigma_1, \sigma_2) \\ P^2(\overline{\sigma_1}, \overline{\sigma_2}) \geq P^2(\sigma_1, \sigma_2) \end{cases} \quad (2)$$

Then it is called Pareto optimality.

3. METHODOLOGIES

In this study evolutionary game theory will be used combined with balanced scorecard (BSC). Game theory has been accepted widely as the best tool for interactive decision making, while BSC on the other hand has been accepted also as the best tool in performance measurement, which is the game theory for determined balanced point in dynamic approach for organization. The model will be built in interactive framework where in making decision each player considers other possible strategies choices.

This study applied a prototype BSC-Game which linked the database management, model base, knowledge acquisition, and dialogue subsystems to construct a BSC knowledge-based system for balancing by using new tools. The BSC-Game comprises three main components, as illustrated in Fig. 1.

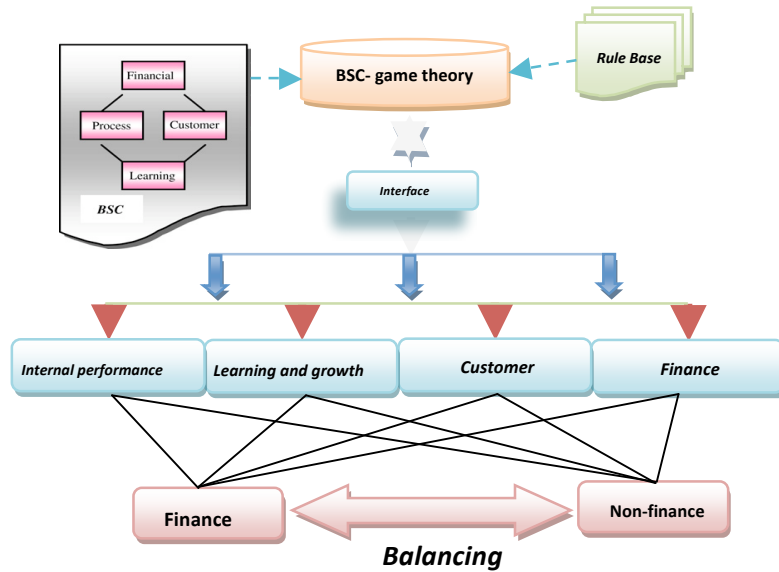

Fig. 1 The architecture of the BSC- game theory system (BSC-Game)

4. APPLYING COOPERATIVE GAME THEORY IN BSC

This might be far-fetched to define the proportional probability of playing the cooperation strategy as the collaboration effort. In a cooperative game, it is natural to assume that players can make continuously varying collaboration effort. In a four-player cooperative game, we assume that each player has a maximum resource budget, $x_{1m}, x_{2m}, x_{3m}, x_{4m}$, respectively. However four players might determine their collaboration effort during the cooperative process.

Let p_1, p_2, p_3, p_4 be the effort index of Player $i (i = 1, 2, 3, 4)$. Accordingly, $p_i x_{im}$ is the total collaboration effort of Player $i (i = 1, 2, 3, 4)$. We denote $B(p_1 x_{1m}, p_2 x_{2m}, p_3 x_{3m}, p_4 x_{4m})$ as common benefit of four players. Because of the efficiency of different players, we adopt $B(p_1 x_{1m}, p_2 x_{2m}, p_3 x_{3m}, p_4 x_{4m})$, which allows asymmetric efficiency between players as the benefit function. Let $C(p_i x_{im})$ be the cooperation costs of four players respectively. Thus, Player i 's payoff function can be written as follows.

$$\Pi_i(p_1, p_2, p_3, p_4) = B(p_1 x_{1m}, p_2 x_{2m}, p_3 x_{3m}, p_4 x_{4m}) - C(p_i x_{im}) \quad (3)$$

Here we would like to emphasize that we are discussing an asymmetric continuous cooperation game. If Eqs. above are concave and we obtain a vector of $\{p_1^*, p_2^*, p_3^*, p_4^*\}$ where $0 \leq p_i \leq 1$, then $\{p_1^*, p_2^*, p_3^*, p_4^*\}$ is a unique equilibrium for this asymmetric continuous cooperation game. We focus on case where the payoff functions are linear to the collaboration efforts. We have the following observation.

Table 1: The players' effort matrix

		Player 1			
		Cooperate		Defect	
Player 2	Cooperate	Player 3 (Cooperate), Player 4(Cooperate)	Player 3 (Defect), Player 4(Cooperate)	Player 3 (Cooperate), Player 4(Cooperate)	Player 3 (Defect), Player 4(Cooperate)
		Player 3 (Cooperate), Player 4(Defect)	Player 3 (Defect), Player 4(Defect)	Player 3 (Cooperate), Player 4(Defect)	Player 3 (Defect), Player 4(Defect)
	Defect	Player 3 (Cooperate), Player 4(Cooperate)	Player 3 (Defect), Player 4(Cooperate)	Player 3 (Cooperate), Player 4(Cooperate)	Player 3 (Defect), Player 4(Cooperate)
		Player 3 (Cooperate), Player 4(Defect)	Player 3 (Defect), Player 4(Defect)	Player 3 (Cooperate), Player 4(Defect)	Player 3 (Defect), Player 4(Defect)

		Player 1			
		Cooperate		Defect	
Player 2	Cooperate	$p_1 p_2 p_3 p_4$	$p_1 p_2 (1 - p_3) p_4$	$(1 - p_1) p_2 p_3 p_4$	$(1 - p_1) p_2 (1 - p_3) p_4$
		$p_1 p_2 p_3 (1 - p_4)$	$p_1 p_2 (1 - p_3) (1 - p_4)$	$(1 - p_1) p_2 p_3 (1 - p_4)$	$(1 - p_1) p_2 (1 - p_3) (1 - p_4)$
	Defect	$p_1 (1 - p_2) p_3 p_4$	$p_1 (1 - p_2) (1 - p_3) p_4$	$(1 - p_1) (1 - p_2) p_3 p_4$	$(1 - p_1) (1 - p_2) (1 - p_3) p_4$
		$p_1 (1 - p_2) p_3 (1 - p_4)$	$p_1 (1 - p_2) (1 - p_3) (1 - p_4)$	$(1 - p_1) (1 - p_2) p_3 (1 - p_4)$	$(1 - p_1) (1 - p_2) (1 - p_3) (1 - p_4)$

We show that the payoff of a player in a special continuous-strategy collaboration game can be used to describe the payoff of the player in a dynamic game. For a discrete-strategy game, we argue that the mixed strategies might be considered as a continuous effort that a player is willing to contribute to the collaboration. Thus, we can consider a mixed strategy essentially as an effort matrix (see Table 2).

In this article, we conglomerate a single factor called social punishment, which is denoted by δ . In this collaboration game, we assume that a player will be punished, e.g. his/her reputation gets hurt, etc., if he/she decides to defect while the other cooperates. We model a symmetric collaboration as shown in Table 2.

Table 2: A symmetric collaboration game

		Player 1			
		Cooperate		Defect	
Player 2	Cooperate	$b - \frac{c}{4}, b - \frac{c}{4}, b - \frac{c}{4}, b - \frac{c}{4}$	$b - \frac{c}{3}, b - \frac{c}{3}, b - \delta, b - \frac{c}{3}$	$b - \delta, b - \frac{c}{3}, b - \frac{c}{3}, b - \frac{c}{3}$	$b - \delta, b - \frac{c}{2}, b - \delta, b - \frac{c}{2}$
		$b - \frac{c}{3}, b - \frac{c}{3}, b - \frac{c}{3}, b - \delta$	$b - \frac{c}{2}, b - \frac{c}{2}, b - \delta, b - \delta$	$b - \delta, b - \frac{c}{2}, b - \frac{c}{2}, b - \delta$	$b - \delta, b - c, b - \delta, b - \delta$
	Defect	$b - \frac{c}{3}, b - \delta, b - \frac{c}{3}, b - \frac{c}{3}$	$b - \frac{c}{2}, b - \delta, b - \delta, b - \frac{c}{2}$	$b - \delta, b - \delta, b - \frac{c}{2}, b - \frac{c}{2}$	$b - \delta, b - \delta, b - \delta, b - c$
		$b - \frac{c}{2}, b - \delta, b - \frac{c}{2}, b - \delta$	$b - c, b - \delta, b - \delta, b - \delta$	$b - \delta, b - \delta, b - c, b - \delta$	$0, 0, 0, 0$

Thus, Player 1's expected payoff is given by :

$$\begin{aligned}
\Pi_1(p_1) = & p_1 p_2 p_3 p_4 (b - \frac{c}{4}) + p_1 p_2 (1 - p_3) p_4 (b - \frac{c}{3}) + (1 - p_1) p_2 p_3 p_4 (b - \delta) + (1 - p_1) p_2 (1 - p_3) p_4 (b - \delta) \\
& + p_1 p_2 p_3 (1 - p_4) (b - \frac{c}{3}) + p_1 p_2 (1 - p_3) (1 - p_4) (b - \frac{c}{2}) + (1 - p_1) p_2 p_3 (1 - p_4) (b - \delta) + (1 - p_1) p_2 (1 - p_3) (1 - p_4) (b - \delta) \\
& + p_1 (1 - p_2) p_3 p_4 (b - \frac{c}{3}) + p_1 (1 - p_2) (1 - p_3) p_4 (b - \frac{c}{2}) + (1 - p_1) (1 - p_2) p_3 p_4 (b - \delta) \\
& + (1 - p_1) (1 - p_2) (1 - p_3) p_4 (b - \delta) + p_1 (1 - p_2) p_3 (1 - p_4) (b - \frac{c}{2}) + p_1 (1 - p_2) (1 - p_3) (1 - p_4) (b - c) \\
& + (1 - p_1) (1 - p_2) p_3 (1 - p_4) (b - \delta)
\end{aligned}$$

Let $\frac{\partial \Pi_i(p_i)}{\partial p_i} = 0$ ($i = 1, 2, 3, 4$) and we obtain the optimal solution. We use an example to show the implementation of our proposed method.

5. CONCLUSIONS

Game theory, in the last decades has emerged as a powerful method to describe and to give way-outs when facing interactive problems solving. However, one big constraint to make it more applicable seemingly is in determining alternative pay-offs. Especially when the problems are dominated by qualitative considerations like what usually happens in strategic problems. Qualitative inputs cannot be processed directly by game theory. They should be translated first into quantitative inputs (pay-offs). As run the model by MATLAB software, I see that is Nash equilibrium point in $p_i = 0.5$ $i = 1, 2, 3, 4$

Fig. 2: Nash equilibrium point

Fig. 3: Error of run model

This paper shows how game theory can be used to balance that perspective of BSC. The research found that the best Equilibrium point for the four players in BSC is by $p_i = 0.5$ $i = 1, 2, 3, 4$. To deal with that, they need to unite their efforts and to support one another.

ABSTRACT

Performance measurement criteria based on financial bench marks of industrial century, show the past performance in reality, and do not give any ideas about the future. With the imbalances arising of not taking into consideration the factors effecting financial performance and financial indicators measuring performance unilaterally, and organizations being unsuccessful in implementing their strategies, has provided the development of Balanced Scorecard (BSC) model. Within this context, short and long term targets, financial and non-financial criteria, results and indicators affecting results, balance formed bittern the performance dimensions in the organization and outside are emphasized in BSC. In this work, the managers of the organizations included in the first 500 were asked whether they used BSC management model in their organizations or not, and to the organizations that use BSC method, their opinions on the implementation of BSC, and to the organizations that do not use BSC management model, were asked whether they thought of using this method in the future or not. The organizations that use BSC method and those that plan to use the BSC method in the future were asked what their expectations were when choosing BSC method. Results obtained, were compared to the work of Coşkun in 2006 (Coşkun, 2006) using the BSC method in the first 500 organizations of Turkey.

Keywords: *Balanced Scorecard; BSC; BSC usage; BSC usage in Turkey*

INTRODUCTION

The purpose of this work is to learn the awareness of Balanced Scorecard (BSC) method, assessed as the most innovative and effective management idea of the last 75 years, by Harvard Business Review, in the and their opinion on the implementation of BSC method. Subsequently, the organizations that use BSC management model and those that do not use it, were compared from the point of importance the place on the dimensions of BSC and the frequency of measuring these dimensions.

BSC that is a strategic management model that is based on measure and that turns strategy into action; it has four dimensions: financial, customer, internal processes and learning and development. In the competitive environment of the information age, in order for the organizations to be successful, BSC must place importance to these four dimensions. However, as it is understood from the definition of BSC, measuring such dimension is also an obligation. Because it is not possible to manage without measuring, within this scope, first literature is searched, and the questionnaire prepared to learn the opinions of the first 500 organizations of Turkey about the BSC, were sent to all excluding 16 organizations that do not wish their names announced, and replies were received from 238 organizations.

EXISTING SITUATION

Many organizations measure their performance by taking into consideration their financial data, and the value creating elements, together with the value creating elements of marketing are ignored. Operations

cannot follow the changes in strategic value creators by only using the accounting or financial performance criteria. While financial criteria can offer perfect information about the past, they do not provide much information about the future. In financial accounting, figures such as profitability, size of balance sheet, sales, costs, production etc. are used for the purposes of performance measure. In the measurement of organizational performance, focusing only in financial data creates a single sided point of view in collective activities; therefore an effective coordination becomes hard (Nilsson&Olve, 2001). Additionally, the fact that financial criteria are related to financial policy, (Kloot&Martin, 2000), its inadequacy in measuring the performance of nonmaterial assets, (Lövingsson, Dell'Orto&Baladi, 2000), that it does not provide the organization any data on answering both the real requirements of the customer and the satisfaction of customer requirements, (Şimşek, 2006) appears the most important inadequacy of financial criteria. In addition to these, the values created or lost as the result of the attitude of the managers, can not be seen in financial tables. Therefore, financial criteria are not in harmony with the business reality of information age. In measuring the operation performance; activities in the operation, condition of the market, interaction of the subjects that are direct interest to the operation strategies such as R&D and heir contribution to strategy must be must solidly put forward. With such an approach, financial criteria and information that will shape the future will be used together, performance criteria will be balanced, and operations' reaching its target will be easier.

In addition to the inadequacies arising from the use of only financial criteria, another reality determined is the fact that organizations inability to implement their strategies correctly. Namely, in a research done by Fortune Magazine in 1980's the rate of the strategies implemented was determined to be 10%; in the research made in 1999 it was stated that 70% of the failures seen arose from the inability to implement strategies (Kaplan&Norton, 2001). Another research showed that only 5% of the employees understood the strategy of the organization, only 25% of the managers have related the incentive premiums with the strategy, 60% of the organizations did not associate budget and the strategy, and 85% of the top level executives, have spent less than an hour, once a month on the strategies (Niven, 2002). As it can be understood from these data, it is quite normal that 90% of the organizations are not successful in application of their strategies. No matter how successful a strategy is, it has no benefit to the organization unless it is implemented. In today's competitive environment, implementation of the strategies are required, rather than their formulation.

Due to all these explanations, operations were forced to focus on new criteria, in order to continue their success (Leinonen, 2005): Performance measure matrix (Keegan, 1989), Smart pyramid (Lynch&Cross, 1991), Balanced Scorecard (Kaplan&Norton, 1992) and performance prism (Kennerly&Neely, 2000) can be shown as examples to these (Metawie&Gilman, 2006). These approaches show similarities with respect to clarify the strategy, putting forward the success factors compliant to the strategy, and defining proper criteria for the critical success factors (Mettanen, 2006).

BALANCED SCORECARD

BSC, has brought an integrated approach to measuring performance, by placing importance to both the financial criteria and nonfinancial criteria in the measurement of organizational performance, and is accepted as the most innovative and most effective management idea of the last 75 years by HBR (Sibbet, 1997). Similarly, among the top level executives, who are active in more than 30 industrial areas by Bain and Company, among the most effective and satisfactory management tool used widely, BSC, is determined as the most successful one (Niven, 2002). BSC has been used successfully in prioritizing the strategic objective instead of daily activities, in following-up and control of these activities in time, both in the public and in business world (Olve&Sjöstrand, 2006).

Kaplan and Norton, who developed BSC management model, have defined BSC as a strategic performance management system that formed a framework for the strategic measurement and management by converting the organization's mission and strategy into a detailed performance measuring set (Kaplan&Norton, 1996). Brown and McDonell (Brown&McDonell, 1995), who handled the subject as of its purpose, has stated that BSC as a performance measurement method developed to assist to overcome the problems arising from the imbalances between the factors affecting the performance with incomplete and one sided measurement due to adhering to the short term indicators, the organizations which use traditional performance measurement systems face. Braam and Nijsen have also (Braam&Nijsen, 2004) emphasized BSC as a strategic management system that clarifies the strategy and turns strategy into action. In addition to these, BSC is also evaluated as performance measuring and evaluation tool that considers the organization as a whole, both an integrated management tool and also that uses various performance indicators (Koçel, 2001), and a tool providing learning and development of betterment, to determine the organizational objective and to provide

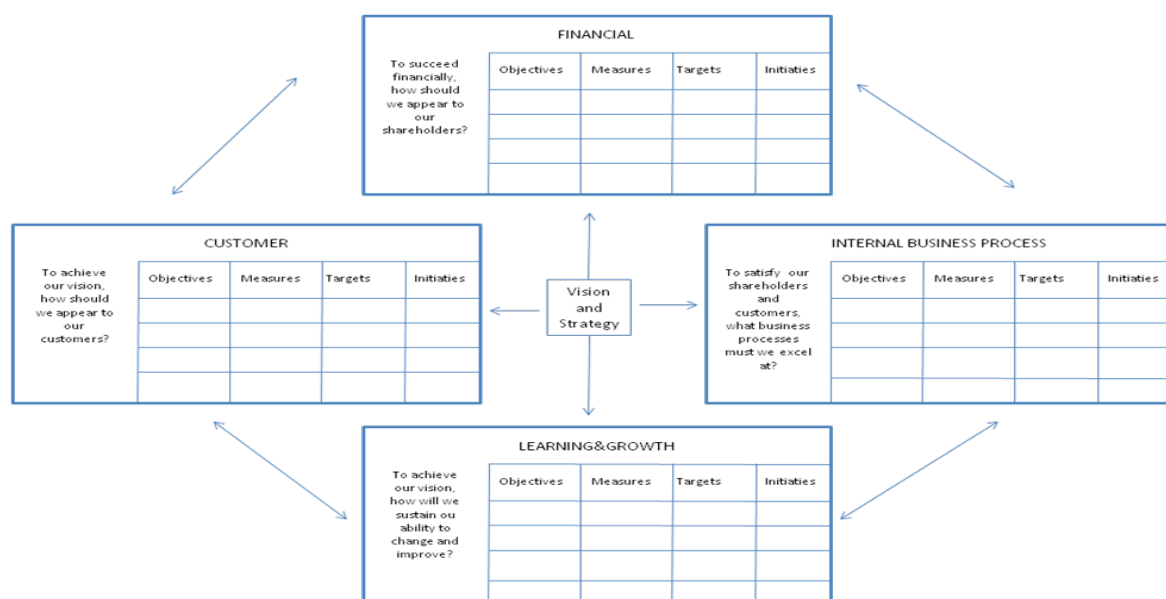

feedback (Gautreau&Kleiner, 2001). As it can be understood from these definitions, BSC, by placing importance to the non-financial criteria in addition to financial one in the measurement of the organization performance, while develops an integrated approach to the performance measurement, also required the determination of the strategic objectives in an absolute way, and definition of these critical factors that shall provide reaching the objective.

In BSC, the results of the strategic decisions are evaluated in four important dimensions. These dimensions are: Financial Dimension, Customer Dimension, Internal Processes Dimension and Learning and Development Dimension. Addition of three dimensions to financial dimension has covered an important incomplete point. While financial measurement puts forward the past performance of the organization, BSC’s other three non-financial dimensions determines the future performance of the organization. These dimensions are generally adequate when defined absolutely. In the event it is required, dimensions can be extended or replace another dimension. Selection depends on the characteristics of the area organization works (Michalska, 2005). Whether all the dimensions are used or not, or adding new dimensions to these in the event it is required, has provided flexibility to BSC.

In financial dimension, the issue of what needs to be done to increase the profit share of the shareholders and the value of the organization is being researched. In customer dimension, customer and market characteristics the managers wish to compete are determined. In internal processes dimension, critical processes are defined that are required to reach financial objectives. It is not possible for an approach where the processes are not compatible with strategies; employees have ambiguous ideas about their roles in the process and the strategy. In learning and development dimension, the abilities of the organizations to provide continuous development in the existing products and production process, to develop their learning and changing capability, and to continue these characteristics are also emphasized.

Each of the dimensions defines the objectives of the operation (that will be succeeded), its indicators (criteria of the objectives), targets (score and timing required to be achieved), activities (how they will be done). Selection of the dimensions this way is quite reasonable. Namely, after the organization decides on its financial objectives, (Financial dimension), in order to reach these objectives, how it should appear to its customers (Customer Dimension), how it will shape its internal processes to reach the objectives it has determined, (Internal Processes Dimension), which methods does it need to provide the continuity of work and its better execution (Learning and Growth Dimension). The questions to which answers are required in this definition can be expressed as: For Financial Dimension; “How do we appear to the shareholders?” For Customer Dimension; “How should the customers perceive us?” For Internal Processes Dimension, “How Can We Provide Perfection?”, and for Learning and Development Dimension, “How can we continue to develop and create value?”

Figure 1: Converting the strategy and vision into physical vision by means of the dimensions of BSC

Source: Kaplan and Norton, 1996:76.

Organizations that can turn the operation strategy into measurement system, they will be more successful in the issue of implementing their strategies since this will provide the understanding of purpose and objectives better. Expressing of the criteria produced from strategy, in numerical objectives and criteria will provide the understanding of the strategy by all employees. BSC, in this sense is helping in removing the barriers met in the implementation of the strategy. Because Balance Measurement Indicator, requires the absolute determination of the strategic objective of the operation and the definition of the criteria that will provide the reaching to these objectives. In this context, by means of the dimensions of the BSC, how the strategy and vision are turned into physical criteria are shown in Figure 1 (Kaplan&Norton, 1996).

As a matter of fact, in a questionnaire conducted by BSC Collaborative in September 2000, 66% of the organizations have stated that they have put the BSC system in use, to bring the organization to the same parallel with strategy, 61% to provide organizational strategy, 57% to establish strategic management system, 54% to connect the strategy with planning and budgeting, 51% to establish strategic targets, 50% to determine strategic priorities, 47% to provide the individuals to be in the same direction with the strategy (Downing, 2000).

METHOD

In the research, as a method of collecting information, questionnaires by mail were used. Whether the organizations included in the first 500 in Turkey, used BSC management model or not was researched, the organizations that use BSC method, their opinions on BSC method, and the organizations that do not use BSC method were asked whether they thought of using it or not in the future. The expectations of the organizations that use BSC method and those which plan to use BSC method when choosing this method were determined. In order to determine the validity of the general opinions related to BSC hypothesis test is used. The questionnaire prepared, is sent to all the largest companies of Turkey that are within the first 500, excluding those 16 that did not wish their names announced. 8 of the organizations the questionnaires were sent to gave feedback indicating that they did not participate in these types of research. 238 organizations have answered the questionnaire.

1. The Duties of the People Who Answered the Questionnaire

It was sent that most of the people who answered the questionnaire are people who work in higher level of management, and who are included in the decision stage of the performance implementations. 94 people (39,50%) are employed in higher levels of management such as general manager, vice general manager, chairman of the board, or vice chairman, member of the board of directors and strategic planning manager. The percentage of answering the questionnaire by human resources manager, quality management manager, accounting, finance or finance manager is 45%. The duties of the people who answered the questionnaire the organization are shown in Table 1.

Table 1. Duties of the People who answered the Questionnaire:

Duty	N	Percentage
General Manager	56	23,5
Vice General Manager	28	11,8
Chairman of the Board/Vice chairman	5	2,1
Member of the Board	3	1,3
Strategic Planning Manager	2	0,8
Human Resources Expert	12	5,0
Human Resources Manager	39	16,4
Quality Management Manager	13	5,5
Accounting, Finance /Financial Manager	29	12,2
Other Managers (Production Man., Marketing Man. / Profitability Branch Manager)	26	10,9
Other (Legal Consultant, Consultant, Chief, Engineer etc.)	21	8,8
Those who did not answer	4	1,7
Total	238	100

2. Field of Activity of the Organizations

The highest rate of receiving answers from the organizations who participated in the research is cement sector with a percentage of 77,27%. The lowest rate of receiving answers is the plastic sector, and the percentage of receiving answers is 30%. No answers were received from aviation sector and tobacco products sector. The fields of activities of those answering the questionnaire are given in Table 2.

Table 2. The Duties of the People Who Answered Questionnaire

Sector	No. of Organ. Questionnaire sent to	No. of Organ. That Answered the Questionnaire	Percentage	Rate of Received Answers
Tree—forestry	12	6	2,52	50,00
Packaging	11	6	2,52	54,55
Informatics	35	15	6,30	42,86
Glass-Ceramics	8	6	2,52	75,00
Cement	22	17	7,14	77,27
Iron-Steel	15	9	3,78	60,00
Electric-electronic	22	14	5,88	63,64
Energy-petroleum	20	8	3,36	40,00
Food-beverage	82	31	13,03	37,80
Fertilizer	6	2	0,84	33,33
Textile-ready Made Apparel	70	28	11,76	40,00
Service	20	12	5,04	60,00
Press-publishing	2	1	0,42	50,00
Rubber	3	2	0,84	66,67
Medicine	13	10	4,20	76,92
Construction and construction material	5	2	0,84	40,00
Chemistry	13	7	2,94	53,85
Jewelry making	3	2	0,84	66,67
Minerals	6	2	0,84	33,33
Machine	23	11	4,62	47,83
Metal	16	11	4,62	68,75
Automotive	39	20	8,40	51,28
Retail	14	7	2,94	50,00
Plastic	10	3	1,26	30,00
Telecommunication	5	4	1,68	80,00
Tourism	4	2	0,84	50,00
Aviation	3	0	0,00	0,00
Tobacco and tobacco products	2	0	0,00	0,00
Total	484	238	100,00	

3. BSC Usage

17,64% of the organizations according to the research use BSC in all departments 4,62% in some departments. Therefore the rate of the organizations that use BSC is 22,26%. Additionally among the organizations that participate in the research 6,72% has completed BSC project and reached the stage of starting the implementation. 69,32% of the organizations that participated in the research never used BSC. 4 of the organizations (1,68%) that participated in the research the BSC implementation that started was abandoned. BSC usage is given in Table 3.

Table 3. BSC Usage

Do you use BSC in your organization?	Frequency	Percentage
Never used it	165	69,32
Implemented but abandoned	4	1,68
Its project is completed we will start implementing it.	16	6,72
We use it in some of the departments of our organization	11	4,62
We use it in all departments of our organization	42	17,64
Total	238	100

Coşkun, in the research carried (2006), has determined that 18,69% of the Turkish organizations used BSC method, in 2,80% BSC project was completed, 59,81% never used BSC, and in 1 organization the BSC implementation is abandoned. When compared to BSC implementation in the world, it will be seen that the rate of implementation of the BSC in Turkey is low. That is to say, in the research made in 1998; 61 of the 236 organizations in Denmark, Finland and Norway, have used BSC method, and 140 were planning to use within two years (Nilsson&Olive, 2001). It is determined that 60% of the organizations in Fortune 1000 in USA know BSC very well and implemented it, this percentage in Swedish organizations was 27% and this percentage is to be estimated to increase to 61% within two years (Ax&Bjornenak, 2005), and in 1999, the rate of usage of BSC in USA is determined to be 43,9% (Rigby, 2001).

4. Opinions Relevant to BSC Implementation

With the aim of learning the opinions of the organizations that use BSC method, on this method, the question “Do you agree with the sentences below relevant to BSC implementation in your organization?” was asked. The sentences the managers were asked whether they agreed or not relevant to BSC are given below:

- Our departments that use BSC work more effectively than other departments,
- BSC can not be used in a healthy way because it is difficult to obtain the required information,
- It is very hard to implement BSC and its benefits are very little,
- Our quality implementations are compatible with BSC,
- Our rewarding system are directly connected to BSC results,
- The objectives determined for employees, are determined in harmony with BSC ,
- We take into consideration the results of BSC when forming company strategies,
- BSC was more beneficial to our organization than we expected,
- We recommend the usage of BSC to other organizations.

The participants of the questionnaire were asked to state their opinions by checking one of the following according to 5 Likert scale, as I do not agree (1), I absolutely agree (5).

When evaluating the answers received; 1,50 and lower percentages, selected “I never agree ”, between 1,51-2,50 percentage “I do not agree”, between 2,51-3,50 percentages “I have no idea”, between 3,51-4,50 percentage “I agree”, and between 4,51-5,00 percentage stated that “I absolutely agree”. Average and standard deviation of the executives related to BSC implementation is shown in Table 4.

Among the answers received from those who answered questionnaire, related to the learning their ideas about BSC, 4 have average 4,00 and above, the answers given to 3 have the average between 3,50 and 4,00. 2 of the answers given turned out to be below 2,00.

Table 4: Opinions related to the implementation of BSC

Opinions	N	Aver.	s.s.
Departments that use BSC work more effectively	63	3,8571	0,87726
BSC can not be used in a productive way because it is hard to obtain the required information.	68	1,7500	0,65506
It is very hard to implement BSC and it has few benefits.	67	1,7015	0,55089
Our quality implementations are compatible with BSC.	68	4,0882	0,78674
BSC results are directly connected to our rewarding system.	66	3,6515	1,05964
The objective determined for employees, are determined in harmony with BSC.	64	4,1250	0,91721

We take into consideration the results of the BSC while forming the strategies.	70	4,3714	0,76464
BSC had more benefits to our organization than we have expected.	66	3,8333	0,75617
We recommend BSC implementation to other organizations.	69	4,3333	0,65679

Hypothesis test was applied to determine the validity of general opinions related to BSC. Hypotheses were written as below:

$$H_0: \mu \leq 3,50$$

$$H_1: \mu > 3,50$$

Below suggestions are taken as alternative hypothesis and are tested by using “single sampling *t* test”:

1. Hypothesis: *The opinion “The departments that use BSC work more effectively” is valid for all of the executives.*
2. Hypothesis: *The opinion “BSC can not be used in a healthy way because it is hard to obtain the required information” is valid for all executives.*
3. Hypothesis: *The opinion “BSC results are taken into consideration when forming the company strategies” is valid for all executives.*
4. Hypothesis: *The opinion “We suggest BSC method to our organizations as well” is valid for all executives.*
5. Hypothesis: *The opinion “BSC has more benefits to the organization than expected” is valid for all executives.*

The results of the hypothesis tests related to BSC usage are give in Table 5.

Table 5: Test results for the opinions related to BSC implementation

Hypothesis	N	Average	s.s.	t value	Result
1. Hypothesis	63	3,8571	0,87726	3,231	Accept
2. Hypothesis	68	1,7500	0,65506	-22,030	Reject
3. Hypothesis	70	4,3714	0,76464	9,535	Accept
4. Hypothesis	69	4,3333	0,65679	10,539	Accept
5. Hypothesis	66	3,8333	0,75617	3,581	Accept

Level of meaningfulness: 0,01

According to the result of the hypothesis test, in organizations where BSC is used, the departments using BSC work more effectively than other departments, BSC results are taken into consideration when forming the company strategies and BSC has more benefits than expected. These organizations did not agree with the opinion that BSC could not be used in a healthy way due to the fact that obtaining required information would be hard. Additionally, the executives of the organizations that use BSC also suggest BSC to other organizations.

5. The opinions of the organizations that do not use BSC method, about using BSC method in future

The organizations that do not use BSC method were asked whether they thought of using this method in future or not. With this aim the question “If you never used BS in your organization, are you thinking of using BSC method in the future?” was asked.

The opinions of the organizations that do not use BSC method, on using the BSC method in future are given in Table 6.

Table 6: The opinions of the organizations that do not use BSC method, on using the BSC method in future

If you are not using BSC in your organizations, are you thinking of using it in future?	N	%
Yes, we are thinking of using it in the very short term.	13	8,0
Yes, we are thinking of using it in the long term.	47	29,0
I can not comment on this issue since I have no information on it.	55	34,0
No, we are not thinking of using it; we are happy with our existing performance management system.	40	24,7
No, we are not thinking of using it; I think it will not be very beneficial to us.	7	4,3
Total	162	100

60 of the organizations that do not use BSC method, (37,0%) stated that they planned to use BSC method in future. 13 of these (8,0%) are planning to use BSC method the nearest future, 47 is planning to use (29,0%) in the long terms. 55 of the executives who answered the questionnaire, (34,0%) stated that they were not informed on this method, 40 (24,7%) stated that they were happy with the existing performance system, and 7 (4,3%) stated that they thought it would not be very beneficial to them.

Coşkun (2006), in his research, have determined that in 25,0% of Turkish organizations, the usage of BSC was planned. The fact that this percentage increase to 37,0% can be interpreted as the organizations that are not happy about their performance measurement system, have received more information about BSC which is a new performance system, and have evaluated this system as a more appropriate system for them. In the research by Coşkun; while 39,71% of the executives stated that they could not comment on the BSC method, since they do not have any knowledge, in a similar work this percentage decreased to 34,0%, and the percentage of the organizations that did not think of using the BSC method with the opinion that it would not be beneficial to them, has decreased to 4,3% from 4,41%.

6. Expectations from BSC Usage

The question, “Which of the following were your expectations when selecting BSC method? (Please state in order of importance)” was asked to the executives of the organizations that implement BSC method or that plan to implement it.

The expectations of the executive in BSC usage are shown in Table 7.

Table 7: Expectations in BSC Usage

Among the following which one was/were your expectation in selecting BSC method?	N	Percentage
To guide the organization in the same direction with our strategies	43	18,1
To form organizational synergy	15	6,3
To establish a strategic management system	8	3,4
To establish the association of our strategies with planning and budgeting.	7	2,9
To establish strategic objectives	22	9,2
To determine strategic priorities	8	3,4
To guide our employees in the same direction with our strategies	7	2,9

According to the answers received first degree expectation of the executives in BSC usage, to guide the organization in the same direction with the organization strategy. Expectations according to the degree of importance are to place strategic objectives, to form organizational synergy, to establish a strategic management system and to determine the strategic priorities.

Managers have stated that their other expectations in BSC usage are management by objectives, to increase efficiency, to measure individual performance, to associate the objectives with financial results, to determine where the objectives are met.

CONCLUSION

It was seen that BSC was accepted in Turkish organizations, and they have started using it. The fact that the percentage of participation in the research was 50% can be accepted as an indicator of Turkish organizations

within the first 500 is interested in BSC method. As a matter of fact, statistical data also verify this situation. 17,64% of the organizations that are among the first 500 and which participated in the research use BSC in all departments, 4,62% use it in some of the departments. Therefore the percentage of the organizations among the first 500 that use BSC is 22,26%. Additionally, in 6,72% of the organizations that participated in the research have completed BSC project, and have reached the implementation stage. In the research done by Coşkun (2005) the percentage of BSC usage in Turkish organizations is 18,69% and the organizations that have completed the project and have reached the starting of implementing it in the short term is 2,80%. Even though an increase was determined in the usage of BSC in Turkey is still low when compared to its usage in the world.

The organizations that use BSC have stated that the departments which use BSC worked more effectively than others. In these organizations, the results of the BSC are taken into consideration when forming the organization strategies and it was stated that the benefits of BSC were more than expected. These organizations did not agree with the opinion that BSC could not be used in a healthy way and they even suggested that other organizations use BSC.

It was seen that 37,0% of the organizations that do not use were thinking of using this method. 8% of these organizations have stated that they planned to use BSC in the very short term, and 29,0% planned to use it in the long term. In the research of Coşkun (2005) while the percentage of organizations that do not have any information on BSC is 39,71% the fact that this percentage decreased to 34% shows that Turkish organizations' interest in BSC have increased.

The biggest expectation of the organizations which use BSC and which plan to use BSC in selecting this method, is to guide the organization in the same direction with the strategy of the organization. Other expectations are, depending on the level of importance, to determine strategic objectives, to form organizational strategy, to establish a strategic management system, and to determine strategic priorities. It can be mentioned that BSC, as is, is used compatible to its purposes in Turkish organizations.

THE KEY DIFFERENCES BETWEEN BALANCED SCORECARD FRAMEWORK FOR PUBLIC AND PRIVATE SECTOR

Marcela Kozena, Michaela Striteska
University of Pardubice, Czech Republic

ABSTRACT

The Balanced Scorecard concept is a strategic management model that has unprecedentedly succeeded in a business sector. In recent years, Balanced Scorecard has been often discussed as a usable conceptual framework for the strategy implementation and strategy development management of public sector organisations. The purpose of the paper is to investigate the main differences between the BSC framework for private subjects and public administration institutions (especially local government). The main aim is to demonstrate how Balanced Scorecard could be modified to become a more suitable framework for specifics and needs of public organisations. Based on the literature review the theoretical construction for the research is developed. In order to meet the main objective questionnaire survey among local government authorities that have already employed the Balanced Scorecard was carried out.

Keywords: *balanced scorecard, strategic management, strategic performance measurement, local government.*

INTRODUCTION

Local government worldwide has come under the strong pressure to improve quality as well as efficiency of service delivery, increase transparency and stakeholder accountability. It is widely acknowledged that if they want to survive and prosper under the current globalize and competitive environment they must rapidly change their way of thinking and acting (Osborne, Gaebler, 1992). In response municipal and regional managers have applied some modern private sector management methods and tools. Approaches like total quality management, process reengineering, benchmarking and Balanced Scorecard have been implemented with varied results. Strategic performance management systems present a unique challenge to most organizations today, whether they are private, public or non-profit.

The current surveys show that only 10 % of organizations are able to implement their strategies, that only 5% of employee in the organization understand the strategy and that 60% of organizations do not link their budget to strategy (Niven 2003, Harvey, Creelman, 2004). Therefore it is more than necessary to impose the performance measurement to the strategic management (Ballantine Brignall, Modell, 1998, Kaplan and Norton 2005). Many strategies of public sector organisations are already outdated, but still valid, since no one measures their results. So how it is possible to solve these shortcomings in management of local government? Could be Balanced Scorecard (hereafter BSC) an efficacious instrument in local government environment?

The article proceeds in the following manner. First, the literature regarding performance measurement systems and BSC method in private sector is briefly reviewed and by case study analysis the main characteristics are defined. Second the main differences between private and public BSC on the basis of questionnaire survey among local government that had already used BSC method are identified. Finally, the research findings within the context of current scientific literature are provided. Logical methods of the scientific work are used in the first place when processing the article. Techniques and methods of questionnaire survey are used to gain the necessary data in order to meet the main objective.

Balanced Scorecard Method – the nature and the importance

Before we start to characterize the basic principles and processes of the BSC method, it is necessary to briefly define the nature of performance measurement system (PMS). Performance is about the potential for future successful implementation of actions in order to attain the objectives and targets (Lebas, 1995). In short it is the result of manager's decision-making. We can identify many reasons to measure company's performance.

The roles can be classified in three main categories (Centre for business performance, 2004):

- strategic,
- communication,
- motivational.

To understand the concept of performance management system we can use the comprehensive definition according to Franco-Santos, Martinez et al. (2004) that indicate PMS as a set of processes an company uses to manage its strategy implementation, communicate its position and progress, and influence its employees behaviors and actions. It requires the definition of strategic objectives, multidimensional performance measures, targets and the development of a supporting infrastructure. Performance measurement systems enable reasonable decisions to be made and actions to be taken because it quantifies the efficiency and effectiveness of past actions through the acquisition, collation, sorting, analysis, interpretation and dissemination of appropriate information (Neely, 1998). In recent years could be seen increasing emphasis on forward-looking non-financial measures such as customer satisfaction or employee learning and innovation (Ittner, Larcker, 2001, Epstein, Manzoni, 1997). The traditional PMS based on financial and productivity measures are often criticised because they (Neely, 1999):

- encourage short-termism,
- lack strategic focus and fail to provide data of quality, responsiveness and flexibility,
- encourage local optimization,
- encourage managers to minimize the variances from standard rather than seek to improve continually,
- fail to provide information on what customers want and how competitors are performing.

Since the mid – 1980s, growing attention has been paid to the study of performance management systems as instruments for effective strategy implementation. As a reaction to the empirical findings that a number of strategic intentions have not been reached emerged the Balanced Scorecard model. The Balance Scorecard was introduced in the early 1990s as a part of a management system using non-financial as well as financial measures in managing a company and aligning these measures with the company's strategic objectives. The BSC concept has since been modified to become a performance management system designed to manage and realize strategy. The authors of the method Kaplan a Norton (2005) describe the BSC as a tool that translates the mission and the strategy of a company into an intelligible set of performance indicators which offer frameworks for the evaluation of its strategy and the management system. The benefit of the model lies in establishing a framework in which the culture and direction of an organization can be translated into strategies that are actionable, specific and measurable (Rohm, 2002).

Some scholars argue that the BSC is basically nothing new and its basic elements are identical with the MBO model (Drucker, 1976), which is based on three parts: the formulation of goals, the participation of the employees and the middle management on the formulation process of this targets and the feedback. For example, Johnsen (2001, p. 321) considers BSC to be an extension of the MBO model, focusing on feedback based on the set of the strategic performance indicators. The BSC is more than an indicator model which enables the control of the vision and strategy fulfilment. According to Niven, (2003) the BSC has three basic functions in an organisation: the measurement system, the system of strategic management and the tool for communication.

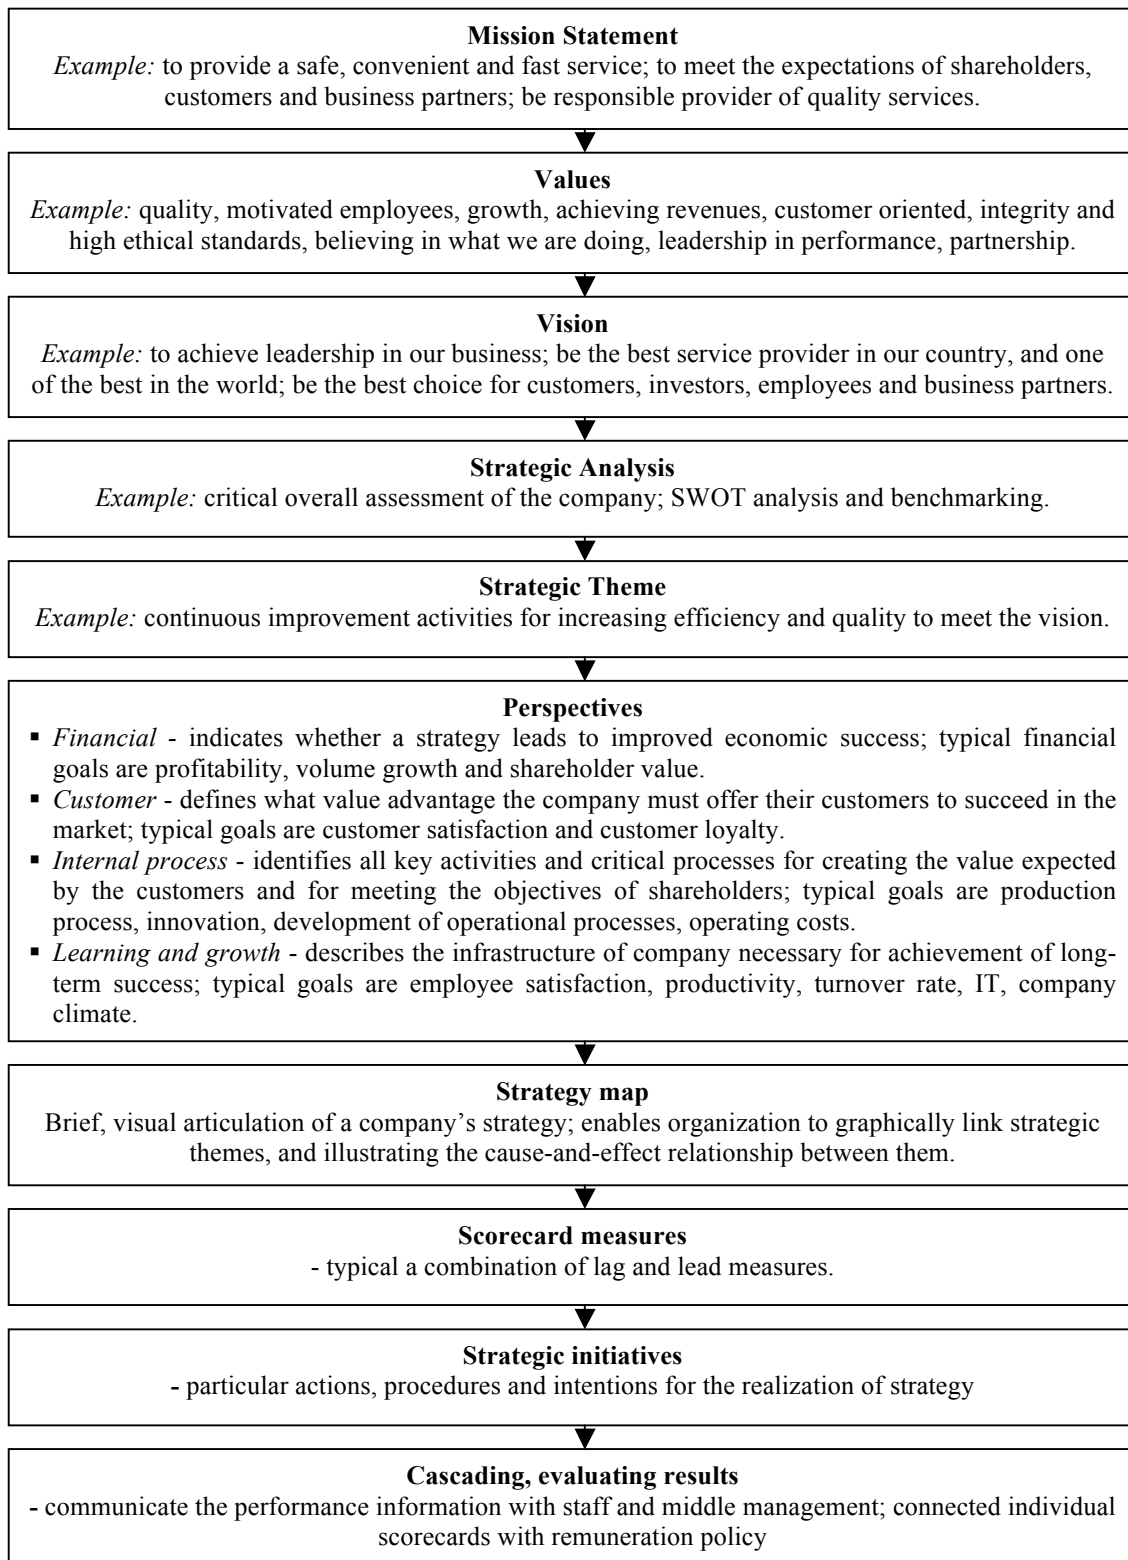

The creation and implementation of BSC – main characteristics

The core of the BSC method is the elaboration and the implementation of a vision and the strategy of a company into fixed targets and intelligible set of financial and non-financial performance indicators. The introduction of BSC means that the goals, the indicators and the strategic actions are assigned to a concrete point of view or the so-called perspectives (Horvath & Partners, 2004). By analysis of three case studies (UNUM Corporation, Air Cargo Terminal, THHK Czech Republic) the main characteristics of the strategic BSC framework for private organizations can be described. The data analysis of the case study was carried out according to Miles and Huberman (1994).

The general BSC model is looking at organisations from four strategic perspectives: the financial, the customer, the internal processes, and the learning and growth, all of them need to be balanced. The balance means the equability between the short-term and the long-term goals; required inputs and outputs; internal and external performance factors; and financial and non-financial indicators. Considering their significance, all the four perspectives are equivalent, from the point of view of causes and consequences, the financial goals in the company's model are influenced by the customer point of view which is affected by the perspective of internal processes and strongly determined by the capability to learn and to grow. It is necessary to highlight the fact that the BSC perspectives do not stand next to each other separately, on the

contrary, their interconnection provides a complete image of the company's activities and simultaneously documents key connections important for the realization of the strategy. In general, the BSC strategic framework can be characterized within several steps:

EXHIBIT 1: The main characteristics of BSC strategic framework

Resource: case studies - UNUM Corporation, Air Cargo Terminal, THHK Czech Republic

Research Design

A questionnaire distributed by electronic mail was chosen as a basic data collection method. A questionnaire enabled us to gather information and experience from foreign municipalities and regions that have been using the BSC method. The questionnaire was distributed to 60 respondents from Europe, USA and Canada, Australia and New Zealand, Asia and Africa. The sample of respondents was defined on the basis of scientific articles (Askim, 2004, Griffiths, 2003 Chan, 2004, Wisniewski and Olafsson, 2004) and freely available information resources. According these available information sources, just 60 cities and regions that are using or that have used the BSC method, was possible identified. This number corresponds with the foreign researches relating to the usage of the BSC method on the local government level.

The questionnaire's rate of return was 36%. The content of the questionnaire was focused on the current utilization of BSC methodology at the level of local government and on the identification of the best principles and procedures of its creation and implementation. Therefore it is possible by the synthesis of respondent's responses define the main differences between private and public Balanced Scorecard.

The key differences between private and public BSC

The implementation of the strategic management tools, based on the approach of the company is on the level of the local government accompanied by considerable doubts. This distrust is valid only if these tools and the approaches can be transferred without any necessary modification and adaptation to the conditions of the public management. According to Horvath & Partners (2004, p. 350), there are no essential differences between the implementation of the BSC in the private and the public institutions because the problems of the strategic management are similar, thus they require similar solution methods. In general, the BSC method in the public administration area "copies" all the processes of the private sector (general aims) and simultaneously it is defined by more aspects (specific aims). One can agree up to a certain point with this statement; however, with the growing number of the BSC implementations in the public administration domain some differences have been discovered.

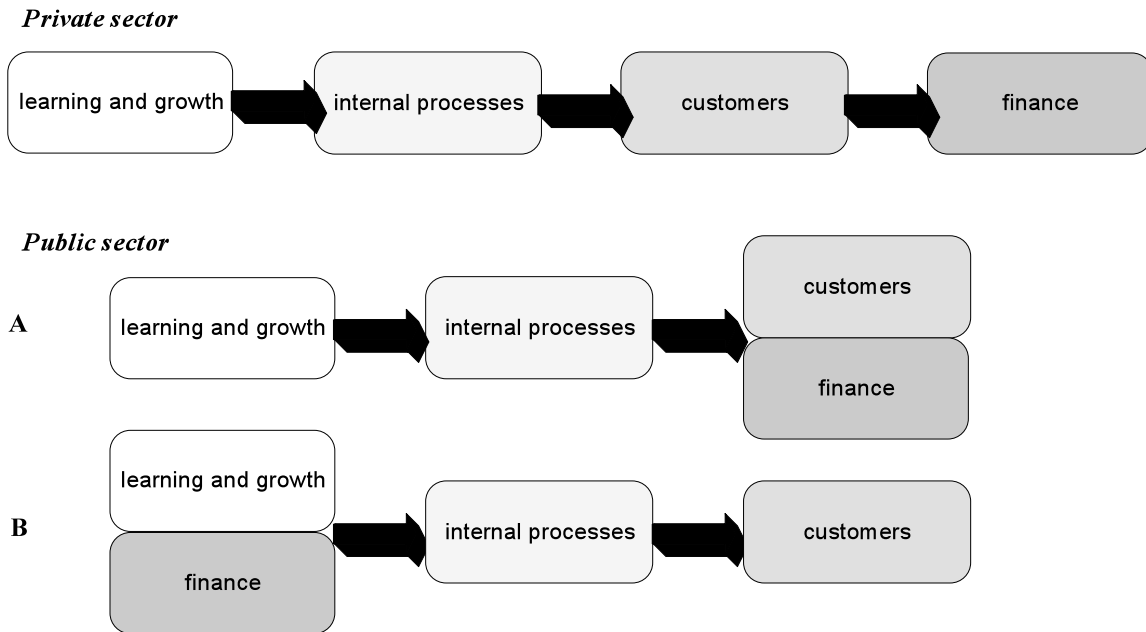

- ***The purpose of the BSC use*** - in the private companies, the scorecard is often seen as an instrument for performance measurement and management improvement. The main focus is on efficiency and performance measures. The primary particularity of the BSC adoption in the local government sphere is the fact that they need to pay attention to the legitimacy and the transparency of their activities. Therefore the communicative function of the BSC is much more emphasizes in the local government environment. Here is BSC understood as effective tool for external performance reporting as well as strong incentive for external accountability.
- ***The relevance of the traditional BSC perspectives*** – the original BSC introduced by Kaplan and Norton were designed for private companies with the aim to change traditional focus of performance measurement on financial measures only. Therefore the question of the relevance of these four perspectives rises.

According to the conducted questionnaire survey the customer perspective is not that appropriate for the needs of the local government, because it serves the users of the public services, and simultaneously to various groups in the concrete community. Sometimes was the perspective of customers renamed to the citizen or stakeholder perspective. This may correspond with the criticism of the original concept that, according to some authors, does not express the interests of all involved parties explicitly (Kaplan, Norton, 2005). In a company model, these interests (e.g. of staff, suppliers, community) are usually hidden in some of original perspectives. The BSC model for local government, however, has to "reflect" these interests much more explicitly.

Similarly, the learning perspective and the growth does not meet the needs of the local government's requirements. While the growth and the increase in the market share is a logical strategic target of the business subjects, to the public institutions, it is rather reasonable to reduce the range of some activities. remains constant, but they are renamed and adapted for the use of local governments. Within the evaluation of questionnaires, we met the adaptation of these perspective several times. This perspective is not suitable for many local units and we can encounter designations as "staff" or "human resources" more often. At the same time, it is necessary to say that 10% of the respondents of overall number introduced the fifth perspective that concerns the sphere of services. Likewise, the term process is not commonly used in the public administration. The results confirm that there are frequent tiny modifications or changed names of the perspectives that meet the local government conditions better.

- **The logical perspective hierarchy** - private sector model is not relevant for local government authorities. A clear difference results from the mission of local government that is usually defined by the act. The mission of local government is to take care of development on its area and of its citizens needs; and by accomplishment of its own tasks it protects the public interests as well. The customer perspective becomes at least one of the ultimate objectives. The architecture of the BSC model, adapted for the needs of the local government can be explained with the help of the following exhibit.

EXHIBIT 2: The logical perspective hierarchy

Resource: adapted from Wisniewski, Olaffson, 2004, p. 606

Finance could be seen as a comparable joint objective in terms of achieving value for money or as an enabler rather than objective. The exhibit shows that in the private sector the final goal is to be successful in the financial perspective, in the public sector it is important to be successful in the customer (citizen) perspective. The financial perspective could be at a comparable level that is understood as the effort to get a higher “value for money” that was available to the public institution (A alternative). Ostrizek (2007) defines the value for money as a ratio of cumulative costs throughout the entire duration of the project (in our case of the strategy) in the relation to the corresponding quality and the consumer benefits. Respectively, the financial perspective determines if a concrete strategy should be implemented or not according to a higher value for money. For public institutions, the core of this perspective is the effort to achieve cost efficiency, thus, to give the customers the maximum value from the public good or service in exchange for paid taxes. The second approach (B alternative) understands the financial perspective role primarily as a condition or a barrier which enables or restricts the achievement of the strategy. With both approaches we have met during the survey. Their selection depended on the respondent’s specific needs and conditions. These alternative hierarchies also must have implications for the creation of the strategy map.

- **The dilemma of measures** - the main problem here is that the effects of interventions by a local government are often difficult to measure. This is because public performance is multiple (they must do justice to different values) and achieved in co-production (in cooperation with third parties) (De Bruijn, 2002). In addition, the period between an intervention and its potential effect may be long. It is then in many cases difficult to measure the final outcome of intervention by an authority, especially when abstract goals like safety, integration or quality are included.
- **Different aspects of BSC implementation need to be highlighted** - there were several interesting application methodologies discovered during the identification of procedures and principles of BSC strategic system introduction. Basic principles and procedures of creation and implementation largely correspond to the theoretical baseline of business BSC, at the same time showing other specific signs. When introducing the system, individual respondents accentuate various BSC aspects based on specific

conditions. The most frequently mentioned aspect was to paid greater accent to change management. The organizational culture, thus the way of work of the complex of standards, values, attitudes and opinions, which are shared by employees of a particular organization, is closely connected with the management of a change. The management of local government has a functional character, which results in lower effectiveness and flexibility. It can be considered a primary barrier to improving the strategic management. Thinking of local government staff must be changed from functional to process one.

- ***BSC is not interconnected with remuneration policy*** – in private sector it is obvious to cascading the corporate BSC for each level of organization and connected individual scorecards with remuneration policy. This phase of BSC implementation is according to respondents view in local government much more complicated process. The results of survey reflect the fact that utilization of BSC as a tool for staff motivation and remuneration at the level of municipalities and regions is still at the beginning.

CONCLUSION

The public administration has been currently facing the unprecedented pressure in terms of changes in management, performance and quality. Implementation of modern managerial methods that originates in business is one possible way how to achieve the performance and quality improvement on the local government level. If the Balanced Scorecard framework is to modify to the conditions of the local government can represent such a modern managerial tool.

The main benefit of the BSC is a removal of the weaknesses of the current strategic management systems which in particular means the separation of strategic formulation from its implementation process. If the BSC method is correctly applied, it contributes to the new type of public institution which is, according to Osborn and Gambler (1992): „slim, decentralised and innovative. It is flexible, adaptable and it learns fast if the conditions change. It uses competition, it is focused on customers and uses other non-bureaucratic approaches in order to solve the problems as effective as possible and in a creative way“.

ENTRY STRATEGIES AND STRATEGIC ALLIANCES

MANAGEMENT OF STRATEGIC ALLIANCE MAKING PROCESS AND THE CASE STUDY

**İnan Özalp
Senem Besler
Burcu Şefika Doğrul**

Anadolu University, Turkey

ABSTRACT

The main object of this paper is to disclose how enterprises' manage the process of forming a strategic alliance. In order to this, the paper is divided to two main parts: the first one provides a brief overview of strategic alliance literature, and examines basic concepts, and various studies related with the subject; the second one gives the process of making strategic alliance via a sample application and then presents theoretical and managerial findings of this application are evaluated.

Interview and document inspection among qualitative data collection methods have been used in the research. At the subject company of the case study, strategic alliances are realized by passing through certain stages. As also emphasized in the findings, the company is both an outsource provider and an outsource receiver in terms of the type of alliance it makes. The stages followed up can be listed as follows, as also supported by the literature: 1-feeling the necessity of building a strategic alliance, 2-determination of the type of strategic alliance, 3- selection process of the strategic alliance partner (preliminary preparations, receiving proposals, conducting technical study and pricing), 4-negotiation process (first preliminary outsourcing contract, nomination process, making a prototype and reaching the stage of actual contract, signing all contracts and realizing alliance.

Keywords: *Strategic alliances; International strategic alliances; Strategic alliance making process.*

INTRODUCTION

Under the rapidly changing competitive conditions, enterprises opt to cooperate with their counterparts, even with their competitors to protect and develop their market shares and technologies. Strategic alliances, as a form of this cooperation, have now turned into a requisite for most sectors. As a result, a significant increase in the number of strategic alliances has been observed in recent years as a "strategic alternative".

The realization of strategic alliance should be considered and analyzed as a process. In the beginning of this process, the reasons or circumstances which impel enterprises to conduct strategic alliances should be identified. The other stages of the process include selecting the partner with whom the strategic alliance is to be formed, identifying the type of alliance, negotiating on the alliance agreement, and finally undersigning the agreement.

This study initially examines strategic alliance literature, and examines basic concepts, and various studies related with the subject. Secondly, the process of making strategic alliance is analyzed via a sample application in stages. Finally, the theoretical and managerial findings of this application are evaluated.

LITERATURE REVIEW

Collaboration and acquisition are two of the strategies the enterprises apply in order to access external resources for growing, and choosing one of them is becoming more difficult, yet inevitable under the

changing business conditions. The basic point of separation of the two strategies is associated with the enterprise's maintenance of its legal and economic independence (Hoffman and Rinkel, 2001: 132). In this context, acquisition strategy is taking over the control of an enterprise through buying its shares or ownership. Meanwhile, cooperation strategy combines or modifies enterprises' sources and services, wherein the enterprise gains competitive edge but still maintains its independence legally.

As a form of collaboration, strategic alliance finds various definitions in the literature. In the simplest sense, strategic alliance is defined as sharing technological and/or market resources between two enterprises or as the cooperation agreements between actual or potential competitors (Hill, 2002:497; Akkaya, 2007: 1; Chenga, Lia, Loveb and Iranic, 2004:459).

Another definition emphasizes that strategic alliance is a common name for solidarity and resource consolidation activities which emerge in various ways among enterprises. Examples to such alliances are mentioned as the enterprises' agreement to use the same distribution channels, make joint investment, conduct joint information bank or R&D activities, provide production and selling authorization, and outsourcing (Dinçer, 1998: 288).

Meanwhile, Ülgen and Mirze's (2007) definition of strategic alliance highlights it as "the contract-based collaboration of two or more enterprises without establishing a new company under a new name or identity, but only share their certain assets and capabilities for the purpose of realizing certain goals that they care for".

Types of Strategic Alliance

Enterprises develop alliances by using different organizational and legal structures. In the literature, the most common classification of strategic alliance agreements is noted as equity alliance and non-equity alliance. Equity alliances cover joint ventures and strategic alliances with minority shares. These alliances are a kind of alliance created by one or more partners through changing stocks without creating a new business. Meanwhile, in non-equity alliances the cooperating enterprises conduct the operations of the development of joint products and services without creating any independent units in order to develop, produce or sell products and services together. These cooperative relations are generally conducted with different types of contracts. Examples of these agreement types can be listed as regional agent and dealer agreements, license and know-how agreements, subcontracting agreements, turn-key agreements, R&D agreements, joint product development, long-term resource utilization, joint production, joint marketing, distribution, franchising, management & marketing agreements outsourcing and the others (Çakınberk, 2009, p.172; Rugman and Brewer, 2003: 404; Zaboş, 2009:248).

In another classification, strategic alliances are divided into two according to the identification level of the strategies. The strategic alliances on corporate level are made as differentiation-focused, synergy focused and franchising. Depending on the strategies on enterprise level, the strategic alliances are divided into two as vertical and horizontal. Horizontal alliances are made among directly or indirectly competing enterprises; while vertical alliances are the types of alliances conducted by the enterprises with the others within their supply chains. The relations between the buyer and the seller or the manufacturer and the service supplier, license agreements, distribution agreements and supplier agreements can be shown as examples to vertical alliance (Ireland, Hoskisson and Hitt, 2008: 177; Loke, Sambasivan and Downe, 2009: 373; Sporleder, 2006: 159). In this scope, outsourcing agreements are regarded as a strategic alliance. Outsourcing is a management strategy which enables enterprises to focus on their core competencies that provide competitive edge, and benefit from the organizations specialized in the subject matters which are not included in their actual areas of activity. Outsourcing can also be defined as delegating a work, which was previously realized within the company, to a supplier from outside who is specialized on that subject with a long term contract (Aydın, 2007:143; Hitt, Ireland and Hoskisson, 2005:272).

Strategic Alliance Making Process

In various sources, the process of making a strategic alliance generally follows the sequence of first feeling the necessity of making a strategic alliance, then determining the type of strategic alliance, choosing the partner and the negotiation process, completion of the alliance and its conduct (Hoffman and Schlosser, 2001: 359; Devlin and Bleackley, 1988: 20; Kaasalainen, Mäkinen and Näsi, 2002: 214-215). However, this sequence may change depending on the subject of activity, purposes, environmental conditions and expectations of enterprises.

The process of conducting strategic alliance begins when each enterprise finds goals and/or reasons for itself. According to Doz and Hamel (1999), enterprises' purposes for realizing strategic alliance include cooperating with their potential competitors and prevent them from creating a threat, to move together with the enterprises that produce complementary products to create network economies in favor of the alliance, to outsource the complementary products/services that they cannot develop on their own, to create value due to the synergy created by the alliance, and especially to ensure learning and internalizing basic competencies. In a research (Çakınberk, 2009), the strongest reason that impels the enterprises in Turkey to build strategic alliance was expressed by 74.5% as reinforcing their positions in competition. Other reasons following are noted as transferring new technology, accelerating the creation of new products or services, gaining place in new markets and increasing market share.

The type of strategic alliance must be identified in the second stage of this process. The duty of enterprises is to properly analyze what they do, the conditions of industry and the competitive structure. All managers who participated in a study conducted by Yoshino and Rangan (1995: 79) expressed that they believed whether the alliance would be successful or not depends on the type of alliance. In general, the type of alliance is expected to add value to the enterprise and reduce costs. According to a study conducted by Çakınberk (2009) in Turkey, it is noted that most of the strategic alliance agreements realized by the participating enterprises of the study were joint marketing agreements (13.6%), and the share of outsourcing agreements is 4.2%. In another study (Aydın, 2007), outsourcing of logistics services in the supply chain management is defined as third-party logistics, and it is emphasized that the relation between the enterprises which provide these services and their customers is a typical strategic alliance relation. Here, it is indicated that the relation which begins with a contract mutually provides benefit in time and turns into a continuous alliance.

After the reasons of making alliance and the scope are identified, the stage of selecting a partner is reached. At the stage of selecting the partner, the senior management should outline the company's strategic position and expectations and identify potential partners accordingly. In the literature, general characteristics of partners are evaluated from the points of trust, commitment, complementariness and financial status (Devlin and Bleackley, 1988: 21; Shah and Swaminathan, 2008: 472; Hanna and Walsh, 2008: 302). Especially in vertical strategic alliances, although the contracts have binding properties, the creation of mutual trust between the partners of the alliance increases the effectiveness of the collaboration. Owing to the trust, the parties spend less time and effort while trying to fulfill the conditions of a contract and the process of learning from each other can be facilitated. For example Nike works with different types of suppliers for footwear manufacturing. However, the 1st rank suppliers include those with a bond similar to a strategic alliance rather than relations bound to a contract (Ireland, Hoskisson and Hitt, 2008: 173). In addition, the market knowledge of the partner, its connections with the main supplier or customers, its reputation, size, experience in previous alliances are also the characteristics that should be taken into consideration (Aydın, 2007: 121–122).

The process of making a strategic alliance continues with the negotiation process in which the mutual expectations, rules, and procedures are set forth and the agreements are signed. The issues to be decided during the discussion process include the provision of equal contributions by the partners of the alliance, clarification of the issue of preserving core competencies, the determination of the sources to be opened for use, dwelling on the conditions to prevent opportunistic actions, determination of clear and realistic objectives, making a clear definition of rules, rights and duties, and clarification of the expectations of the parties (Hoffman and Schlosser, 2001: 361-363; Elmuti and Kathawala: 213).

Together with the realization and beginning to conduct strategic alliance, the final stage of the process is reached. At this stage, the alliance continues its activities in order to reach pre-defined objectives, by obtaining the support of senior management and by building a communication-coordination system. The results obtained regarding the performance of the partners of the alliance, the control of the transfer of sources, the learning process, and achieving the objectives allow the partners to decide on whether terminating or continuing with the alliance (Hoffman and Schlosser, 2001: 363-364). However, the stages of continuing and terminating the alliance are excluded from the scope of our study.

METHOD

Importance of Research

In the current century, the developments in the economic, social and technological area caused to the globalization of markets, and a change in international competition. Long-lasting products, stable customer

requirements, certain national and regional markets and clearly known competitors have now been replaced with new products, changing customer needs, short product life-cycles, and global markets. **This race in competition** has led enterprises into new inquests. Therefore, in this competitive environment which has gradually become more complex, enterprises began to look for something new and felt obliged to reconsider not only their organizational structures but also strategies. One of them is the strategic alliances in which two or more enterprises come together to realize a certain purpose. Strategic alliances are an important basis for enterprises to continuously grow and stay on foot; and it is an easy way to outreach the sources and talents that enterprises may require. In short, it is a great source of power for sustainable competitive superiority. Therefore, how strategic alliances emerged in the business world and how they are managed is an important research subject. It is believed that the results obtained from the research will be influential in increasing the effectiveness of making a strategic alliance in practice.

Purpose of Research

The core purpose of the study is to disclose how enterprises' manage the process of forming a strategic alliance.

According to this core purpose, the study probes for answers to the following questions:

- Why do participating enterprises need alliance-
- What kind of a strategic alliance do they make
- Which criteria do they take into consideration when selecting the correct partner for alliance,
- How do they form the correct type of alliance.

Method of Research

The method used in the research is case study, among qualitative research methods. Case study elaborates an environment, single person, single type of document of or case.

The analyzed unit of the study is Esalba Metal Company, which is registered at Eskişehir Chamber of Organized Industry, operating at Eskişehir Organized Industry Zone, and established to serve in automotive, household appliances, defense industry, lighting and ventilation sectors.

Interview and document inspection among qualitative data collection methods have been used in the research. The data have been collected through semi-structured interviews. A series of questions have been listed for interviews. The interview questions have been prepared to deeply question the alliance forming process of managers. The questions include many details related with the justifications behind selecting an alliance partner, how the alliance partner is selected and what kind of an agreement is made. Each participant is provided with preliminary information before the negotiations. Totally two managers have been interviewed with at the analyzed enterprise. When selecting these managers, the managers who actively participate in strategic alliance decision and process have been taken into consideration. The interviews have been recorded with a recording device and then they have been transcribed and analyzed. Interviews lasting respectively 75 minutes and 60 minutes were made with the first and second manager. Three specialists from the field have conducted analyses according to the categories that have been defined independently. A common opinion has been reached, its validity and reliability has been ensured as a result of the comparisons.

Limitations

This research should be considered by taking into account the following limitations.

- Inability to benefit from multiple data collection methods
- Time restrictions of managers (as they are senior level managers)
- Voice recording may prevent the actual thoughts of managers
- The low number of participants

The enterprises and managers involved in the research

The enterprise at which we carried out the study is a supplier industry enterprise which conducts the activities of forming sheet components, called stamping in international literature, which are required by the automotive and household appliances industries. The enterprise was opened in 2006 as a joint venture of Cerrahoğlu which is among the first major shipping companies of Istanbul and Albakom enterprises. In this family business, Cerrahoğlu Company participated with its capital, while Albakom Company contributed with its knowledge and expertise in stamping for three generations.

The managers of Esalba Metal Company, which is acting in the private sector in Eskişehir, also took part in the research. The participants included two senior managers; one of which is financial and administrative

affairs manager, and the other one is the manager of commerce. In terms of demographic properties, the ages of the participants are 49. The average number of employees at this company is 150, and the company was founded as a family company. The basic areas of specialization of the participants are respectively business engineering and economy. Both participants have completed their education at MBA level.

FINDINGS

The data obtained from the studied enterprise were first indexed within the framework of concepts and themes, then the created themes were coded and interrelated themes were brought together and classified in accordance with certain categories. During the creation of the categories, the questions used during the interviews were taken into consideration. Three specialists from the field secondarily read the entire data set and checked the created themes and categories.

The findings of our study are listed according to the secondary objectives and the stages of strategic alliance building process.

I. Feeling the Necessity of Building Strategic Alliance

One of the most important reasons why the examined enterprise builds alliance with the strategic partner is the acquisition of “industrial culture” according to their expression.

A: “Electrolux made the first refrigerator, or Renault made the first car 250 years ago. There is an infrastructure and knowledge based on 250 years. There is a learning process.”

*A: “Therefore, company culture and industrial culture are different. There is industrial culture before the company culture. And what lies in the infrastructure of **industrial culture** is: knowledge. It is mathematics, physics, machinery knowledge, design, and process knowledge. And what is missing in our country is this industrial culture. We receive **industrial culture** from our customers.”*

The second major reason is the owners’ and managers’ vision “to become a well-known and trusted global supplier”.

*M: “For example in the automotive industry, there are certain companies that we have chosen as targets; in order to reach those companies, we are willing to act as a secondary supplier if required, but by aiming to become the first supplier through production quality products and exceeding expectations and offering solutions beyond those expected from us. We are even advancing towards the objective of becoming a **co-designer**, which is also included in our vision.”*

*A: “Now there is a tremendous cooperation beyond us, for example a strategic cooperation. You are to pass through several audits, discussions etc. before entering through the gate of Electrolux. But when you enter Electrolux, it has 300 factories around the world. That is, you work on a global scale with each factory; can you obtain that just with money?” You are becoming a **global supplier**.*

*A: “First of all, its initial impact is not something that can be underestimated, its **opening you to the market**. ...That is, if you begin to make components for this group within the framework of our strategic cooperation, then it means you are opening to the market... Then the ball is in your hand... That is, it opens you down to the bottom of that market. Requests for proposal are beginning to come from everywhere.”*

And another reason is becoming “sustainable”. The expression of a manager in this regard is as follows:

*M: “That’s why we are working together with the supplier organizations with which we can move together. We wish to trust each other, have a **sustainability** of this work and win and win together. We can also take part in its objectives but of course we are looking at our own objectives.*

And the fourth reason is the desire to make joint venture agreements, which probably arises as a result of the completion of the other three reasons. As can be understood from the opinions of the managers, the enterprise is willing to become a part of larger partnerships as a result of the earnings from supplier and outsource agreements. The expression of a manager in this regard is as follows:

A: “Our cooperation is at this extent. And now imagine Esalba 3 years later. When the turnover is not 15 million Euros but 50 million Euros instead. Then we are going to begin looking for a merger for our daughter. A daughter should reach a proper age to marry her. You cannot give in marriage an 11 year old girl, can you? She needs to reach maturity. Now, you can say that you are going to appear in the international market. These things never happen with consulting companies.”

M: "This is just a place for 4 years. I mean it is very young. Actually, the position it has obtained in the market is very important despite its age. We will absolutely fulfill this objective of partnership; we believe but it is not something which can happen in only a few months."

II. Identification of the Type of Strategic Alliance

Identification of the type of alliance is the second stage of making strategic alliance of the studied enterprise. The type of the alliance made is in the form our outsourcing agreements within the scope of vertical supplier alliances. The enterprise is both an outsource provider and outsource receiver.

As an outsource provider, the company makes agreements for producing the components required by the enterprises acting in household appliances and automotive industries (Electrolux, Arçelik, Tofaş, Bosh Fren, Demirdöküm, etc.)

A: "In the household appliances and automotive industry, the companies called supplier industry similar to us are becoming candidates for the works which were previously conducted by the main company. For example, there are many plastic components in a car or a refrigerator. Certainly 19,000 of the 20,000 components in a car are outsourced. Actually the current rate of outsourcing is 95% and the remaining is just installation."

A: "We are one of the supplier industries that cover sheet component requirements of automotive and household industries. For example, let's say oven. Think of an oven. 90% of an oven is metal sheet."

At the position of outsource receiver, the studied enterprise outsources the components required during the production process (designed according to the expectations of the main company) from other companies.

*M: "You made a design but there is a physical thing, something that should be produced. We are talking about hundreds of pieces to make and achieve in a short time. Then you know how to do it. You already designed, drew how it should be made, and now only producing it by looking at that drawing is required. Therefore, you have to **outsource** that, some of its components."*

*M: "You can **outsource**, this is how we perceive the issue from our customers' perspective; but we also look at it from the point of our suppliers similarly to see what are our operations and structures that we can **outsource**. This works on both directions for both us and them."*

III. Selection Process of the Strategic Alliance Partner

Because the studied enterprise conducts bilateral alliances within the scope of vertical supplier alliances (as about outsource provider and receiver), the process it follows includes certain differences.

Preliminary planning

This is a stage where the desire of the enterprise to make a strategic alliance in its vision and objectives is found, and where the associated preparations are made.

As an outsource provider, the enterprise tries to reach the resources that may be required, such as human resources, technical equipment and capital structure. In the meantime, it also deals with the activities which provide a basis for partnership connections.

A: "In order to market something, you need to reach a certain size. Now, this includes many things; a turnover, customer relations value added, customer, profitability, etc. There are many things."

A: "I need to hire people who work properly, I need to hire people who have knowledge, I need to buy good machinery but if you don't do them, then you cannot achieve your main goal."

A: "I mean whether you search on internet, enter the society at an evening dinner, or go to exhibitions; each one is a technique. That is, you should travel the world all the time."

*A: "There is a computerized request for proposal system. You become a member to that **portal**; that is, you become an approved supplier. All quotations automatically drop in our system... The quotation system."*

As the **outsource receiver**, while the enterprise is producing the requirements of the company to which it is supplying products, it also has to outsource certain works in order to realize the mentioned production process in time. Accordingly, the enterprise tries to find out the areas in which it can undersign outsource agreements. In finding the alliance partners, the company rather acts by benefitting from recommendations and references. At this stage, initially the commerce department of the enterprise takes a step. Then the other units move.

M: "...but also from the point of our suppliers, we see what the operations are and what the structures that we can similarly outsource are"

M: "We select partners for us in some fields. We orient certain works directly there."

M: "First of all, we benefit from recommendations and references during the research. First, we are certainly trying to find out their references, and the works they have done. Just knocking our door is not enough for being accepted. We contact the people with whom they worked and seek to find out which works they previously achieved. And in general, people in this community know each other. They also benefit from each others' skills. This is a very effective and strong structure. And the results are not very bad, that is, they are not misleading."

M: "In the first stage, the commerce department plays a major role in both purchasing and sales. They slightly maturate the issue... Then the decision to work together is generally a common decision that we take altogether."

The criteria considered

When the studied enterprise signs outsourcing agreements, it takes into consideration certain criteria such as being strong in selecting the alliance partner, and having an industrial culture.

M: "Among the automotive companies we are trying to select those which are strong in the world and in Europe, and which are also strong in Turkey."

A: "What we initially receive from our customers is industrial culture, that is knowledge. We take the knowledge that the guys created in 250 years. We take the process know-how."

We see that the enterprise we have studied is more selective about selecting their own suppliers. They are willing to work with the enterprise which has the attributes in which they feel they are weak in terms of capacity, time and cost.

M: "A partner who can cover up the **aspects in which we are weak** in the strongest way possible. This is the first criterion. I mean, the aspect in which we are weak may be related with **capacity**. It can also be related with **time**. That is, someone who can produce fast..."

M: "We found an organization which could make **free from mistakes** as much as possible and help up. Of course, when selecting it, we consider everything; being **near to us**, producing **quality** work, **price**, etc. Only one or two criteria are not enough. But of course, for most of the time the price may be important in the second or third rank. And first of all the quality and speed is important; is it able to complete in time? Can it catch up with the deadlines that we request?"

M: "...first, we benefit from recommendations during the research. We benefit from the references. First, we are certainly trying to find out their references, and the works they have done. Just knocking our door is not enough for being accepted. With whom they worked and which works they achieved previously? We contact with such places."

Proposal stage

At the point of providing outsourcing, the enterprise receives proposals from the main companies. At the final stage of the outsourcing process of main companies, the enterprise that we are studying steps in and the drawing of the sheet component which is required to be produced by main companies in the last one end a half year is handed over to them. Manager A has shown us many documents from the component drawings and received proposals as samples. If the enterprise is the receiver of outsource, then it communicates its proposal related with the subject of alliance to the partners who are found according to the criteria.

Conduct and pricing of technical study

After the proposal is received by the company which is to provide outsourcing, the stage that includes the conduct of all detailed analysis on the proposal begins. At the point that receives outsourcing, this stage is the period when the enterprise waits for the analyses of its supplier.

A: "This is the picture Volkswagen, a sheet component over the shock absorber set... This picture is now delivered to you. And we are making the technical study and price study according to this picture and presenting it to the customer. But the customer buys it from several places similar to me."

A: "Of course the extent of the work is very important, but first, can we produce that component? Can that component be produced by our knowledge and at our machinery park? Immediately a technical study is conducted if it passes through manufacturability criteria. During the technical study, answers are searched for the questions such as at which machine would that process be made, in how many seconds, with which mold, and how much will the labor cost be? A detailed cost analysis is carried out one by one."

A: "Then, according to this technical solution, in the trade department I am involved in the process. We break down the entire information on a cost analysis form and bid for that component."

IV. Negotiation Process

First interim outsourcing contract

This stage begins when the enterprise is in the position of the outsource provider. Any statements of the managers indicating that they signed such a contract as the receiver of outsourcing have not been observed.

The parties enter the process by signing various interim contracts after the main company's preliminary acceptance. The interviewed manager describes these contracts between the parties as "a death warrant", and expresses that the parties pass through several modifications before the documents turn into a contract. As can be seen from the examined documents, the documents are subject to many processes.

A: Here, the customer has criteria. What is he going to look at; he is going to look at the price, the quality, whether we can do it, which means, being reliable is important. From those 1.5 years ago, you take that first picture, and this outsourcing agreement is made during this process, the contracts are made."

*A: "It's like; even they will almost ask your mother's **maiden name**. Here, for example a **death warrant**, from whom did it come finally. It was from Electrolux, general permission, perceiving agreement"*

A: "Purchase tools, how does the business run, how are the modifications made, how are the tests done, how is the approval done, how do the quality guarantees happen, how is approval obtained, how are quality warranties made, what are warranty conditions, how should manufacturing conditions be, how should pricing be done, how should deliveries be done, how should product responsibilities be ..."

In this process, it can be concluded from the experiences of the enterprise that the size of the enterprise and its power are influential in determining the conditions of the contract.

*A: "For example we received a small work at Tofaş; I said Tofaş come on, the articles of your contract are like a **death warrant**, please change this part... And he says hey Mr. Ahmet, who are you?... He says, if there are such problems then don't get involved in this project at all, I can get it to someone else."*

*Y: "Yes, unfortunately we cannot have many expectations, why? Because of the **balance of powers**. For example, let's say Electrolux is on the other end of the table. And the group turnover of Electrolux is 12 billion Euros. You cannot say 'Electrolux hang on, I'll have caprices'. We are obliged to do the work given. For example like Bosch, Valeo, Siemens. Therefore, frankly we, as the small enterprises, do not have any enforcement powers; therefore we do whatever the customer wants."*

Nomination process

The enterprise in the status of the provider of outsource is inspected by the main companies during the 5-6 months process which they define as the nomination process. This process can also be considered as a kind of persuasion process.

M: "You are passing through many inspections; technical inspections, financial inspections and so on. These inspections are mostly made within the framework of quality systems. That is, they are beginning from sales, questioning all your processes, how you do business and what your processes are. They open up the processes we use, and we say look this is how we are doing it. And they look at the strong and weak aspects of this system. They ask us to improve if there is something wrong."

Y: "...Now the customer nominates you there, and maybe this process lasts for 5 or 6 months. The customer nominates you here. He says, ok you've got the job."

The length of the nomination process when the enterprise is the provider of outsourcing may change depending on the type of industry and the specifications of the work. In addition to physically examining its suppliers, the enterprise also realizes various inspections according to the criteria that it is searching for.

M: "Of course we also perform physical inspections. A company is required to pass through our audit."

M: "Our audit is realized in every aspect. We are supervising the opposite company from the aspects of quality and commerce. I mean, it is not just a technical inspection where two people come together. Nevertheless, we continue following each other closely for some more time. This is something in continuity."

M: "Everyone examines the issue and closely monitors with the nearest counterpart to his level, to whom he can reach, and accordingly, we are frequently informing each other as a team and follow the course accordingly."

The production of prototype and reaching the actual contract stage

After this preliminary acceptance, the prototypes of the requested product are manufactured. After passing to bulk order, they reach agreement with the approval of the main company. However such an operation is not mentioned when the enterprise is the receiver of outsource.

Y: "...you produce the piece, samples in the 1-year process, and you produce the first prototype. Now I am beginning to send you bulk orders... And in that 1 year and 8 months process, the prototypes, approvals, customer approvals so on."

Signing all contracts and realizing the alliance

After a decision is given between the enterprise providing outsource and the main company to work together, the main contract is signed.

A: Then, nearly a period of 1 year, a period between 12 and 8 months remains. Now everything is alright, you are at the stage of contracting.

A main contract is also signed between the outsource receiver enterprise and its supplier when the parties decide to work together. However, a manager indicated that in addition to the contract, fair play agreements were also importance during the alliance process and during the conduct of the alliance.

M: "It is bound to a contract. Also the contract's requirements are closely monitored. Well, actually the contract already includes many sanctions."

M: "But being bound with a contract means a decision has been given to set off together".

M: "... but for us, the important thing is the spoken words. They are important for us although there is not a contrary situation. When we give a promise, we pay attention to fulfill it even if it is not written in the contract."

DISCUSSION

Our study shows that, the strategic alliances of enterprises directly contribute to the enterprise, and indirectly, it is an important source which provides sustainable competitive superiority. It allows for reducing costs, gaining speed, increasing quality, and acquiring industrial culture on the one side and it allows for the enterprise to act in a global market on the other side. As also supported by the studies in the literature, the strategic alliances also create network economies at this enterprise, and contribute for producing and marketing the products which cannot be produced by the enterprises on their own.

Another issue related with the strategic alliances claimed in the new literature is the core competencies. If the core competencies of the allying enterprises would be inter-complementary, then they create the opportunity to obtain important advantages for the enterprises. In this context, the core competencies of enterprises have an important place in the formation of alliance. Although it is not directly included in the scope of our study, the analysis of the alliance building process also reveals about which core competencies the studied enterprise and its partners come together. The most important competencies of the examined enterprise include design, technology and human resources. The managers that we have talked have dwelled on these two elements about the reasons why the strategic partner chose them. The trust they have provided to the other party about the quality of work and production of work is also another major characteristic and competency of the enterprise. With regard to the competencies of strategic partners, the industrial culture comes forth at the main enterprises, meanwhile, the conformity of quality-cost-speed-capacity comes forth at the companies from which they receive outsource. They have had the opportunity to reach the sources and competencies they lack by virtue of strategic alliances.

The type of alliance performed by the studied enterprise is outsourcing agreements. Through these agreements, the enterprise obtains certain works from main companies on certain issues (in their own businesses) and better specializes, meanwhile it can also more closely monitor the market and accommodate with the changes more quickly. Besides, because it is preferred as a reliable partner, it can also assist main companies in reducing costs and increasing their profitability. One of the managers that we have interviewed exemplifies this with certain activities that they call "make or buy analysis". With this analysis, the enterprise compares the cost of producing on its own with the cost of outsourcing and tries to make the best decision. With this aspect, outsourcing practices also positively influence the development of the core works on which the company is concentrated.

At the subject company of the case study, strategic alliances are realized by passing through certain stages. As also emphasized in the findings, the company is both an outsource provider and an outsource receiver in terms of the type of alliance it makes. It has been observed that being at different positions does not cause to great differences between the processes. The stages followed up can be listed as follows, as also supported by the literature: 1-feeling the necessity of building a strategic alliance, 2-determination of the type of strategic alliance, 3- selection process of the strategic alliance partner (preliminary preparations, receiving proposals, conducting technical study and pricing), 4-negotiation process (first preliminary outsourcing contract,

nomination process, making a prototype and reaching the stage of actual contract, signing all contracts and realizing alliance).

In both practice and in the literature, many examples indicating that the enterprises built as joint venture have failed. When we look at the reasons behind these failures, we first reason is noted as that the partners cannot properly analyze each other. Getting acquainted with each other in enough time with all their aspects bears great importance for the success of the agreements. In this context, being in continuous cultural and industrial interaction with the alliance partner of the enterprise that we are examining will bring a very great advantage to the enterprise that we have studied. When it reaches the stage of realizing joint venture agreements, which is determined as a prospective goal, it will be able to stand beyond its competitors.

Another important conclusion of our study is that, the managers that we have discussed prefer obtaining information from alliance partners instead of universities. The reason is the belief that they could learn the most correct method in the shortest time from their partners, and their experiences have proved that. Such information that they acquired during the learning process can either be technical information related with production, or they can also be related with the acquisition of a culture that prepares grounds for disciplined and efficient working. And this explains the role of alliances in the process of learning.

During the process of making strategic alliances, especially the negotiation process requires an intense labor and time, and plays an important role in the successful conduct of the alliance. This process plays an important role in terms of both the acquaintance of alliance partners each other and both clarifying the objectives of the alliance. We can say that the enterprise that we have examined has managed the negotiation process properly, and has shown a great care in making the required inspections, identifying the contents of the contracts and fulfilling the requirements of the contract.

A STUDY ON THE ENTRY STRATEGIES OF TURKISH COMPANIES TO THE DEVELOPING ECONOMIES: CASE OF ROMANIA

İbrahim ANIL

Gaye ÖZKASAP

Marmara University, Turkey

ABSTRACT

There is a wide literature about companies' entry-modes (acquisition and greenfield) (Hennart and Park, 1993; Barkema and Vermeulen, 1998; Brouthers and Brouthers, 2000; Demirbag, Tatoglu and Glaister, 2008) and ownership preferences (JV and WOS) (Anderson and Gatignon, 1986; Padmanabhan and Cho, 1996; Delios and Beamish, 1999; Makino and Neupert, 2000; Yiu and Makino, 2002) that they use while investing to abroad. In terms of the entry-modes, the explanation capacity of Institutional Theory, Transaction Cost Theory and Resource Dependency Theory, which are called as Entry Strategies, has been measured by several studies. However, since it has been understood that when these strategies are evaluated separately their explanation capacity decreases, the new approaches have been using for a while. One of these new approaches belongs to Dunning. According to Dunning's approach (1988, 1993), which is called as OLI, the explanation capacity of these theories would be enhanced by integrating them. This approach has been used in the new studies.

The aim of this study is to contribute to the relevant literature that mentioned above by understanding that which entry strategy would explain the behavior of Turkish companies while investing to one another developing country. It is stated in the relevant literature that the development degree of the institutional structure of a host country has a significant importance on the entry strategy and ownership preference of a foreign country (Peng, 2003; Meyer, 2001; Peng and Zhou, 2005; Meyer et.al.,2009). It is well known that companies choose appropriate entry strategies in accordance with this institutional structure. In the countries, in which institutions have not diffused yet, foreign companies prefer to use JV as an entry strategy by collaborating with a local company in order to reduce risks and ensure legitimacy. However, in other countries, in which institutions diffused widely, foreign companies prefer to use WOS (Yiu and Makino, 2002). In addition to that, the limitations of the host country on the acquisition or greenfield (WOS) influence the companies' entry decision (Gomes-Casseres, 1989; 1990; Padmanabhan and Cho, 1996; Cho and Padmanabhan, 1995). The Transaction Cost Theory addresses the entry and ownership modes of companies in terms of transactions and argues that companies prefer to budget friendly strategies while investing abroad (Williamson, 1985; Anderson and Gatignon, 1986; Gatignon and Anderson, 1988, Hennart and Park 1993; Erramilli and Rao, 1993; Cho and Padmanabhan, 1995; Padmanabhan and Cho, 1996; Zhou et.al., 2004). Resource Dependency Theory, on the other hand, addresses these issues in terms of the resources and capabilities of a firm (Barney, 1991; Peng, 2001; Barney et.al., 2001). According to this theory, companies prefer the entry strategies that are suitable for keeping and enhancing their competitive advantage (Greenfield/WOS) (Anand and Delios, 2002; Barkema and Vermeulen, 1998; Ekeledo and Sivakumar, 2004) and if the reason of investing is to obtain a resource that gives competitive advantage companies prefer to entry strategy which is suitable for obtaining this resource with the limitation of the institutional structure of host country (Meyer et.al., 2009). Finally, in his Eclectic Approach, Dunning (1988, 1993) argues that these theories would be integrated by accepting that ownership advantages would be assessed as resource dependency theory, location advantages would be assessed as institutional theory and internalization advantages would be assessed as transaction cost theory. This Eclectic Approach is used in this study in terms of the interactions of three different approaches (Brouthers, Brouthers and Werner, 1996; 1999; Agarwal and Ramaswami,1992; Nakos and Brouthers, 2002; Tatoglu and Glaister,1998).

So far, it has been argued in the studies which analyze the entry modes of foreign companies to the developing host countries that multiple perspectives would be more effective than a single theory in order to explain the entry modes of these companies (Hoskisson, et.al. 2000; Wright et.al., 2005; Brouthers and Hennart, 2007; Meyer and Peng, 2005). In this study, entry strategies of Turkish companies to the Romania are explained and discussed in terms of these theories.

Keywords: *Emerging Economies, entry-mode, entry strategies, Turkish outward FDI*

THEORETICAL FRAMEWORK

When the principal findings of previous studies of the entry into business and its ownership are examined, it is seen that in JV ownership mode, investment firms take advantage of local partners establishing ties with valuable resources, minimizing the investment risks and overcoming the liability of foreignness by means of ensuring legality; and that, in WOS ownership mode, firms take advantage of ensuring full control of local activities and the benefit of administrative autonomy in overcoming the harmonization problems resulting from the partners' different abilities, interests and aims (Dikova and Witteloostuijn; 2007, pg.1015).

According to Cho and Padmanabhan, Japanese firms preferred acquisition of their local or foreign competitors rather than greenfield investment, despite its high cost, with the aim of reducing potential competition and blocking the possibility of competitors entering the market (Cho and Padmanabhan, 1995, pg.276).

A. Institutional Approach

In the studies carried out within the framework of the institutional theory, it has been shown that, at the early stages of transition into the market economy, foreign firms preferred to establish JVs with local firms rather than establishing wholly owned subsidiaries (WOS), due to the intense uncertainty seen at this stage and the weakness of the institutions supporting the market; however, at the last stage of transition into the market economy they preferred WOS, as there is less uncertainty and institutional support for the market becomes stronger (Peng, 2003, pg.286-290). It is claimed that the higher number of restrictions upon foreign investors in the host country affects their preference for JV (Cho and Padmanabhan, 1995, pg.266).

It has been determined that when the regulatory and normative constraints of the host country have a restrictive effect, investment firms prefer to establish JVs rather than WOS, in order to ensure legality within the institutional framework. It is claimed that the foreign firms prefer the most common ways of entry into market of competitors that have previously entered into the market (external mimicry) or their own, previously successful ways of entering a foreign market (internal mimicry); and their preferences, which aim to ensure legality through local or domestic partners, depend on the "legality" criteria (Yiu and Makino, 2002, pp.667-668; Scott, 1995 and, DiMaggio and Powel,1983).

However, Gatignon and Anderson (1988, pg.315) suggest that risks pertaining to the country generally include the political, legal, cultural and economic environment of the country in relation to the stability of commercial activities. They reported that risks may necessitate more flexibility and, thus, this may lead to the preference for administration styles with less control (JV). They found that, for countries with high risk, firms avoid establishing wholly owned subsidiaries. A similar finding was reported by Kim and Hwang (1992, pg.35), who determined that when the country risk is high, multi-national firms prefer (JV) entry mode with less resource commitment, in order to minimize potential losses by restricting the resource commitment in the country in question. In a study by Luo (2001), carried out in China, which has a developing economy, it was found that when the leaders of multinational firms perceive an uncertain environment and greater state intervention, firms prefer JVs.

In their studies on the preference for WOS or JV, Kogut and Singh (1988), Gatignon and Anderson (1988), Erramilli and Rao (1993), Meyer (2001), and Tsai and Cheng (2004) found that when the cultural remoteness between the host country and the country of the firm is greater, there is a greater preference for JV rather than WOS. Investment firms may need complementary information and experience in order to succeed in a culturally different (remote) country and, as mostly such complementary information is thought to be obtained from JV partners, they are expected to prefer JV rather than WOS (Padmanabhan and Cho, 1996, pg.49; Hennart and Larimo 1998, pg.534). However, Brouthers and Brouthers (2000) found no

meaningful connection between cultural remoteness and preference for an entry mode among Japanese firms investing in Western Europe.

In contrast, a study by Anıl, Cakir and Canel (2010) that compared the determinants of foreign direct investments in Turkey and Turkey's investments vice versa, found that when firms are fully aware of the similarities between the business styles and the local culture of the country in question, they prefer JVs. However, the study reveals no meaningful connection between the cultural similarity and the preference of entry mode (greenfield/acquisition).

B. Transaction Cost Approach

The keynote of this theory is that the determining factor for the preference of entry modes and ownership is the firm's organisation and administration structures minimizing the transaction costs (Zhao et al., 2004, pg.526). When the costs of protection against opportunist behaviour, performance monitoring and adaptation of production technologies are high, the firm would prefer an internal administration structure (WOS) (Luo, 2001, pg.445; Meyer and Peng,2005, pg.603; Williamson, 1985)

In most of the studies carried out in this field, it has been stated that if the firm's asset specificity is high, it is more likely to prefer JV rather than WOS (Gatignon and Anderson, 1988; Padmanabhan and Cho, 1996; Delios and Beamish, 1999; Makino and Neupert, 2000; Luo, 2001; Brouthers, 2002; Tsai and Cheng, 2004). Previous studies have generally found that, in order to protect the product specific to the asset against problems of opportunism and misuse, administration structures with higher control such as WOS are more appropriate. When technological deficits in the transition economies are taken into account, an R&D-intensive firm may prefer to have full control in order to protect its proprietary expertise and/or to use it optimally (Padmanabhan and Cho, 1996, pg.48). Padmanabhan and Cho (1996, pg.60) found that R&D-intensive Japanese firms generally prefer whole ownership (WOS) in their foreign investments. Moreover, Meyer (2001, pg.360) stated that, as the institutional structure cannot ensure effective protection of intellectual proprietary rights, the spread of information can be an important problem in transition economies and developing economies; thus, technology-intensive firms prefer to internalise (WOS) their transactions for goods and services necessitating advanced technology.

Some studies have found that asset specificity affects firms' greenfield and acquisition preferences. In a study by Hennart and Park (1993, pg.1068), in which they analysed the greenfield and acquisition preferences of Japanese firms investing in America, it was ascertained that R&D-intensive Japanese firms prefer to enter into business in America through greenfield investment. The authors suggested that this preference is possibly because firms perceive it as the most effective way of transferring their technological advantages to American shores. Cho and Padmanabhan (1995, pg.264-265) stated that this is in line with firms' strategy to transfer their implementation overseas and also their cost saving objectives.

Because uncertainty renders contracts ineffective and leads the partners to be exposed to delays, WOS is preferred (Brouthers and Hennart, 2007, pg. 403). In accordance with the model proposed by Williamson, when the asset specificity and country risk (foreign uncertainty) are both high, firms prefer entry modes with higher control (WOS) (Gatignon and Anderson, 1988; Anderson and Gatignon, 1986; Erramilli and Rao, 1993).

In studies related to transaction cost, it was reported that the firm's experience in the host country or in the international field affects the entry and ownership mode in the overseas market. Firms with greater host country or international experience are potentially better placed to undertake administration responsibility and risks pertaining to wholly owned foreign activities (Padmanabhan and Cho, 1996, pg.48). As the firm with greater international experience has less disadvantage concerning the local information, the firm may have less need for a local partner to overcome the liability of foreignness and thus, it may desire to have whole ownership (Dikova and Wittelloostuijn, 2007, pg.1016; Padmanabhan and Cho, 1999, pg.27; Gatignon and Anderson, 1988; Delios and Beamish, 1999; Tsai and Cheng, 2004).

Some studies found that the firm's international experience affects its preference for acquisition or greenfield entry. Increasing internalisation offers firms the opportunity to learn how to administer new departments and how to adapt its activities with the center (Larimo, 2003, pg.794). A firm with greater international experience can increase the acquisition risk and can unify the subsidiaries of different managerial nationalities. Therefore, when there is greater multinationalism, the firm will be better able to pursue acquisitions (Kogut and Singh, 1988, pg.420). Tsai and Cheng (2004, pg.20) analyzed the entry modes of Taiwan manufacturing firms into China, South East Asia and Western Europe; it was found that Taiwanese firms with greater experience with foreign firms prefer acquisition. Moreover, it has been stated that

experience/information specific to the host country assists the investment firm in determining and evaluating potential acquisition candidates and in negotiating with them (Larimo, 2003, pg.794)

However, Zejan (1990) tested the acquisition preference of less experienced firms and the greenfield preference of more experienced firms; and studies by Cho and Padmanabhan (1995), and Larimo (2003) revealed no meaningful relationship between experience and acquisition/Greenfield preferences. Anıl, Cakir and Canel (2010) found that previous firms' experience in the host country is not related to the preference for ownership mode or entry mode.

In contrast, in a study by Padmanabhan and Cho (1999, pg.37) that analyzed the importance of experience specific to the decision in multinational firms' preferences for overseas entry and ownership modes, important empirical evidence was found supporting the hypothesis that these firms have the tendency to choose ownership modes (JV/WOS) and entry modes (acquisition/greenfield) similar to the structures in which they are experienced.

C. Resource Based Approach

In a study by Meyer, Wright and Pruthi (2009, pg.558), resource based approach explained to be applied to the analysis of entry modes focusing on resource supplies of local firms, organisational learning, erosion potential of firms at the value of know-how, transfer of non-verbal information and the resource- utilization costs.

Brouthers and Hennart (2007, pg.404) reported that information based approach and resource based approach, which is claimed to include organisational abilities, help to develop the unique resources that the firms can use in foreign markets or benefit from the foreign markets as resources for obtaining and developing new resource-based advantages. The results of Hitt et.al. (2000) studies show that in selecting partners, firms from developing markets are more eager to share the financial assets, technical abilities, abstract assets and expertise of their partners; on the other hand, firms from developed markets emphasize the unique competence, market knowledge and access to the market of more than one partner. Moreover, firms from developed markets try to use their own resources in obtaining a competitive advantage by looking for partners with unique competence, local market knowledge and access to the market, but firms from developing markets look for partners from which they can learn organisational and technical abilities (Hitt et.al.,2000, 461-463).

By unifying the resource-based and institution-based approaches, Meyer et al. (2009, pg.62) analysed the strategies of foreign firms in entering developing economies. They stated that in a weaker institutional environment, JVs are used to provide access to many resources, but in an environment where the institutions are stronger and market activity is higher, acquisitions become more important in securing access to abstract resources and JVs have less importance.

When a firm enters into a foreign market, it will transfer its resources and abilities to the foreign operation. Therefore, it is necessary to chose the entry mode that will optimally transfer its resources and abilities from the home country to the host country without depreciating their values (Erramilli et al., 2002, pg.225-226). In accordance with the resource-based approach, when the resources can not be imitated or substituted, greenfield investment protects the resources and knowledge more than the acquisition of the present firm. Furthermore, greenfield investment enables effective knowledge transfer between the main firm and the subsidiary and also prevents the cultural and organisational adaptation problems than can emerge in relation to international acquisitions (Demirbag et al., 2008, pg.15).

Anand and Delios (1997, pg.582) stated then when there are no local partners and when it is necessary for the firm to obtain new resources such as local competence in order to overcome disadvantages specific to a challenging position, acquisitions may be the only acceptable way of entering into the foreign market. Anand and Delios (2002, pg.121-122) ascertained that the preference of the entry mode is shaped partially by the relative technological advantage of the host country and the home country of the investment firm. When the host country has the relative advantage, it is more likely that the foreign firm would prefer entry by acquisition. However, when the home country of the investment firm has the relative technological advantage, the firm would use the Greenfield method and therefore benefit overseas from this technological advantage. Barkema and Vermeulen (1998, pg.9) stated that firms with stronger technological competences have a strong preference for the greenfield mode for two reasons: Firstly, existing local firms have relatively little technological competence to present to firms with stronger technological competences; Secondly, if the acquiror has superior technological competences, transfer of these competences to the acquiree company may

be difficult or impossible because of the organizational inertia, i.e. the resistance of the workers within the acquired firm to the changes that would result from the acquisition process.

In the studies relating to the resource based view, the size of the firm is regarded as a sign of competitive advantage in terms of financial, physical, humane, technological or organisational resources (Ekeledo and Sivakumar, 2004, pg.78). It has been asserted that larger firms are better at absorbing the risks and costs relating to foreign direct investments and have greater advantage in balancing disadvantageous positions (Buckley and Casson, 1976; Terpstra and Yu, adapted from Kumar, 1984, 1988, pg.35). It has been stated that the larger the investment firm, the greater the acquisition competence of the firm (Kogut and Singh, 1988, pg.420; Chang and Rosenzweig, 2001, pg.756; Larimo 2003, pg.801.)

D. Eclectic Approach

Evaluating the firms' own ownership advantages, the advantages of the host country's position and the internalizing advantages of integrating the operations within the firm, Dunning's eclectic paradigm stipulates that firms would prefer the most appropriate method of entry into international markets. (Tatoglu and Glaister, 1998, pg.284).

Considered as factors peculiar to the country, the position advantages include the size of the market and the potential demand; similarities and differences in economic, legal, political and commercial policies; similarities and differences in the culture; similarities in market infrastructure and the usability of lower production costs (Brouthers et al., 1996, pg.379, adapted from Dunning, 1993).

There are various studies examining Dunning's OLI (Ownership, Location and Internalization advantages) factors and the firm's modes of foreign entry to the markets, such as Agarwal and Ramaswami (1992); Brouthers, Brouthers and Werner (1996); (1999); Tatoglu and Glaister (1998); Nakos and Brouthers (2002).

Agarwal and Ramaswami's study (1992, pg.20-21) is one of the most cited studies on this issue and is differentiated from others as it analyses the impact of mutual relations among the firm's property (ability to develop differentiated product, its magnitude and international experience), the firm's position (potential of the market and its investment risk) and the firm's internalizing advantages (risks regarding the contract) in the firm's preferred market entry modes (exportation, licensing, JV, WOS). The study determined that, since Joint Venture agreements reached with the firms of the host country provide an opportunity to share the complementary assets and abilities of the partner firm and also the opportunity to share the costs and risks, small firms with limited international experience prefer to enter markets with high potential through JV. On the other hand, it has been determined that larger firms with more international experience preferred WOS ownership mode, in order to expand to markets with lower potential and to realize their profit targets. In countries where the contractual risks (risks regarding the spread of information, deterioration in the quality of assets and services and the costs of preparation and implementation of the contract) of the firms with the ability to develop differentiated products are considered high, it has been determined that firms tended to prefer WOS due to the firms' anxiety to have potential losses in their advantages.

In the study (Tatoğlu and Glaister, 1998, 287) analysing the hypothesis that firms would prefer WOS instead of JV when the market potential, positive government policies, advantages of strategic position, relative importance of labour supply and infrastructure are greater; and would prefer JV when the relative importance of investment risk and industrial competition is greater; the authors found that only investment risk and industrial competition rate are related to the preference for ownership mode of Western firms investing in Turkey.

Anıl et al. (2006, pg.44-61) Examined 19 factors as position advantages peculiar to host countries in the investment preferences of firms from Turkey entering developing countries. They determined that, of these 19 factors, greenfield investment preferences were more influential than the growth rate of the economy, geographical proximity and level of unionization; and that, on the other hand, the competition level in industry was more important in the preference of WOS than in JV (Anıl, Cakir and Canel, 2010).

In previous studies, it has been claimed that several factors affected a firm's preferences in developing economies, as such economies are more unstable and uncertain than developed countries, and thus involve great risks for foreign firms that have entered the market. For this reason, it has been stated that reliance on only one theory or perspective would be inadequate to explain the preferences, and that various theories and perspectives would be more beneficial in this respect (Hoskisson et al., 2000; Luo, 2001; Wright et al., 2005; Meyer and Peng, 2005; Brouthers and Hennart, 2007). It has been stated that, in examining the preferences of firms entering into developing countries, institutional theory, transaction cost theory, resource-based

approach and Dunning's eclectic approach are mostly used; and that Dunning's approach can be used as a means to combine the other three theories, and thus a more explicative framework can be established (Brouthers and Hennart, 2007).

FINDINGS

Data relating to 7 Turkish firms investing in Romania has been collected through in-depth interview method. The obtained data was evaluated by means of the case study method and the findings are given below:

A- Findings related to Entry Modes:

Four out of the seven firms analysed entered the Romanian market through greenfield investment mode. The greenfield investments of Ulker, Pakmaya, Superlit and DYO were realized in 2002, 1994, 2006 and 2003, respectively. When the investment of DYO is considered as only the purchase of an empty building and a building plot, this may be regarded as an acquisition; however, when attention is given to the absence of a takeover of any manufacturing resources and knowledge, this should be regarded as a greenfield investment. Each of the four companies supports the arguments of Transaction Cost and Resource Dependency theories by preferring Greenfield with their strong research and development, ownership and internalization advantages.

The other three firms entered the Romanian market through acquisition. Kombassan entered into Romanian market in 1998, Arçelik in 2002 and Ereğli Iron and Steel Works Co. in 2002, by making investments through acquisition. Despite of their strong research and development, ownership and internalization advantages Arçelik and Ereğli companies preferred to enter Romania by using acquisition and this situation contradicts with the theory. If it is thought that Arçelik and Ereğli entered the market in order to prevent the possibility of one another company's buying option, it could be said that they behave like Japanese firms. Since Kombassan aims to use its financial power to buy cheap facilities in terms of privatization and using diversification strategies, this company needed to acquire and fill the lack of knowledge, skill and asset.

B- Findings related to Ownership Modes:

Five out of the seven firms analyzed realized investments through whole ownership. In the investment of Ereğli Iron and Steel Works Co, Arçelik and Pakmaya all the shares belong to the firm itself but Ulker (a co-partner, initially with a very small share with the German Investment Bank) and Kombassan (a co-partner with the labour unions, previously a share of 35%, and 9% now) left an unimportant share for their small partners. Administrative control lies entirely with Ulker and Kombassan. As regards the other two firms, although Superlit entered with a share of 40% with the Romanian single proprietorship, and DYO 50% with a Turkish paint marketer, today all the firms except Kombassan obtained whole ownership. Partner choice behavior of the companies that use JV do not support the relevant theory because while choosing their partners these companies do not consider reducing the amount of resource that put into risk, reducing the uncertainty or ensuring a resource that they need.

ARGUMENT

A- The Kombassan and Ereğli firms entered Romania as a result of their financial strategies. They invested in order to pursue speculative profits by using their current surplus resources in acquiring facilities that were operated in a cheap and inefficient manner. Entry modes including the diversification strategy implementation are not examined in the literature. Since the literature does not include such studies examining the behaviors of those firms, it is not possible to explain this peculiar situation within the current institutional frameworks.

B- According to the institutionalist approach, firms with strong resources should prefer greenfield entry modes and JV partnership modes in situations where the risk of the country is considered high. Until 2005, Romania was among the countries considered to be an investment risk by the global competition actors. None of the Turkish firms considered Romania as a risky country in which to invest. Within the literature it can be seen that foreign investors prefer the JV ownership mode, in order to reduce the risks. However, since the greenfield investment process for Superlit and all the clients of its products are public bodies, Turkish firms have preferred JV in order to facilitate cooperation with a former Senator and to thereby ease the bureaucratic procedures and to establish a network. Other findings -another argument of the institutionalist approach- indicating that firms perceiving a lack of cultural similarities may prefer JV, can also be helpful in explaining the behaviour of Kombassan. Though Kombassan does not have strong resources and assets regarding the manufactured product, according to the institutionalist approach, it can be

seen that, in order to diminish problems of compliance, Kombassan preferred JV rather than buying the small share owned by the labor unions. Kombassan preferred to employ Romanian Director-Generals, Deputy Director Generals and staff in order to overcome the compliance problem. It is known that the Romanian-Turkish business association plays an active role in creating networks, providing information and in lobbying activities.

C- According to the arguments of the Transaction Cost Approach, it has been foreseen that whole ownership and greenfield entry modes would be preferred when there is deterioration in the quality of the product and when it is perceived that there is a risk of spreading product information. The investment of the Erdemir firm confirms these arguments. However, as Erdemir aimed to diversify existing products with a different product, it preferred acquisition rather than greenfield. The JV ownership mode, preferred for entry by the DYO and Superlit firms, supports this claim. It has been stated that, in DYO, the problem was solved by JV partners having no share in the manufacturing process, but taking responsibility only for marketing activities; the Superlit firm indicated no risk of spreading product information or deterioration in the quality of the product, by giving responsibility to their partner for the marketing activities with the investment and public procurements and not including it in the manufacturing process. Ulker, which has a high level of technology intensity, R&D level, abstract assets and market power, confirmed the arguments of this theory by preferring the greenfield investment of DYO and Superlit firms; and, with regard to the whole ownership, only Ulker was confirmed and DYO and Superlit were not confirmed. It has been determined that the actions of firms perceiving the existence and high level of transaction costs do not affect the preference decisions, in contradiction to the arguments of the approach.

D- According to the arguments of the resource-based approach, it has been foreseen that firms that have high-level ownership advantages prefer whole ownership and greenfield investment. These arguments are confirmed by the fact that Ulker prefers greenfield and whole ownership by perceiving its full and high-level ownership of all the resources; that Superlit and DYO prefer greenfield when other resources belong to the firm itself and prefer JV when the partner has only the market information.

E- Dunning's Eclectic Approach states that whole ownership is preferred when there is a strong perception that the competition is low and the market is appealing. All the Turkish investment firms declared that the market is appealing and there is the opportunity to access close markets; and thus they preferred whole ownership structures. In the entry stage, the ownership modes of DYO and Superlit confirms the predictions of the approach. Important motivations included a qualified and cheap labour force, the advantage of being first to enter the market, the high probability of Romania becoming a member of the EU, and thus to be operate within the EU. It has been observed that perceptions regarding the host country and its positions, and preferences based on the market do not have an effect on investing companies' preferences for entry mode into overseas markets?

CONCLUSION

In this study, it has been analyzed that which entry (Greenfield/ acquisition) and ownership (JV/WOS) styles are used by one developing country's firms (Turkey) during the entrance process of one another developing country (Romania). By doing that various theoretical aspects, Institutional Theory, Transaction Cost Theory, Resource Dependency Theory and Dunning's Eclectic Approach (OLI) which covers first three theories and add them some other factors, has been used. Despite of the wideness of research that deal with the entrance styles of the developed countries' companies and their entrance process to the developing countries, there relatively are few research that deal with the entrance styles of developing countries' companies that enter to other developing countries. Thus, this study aims to contribute filling this gap.

In this study it has been found that none of the relevant theories could explain the entrance behavior of Turkish companies to Romania alone; but, each of them partly explains it. As a result, it could be said that Dunning's Eclectic Approach is more explanatory than other theories. One another finding of this study is that the behavior of the companies which invest to Romania in order to realize their finance or diversification strategies could not be explained by the existing theories. In addition, none of the relevant theories aims to explain the behavior of the companies that wants to enter international markets by investing different fields. By contrast with the arguments of the relevant theories, Turkish companies which have strong ownership and internationalization advantages prefer to use acquisition strategies. In addition, some other companies which have strong financial structure prefer to use JV strategies. All of them these findings contradict to the existing literature. Since the companies that developed without using hedge funds generally invest to fields that match their specialization, there is little research that deals with the entering international market by using diversification strategies.

Although Institutional Theory argues that in the countries where the uncertainty and cultural distance are high companies would choose JV, all of the Turkish companies that was analyzed in this study but two did not prefer to use this strategy. Moreover, these companies indicate that they did not care the transaction costs because the conditions were similar to Turkey. Finally, it has been found that Resource Dependency Theory has a capability to explain the behavior of these firms; but, even this theory could not shed light on some aspects.

When we assess the Dunning's Eclectic Approach's arguments in terms of advantages that are related with the country and company it could be said that following factors have an impact on the decision of the Turkish companies: having a factory in EU, taking the advantage of being first mover, entering international markets, buying a cheap facility in terms of privatization. Hence, in this study which tries to explain the entrance behavior of the companies from different sectors, sizes and from different entrance years, it has been found that Eclectic Approach is more exploratory than other theories. Because all of this conditions more or less have an impact on the decision of Turkish companies.

In this study it has been analyzed of the entrance behavior of companies from one single country (Turkey) to one another (Romania). In addition, only manufacturers have been analyzed but service companies have not been taken into consideration. The findings of this study are limited with the seven companies. All of these conditions are the limitations of this study.

ABSTRACT

This paper analyses the relationship between human resource flexibility and cooperation in a sample of Spanish manufacturing firms. Using data from a panel of 1,626 Spanish industrial firms in the period 2003-2006, the paper tests a model of research hypotheses and analyses the differences of firms characteristics and technological strategy among cooperation and non-cooperation firms.

Keywords: *Human Resources Flexibility; Innovation; Cooperation; Technological Cooperation. Technology Outsourcing.*

INTRODUCTION

Cooperation, the strategic phenomenon in which firms engage in simultaneous cooperation and competition with each other (Nalebuff and Brandenburger, 1996), is intriguing in theoretical as well as practical terms (Gnyawali et al., 2006). Although some scholars suggest that collaboration among rivals may inhibit competition by facilitating collusion or by shaping industry structure in anticompetitive ways, others suggest that firms derive valuable resources from other collaborative-competitive relationships and strengthen their competitive capabilities (Gnyawali and Madhavan, 2001).

The findings of existing studies on cooperation and innovation imply that relationships between competing firms include unique characteristics that are lacking in relationships between non-competitors, and that these characteristics might produce different results in terms of innovation. However, despite the growing relevance of the topic, the development of theoretical frameworks for innovation-related cooperation is still in an emergent phase (Ritala and Hurmelinna-Laukkanen, 2009). Our aim in this study is to address this gap, and to focus on the question of how innovation-related cooperation differs from non-cooperation in terms of some flexibility dimensions related to human resources and to the network process of accessing and deploying knowledge within the firm.

THEORY AND HYPOTHESES

According to the knowledge-based view, a firm gains a competitive advantage by exploring, exploiting, and integrating different specialized knowledge areas through internal R&D activities and external technology sources (Grant, 1996). Focusing on in-house R&D activities allows a firm to develop its core technological capabilities and experience higher economic returns while allowing for better control and tacit knowledge understanding embedded in the development process (Kessler et al., 2000). Alternatively, a firm should implement external technology sourcing to broaden its existing technological knowledge base, keep abreast of cutting-edge technologies, and remain flexible (Grant, 1996).

The existing literature addresses various modes of external technology acquisition. These modes include cooperative agreements, R&D outsourcing, inward technology licensing, and mergers and acquisitions. This paper focuses on R&D cooperation and outsourcing because they are more related to organizational

flexibility. First, firms can improve their technological innovation by collaborating with competent competitors (Tether, 2002). By sharing technological knowledge and skills, firms involved in this type of cooperative agreement may create a synergistic effect on new knowledge creation (Inkpen and Pien, 2006). A firm collaborating with its competitors may therefore gain better innovation performance than by working alone. Using this approach, firms can simultaneously accelerate their capability development and reduce technological innovation time and risk. Furthermore, collaboration provides a good opportunity to firms to measure their competitors' technological levels. Firms that are more knowledgeable about their competitors' technology strategies are better able to differentiate themselves from their competitors. Firms can also learn lessons from their competitors' technological innovation mistakes or problems.

Coopetition creates value through cooperation between competing organizations, aligning different interests toward a common objective and helping to create opportunities for competitive advantage by removing external obstacles and neutralizing threats. It implies that organizations can interact in rivalry due to conflicting interests and at the same time cooperate due to common interests. Firms that engage in coopetition ties find themselves gradually enmeshed in a network of crosscutting ties. Consistent with well-established network arguments, such firms derive several benefits from their coopetition network, such as easier and earlier access to a large volume of network resources, earlier knowledge of important developments in the industry, and ability to control information and resource flows in the network. The existence of simultaneous cooperative and competitive relations possesses a unique dynamic that is just beginning to be understood (Ketchen et al., 2004).

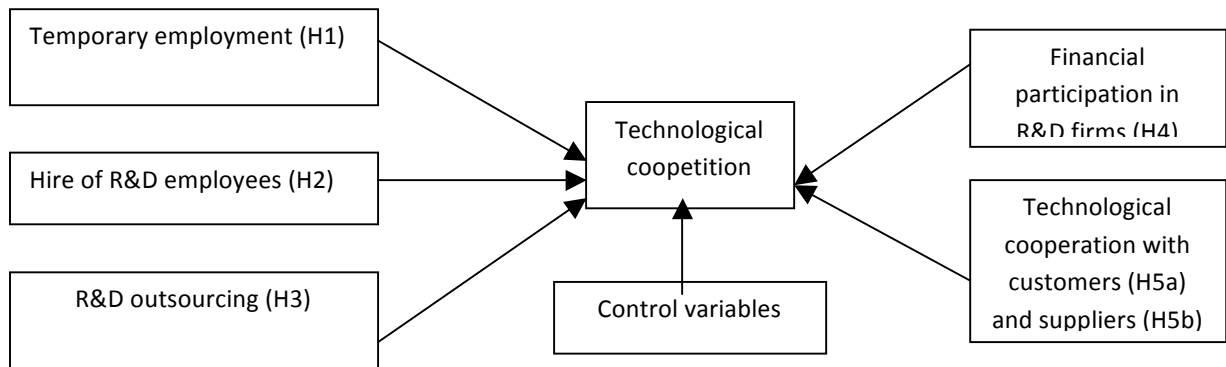

The most prominent theoretical and conceptual approach to coopetition and innovation includes arguments from game theory, the resource-based view (RBV) and capability theory, and transaction cost economics (see Lado et al., 1997; Quintana-García and Benavides-Velasco, 2004, for a thorough discussion on coopetition from these perspectives). According to these views, competitors are sometimes in a position to engage in positive-sum games that create value for all participants (the game-theoretic perspective). Further, competitors sometimes possess similar knowledge and a common market vision, which helps them to engage in such collaboration (the RBV perspective). Conversely, from the perspective of transaction cost economics coopetition is considered an extremely risky business because competitors have individual business incentives that might lead to opportunistic behaviour.

Regarding flexibility, the most frequent approach to analyse flexibility in organizations is the RBV and capability theory. Competitive behaviour depends not only on the firm's ability to exploit its resources but on exploring new not yet existing or at least fully realized dynamic capabilities (Rothaermel and Hess, 2007). Flexibility options have the potential to broaden the range of capabilities necessary to innovate. Wright and Snell (1998) define flexibility as a firm's ability to quickly reconfigure resources and activities in response to environmental demands. To attain the level of flexibility that customers value. This paper focuses on the influence of external workplace and technology flexibility on coopetition because this flexibility is more related to the firm's inter-organizational cooperation and to the process of accessing and deployment of knowledge in the firm that may influence more strongly the innovation process and the competitive behaviour of the firm.

Much of a firm's innovation now occurs in conjunction with other firms (competitors, customers & suppliers) rather than inside the firm because the increasing complexity of markets makes difficult for firms to have all of the resources necessary to innovate. Since developments in non-core knowledge areas have become very rapid, it is no longer feasible to keep up with all of these knowledge areas in as much detail as needed (Quinn, 2000). External sources of knowledge are sometimes the only option for firms that wish to keep up-to-date. Prior research suggests that the use of flexible employment contracts or outsourcing may be perfectly compatible with the achievement of innovation in dynamic and high-technology environments to ensure the presence of knowledge resources that may be beyond existing internal capabilities (Matusik and Hill, 1998; Nesheim, 2003).

Figure 1 depicts the research model. The next paragraphs develop the research hypotheses. We propose that several workplace flexibility practices are positively related to coopetition: temporary employment, hire of R&D employees, and R&D outsourcing. Two more technological flexibility dimensions are also proposed to be positively related to coopetition: financial participation in innovative firms, and technological cooperation with customers and suppliers. The purpose of this research is to contribute to develop theoretical frameworks for innovation-related coopetition. Recent studies find that flexibility dimensions are relevant to analyse the firm's competitive behaviour of firms in the innovation field (e.g., Martínez-Sánchez et al., 2009).

Figure 1. Research model

First, temporary employment is an external flexibility dimension that contributes to adjust the stock of employees and skills in a dynamic environment. Dynamic environments are characterized by variations in product demand but also in technologies and in customer preferences. When the firm's operating environment is highly dynamic, previously developed capabilities may not be able to keep up with the frequent changes in technological conditions. The misfit between a firm's existing capabilities and the firm's operational environment may be mitigated if the firm has flexibility to explore new areas and build new capabilities. The use of temporary employment opens new possibilities to firms that cooperate technologically with competitors. Training, recruitment, and hiring costs are lower for temporary than for permanent employees, and firms can manage capacity more efficiently (Kalleberg and Mardsen, 2005). On the other hand, firms may also develop flexibility capabilities by accessing, creating, and implementing 'new knowledge'. Therefore, the use of temporary employment in innovative activities may facilitate the competitive behaviour related to coopeitition.

Hypothesis 1. The percentage of temporary employment in the workforce is positively related to technological coopeitition.

Firms may also need access to relevant external knowledge through specialised R&D employees who bring knowledge of occupational and industry best practices into the firm. External knowledge may leverage the internal stock of knowledge to develop innovations in order to overcome greater environmental uncertainty. Nesheim (2003) and Nesheim et al. (2007) found that firms use external personnel and consulting firms in core value-creation areas to bring knowledge and industry 'best-practices' into the firm. Compared with others, firms that hire R&D experts are more likely to benefit from specialized knowledge that complements in-house expertise by acquiring, processing, and using diverse information and resources and in turn undertaking a wide range of competitive activities that favour coopeitition. Therefore, firms that incorporate R&D experts are in a better position to establish cooperative relationships with competitors because they are able to advance in new technological fields and complement the stock of knowledge of core employees in the coopeitition firms.

Hypothesis 2. The use of external R&D employees is positively related to technological coopeitition.

The outsourcing of some innovative activities may also bring new knowledge and complement innovation capabilities of core employees in firms who cooperate technologically with competitors. When properly planned and executed, firms that outsource R&D reduce innovation process obstacles and maximize innovation and overall company performance (Gupta et al., 2009; Huang et al., 2009; Watanabe and Hur, 2004). In addition, R&D outsourcing can be treated as an external learning process and has direct implications regarding how effectively firms can apply existing knowledge from outside sources to produce innovation performance (Kessler et al., 2000). Mol et al. (2004) find that during periods of increased product innovation, firms intensify their global searching activity to obtain and combine knowledge from various specialised sources. Similarly, firms that conduct their own R&D and seek external knowledge related to their core competences can more effectively incorporate this external knowledge and use it to enhance the innovation needed in coopeitition (Bierly et al., 2009). Thus, we propose:

Hypothesis H3. The outsourcing of R&D activities is positively related to technological coopeitition.

Cooperative ties with competitors provide a firm with opportunities to learn about its partners and afford access to resources residing in the network. Gnyawali and Madhavan (2001) suggested that network resources are critical in shaping a firm's competitive behaviour. Firms with a superior position in their networks are likely to learn about competitive opportunities sooner and use that knowledge in planning and executing competitive actions. Structurally advantaged firms have more opportunities to learn about the capabilities of other firms in the network, have greater flexibility to take action based on such knowledge, and can draw key assets from the network with less difficulty. A source of superior advantages for firms in network relationships is the financial participation in R&D firms that develop technological innovations. This access to external knowledge enables the firm to stay in a better position to cooperate with competitors because on-going R&D projects provide the edge to advance the technological fields that create value and new markets. Thus, we propose:

Hypothesis H4. The financial participation in firms that develop technological innovations is positively related to technological cooperation.

The empirical studies that have focused on the connection between different collaborative R&D partners and innovative performance provide evidence of the fact that competitors differ from other kinds of collaboration partners in innovation, and that cooperation between competitors contributes more to creating completely new products than cooperation between non-competing firms (Quintana-García and Benavides-Velasco, 2004; Tether, 2002). According to the game theory, cooperation is rational when cooperating with a competitor increases the size of the market so that there is more to allocate among the participants than there would be otherwise. With respect to innovation activities, this intuition seems to be particularly applicable. Creating new product and services or improving current ones in collaboration with competitors may increase the size of the current market or create completely new ones. This leaves the collaborating competitors better off than if they had not been collaborating.

Research suggests that the more competitive actions a firm undertakes or the more competitively aggressive the firm is, the more likely that it will increase market share and profitability, and improve its competitive advantage (Young et al., 1996). Thus, firms that cooperate technologically with customers and suppliers have broader learning opportunities as they are exposed to a large amount of information from diverse environments. Such firms may be more externally oriented and can take advantage of external resources more efficiently.

Suppliers usually have greater expertise and better knowledge of components and parts that are critical to a firm's technological development. Their expertise and different perspectives may make it easier for a firm to create new product development methods and to identify potential technical problems and increasingly difficult and costly design changes (Kessler and Chakrabarti, 1996). Collaborating with customers is also important because it helps to identify technology development market opportunities and reduces the likelihood of poor design in the early stages of development (Brockhoff, 2003). Consequently, firms that cooperate technologically with customers and suppliers are likely to possess the internal capabilities needed to use network resources more efficiently and effectively and therefore benefit more from cooperating with competitors and increasing the size of the market through cooperation.

Hypothesis H5a. Technological cooperation with customers is positively related to technological cooperation.

Hypothesis H5b. Technological cooperation with suppliers is positively related to technological cooperation.

METHODS

In order to test these hypotheses, we conducted an empirical study on Spanish industrial firms. We use the Survey of Business Strategies (SBS) questionnaire which contains a set of statements that permit the study of competitive behaviour for a great number of Spanish industrial firms. The SBS is an annual survey conducted by the SEPI Foundation in collaboration with the Spanish Ministry of Industry with the objective of knowing the evolution of the characteristics and strategies of Spanish industrial firms. This survey contains information about markets, customers, products, employment, technological activities and economic-financial data of the firms. The reference population comprises industrial firms operating in Spain and with more than 10 employees, with representativeness being one of its characteristics. We develop a database with panel data from 1,367 industrial firms in the period 2003-2006.

The research hypotheses were tested through logistic regression analysis. The dependent variable in the study is a dummy variable that indicates if the company cooperates technologically with competitors. The independent variables are:

- Four measures of external flexibility: the percentage of temporary employees in the workforce, the hire of employees with R&D experience (dummy), the outsourcing of R&D activities (dummy), and the financial participation in firms that are developing technological innovations (dummy).
- Two dummies of technological cooperation in the supply chain with customers and suppliers.

The regression analysis controls for: firm size (logarithm of sales) because firm size is widely accepted as a predictor of competitive behaviour (e.g., Miller and Chen, 1996); R&D effort (percentage of R&D employees in the workforce); firm's performance (return on sales) as previous performance is likely to influence competitive behaviour (Young et al., 1996); identity between firm ownership and control (dummy), and industry. Before the multivariate analysis, a comparative study was also carried out to study differences between cooperation and non-cooperation firms. Contingency analysis and means comparisons (t-test) are used in this descriptive study.

RESULTS

Cooperation is a marginal strategy among Spanish manufacturing firms. Only 2.63% of companies cooperated technologically with competitors in the period 2003-2006, whereas technological cooperation with suppliers (21.24%), customers (18.03%), and R&D centres (22.26%) is more widespread. Nevertheless, cooperation is positively associated to these other forms of technological cooperation. Table 1 indicates several contingency indicators between cooperation and technological cooperation with suppliers, customers and R&D centres. The results indicate that cooperation is positively associated to other forms of technological cooperation in the value added chain: firms that cooperate technologically with competitors also cooperate with suppliers (82.95%), customers (76.13%) and R&D centres (86.93%).

+p<0.1 *p<0.05 **p<0.01 ***p<0.001

The percentage of cooperation firms increases in the sample of innovative firms. Considering only those firms (21% of total firms) that have developed at least 1 product innovation in the surveyed period, 6.23 per cent cooperated technologically with competitors. The percentage of cooperation firms is also higher (5.56%) in the sample of firms that have developed at least 1 process innovation in the surveyed period (27% of total firms). Similarly, the percentage of cooperation firms in the group of patenting firms (6.3% of total firms) is much higher (51%) than among non-cooperation firms. The contingency indicators for these sub-samples of firms also show that cooperation is positively associated to other types of technological cooperation and that cooperation with suppliers, customers and R&D centres is higher among cooperation firms and the differences are statistically significant (p<0.001). The percentages of cooperation firms that also cooperate with suppliers, customers and R&D centres are similar to the percentages in the total sample; for instance product innovative firms that cooperate technologically with competitors also cooperate with suppliers (79.5%), customers (75%) and R&D centres (90.9%).

Tables 2, 3 & 4 show mean differences (t-test) of several characteristics of the firm: organization (size, age, employment type,...), innovation inputs, and innovation outputs. Table 2 shows the differences of organizational variables. The statistically significant results indicate that cooperation firms are larger, older and more foreign-owned than non-cooperation firms (p<0.001). They are also highly dynamic and exporting firms and use more intensively their production capacity. Table 3a indicates that cooperation firms invest more resources in R&D activities and have a higher percentage of R&D employees than non-cooperation firms. These differences are also found for those firms with positive R&D inputs (Table 3b); however the difference between cooperation and non-cooperation firms is now significant for the percentage of equipment expenditures on sales: cooperation firms invest less intensively in equipment than non-cooperation firms. Regarding innovation outputs, Table 4a shows that cooperation firms are more innovative than non-

coopetition firms because they obtain more patents and product innovations; however Table 4b indicates that these differences are less statistically significant for those firms with positive R&D outputs, and even the number of product innovations is lower in coopetition than in non-coopetition firms.

Table 5 indicates contingency indicators of the association between coopetition and different types of product innovation. All types of product innovation are significant and positively associated to coopetition. However, only 50% of coopetition firms have developed product innovations in the surveyed period although this percentage is greater than among non-coopetition firms (20.3%). In the sample of coopetition firms that develop product innovations, the main type of product innovation is new design (79.76%), followed by new functions (61.9%), new components (55.8%) and new materials (50%). Table 6 shows that there are some

statistically significant differences of types of product innovation among product innovative firms, according to the type of external cooperation. There is a larger percentage of product innovative firms that use several types of product innovation among the group of cooperation firms (columns ‘Yes’ in table 6). Technological cooperation with customers introduces more statistically significant differences than other forms of external cooperation. Cooperation only produces significant differences for the type of product innovation based on new functions.

Regarding the access to sources of external technology, Table 7 shows the contingency indicators of the association between cooperation and different sources of external technology. First, the financial participation in R&D firms that develop technological innovations is carried out by 28.4% of cooperation firms versus 4.8% of non-cooperation firms. Second, 23.86% of cooperation firms hire personnel with business R&D experience versus 4.88% of non-cooperation firms. Cooperation firms also hire more frequently personnel with public R&D experience (13.07% vs. 1.78%), and outsource R&D activities than non-cooperation firms (3.4% vs. 1.2%). The stronger positive associations are for the financial participation in R&D firms and the hire of R&D personnel. R&D outsourcing does not seem to be positively associated to cooperation.

Table 7. Contingency indicators of association between cooperation and access to external knowledge

	Financial participation in R&D firms	Personnel hired with private R&D experience	Personnel hired with public R&D experience	R&D outsourcing
Chi-square Pearson	185,261***	121,217***	107,270***	6,688*
Continuity Correction	180,706***	117,519***	101,796***	5,035*
Likelihood Ratio	100,190***	70,136***	51,113***	4,629*

+p<0.1 *p<0.05 **p<0.01 ***p<0.001

Table 8 assesses the association between cooperation and the use of different flexible production technologies: Computer-Aided Design (CAD), Local Area Networks (LAN), Numerically Controlled Machine Tools (NCMT), Robots, and Flexible Manufacturing Systems (FMS). The percentage of cooperation firms that use these technologies is higher, and all the differences are statistically significant (p<0.001): CAD (68.75% vs. 37.92%), LAN (59.09% vs. 24.41%), NCMT (68.6% vs. 49.22%), Robots (58.52% vs. 27.82%), and FMS (54.54% vs. 24.51%).

Finally, Table 9 shows the results of the logistic regression that tests the hypotheses. The percentage of temporary employment is positively related to cooperation ($\beta = 1.331$; $p < 0.05$) which supports hypothesis H1; the hire of R&D employees is only marginally related to cooperation ($\beta = 0.395$; $p < 0.1$) which does not support hypothesis H2; R&D outsourcing is not related to cooperation ($\beta = -0.783$; $p > 0.1$) which does not support hypothesis H3; the financial participation in R&D firms is positively related to cooperation ($\beta = 0.537$; $p < 0.05$) which supports hypothesis H4; and the technological cooperation with customers ($\beta = 1.097$; $p < 0.01$) and suppliers ($\beta = 1.507$; $p < 0.01$) are positively related to cooperation which supports hypotheses H5a & H5b.

DISCUSSION AND CONCLUSIONS

Scholars suggest that cooperation is an intriguing phenomenon and deserves scholarly attention (Lado et al., 1997), and the managerial trend shows increased tendency to form cooperative ties with competitors and

network-based competition among firms. Yet, little empirical research has addressed the determinants of technological cooptation and its implications (Ketchen et al., 2004). By empirically examining how external workplace and technology flexibilities are related to technological cooptation, we believe that this study advances our understanding of cooptation and suggests several possibilities for future research and managerial practice.

Two points are noteworthy based on our theory and data. First, external workplace flexibility is positively related to cooptation. One direct implication is that firms that have access to external sources of knowledge are in a better position to cooperate with competitors because they may perceive less risk involved in knowledge access and deployment in the network relationship. Second, technological flexibility from networking in the supply chain is also positively related to cooptation. Then, firms able to access technological advances in new technology-based firms and cooperate with customers and suppliers are also better prepared to deal with the uncertainty of technological developments with competitors. Executives need to consider how the different components in the organisational structure interface with the external environment, and they also need to understand the implications of different flexible dimensions for competitive behaviour.

Our result that cooptation only produces significant differences for the type of product innovation based on new functions contributes to the literature that finds a lesser impact of cooptation on the degree of product innovation novelty. Some studies find that different types of partners (except competitors) affect this degree of product innovation novelty. For instance, Nieto and Santamaria (2007) reveal that competitor collaboration has a negative impact on the degree of innovation. Management analysts do not view competitor collaboration as an appropriate instrument to achieve more novel innovations due to lack of trust and the fear of helping a rival. However, Tsai and Wang (2009) suggest that, depending upon the firm's internal R&D investment, collaborating with competitors is a good choice for a firm's innovation performance. Firms with more efforts in internal R&D usually exhibit stronger absorptive capacity (Cohen and Levinthal, 1990), enabling them to better incorporate and use new knowledge from collaboration with competitors for their own ends.

This study is exploratory but opens new venues for research. We do not claim for causality in the flexibility-cooptation relationship. Longitudinal studies should provide directions for causality because some flexibility dimensions could be caused by cooptation. The study of moderator effects could also focus the analysis on the impact of other flexibility dimensions on cooptation.

ACKNOWLEDGEMENT

The authors greatly appreciate the financial support of the Spanish Ministry of Science and Innovation (Grant SEJ2007-62964/ECON), and the access to the Survey of Business Strategies provided by the SEPI Foundation and the Spanish Ministry of Industry.

EFFECTIVE INTERNATIONAL EXPANSION STRATEGIES OF DEVELOPING COUNTRIES: TURKISH HOME APPLIANCE COMPANIES AND THE GLOBAL RECESSION

Tanses Gülsoy
Beykent University, Istanbul, Turkey

Özlem Özkanlı
Ankara University, Ankara, Turkey

Richard Lynch
Middlesex University, London, UK

ABSTRACT

Over the last twenty years, Turkey has significantly increased its international trade in manufactured products. It is possible that this has been built on the basis of its lower labour costs compared with those of developed countries and the willingness of both Turkish national companies and multinational enterprises (MNEs) to invest in Turkey. While the basic evidence of Turkish trade development is clear, there has been only limited research on the business logic behind such growth, the reasons for choosing particular forms of expansion and the outcomes of such strategies at the present time for Turkish companies.

In order to explore these issues, we have undertaken a preliminary study of the Turkish manufacture and export of home appliances companies. Our findings show that companies have largely focused on European markets. We have some preliminary evidence on the reasons for this. We will be investigating this in the next stage of our research. It is possible that our later research may provide some assistance both to individual companies and to Turkish national policy makers on future export development. However, our primary purpose will be to shed further light on the content and process by which developing countries pursue effective international expansion strategies.

Keywords: *Global strategy; Developing country strategy; Turkey export strategy; Turkish home appliances manufacture*

LITERATURE REVIEW AND RESEARCH FRAMEWORK

Although the literature in international business research is extensive and continues to grow (Werner, 2002), Axinn and Matthyssens (2002) have argued that most theories on international strategies focus on explaining the behaviour of large firms from developed countries. They do not provide the same insights into the behaviour of firms from developing nations in the international market place. Given the emergence of companies from new international trading nations like India, China, and Turkey, the authors claim that it is imperative to look at new empirical evidence, rather than rely on existing theories of international trade. Equally, Buckley (2002) commented that the entry of developing countries as major players in the global

economy may give new impetus to such research. This is echoed by other scholars' calls for research into strategies for firms from emerging economies (Peng, 2005).

In view of the preliminary nature of the research developed in this paper, we have chosen to summarise the main strands of the literature in the table below. We make the assumption that readers will be broadly familiar with the relevant papers and focus on drawing out the main highlights.

Strategic issues	Some references
International business expansion	Dunning and Lundan 2008, Werner 2002; Axinn and Matthysens 2002; Buckley 2002, Johanson and Vahlne 1977
Global strategy and related issues in regional strategy	Levitt, 1983; Douglas and Wind, 1987; Ghoshal, 1987; Yip and Coundouriotis, 1993; Dunning 1993; Dunning 1995; Ghemawat and Ghadar, 2000; Ghemawat 2003; Rugman and Verbeke 2003a, Rugman and Verbeke 2003b
Turkish international strategy – including routes to development	Taylan and Aari 2008, Çakır, 2004, Karabati and Tan 2005
Strategic process	Reger and Huff, 1993; Pettigrew, 1992; Papadakis and Barwise, 1997; Chakravarthy and White, 2002 – who identify four routes
Entry and expansion strategies of MNEs	Dunning and Lundan 2008, Delios and Henisz 2003, Forsgren 2002, Bartlett and Ghoshal 1989, Doz et al 2001
Company resource management – international decisions and expansion	Doz, 1986; Ohmae, 1983; Doz and Prahalad, 1991; Barney, 1991; Peteraf, 1993; Murtha et al 1998; Grant, 2002; Lynch 2008

This research builds on a previous study undertaken on the Turkish television industry (Gülsoy et al., 2009). In that study we set out the trends for international expansion in that industry. This new paper builds on this earlier work with new data on Turkish home appliances. Importantly, we now add new empirical evidence on the reasons for the trends.

RESEARCH METHOD

At this early stage in our research, we have taken an eclectic approach to the gathering of data. We have been more concerned to see where the strands of information might lead us than to address specific hypotheses. Our approach has therefore been to examine the existing trade and company data in Turkey from an international development perspective.

In addition to undertaking a statistical analysis of the Turkish home appliances industry, we have also, on a historical basis, conducted four face-to-face interviews over a period of one year in order to gain a historical and in-depth perspective on the trends in the industry. They were also undertaken to develop an understanding of why various strategies were adopted. For reasons of confidentiality, we do not identify the individual managers and the senior industry representatives that we interviewed. However, we are confident

that the insights offered by these senior Turkish figures throw new light on the international development strategies of the Turkish domestic appliance industry.

Prior to the interviews, we identified the relevant senior executives and made appointments to see them. The four interviews each lasted one-and-a-half to two hours. Two interviews were tape-recorded, and two interviews were documented by written notes. For the tape-recorded interviews we hold the full evidence and have used this in the research material after presenting the industry data.

The main data sources have been developed under the guidance of the Turkish Statistics Institute (TÜİK 2010a, 2010b and 2010c), the Export Promotion Center of Turkey İGEME (Esen, 2009), the State Planning Organisation of Turkey DPT (Demir, 2001), and the Istanbul Chamber of Commerce (Çeşmecioglu, 2001).

We have drawn heavily on these sources in our initial examination of the issues. However, some of this data has been summarised in reports prepared by the Turkish government and other official organisations and may therefore be subject to the opinions of those tasked with drawing up reports on Turkish international performance. To ensure that our data is accurate and not subject to interpretation bias, we have used the raw data from the relevant Turkish government offices in the compilation of our research rather than rely solely on the finished reports.

In addition to the overall data, we have examined in depth the individual product areas. However, for reasons of space, we are not presenting that data in this paper. The researchers interested in those details may contact the authors for further information.

Initially we had some difficulty with the Turkish statistical data, but we have now resolved these problems. We are confident that our basic research information provides an adequate picture of the state of home appliances production and international trade up to 2008. However, we would caution that the international trade downturn in 2009 is only partially reflected in our data set. Nevertheless, three of our in-depth interviews were conducted in late 2009 and in 2010. Hence, we have some evidence on how companies have coped with the world economic recession.

In addition to Turkish government official statistics, we have used the business press and other reports to develop as full a picture as possible at this stage of the Turkish home appliances industry, its role and strategies in international trade development.

RESEARCH RESULTS

We present our research results in two parts. First, we outline the industry data, especially with regard to international expansion. Second, we present our interview evidence to explore in more depth the reasons for the trends in the industry. As part of this, we look in depth at Turkey's leading home appliances company Arçelik.

Section I. An Overview of the Home Appliances Industry in Turkey

Definition of terms

The term "home appliances," also referred to as "household appliances" or "domestic appliances," is commonly used to indicate electrical appliances used in the home such as refrigerators, washing machines, dishwashers, ovens, cookers, and small kitchen appliances. The Trade Statistics Branch of the United Nations includes under the category of "domestic appliances" refrigerators and freezers, dishwashers, washing machines, electric blankets, household sewing machines, vacuum cleaners, irons, small kitchen appliances, cookers and ovens, as well as water heaters and heating resistors. Sometimes the term "white goods" is used to refer to large household appliances such as refrigerators and washing machines that used to be typically finished in white enamel (Bonaglia and Goldstein, 2007: 8). The category commonly includes refrigerators, washing machines, dishwashers, ovens and cookers, and heating, cooling and air conditioning appliances. Sometimes white goods is considered a subcategory of home appliances which also includes small home appliances. Small home appliances are further divided into small kitchen appliances (such as toasters, blenders, coffee machines, etc.), personal care appliances (such as electrical shavers, hair dryers, electrical toothbrushes, etc.), and other small home appliances (such as vacuum cleaners, electrical irons, sewing machines, and floor waxing machines) (Özbek, 2001: 3).

Turkey's White Goods Industrialists Association (TÜRKBEŞD) monitors data on refrigerators, washing machines, dishwashers, and ovens and cookers while there is another association that is chiefly dedicated to small home appliances - (KESİD). In this paper the term "home appliances" will be used chiefly to indicate refrigerators, washing machines, dishwashers, and ovens and cookers.

Brief History of the Home Appliances Industry in Turkey

The Turkish home appliances industry has had its beginnings in the late 1950s. The first washing machine was produced in 1959 by Arçelik, using a Belgian license, and the first refrigerator was again produced by the same company in 1960, assembling the parts supplied by an Israeli company (Buğra, 2000: 71).

Until the 1980s the industry's development was arrested by a variety of factors: As Turkish industry was protected by import tariffs and quotas, there was little foreign competition to encourage growth, which was also hampered by dearth of qualified personnel, lack of high technology, and the low purchasing power of the consumer (Çeşmecioğlu, 2001: 6).

Following the introduction of a major stabilization program in January of 1980, aimed at curbing inflation, overcoming the scarcities that hindered production, and reducing the foreign trade deficit through the promotion of exports and trade liberalization (Aktan, 1997: 174), the industry entered a period of rapid growth and several foreign companies began investing in the Turkish market. It was during this period, for instance, that the German company BSH Bosch Siemens Hausgeräte was founded in the Turkish market, in 1992 (BSH plans new dishwasher plant," 2006), and again it was during this period, in 1994, that the Italian company Indesit established its first production plant here ("Indesit confident in Turkey," 2010). The entry of foreign competitors increased competition. In the mid-1980s the industry speeded up its efforts to modernize both its product range and its technologies (Özbek, 2001: 5). The end result was the availability of better quality product choices for the consumer (Çeşmecioğlu, 2001: 6).

Today the status reached by Turkey's home appliances industry belies its modest beginnings. Turkey is the world's fourth biggest exporter of home appliances (considering the four major categories of refrigerators, washing machines, dishwashers, and ovens and cookers). The country is considered to be a production center for BSH (BSH plans new dishwasher plant," 2006), and Indesit expresses an interest in turning Turkey into a base to serve the Balkans, the Middle East, Central Asia, and Africa ("Indesit confident in Turkey," 2010). Furthermore, Turkish manufacturers are held up as models for other companies from emerging economies to emulate. How has this miracle happened? This question has formed the starting point of this paper, the rest of which will be devoted to exploring the reasons behind. Just from the face of it, however, it appears that the reasons lie as much in some astute government initiatives as in clever business management.

Turkey's Place in the World Home Appliances Industry

In 2008 the world trade for the major household appliances of refrigerators, washing machines, ovens, and dishwashers occurred at around 40.7 billion dollars (Please see the table below). In the last four years world trade has grown by an average of 10.40%. The growth rate for 2008 is 2.38%. When vacuum cleaners, electrical smoothing irons, and electrical kitchen appliances are also included, the world trade for home appliances reaches 61.6 billion dollars, with growth occurring at an average of 11.9% over the last four years, and the 2008 growth rate occurring at 9.9% (Esen, 2009: 7), indicating that future trade growth may depend on small rather than large home appliances.

Table 1: World exports for major household appliances, 2004-2008

World Exports for Major Household Appliances, 2004-2008 (USD)					
	2004	2005	2006	2007	2008
Refrigerators	11.070.641.000	12.415.001.000	14.857.543.000	17.670.327.000	18.056.795.000

In imports of the major household appliances of refrigerators, washing machines, dishwashers, and cookers and ovens, the US is the leading country (15.86%), followed by France (6.64%), Germany (6.34%), the UK (5.81%), and Russia (4.39%). Turkey's share in world imports of home appliances is less than 1% (0.68%), but it has grown on an average of 0.57% over the past five years.

Production and Sales

The first company in Turkey's home appliances industry – Arçelik – was established in 1955. In 1959 the first washing machine was assembly-manufactured, followed by the first refrigerator a year later (Özbek, 2001: 5). Until the 1980s only a few firms were operating in the industry, and product types and technologies were considered outdated (Özbek, 2001: 5).

* According to the legislation pertaining to data confidentiality, figures pertaining to dishwashers were not released for the years before 2007. The years 1998-2000 are from the Turkish Statistics Bureau as they were cited in 2001 (*Dünya*, 2001: 1) before the legislation went into effect.

** Source: TÜİK data file 2010c. 2009 figures are provisional.

Production figures for the four major household appliances – refrigerators, washing machines, ovens and cookers, and dishwashers – are given in Table 4 for the 42-year period between 1968 and 2009.

The production of the four major home appliances has shown a steady increase over the years with occasional contractions reflecting recessionary periods (for example, the years 1994, 2001, and 2009 are notable for considerable contraction of production).

The Market for Home Appliances in Turkey

Domestic market sales of home appliances may be considered a better indicator of national economic trends than production figures alone as the latter could be harboring export-slanted production.

Table 5: Home market sales of home appliances in Turkey, 2004-2009

** Only sales data from the members of the White Goods Industrialists Association of Turkey is included. Therefore, the data does not include importers or non-members of the association.

Source: White Goods Industrialists Association of Turkey, 2010.

Today there are around eight large manufacturers (Please see Table 6), nearly 100 small- and medium-sized manufacturers, and 15-20 importers operating in a largely oligopolistic market (Çeşmecioğlu, 2001: 7).

Table 6: Major manufacturers of home appliances in Turkey

Main Companies in Turkey's Home Appliances Industry	
Manufacturer	Brands
Arçelik	Arçelik, Beko, Altus
BSH	Bosch, Siemens, Profilo, Gaggenau

Although not a member of the White Goods Industrialists Association of Turkey, two other manufacturers that should be included among the country's important manufacturers of home appliances are Kumtel, which manufactures mainly ovens, cookers, and heaters under the brand names of Kumtel and Luxell, and Auer, which manufactures ovens and cookers under its own brand name. In addition, there a myriad oven and cooker manufacturers mainly in the Kayseri and Ankara areas.

Home Appliances Exports

Turkey's exports in the four major categories of home appliances in 2008 accounted for 1.73% of Turkey's entire exports for that year in value. More than half of production is exported, and more than half of Turkey's total exports of home appliances are destined for European Union countries.

Total Home Appliances Exports for 2008: \$ 2.151.077.039		
* The home appliances included are refrigerators, washing machines, dishwashers, and ovens and cookers.		
Source: TÜİK Turkish Statistics Institute, 2010b.		

When examined by product group, top export markets appear to be again European Union countries. The main markets for Turkey's refrigerator exports are France, the UK, Germany, Italy, and Spain; the main markets for washing machines are Germany, Italy, France, the UK, and Spain; the main markets for ovens and cookers are the UK, the Russian Federation, France, Ukraine, and Germany; and the main markets for dishwashers are France, Spain, the UK, Italy, and Germany.

More than half of Turkey's refrigerator exports go to five countries: Germany, France, the UK, Italy, and Spain. The same holds true for washing machine exports and dishwasher exports. The only market diversity appears in the exports of ovens and cookers, where Russia and Azerbaijan join other European countries in the list of top export markets.

Home Appliances Imports

While Turkey has been running an unremitting trade deficit for decades, the category of white goods is one area where the trend is reversed. Turkey's white goods imports are a fraction of exports: For the year 2008, exports of the four major product groups (refrigerators, washing machines, dishwashers, and ovens and cookers) totaled \$2,151,077,039 for a mere \$199,683,020 in imports of the same items (TÜİK, 2010).

In the home appliances industry, imports mainly consist of raw materials and semi-manufactured goods which range anywhere from 10% to 70% of the finished good, and they are imported mostly from the EU countries (Çeşmecioğlu, 2001: 23). With the reduction of customs duties in 1989, home appliances imports have increased significantly, and some foreign companies and brands have thereby entered the Turkish market (Çeşmecioğlu, 2001: 23).

Again, the EU countries appear to be the main trade partner, but the Asia Pacific Economic Cooperation (APEC) countries also emerge as a significant source of imports. The share of APEC countries in 2008 is around 33% in Turkey's total white goods imports. South Korea, China, Thailand, and Mexico account for sizeable shares in the dollar value of imports of various product groups.

Table 8: Turkey's imports of home appliances by country grouping, 2008

Turkey's Total Home Appliances Imports for 2008: \$ 199.683.020		
* The home appliances included are refrigerators, washing machines, dishwashers, and ovens and cookers.		
Source: TÜİK Turkish Statistics Institute, 2010b.		

When examined by product group, nearly one-third of refrigerator imports in 2008 appear to have come from South Korea (29.27%), more than half of washing machine imports come from Italy (55.61%), and an overwhelming majority of ovens and cookers arrive from China (60.29%). In dishwasher imports Italy tops the list with 40.12%, followed by Germany with 33.44% in 2008.

The impact of the global recession in 2008-2009 can be seen in the reduction of Turkey's home appliances imports. From 2008 to 2009, imports in all major appliance categories imports have declined. Specifically, the total value of refrigerator imports have declined by 28.4%, washing machines by 30.1%, ovens and cookers by 38.8%. Only in dishwasher imports the decline in total value of imports has been negligible (1.8%).

Section II. International Expansion Strategies of Turkey's Home Appliances Manufacturers

Beginnings of International Expansion

Before the introduction of the 1980 stabilization program referred to in the "History" section at the beginning of this paper, the Turkish home appliances industry engaged in limited exportation. In 1980, for instance, Turkey's exports for refrigerators, washing machines, and dishwashers totalled 7 million dollars (TÜİK 2010), and the number of units exported accounted for a miniscule fraction of production. This is in sharp

contrast to the situation today where more than half of all production is exported, and exports of the four major categories of home appliances account for nearly 2% of Turkey's entire exports in value.

In the early 1980s the biggest export markets were Iran, Iraq, and Jordan (TÜİK, 2010b).

Following the establishment of the stabilization program, policies of export incentives helped the Turkish home appliances manufacturers take a big leap in their export-oriented efforts. Between 1985 and 1986, two years after the import regime had been liberalized, import value of home appliances for the four major product groups increased by 60% from 2.9 million dollars to 4.8 million dollars. Exports from 1985 to 1986, on the other hand, recorded an even more impressive increase, climbing from 3.5 million dollars to 8.6 million dollars – increasing by 148%. Within the three years between 1986 and 1988, to take another example, Turkey's home appliances exports for the four main product categories of refrigerators, washing machines, dishwashers, and ovens and cookers increased from 8.6 million dollars nearly fivefold to 41.8 million dollars (TÜİK, 2010b).

Table 9: Turkey's foreign trade in major household appliances, 1989-2009

Turkey's foreign trade in home appliances ^a , 1989-2009						
	Exports (Units)	Exports (USD)	Year-on- year export growth by value (%)	Imports (Units)	Imports (USD)	Year-on-year import growth by value (%)
1989	454.254	30.850.237		18.710	7.967.073	
1990	484.715	34.615.679	12,21	133.136	47.412.066	495,10

^aThe home appliance categories included are refrigerators, washing machines, dishwashers, and ovens and cookers.

* Figures for 2009 are provisional.

Source: TÜİK, 2010b.

In the 1990s exports continued to grow, but imports grew even faster. Early elections in 1995 led to an expansionary monetary and fiscal policy, which led to a steep climb in Turkey's imports (Serin, 2001: 310). The effects of this policy can be detected also in the imports of home appliances in Table 9 above.

The Customs Union that went into effect in 1996 signals an important turning point in Turkey's foreign trade. The removal of protective barriers meant that Turkish goods would now be exposed to foreign competition from import brands. In fact, the Customs Union could be considered a litmus test of a brand's competitiveness. One year before, a formidable competitor – Bosch Siemens Hausgeräte – bought Profilo, one of the two main competitors in the Turkish market of home appliances, increasing competition in the industry.

In 1996 and 1997, while Turkey fulfilled its obligations arising from the Customs Union, the European Union could not fulfill its own obligations for various reasons (Serin, 2001: 310). Other factors that unfavorably affected Turkey's exports in 1996 and 1997 were the economic recession in Europe and the war in former Yugoslavia, which very much hampered land transportation (Serin, 2001: 310), and these factors may have also contributed to the contraction in Turkey's home appliances exports in 1996 (Please see Table 9).

The Turkish home appliances industry continued to increase its exports with vigor throughout the 2000s. Between the years 2000-2008 export volume expanded seven-fold. Also notable from Table 9 is that in recessionary years or in their immediate aftermath Turkey's white goods manufacturers appear to have redoubled their efforts to sell to export markets – probably to compensate for the reduced home market sales (Please note the years 1995 and 2002, two years that immediately followed two recessionary years).

Although not much mentioned in accounts of the growth of Turkey's foreign trade, the impact of the modernization and standardization of the country's official airline, Turkish Airlines (Kaynak, 2001: 182), and the opening up of new flight routes to Turkey's trading partners and potential trading partners also needs to be underlined (Please see Kozlu, 2007: 95).

In 1980, for instance, the share of refrigerator production exported was a mere 5.5%. Less than 1% of the washing machines manufactured were exported that same year, and only two dishwashers were exported. (No export figures are available for ovens and cookers for 1980.) Protected by tariffs and customs duties, Turkey's manufacturers of home appliances appeared content to manufacture mainly for the home market, which, with its young population, continued to grow.

The majority of early home appliances exports were headed to the countries of the Middle East, Libya, Iraq, and the Turkish Republic of Northern Cyprus notable among them. In 1989, for instance, Iraq accounted for 33.91% of Turkey's washing machine exports by value and 17.73% of oven and cooker exports. More than one-third of refrigerator exports went to Libya that year, and 70.77% of dishwasher exports were bought by the Turkish Republic of Northern Cyprus.

Part of the reason for the choice of destination may have been logistics. Regarding refrigerators, the biggest export item in the home appliances category, noted an Arçelik executive: "As refrigerators are voluminous items, their transportation across long distances presented many insurmountable problems for us in those days," (Mamulattan Markaya, 2001: 315).

Another reason may have been the standards demanded in Western markets. "There was a more discriminating consumer in the West," explained another Arçelik executive (Mamulattan Markaya, 2001: 313), before adding that Arçelik managed to live up to this challenge also.

Government initiatives may also have played a part in the choice of export market at this stage. As recounted by an Arçelik executive, in the early 1980s exportation was an activity spearheaded by the government: "A delegation of 400 to 500 people, including mainly high-level government officials and bureaucrats and some businesspeople, would go to a country, for instance Iran or Iraq, and first would engage in a number of official meetings, and then under the supervision of a committee called the "mixed economic committee" a series of protocols would be signed that would stipulate that Turkey would sell to the country in question so many quantities of certain goods and would buy in turn so many quantities of certain other goods. What was interesting about this was that in this exportation effort, our competitors were not the countries of the Far East or other countries, but companies from our own country, and we would have to share the export agreement with that competitor," (Mamulattan Markaya, 2001: 313).

Yet another factor may have been "psychic distance," defined as "the factors preventing or disturbing firms learning about and understanding of a foreign environment" (Vahlne and Nordstrom, 1992: 3, as cited in Dunning and Lundan, 2008: 92). Hence, according to the model, firms in the early stages of internationalization would choose markets where the psychic distance would be smaller, but as their organizational learning and experience increased, they would increase resource commitment to foreign markets (Vahlne and Nordstrom, 1992: 3, as cited in Dunning and Lundan, 2008: 91).

With the fall of the Berlin Wall in 1990, the unification of East and West Germany, the increasing disintegration of the Soviet Union, and the regime changes in the former Eastern Bloc countries, demand for home appliances rose. Again, Turkish manufacturers appeared ready to take advantage of this opportunity.

Within the year between 1990 and 1991, Turkey's exports for the four major home appliances categories rose by 41.9% from 34.6 million dollars to 49.1 million dollars (TÜİK, 2010b).

Turkey's home appliances export boom continued unabated throughout the 1990s. In the ten-year period from 1990 through 1999 exports increased more than eight-fold in value, from 34.6 million dollars to 286 million dollars. This was all the more noteworthy considering that in 1996 Turkey had joined the Customs Union, which meant that Turkey's manufacturers were no longer protected against foreign competitors. In 1996 a considerable 39% of refrigerator production was exported. By 1999, 40% of the refrigerators manufactured in Turkey were being exported, in addition to 14% of the washing machines, 30% of the dishwashers, and 73% of the ovens and cookers.

** Only sales data from the members of the White Goods Industrialists Association of Turkey is included. Therefore, the data does not include importers or non-members of the association.

Source: White Goods Industrialists Association of Turkey, 2010.

As can be seen from Table 10 which shows home market sales of the four major home appliances for the 24-year period between 1986 and 2009, the recessionary years in Turkey can be virtually handpicked from the growth figures (please note the years 1994, 1999 – the year of a devastating earthquake, 2001, and the year 2009).

Also important to note is that a big change had taken place in the 1990s. The top destinations for Turkey's home appliances were no longer the same as those of ten years ago. Now, the European Union topped the list of Turkey's export markets for home appliances. This development could partly be attributed to the crisis in Iraq that began in 1990 and later erupted into the Gulf War. Other reasons remained to be explored.

Research evidence on opportunities and challenges for the industry

In order to understand the trends outlined above, we conducted four research interviews. This section of our paper summarizes the evidence collected. In addition, we have, when appropriate, linked this evidence to previously published papers.

If export volume is any indicator of an industry's competitiveness, Turkey's home appliances industry could be called competitive. A report by Turkey's State Planning Organization in 2001 predicted that by 2006 the industry could reach an export potential exceeding two billion dollars (Demir, 2001: 107). The Turkish home appliances industry appears to have fulfilled this prediction: In 2007 exports of the four major home appliances (refrigerators, washing machines, dishwashers, and cookers and ovens) had exceeded two billion dollars (Trade Map, 2010). In fact, in all four of these product categories, Turkey is among the world's top five to ten exporters for the five-year period between 2004 and 2008.

The industry's main problem appears to be the fluctuations in home market demand. High taxes imposed on home appliances, lack of stringent controls, and unrecorded sales compound the problems in the home market (Çeşmecioğlu, 2001: 31). To combat fluctuations in home market demand, the industry has traditionally relied on promotions and extended payment plans, recently receiving government support in the form of temporary removal of the special consumption tax (ÖTV) levied on luxury goods (the tax removal was effective for three months from March 17 to June 15 of 2009). Exportation appears to be the main means of escaping the fluctuations in home demand. Among suggestions for improving home sales are increased attention on the training of sales personnel in product features and sales, relaxing product return policies for consumers and using the information gained thereby in product development (Demir, 2001: 109).

To increase their market shares abroad, manufacturers of home appliances are advised to harmonize production to European Union regulations and concentrate on developing environmentally friendly and energy-efficient products. One industry observer in the US remarks that while the number one reason people replace their home appliances is because the appliances no longer functioned properly, the number two reason is that people have made the decision to upgrade to energy-efficient appliances before their existing appliances have expired (Bulk, 2007, as cited in Gilliland et al., 2008: 5).

Also, manufacturers should aim for increasing economies of scale by increasing overseas sales. Finding ways of entering the US market is one of the main suggestions forwarded (Demir, 2001: 109).

Research evidence on Arçelik: How it managed to cope with the Turkish economic recessions of 2001 and 2009 by international expansion

Arçelik is the leading manufacturer in Turkey's home appliances market with over a 50% market share (Arçelik Annual Report, 2008: 26). In fact, the company's two main brands, Arçelik and Beko, have maintained a combined market share of around 50% for well over a decade (Ghemawat and Thomas, 2008: 1). In 2008 the company produced nearly 10 million units and had sales of 5.27 billion dollars, making it the leading firm in Turkey's consumer durables. Koç Holding, Turkey's largest conglomerate, owns 40.51% of Arçelik; Burla controls around 19.53%, other Koç companies hold another 16.69%, and the remaining 23.26% are publicly traded on the Istanbul Stock Exchange (Koç Holding Annual Report, 2009: 44).

Founded as Turkey's first home appliances manufacturer in 1955 and enjoying the largest share of the home appliances market in Turkey, Arçelik could perhaps be thought of as a company that did not need to expand beyond its home market. Apparently, so did Arçelik - until about the mid-1990s.

How has it then happened that this well-established Turkish company turned its eyes outward with vigor – so much so that today it is Europe's third largest manufacturer of home appliances (Koç Holding Annual Report, 2008: 25)? In fact, today the company has 11 production plants in four different countries, is active in 18 different countries, and offers its products and services to more than 100 countries (Arçelik Annual Report, 2009: 19, 37).

The answer may be a difficult one to disentangle. As with any complex issue, there are usually several factors at play that need to be uncovered.

In fact, exportation of Arçelik production began in 1967 (about 12 years after the company was founded). It could be said, however, that the company exported on an “opportunistic” basis. In the words of one Arçelik executive, the attitude towards exportation was “selling abroad what was left over after domestic demand was met” (Mamulattan Markaya, 2001: 309). The efforts appeared to be sporadic and mostly a reaction to government incentives. It is important to note, however, that the Group’s founder Mr. Vehbi Koç had recognized the importance of foreign trade even in the earliest days of the company.

In 1970 Mr. Koç instigated the establishment of a foreign trade company within the conglomerate: Ram Dış Ticaret. With the 1980 stabilization program and the concomitant export incentives, Ram became a very important company. In 1983, an export department was established within Arçelik. In 1988, this export department contracted to supply refrigerators on an OEM basis to Sears Roebuck for distribution in the Caribbean and Latin America under the Kenmore name (Root and Quelch, 1997: 8).

In the 1980s Arçelik licensed technology from GE and Bosch-Siemens that could be used for domestic production only. In 1997 the OEM contract in the US with Sears Roebuck in 1988 was followed by a much larger European deal with Whirlpool for dishwashers. As a condition of these deals, Arçelik committed not to sell similar products in Europe under own brands (Bonaglia and Goldstein, 2007: 22). In 1996, 50% of washing machine exports and 30% of refrigerators’ were under OEM contracts (Bonaglia and Goldstein, 2007: 22).

In 1994 there was a steep devaluation of the Turkish lira. To guard against future devaluations, Arçelik decided to open an industrial plant outside Turkey, and in 1998 the Tunisia plant was built, which would enable the company to avoid high customs duties (Çarkman, 2009: 126, 128).

The early export efforts were mainly targeting the countries of the Middle East.

One reason was the proximity of those markets, as noted in the previous section. Another was the standards required by West European markets that made it difficult for Arçelik to enter those markets (Mamulattan Markaya, 2001: 315).

But, in time Arçelik turned its eyes westward. We now use the evidence from our four research interviews, labeled A, B, C, and D [Full details are given at the end of the paper].

Respondent A listed the difficulties encountered in the markets of the Middle East and Africa as protectionist import regimes, transportation costs, some problems in banking transactions (such as the difficulties in opening letters of credit in some markets), and the necessity of training the after-sales personnel. Respondent C, in an interview conducted with him in January of 2010, pointed out that one of the reasons for moving away from the markets of the Middle East was the small size of the markets and the different type of products demanded. The Saudi Arabian market, for instance, noted Respondent C, demanded American-type side-by-side refrigerators and again American-type ovens.

The psychic distance, however, was probably smaller in the Middle East and Africa, and this may have helped Arçelik in increasing its market share. In an interview conducted in March of 2010, Respondent D noted that Turkish executives could easily adapt to the corporate culture in these countries because their way of conducting business was similar to that in Turkey. The company’s success in these markets may have helped it become a more seasoned exporter and thereby given the company a stronger position in Western markets.

A big part of the reason for taking on the European market was the existence there of a market with a higher purchasing power, noted Respondent B, and consequently, of larger profit margins (Çarkman, 2009).

Arçelik may have wanted to enter the European market also for political reasons. Europe’s attractiveness may lie in its political and economic stability compared to other parts of the world, its clear laws, and transparent administration (Çarkman, 2009: 140).

Consequently, exporting to the West European markets appears to have become an ideal, and its achievement was regarded a significant accomplishment. “What has carried us to a market share of 11% in as developed an economy as that of the UK is the quality concept at Arçelik and new technology investments,” remarked another Arçelik executive (Mamulattan Markaya, 2001: 308). Today, with a 15% market share, Arçelik holds

the number two position in the UK market, and in Romania, the company holds the leading position with 35% (based on information in the company's website, retrieved April 11, 2010, from www.arcelik.com.tr).

Arçelik entered the UK by opening its first sales office there in 1989. One of the factors that appeared to favor Arçelik in Europe was the change of regime in the former Soviet bloc countries. Before the fall of the Iron Curtain, the UK would purchase its table-top refrigerators from East European countries. Following the fall of the Curtain, prices of the table-top refrigerators increased and this gave Arçelik an opportunity to move in (Çarkman, 2009: 141). The change of regime may also have helped Arçelik to gain a foothold in Europe. The company entered these markets around the same time as big global players, noted Respondent D, indicating that low brand loyalty to global brands here may have helped Arçelik.

While in West European markets the distribution channel most often used for white goods is big chain stores, in the former Soviet bloc countries these chain stores were often nonexistent, and therefore Arçelik could easily capitalize on its decades-old experience of setting up and maintaining an exclusive distributor network. Respondent D pointed out that especially in some of the East European markets and in some of the Turkic Republics, Arçelik's home market experience of establishing a network of exclusive dealerships proved a competitive advantage. The strength of Arçelik's competitive advantage had formed the content of an earlier analysis (Buğra, 2000: 63-96).

While circumstances in Europe in the 1990s may have played in Arçelik's favor, company reports underline that Arçelik's ensuing success in these markets is actually predicated on the company's informed efforts to build its brands.

In preparation for the removal of import tariffs, Arçelik invested heavily in upgrading its manufacturing quality and productivity to world class standards. Between 1991 and 1996, capital expenditures totaled \$247 million, approximately 6% of sales (Root and Quelch, 1997: 4). By 1995 all Arçelik plants had received ISO 9001 quality certification. Through the incorporation of just-in-time and flexible manufacturing systems, the company reduced raw material and labor costs, thereby increasing productivity (Root and Quelch, 1997: 4).

According to Respondent D, the company's success in international markets today should be attributed to those important investments in the past, including investments in manufacturing quality, productivity, technology, and human resources. Also noted was the significance of Ram in Turkey's export efforts as well as in helping Arçelik gain a foothold in international markets; this was underlined by Respondent C, in an interview conducted with him in January of 2010.

Arçelik's investment in human resources and in technology development are credited with a big share in the achievements of today. Manufacturing under license brought with it contractual restrictions. "Even back in [the period 1980-1990] it was apparent what the features of a refrigerator or a washing machine had to be for it to have a competitive advantage internationally. The solution was obvious: to create our own technology and to make important investments in R&D towards that end," noted one company executive (Mamulattan Markaya, 2001: 282). To get around the restrictions accompanying licensed technology and to support its internationalization, in 1991, Arçelik established its R&D Center (Company reports). In the early 1990s the company invested in its technology and made it compatible with European standards. The company secured World Bank funding to research how to eliminate CFCs from refrigerators (Root and Quelch, 1997: 4). Between 1990 and 1995, \$69 million or 1.5% of sales was allocated to R&D (Root and Quelch, 1997: 4). One consequence was that Arçelik was the first white goods manufacturer in Turkey to completely eliminate the CFC in its refrigerator production long before the year 2006, which was stipulated by the Montreal Protocol for Turkey (Arçelik Annual Report, 2008: 69).

Another Arçelik executive explained: "When looking on [Arçelik's] international successes from the perspective of the year 2000, I believe Arçelik is ready to face global competition. ... Our investments in technology are at international levels. In short, in terms of both our 'hardware' (that is, our plants) and our 'software' (our human resources), we have all it takes to be a global brand," (Mamulattan Markaya: 301).

Investments in R&D have begun to produce positive returns. Over the last few years Arçelik has come up with innovative products built around environment friendliness. In 2008, for instance, the company produced the world's first A++ no-frost refrigerator with the lowest electric consumption in its class (Company reports).

In other words, the company has also relied on firm-specific advantages in its international expansion efforts.

The importance of the company's human resources in the results achieved was also underlined by Respondent D: "The serious investment in human resources in the 1980s and 1990s has paved the way for the company's achieving competitiveness in foreign trade." The work force is highly educated and many company managers have attended business schools in North America and Europe (Root and Quelch, 1997: 4).

The ability to develop its own technology and the experience it gained in foreign markets helped the company stand against the competition ensuing after Turkey joined the Customs Union in 1996, noted Respondent D.

In 1995, an important development occurred in Turkey's home appliances market. The German BSH (Bosch Siemens Hausgeräte) bought the Turkish company Profilo (based on the company's website, retrieved from www.profilo.com.tr on April 11, 2010) and thereby acquired Profilo's distribution network. It is testament to Arçelik's strength that it could stand up against such a formidable competitor, again remarked Respondent D.

Also important for Arçelik's expansion efforts were the two-pronged strategy of acquisitions and organic growth by investing in its brands.

Between 1998 and 2001 the firm was reorganized, and the five existing firms were brought together to form Arçelik A.Ş. In that period it was decided to export white goods and TV under the Beko brand since this was already known in major European markets. Arçelik decided to develop as an OBM in the UK and in France while continuing to operate as an OEM in Germany, and sales offices were opened in all such markets in the second half of the 1990s (Bonaglia and Goldstein, 2007: 22).

Despite these export efforts, Respondent D noted that even as recently as 1999, international sales accounted for only about 16% of the Arçelik's annual revenues. Interestingly, however, in 2008, international sales accounted for 52% of the company's annual revenues (based on the company's 2008 annual report).

The crunch appears to have come in 2001. The economic crisis in Turkey in February 2001, as well as the subsequent rise in unemployment, contributed to a 35% reduction in domestic demand for household appliances, and the company revised its strategy at that time: The key goal was to be international growth (Ghemawat and Thomas, 2008: 1).

The company's CEO at the time remarked that the company had then turned its attention to increasing exports and also to international acquisitions with the aim of "gaining an international identity as well as decreasing our high dependency on the volatile local market" (Ghemawat and Thomas, 2008: 1). Respondent D agreed that this was the turning point at which Arçelik realized that over-reliance on a single market was not a sustainable growth strategy.

Arçelik needed to increase sales to maintain economies of scale, and the devaluation in the Turkish lira had increased the company's existing price competitiveness in international markets (Ghemawat and Thomas, 2008: 1).

In 2004 Arçelik's holding company, Koç Group of Companies, announced in its annual report that for 2005 signs of contraction in the domestic market were noticed, and that the Group would try to compensate for this by its activities in foreign markets and by virtue of its competitive power. The goal was expressed as acquiring half of Group revenues from international sales (Koç Holding Annual Report 2004, p. 7).

In 2002 Arçelik bought the German home appliances company Blomberg, the Austrian home appliances company Elektra Bregenz and its brands Elektra Bregenz and Tirolia, the British home appliances brands Leisure (cookers) and Flavel (appliances and TV sets), and the Romanian refrigerator producer Arctic. Arçelik invested to modernize Arctic's operations and expand the product range, and made the subsidiary the largest production site for cool appliances for the EU market (Bonaglia and Goldstein, 2007: 23). In 2002 the company thus acquired four European brands, thereby increasing its revenues and market share in Europe.

In 2005 the company invested in Russia, where it initially produced laundry machines, then refrigerators and television sets. In 2007 this time Arçelik invested in China to produce laundry machines.

In 2009 the company achieved the highest profitability level in its history, which Respondent D claimed was due to careful cost analysis and astute management. As testament to the company's success, Arçelik managed to increase its market share in a contracting European market. In fact, in Europe sales increased by 15%, in Africa and the Middle East by 21% (Arçelik Annual Report 2009: 8). In Turkey the company also achieved significant results despite the recession. In addition to careful inventory management and using variable interest rates in its loan positions, the company has not refrained from marketing and technology investments, diversified its product range and achieved higher sales in bigger-ticket items (such as built-in kitchen appliances).

"Even when external circumstances offer some opportunities, you cannot take advantage of those opportunities unless you have the necessary groundwork," noted Respondent D.

International expansion appears to be ongoing. In 2009 the company realized revenues of 6.6 million Turkish liras (around 4.26 billion USD), 52% of the company's revenues came from international sales (Arçelik Annual Report, 2009: 9; Koç Holding Annual Report, 2009: 44). Even more importantly, however, is the fact that 80% of those international sales were for branded goods (Arçelik Annual Report, 2009: 9).

Arçelik appears to have used economic recessions as opportunities in disguise to build itself into a global player. With the results of the last recession in, the company appears to be poised to take advantage of other opportunities.

DISCUSSION AND CONCLUSION

In terms of the validity of the research evidence presented in this preliminary study, we are confident that it is statistically valid. Moreover, the data is longitudinal unlike immediate survey data and therefore presents a useful historical perspective on Turkish international development through the year 2009. We are also confident that we have been able to separate the factual evidence from the judgements of opinion formers in the industry.

This report essentially summarizes the current information on the Turkish home appliances industry. It identifies several important factors that have helped Turkish companies cope with the global recession. In addition, the evidence shows that one company – Arçelik – has succeeded in growing throughout this period. Our early evidence shows that there are five principal factors helping Turkish home appliance companies to cope with the global recession. They are investment in human resources, research and development, international acquisitions, and branding, coupled with some national government support. In addition, we note that background economic political factors (for example, the fall of the Berlin Wall) provided additional business opportunities.

In conclusion, this is only a preliminary examination of the Turkish home appliances market. The questions we will be exploring in further research will include the reasons why Turkish exports have mostly headed to the European Union within the context of international expansion strategies. What are the elements of cultural distance, administrative distance, economic distance, and in some instances, geographic distance, that will encourage Turkish manufacturers to expand more into other markets beyond the EU? Why have Turkish exporters chosen particular strategies to export their goods? The answers may have critical implications for Turkish exporters in a variety of markets. In the next stage of our research we are seeking a larger research sample of Turkish domestic appliance manufacturers to shed further light on these questions.

NOTE

The respondents to the four interviews conducted for this paper are indicated below with the following designations:

Respondent A: Senior executive from a leading company. The interview was conducted in April of 2009.

Respondent B: Senior executive from an industry body. The interview was conducted in December of 2009.

Respondent C: Senior executive from an industry body. The interview was conducted in January of 2010.

Respondent D: Senior executive from a leading company. The interview was conducted in March of 2010.

RISK PERCEPTION OF TURKISH EXPORTERS IN TRANSPORTATION: AN EXAMPLE OF AEGEAN REGION

Aykan Candemir
Ege University, Turkey

Ali Erhan Zalluhoglu
Ege University, Turkey

Erdal Demiralay
HRM (Human Resources Management), Turkey

ABSTRACT

In international trade, various methods of payment, delivery and different currencies take place. To understand the various rights and responsibilities of the parties in international trade it is necessary to understand when title to goods passes under a contract of sale and in particular when risk in the goods passes. Rules for the interpretation of international commercial terms were developed with regard to the transportation of goods to describe rights and liabilities by the International Chamber of Commerce (ICC). The study aims to find out the risk perceptions of the Turkish exporters in the Aegean Region within the context of transportation function of logistic through incoterms. Also, scope of this study is to find out the utilization of risk minimization methods via insurance.

Key Words: *Exports, INCOTERMS, Transportation, Risk.*

INTRODUCTION

The global economy has given businesses broader access than ever before to markets all over the world. Goods are sold in more countries, in larger quantities and greater variety. But as the volume and complexity of international sales increase, so do the possibilities for misunderstanding and costly dispute when sales contracts are not adequately defined.

Globalization of markets through the developments in communication, technology and transportation forces international companies to change the ways they operate. Humphreys et al. (1998) stated that manufacturers are influenced to implement international sourcing decision mainly due to their desire to establish a presence in a foreign market, the introduction of competition to the domestic supply base, their needs to satisfy offset requirements and to increase the number of available sources, and their reactions to local and foreign competitors. Although there are advantages of global manufacturing and trade, there will be a huge flow of goods, therefore the successes of processes mainly necessitate implementing effective flow of goods which leads to the need of a well-functioning transportation and delivery system.

In international business transactions, different methods of payment, delivery and different currencies take place than in domestic transactions. In addition, while the terms of sale in international business often sound similar to those commonly used in domestic contracts, they often have different meanings in global transactions. Confusion over these terms can result in a lost sale or a financial loss on a sale. Thus, it is essential to comprehend what terms are agreed to before finalizing the contract.

To understand the various rights and responsibilities of the parties in international trade it is necessary to understand when *title* to goods passes under a contract of sale and in particular when *risk* in the goods passes. The law of sale is complex and to give a full explanation requires infinite detail besides necessitating a return to the basic rules of contract. The principal question that must be answered is: "At what moment does *risk* in the goods pass from the seller to the buyer or from the shipper to the consignee?" In other words, one is much more concerned with transfer of *risk* than transfer of *title* in respect to loss or damage to goods under a contract of carriage.

LOGISTICS, SUPPLY CHAIN MANAGEMENT AND RISK

Logistics is defined by Davies (1987) and Gary and Davies (1991) as composed of materials management, physical distribution management, credit rating, insurance and delivery promises. According to Houlihan (1987), the concept of international logistics can be expanded into international supply chain management by including purchasing, product distribution and sales.

Supply chain can be described as an integration of key business processes that are involved through upstream and downstream linkages in the key business processes from end user through original suppliers that sourcing raw materials and parts manufacturing and assembly warehousing and inventory tracking, order entry and order management, distribution across all channels, delivery to the customer, and the information systems necessary to monitor all of these activities that add value for customers and other stakeholders (Lambert and et al., 1998, Christopher, 1998; Lummes and Vokurka, 1999). Considering the globalization and the increasing volume of international trade, establishing a well-functioning system for international trade becomes inevitable.

Risk, in the context of supply chain management, is a multi-dimensional construct (Zsidisin *et al.*, 2003). According to Lambert and Cooper (2000) and Mentzer et al. (2001), supply chain management (SCM) is sharing both risks and rewards between the members of the supply chain. This is often mentioned, but not further elaborated on, in traditional SCM literature. The focus of supply chain risk management (SCRM) is to understand, and try to avoid, the devastating ripple effects that disasters or even minor business disruptions can have in a supply chain (Norrman and Jansson, 2004). Supply chain disruptions can result in a variety of problems such as long lead-times, stock-outs, inability to meet customer demand, and increases in costs (Levy, 1995; Svensson, 2000; Chopra and Sodhi, 2004). Risk management is a continual process that involves long-term dedication of all members. Ongoing risk assessment involves gathering, communication, and evaluation of information that helps in developing appropriate risk management strategies (Zsidisin et al., 2000).

A categorization for identifying risks and uncertainties in supply chains is shown as the five sub-chains/networks to every supply chain (Cavinato, 2004; Spekman and Davis, 2004; Norrman and Jansson, 2004; Barry, 2004).

- Physical – the actual movements and flows within and between firms, transportation, service mobilization, delivery movement, storage, and inventories.
- Financial – the flows of cash between organizations, incurrence of expenses, and use of investments for the entire chain/network, settlements, Accounts Receivable (A/R) and Accounts Payable (A/P) processes and systems.
- Informational – the processes and electronic systems, data movement triggers, access to key information, capture and use of data, enabling processes, market intelligence.
- Relational – the appropriate linkage between a supplier, the organization and its customers for maximum benefit; includes internal supply matter relationships throughout the organization.
- Innovational – the processes and linkages across the firm, its customers, suppliers, and resource parties for the purpose of discovering and bringing to market product, service, and process opportunities.

Market requirements also force firms to reconfigure their logistics activities. The increased pressure on time-to-market and order-to-delivery requires firms to be in close proximity to their customers, not necessarily in terms of physical distance, but in terms of time (Lemoine and Skoett-larsen, 2004). Logistics involves the movement of products (raw materials, parts, supplies, and finished goods) from point-of-origin to point-of-consumption. A product produced at one point has very little value to the prospective customer unless it is moved to the point where it will be consumed. Transportation achieves this movement. between facilities using vehicles and equipment such as trucks, tractors, trailers, crews, pallets, containers, cars and trains (Stock and Lambert, 2001; Ghiani et al, 2004). This function of transportation articulate its importance in international trade.

RISK WITHIN THE CONTEXT OF INTERNATIONAL TRANSPORTATION AND DELIVERY TERMS-INCOTERMS

By the 1920s, commercial traders had developed a set of trade terms to describe their rights and liabilities with regard to the transportation of goods. These trade terms consisted of short abbreviations for lengthy contract provisions, and therefore they were commonly used for convenience. Unfortunately, there was no uniform interpretation of them in all countries, and therefore misunderstandings often arose in cross-border transactions.

Gradually, two similar sets of terms and their definitions were developed— the American Standard Foreign Trade Definitions and the International Commercial Terms, better known as Incoterms (Weiss, 2008).

To improve this aspect of international trade, the International Chamber of Commerce (ICC) developed rules for the interpretation of international commercial terms. First published in 1936, these rules have been periodically revised to account for changing modes of transport and document delivery, and they have become popularly known as Incoterms (Shippey, 2008). Although the International Chamber of Commerce is not a governmental body, the terms are recognized worldwide as legally binding upon the parties to an international transaction (Wood et. al., 2002). They are periodically reviewed and updated by delegates selected from many countries in order to reflect current practice and changing technologies. The last revision was in the year 2000, and the publication is referred to as Incoterms 2000.

INCOTERMS 2000 clearly defines for the seller and the buyer (Petersen, 2004);

- When **RISK** Transfers?
- Who pays which **COSTS**?
- Who is **RESPONSIBLE** for forwarder & carrier selection?
- Who prepares the **DOCUMENTS**?

The terms do not regulate in particular (Zurich Global Corporate, 2005);

- Transfer of ownership,
- The payment process,
- Applicable law,
- The jurisdiction.

INCOTERMS are informally separated into four different groups (E, F, C and D), which increasingly shift the level of responsibility for transportation from the buyer to the seller. Under Group E, the seller is required to make the goods available at its own facilities to the buyer. Once the seller has done this, the buyer is then responsible for the shipment. The Group F terms require the seller to deliver the merchandise to the next carrier at the named facility, airport or port, where the buyer assumes responsibility for “main” or transnational carriage. Group C places the responsibility for main carriage on the seller, while under Group D the seller is responsible for transporting the goods to the country of importation and incurring risk to destination. These relative responsibilities divide the costs of arranging transportation, and in some cases insurance between the parties. It also divides the risk of loss between them. INCOTERMS are not shipping terms, instead they are part of the sales contract and help the seller and buyer define the roles and the costs that each will have in the transaction. Group E, F and C refers delivering at shipment at the place of loading country. The Risk caused from transportation period on the behalf of buyer. Group D refers delivering at unloading at the destination. The Risk caused from transportation period on the behalf of seller (ICC, 1999). Risk allocation of Incoterms are given below according to classified 4 groups as summarized and later detailed;

Delivery Terms: Ex-Works

“Ex Works (... named port of shipment)” means that the seller delivers when he places the goods at the disposal of the buyer at the seller’s premises or another named place (i.e. works, factory, warehouse, etc.) not cleared for export and not loaded on any collecting vehicle. This term thus represents the minimum obligation for the seller, and the buyer has to bear all costs and risk involved in taking the goods from the seller’s premises (ICC, 1999). However, if the parties wish the seller to be responsible for the loading of the goods on departure and to bear the risk and all the costs of such loading, this should be made clear by adding explicit wording to this effect in the contract of sale. This term should not be used when the buyer cannot carry out the export formalities directly or indirectly (ICC, 1999).

Delivery Terms: FCA

“Free Carrier (... named port of shipment)” means that the seller delivers the goods, cleared for export, to the carrier nominated by the buyer at the named place. It should be noted that the chosen place of delivery has an impact on the obligations of loading and unloading the goods at that place. If delivery occurs at the seller’s premises, the seller is responsible for loading. If delivery occurs at any other place, the seller is not responsible for unloading. This term may be used irrespective of the mode of transport, including multimodal transport. (ICC, 1999). The seller must deliver the goods to the carrier or another person nominated by the buyer, or chosen by the seller, at the named place on the date or within the period agreed for delivery. Exporter is responsible of all risks until delivering the goods to truck including loading expenses and risks (ICC, 1999).

Delivery Terms: FAS

“Free Alongside Ship (... named port of shipment)” means that the seller delivers when the goods are placed alongside the vessel at the named port of shipment. This means that the buyer has to bear all costs and Risks of loss of or damage to the goods from that moment. The FAS term requires the seller to clear the goods for export (ICC, 1999). Exporter carries all risks until delivering the goods alongside the ship nominated by buyer at the loading place named by the buyer at the named port of shipment on the date or within the agreed period and in the manner customary at the port risk crossing point. The risk starts at sellers’ factory/warehouses and ends until delivering at port at the alongside the ship (ICC, 1999).

Delivery Terms: FOB

Free on board (... named port of shipment) “Free on Board” means that the seller delivers when the goods pass the ship’s rail at the named port of shipment. This means that the buyer has to bear all costs and risks of loss of or damage to the goods from that point. The FOB term requires the seller to clear the goods for export. This term can be used only for sea or inland waterway transport. If the parties do not intend to deliver the goods across the ship’s rail, the FCA term should be used (ICC, 1999).

Delivery Terms: CFR

Cost and freight (... named port of destination) “Cost and Freight” means that the seller delivers when the goods pass the ship’s rail in the port of shipment. The seller must pay the costs and freight necessary to bring the goods to the named port of destination, but the risks of loss of or damage to the goods, as well as any additional costs due to events occurring after the time of delivery, are transferred from the seller to the buyer. The CFR term requires the seller to clear the goods for export. This term can be used only for sea and inland waterway transport. If the parties do not intend to deliver the goods across the ship’s rail, the CPT term should be used (ICC, 1999). The risk starts at sellers’ factory/warehouses and ends after passing the ship’s rail at the named port of shipment.

Delivery Terms: CIF

Cost, insurance and freight (... named port of destination) “Cost, Insurance and Freight” means that the seller delivers when the goods pass the ship’s rail in the port of shipment. The seller must pay the costs and freight necessary to bring the goods to the named port of destination but the risks of loss of or damage to the goods, as well as any additional costs due to events occurring after the time of delivery, are transferred from the seller to the buyer. However, in CIF the seller also has to procure marine insurance against the buyer’s risks of loss of or damage to the goods during the carriage. Consequently, the seller contracts for insurance and pays the insurance premium. The buyer should note that under the CIF term the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have the protection of greater cover, he would either need to agree as much expressly with the seller or to make his own extra insurance arrangements. (ICC, 1999).

Delivery Terms: CPT

Carriage paid to (... named place of destination) “Carriage Paid to...” means that the seller delivers the goods to the carrier nominated by him but the seller must in addition pay the cost of carriage necessary to bring the goods to the named destination. This means that the buyer bears all risks and any other costs occurring after the goods have been so delivered. If subsequent carriers are used for the carriage to the agreed destination, the risks passes when the goods have been delivered to the first carrier. The CPT term requires the seller to clear the goods for export. This term may be used irrespective of the mode of transport including multimodal transport (ICC, 1999). Exporter carries all risks until risk crossing point. Risk Crossing Point is delivering the goods to carrier nominated by seller. The main risks are: Any damage or losses until loading to main carrier such as: accident, theft, natural disasters (earthquake, torrent etc.), breaking etc.

Delivery Terms: CIP

Carriage and insurance paid to (... named place of destination) “Carriage and Insurance Paid to...” means that the seller delivers the goods to the carrier nominated by him but the seller must in addition pay the cost of carriage necessary to bring the goods to the named destination. This means that the buyer bears all risks and any additional costs occurring after the goods have been so delivered. However, in CIP the seller also has to procure insurance

against the buyer's risks of loss of or damage to the goods during the carriage. Consequently, the seller contracts for insurance and pays the insurance premium. The buyer should note that under the CIP term the seller is required to obtain insurance only on minimum cover. Should the buyer wish to have the protection of greater cover, he would either need to agree as much expressly with the seller or to make his own extra insurance arrangements. If subsequent carriers are used for the carriage to the agreed destination, the risk passes when the goods have been delivered to the first carrier. The CIP term requires the seller to clear the goods for export. This term may be used irrespective of the mode of transport including multimodal transport. (ICC, 1999)

Delivery Terms: DAF

Delivered at frontier (... named place) "Delivered at Frontier" means that the seller delivers when the goods are placed at the disposal of the buyer on the arriving means of transport not unloaded, cleared for export, but not cleared for import at the named point and place at the frontier, but before the customs border of the adjoining country. The term "frontier" may be used for any frontier including that of the country of export. Therefore, it is of vital importance that the frontier in question be defined precisely by always naming the point and place in the term. However, if the parties wish the seller to be responsible for the unloading of the goods from the arriving means of transport and to bear the risks and costs of unloading, this should be made clear by adding explicit wording to this effect in the contract of sale. This term may be used irrespective of the mode of transport when goods are to be delivered at a land frontier (ICC, 1999).

Delivery Terms: DES

Delivered ex ship (... named port of destination) "Delivered Ex Ship" means that the seller delivers when the goods are placed at the disposal of the buyer on board the ship not cleared for import at the named port of destination. The seller has to bear all the costs and risks involved in bringing the goods to the the seller to bear the costs and risks of discharging the goods, then the DEQ term should be used. This term can be used only when the goods are to be delivered by sea or inland waterway or multimodal transport on a vessel in the port of destination (ICC, 1999).

Delivery Terms: DEQ

Delivered ex quay (... named port of destination) "Delivered Ex Quay" means that the seller delivers when the goods are placed at the disposal of the buyer not cleared for import on the quay (wharf) at the named port of destination. The seller has to bear costs and risks involved in bringing the goods to the named port of destination and discharging the goods on the quay (wharf). The DEQ term requires the buyer to clear the goods for import and to pay for all formalities, duties, taxes and other charges upon import (Incoterms, 1999).

Delivery Terms: DDU

Delivered duty unpaid (... named place of destination) "Delivered Duty Unpaid" means that the seller delivers the goods to the buyer, not cleared for import, and not unloaded from any arriving means of transport at the named place of destination. The seller has to bear the costs and risks involved in bringing the goods thereto, other than, where applicable, any "duty" (which term includes the responsibility for and the risk of the carrying out of customs formalities, and the payment of formalities, customs duties, taxes and other charges) for import in the country of destination. Such "duty" has to be borne by the buyer as well as any costs and Risk caused by his failure to clear the goods for import in time (ICC,1999).

Delivery Terms: DDP

Delivered duty paid (... named place of destination) "Delivered Duty Paid" means that the seller delivers the goods to the buyer, cleared for import, and not unloaded from any arriving means of transport at the named place of destination. The seller has to bear all the costs and risks involved in bringing the goods there including, where applicable, any "duty" (which term includes the responsibility for and the Risk of the carrying out of customs formalities and the payment of formalities, customs duties, taxes and other charges) for import in the country of destination. While the Ex-Works term represents the minimum obligation for the seller, DDP represents the maximum obligation. This term should not be used if the seller is unable directly or indirectly to obtain the import licence. However, if the parties wish to exclude from the seller's obligations some of the costs payable upon import of the goods (such as value-added tax: VAT), this should be made

clear by adding explicit wording to this effect in the contract of sale. If the parties wish the buyer to bear all Risk and costs of the import, the DDU term should be used. (ICC, 1999)

Under the Institute Cargo Clauses drafted by the Institute of London Underwriters, insurance is available in “minimum cover” under Clause C, “medium cover” under Clause B and “most extended cover” under Clause A (ICC, 1999).

a) **Minimum Cover :** This insurance named Institute Cargo Clauses (FPA) on Institute Cargo Clauses (C) for sea transport, Truck Clauses for road transport, Railway Clauses for railway transport. This clause cover risk of loss of or damages to goods: **physical occurrences** such as hitting, bumping, burning, to be capsized, to go off the road, and **natural disaster** such as earthquake, torrent and **maritime average**, damages sustained by a ship or its cargo and unloading from ship.

b) **Maximum Cover:** This insurance named as Institute Cargo Clauses (All Risk) on Institute Cargo Clauses (A). This clause cover risk of loss of or damages to goods during carriage, loading and unloading excluding any defect comes from goods nature, main cause of being lateness. Other uncovered Risk are mentioned below.

c) **War, riots, civil commotion, strikes and other labor disturbances:** Below mentioned A and C clauses does not cover these risk. The side who is responsible to arrange the insurance, if wishes to cover these risk, additionally must inform the insurance company to cover these risk.

When Institute Cargo Clauses (All Risk) mentioned as maximum coverage the nine types of risks are excluded from this clause. These risk are:

- 1- Any loss of or damages to goods comes from insured side’s deliberated activities
- 2- Any loss of or damages to goods comes from goods nature, Corrosion, to get worn-out, Normal flow, weight and volume loss
- 3- Any loss of or damages to goods comes from being lateness
- 4- Inappropriate and Lack of packaging
- 5- Financial problems comes from carrier
- 6- Carriage vehicles’ inappropriate to carry the goods
- 7- Atom and Nuclear pollution
- 8- War
- 9- Riots, Civil commotions, strikes and other labor disturbances

These clauses may be extended for several activities including loading and unloading of cargo.

METHODOLOGY AND FINDINGS

In this research, the risk perceptions of the Turkish exporters in the Aegean Region within the context of transportation function of logistic through incoterms are examined. Also, scope of this study is to find out the utilization of risk minimization methods via insurance. The factors affecting the risk perception such as sector, size, foundation year, export experience etc. are analyzed. An e-mail survey was conducted to generate data to test the hypotheses. With its organized industrial zones and free zones, Aegean region is one of the important centers for manufacturing and trade of the Turkish economy. In Aegean region, The total number of exporters is 3775, but only 2889 firms registered their e-mail addresses as contact information was selected from the Aegean Exporter’s Union and other governmental institutions database system. The sample included businesses from a wide range of industrial sectors. A web based questionnaire were prepared and e-mailed as attached document to the firms and expected to be answered by the top managers, export managers and export specialists. Two weeks after sending the e-mails, a follow-up e-mail was sent for non-responses. In total, out of 224 firms 19 were deemed ineligible (e.g. not properly filled) and 205 firms were taken for analysis. Company policies restricting the giving of information to external parties; and time constraints forms the main reasons for non-participation and non-response.

The questionnaire included three sections; The first section aimed to define Aegean exporters characteristics. Other sections include questions regarding exporters’ preferences of delivery terms for international transportation and how risky they perceive various types of delivery terms and the last section for the measure of which minimizing method of delivery risk mostly used.

NUTS classification used in the analyses was created by the European Office for Statistics (Eurostat) as a single hierarchical classification of spatial units used for statistical production across the European Union is used to determine for compare perceived risks of each terms between subregions. Sub sectors consisting the

exporters were gathered into three main sectors i.e. agriculture, industry and mining in accordance with the classification of Undersecretariat of Foreign Trade of The Republic of Turkey.

Table 1: Frequency Table

	Valid Frequency	Valid Percent (%)		Valid Frequency	Valid Percent (%)
Sector			Size of the Firm (classification according to number of employees)		
Agriculture	64	31,2	Small (1-49)	73	36
Industry	113	55,1	Medium (50-249)	87	42,8
Mining	28	13,7	Big (250 and over)	43	21,2
Total	205	100	Total	203	100
Type of Activity			Export Experience		
Producer and Exporter	166	81	Export Experience Between 1-9 Years	63	30,7
Only Exporter (No production)	39	19	Export Experience Between 10-19 Years	51	24,9
Total	205	100	Export Experience Between 20-29 Years	45	22
Year of Establishment			Export Experience 30 Years and More	46	22,4
1985 and before	65	31,7	Total	205	100
1986 – 1993	35	17,1	Capital Structure		
1994 – 2001	53	25,9	%100 Turkish	175	85,4
2002 and later	52	25,4	Foreign invested company (%1- %100)	30	14,6
Total	205	100	Total	205	100
Market orientation (Foundation of the Firm)			Location for NUTS		
Founded primarily for domestic market	90	43,9	TR31 Izmir and subregion	149	72,7
Founded primarily for export markets	63	30,7	TR32 Aydin and subregion	29	14,1
Founded both for domestic and foreign markets	52	25,4	TR33 Manisa and subregion	27	13,2
Total	205	100	Total	205	100
No. of Employed in Export Department			Export Sales /Total sales		
1	32	15,6	%0-%25	56	27,3
2	62	30,2	%26-%50	41	20
3	34	16,6	%51-%75	23	11,2
4 and over	61	29,8	%76-%100	85	41,5
Nobody work about export	16	7,8	Total	205	100
Total	205	100			

Perceived risk score of exporters was calculated by addition of all given points (Table 2). But to get more accurate solution the average risk point is calculated to compare the perceived risk of delivery terms. “Delivery duty paid” and also “Delivery ex quay” terms are found out to be the most risky options perceived by the exporters in Aegean Region. Therefore due to this calculation perception of “Ex-work” and “Free carrier (FCA)” are the teast risky ones. That is based on for the responsibility time of goods for the seller is for a short time.

Table 2. Perceived Risk Score of Delivery Terms

	N	Total Point	Mean		N	Total Point	Mean
Ex-Works	125	30	0,24	CIF	126	151	1,19
FCA	78	51	0,65	DAF	50	74	1,48
FAS	61	42	0,68	DDU	74	112	1,51
FOB	138	106	0,76	DES	48	73	1,52
CFR	87	95	1,09	DEQ	47	76	1,61
CPT	63	70	1,11	DDP	68	118	1,73
CIP	62	74	1,19				

As it seen from Table 3 that the most preferable delivery terms for the exporters are FOB (Free on board) and CIF (Cost, Freight and Insurance) in international trade. Perception of both FOB and CIF are average risky delivery terms. FOB is the most preferable term because of easy to use for exporters.

Table 3. Most Used Delivery Terms

	Frequency		Frequency
FOB	163	CPT	19
CIF	131	CIP	15
Ex-Works	94	DDP	8
CFR	52	FAS	6
FCA	41	DAF	5
DDU	35	DES or DEQ	-

As it seen in Table 4, each given points is between 1-3 (frequently used) and were added and then divided to total answer to find the average usage point of each risk minimization methods of delivery terms. As a result, exporters firstly prefer “Maximum Cover (A Clauses) Insurance” and secondly “loading clauses” to assess their delivery risk.

Table 4: Most frequently Used Risk Minimization Methods of Delivery Terms

	N	Total point	Mean
Maximum Cover (A Clauses) Insurance	146	332,00	2,27
Loading Clauses	115	210,00	1,82
Unloading Clauses	115	197,00	1,75
Additional Clauses (Strike, lockout, war and civil commotions)	115	187,00	1,62
Minimum Cover (C Clauses) Insurance	112	186,00	1,61

In order to be able to determine which criterias which is stated in Table 1 affects to exporters decision when evaluating perceived risks of exporters to the delivery terms, several Independent t-tests and one-way ANOVA tests were conducted.

Ho= There is no difference among the sectors for perceived risks of exporters to the delivery terms.

There is a difference within the groups of sector. Considering the CIP (Carriage, insurance paid to), the mean for agriculture sector was 2,39 and for the industry sector's mean was 2,06. Perishability of agriculture products may be the reason of why exporters of agricultural products tend to perceive higher risk.

Within 90% confidence interval, there are some differences between the groups. For the DEQ (Delivery Ex Quay) and DDP (Delivery duty paid) mining sector is different from the agriculture and industry sector. One way ANOVA test was applied to the groups of sector for the DEQ and the values of $F=3,499$, $df=2$ ve $p=0,039$ also when we analyze DDP again for the sector perception we get the values of $F=2,903$, $df=2$ ve $p=0,062$. Within these statistics, null hypothesis are rejected. The reason may be that the mining sector is based on natural resources and there is low risk for damage of goods and commodities. Perception of mining goods are less risky by exporters than both agricultural and industry products. Also when any exporter applying DDP and DEQ than the delivery cost will be higher with the taxes.

Ho= There is no difference among the export experience for perceived risks of exporters to the delivery terms.

Within 95% confidence interval, one way ANOVA test was conducted to the groups of export experience and for the values $F=5,079$, $df=3$ ve $p=0,002$, null hypothesis is rejected. For the CIF (Cost, insurance and freight), the differences between the groups early 1994 and after 1994. Perception of firms which export before 1994 are less risky than the firms started to export after 1994.

Ho= There is no difference between export experience and perceived risks of exporters to the delivery terms.

On the contrary to expectations the hypothesis could not be rejected so there is not enough evidence to conclude that there is a perception of risk difference.

Ho= There is no correlation between export sales/total sales of a firm and perceived risks of exporters to the delivery terms.

The hypothesis could not be rejected, therefore there is no statistical relationship between export sales/total sales and perceived risks of exporters to the delivery terms.

Ho= There is no difference among the exporters which have/have not export department for perceived risks of exporters to the delivery terms.

According to independent sample t-test, differences were found in perception of DDP (Delivery duty paid) which have export department and have not ($t=-3,466$, $df=58$, $sig=0,001$). From the analysis, it can be seen that the perception mean of exporters which have no export department is (3,00) and the exporters which have export departments is 2,69. The exporters which do not have export department perceive that the DDP is more risky. The reason may be that the DDP requires more bureaucracy.

Moreover when risk minimization methods are analyzed within the context of insurance;

Ho= There is no difference among the sectors for most used risk minimizing tools of exporters in delivery terms.

According to one way ANOVA test within 95% confidence interval, the values of $F=4,624$, $df=2$ ve $p=0,012$. There is a difference between groups, and null hypothesis is rejected. Considering the minimum cover insurance, the mean of agriculture sector perception 1,35, and the mean of industry sector perception is 1.79. In industry sector, usage frequency of minimum cover insurance is more than agriculture sector. Due to the perishability for agricultural goods, mostly “Maximum Cover (A Clauses) Insurance” is the first preference in this sector.

Ho= There is no difference among year of establishment for most used risk minimizing tools of exporters in delivery terms.

Although there is no difference between groups, there some some differences within the groups. Considering the “additional clauses”, exporters which established between 1986-1993 are different from the other exporters. Perception of the exporters which establish in this period mostly used additional clauses. The firms established during this turbulent period of Turkish history (strikes, lockout, economic crises and civil commotions) and the memories as well as the experiences of the past may be a force for additional clauses..

Ho= There is no difference among the exporters which have/have not export department for most used risk minimizing tools of exporters in delivery terms.

According to independent sample t-test, ($t=2,826$, $df=35,289$, $sig=0,008$). We reject the null hypothesis, therefore the firms which have export department use additional clauses more than the firms which have not.

CONCLUSION

Several factors affect the international trade activities of firms, and their perception and behaviour patterns. These may be the country and the sector to which the exporting firm belongs, the characteristics of the firm, its export level, size, organisational structure, human resources, international experience, export sales/total sales rate and nature of the products to be traded. Some factors such may be considered more important than commonly known factors such as export experience, age of the firms.

Today, risk is part of world environment and existing in obtaining these items, whether it is explicitly acknowledged and managed, investigated in a cursory manner, or ignored altogether. So, businesses have been always faced with various risks that emanate from the environment in which they operate (Zsidisin *et al.*, 2003; Giunipero and Eltantawy, 2003). Supply chain risk management taking both an academic’s and a practioner’s growing interest in view of the growth of the logistic needs. This study presents research which has investigated logistics risks from a transportation perspective in a framework of INCOTERMS.

SMEs constituting the 95% of the firms in Turkey, face several kinds of risks when considering the delivery terms in international trade. According to the findings of the study, delivery terms are decided together by the seller and the buyer. Ex-Works delivery term is perceived as the least risky by the firms. This may be due to the size of the firms (being small and medium sized) and to the management culture which avoids risks. The absence of an export department (%20 of the firms) leads to the preference of delivery terms requiring minimum bureaucracy. However, no difference between the firms are found for risk minimization choices. Only for industrial goods, for some type of goods minimum cover insurance are used.

The number of years in export experience of a firm is also found to have no relationship(s) with any risk perception of delivery term(s) anyway from the export experience the firms which started export after 1994 perceive the delivery terms(s) which include insurance more risky in international trade. From the aspect of export experience it can be said that delivery terms including the insurance is perceived as more risky when the costs are considered. After 1994, the diversification of export marketing activities and the increasing number of countries for export may have increased the delivery terms with high costs. Experienced firms do not perceive high cost delivery terms as risky regardless of the countries.

Differences in risk perceptions depending on the size of the firms and type of partnership couldn't be found. This may be due to the size of the firms (majority being SME) and the number of the firms with foreign partners (majority is Turkish owned). Perception of risk for delivery terms and risk minimization methods by the firms do not indicate significant results. It is found that the firms without export departments try to avoid "additional clauses".

The increasing volume of trade, diversification, geographic expansion and the changes in logistics services increases the importance of delivery terms. Besides these, the increasing utilization of risk minimization methods for delivery terms seems a good improvement however preference for simple forms of delivery terms for the exporters indicates the lack of information about the delivery terms and risk minimization methods. This study notes remarks the importance of continuous information flow and the necessity of awareness about the developments in foreign trade environment, domestic, international legislation and rules. The study also aims to make contributions for the literature about export marketing and international trade.

Well-formulated and integrated strategies in international purchasing, inventory management and logistics can provide fundamental mechanisms for managing the environmental uncertainty in global operations where success depends on configuration, control and coordination. International purchasing, inventory management and logistics strategies should go far beyond benefits derived solely from the difference in cost of production. They should, in addition, and most importantly, also help achieve improvements in product quality, value, customer satisfaction, responsiveness, flexibility and the competitive position of the firm.

SELF-ASSESSMENT OF SEVERAL COMPANIES IN ORDER TO ESTABLISH A HOLDING

Imran Aslan

Orhan Çınar

The University of Erzincan, Turkey

ABSTRACT

This study presents a reorganization of a group, which is the main result of Strategic Management to turn to a holding from a company group. The reasons for restructuring can diverse but it is obvious that change comes after a structuring designing process a complex work requiring an extensive study. To reorganize the group, interviews and surveys were carried out to collect information and learn the problems of the group. A SWOT (Strengths-Weakness-Opportunities-Threats) analysis was done to bring out strategies which are used to prepare the new organization chart. Moreover, existing economic situation and future expectations of the group were taken into consideration. Because of the number enormous factors affecting design, there is no unique right design for the group but most important factor is human and human relations. This factor can change very dramatically for each organization. The duties and responsibilities of new structure were determined to avoid the vagueness of tasks. The current situation of the group shows how much the project has realized.

This proposed structure's cornerstone is human and relation. External factors are common for all textile and apparel sector. Thus, the offered organization structure can be a model for different size of companies with some revisions. The external analysis can be used to determine threats and opportunities of textile sector.

Keywords: *Change Management, Self Assessment, SWOT Analysis, Reorganization*

INTRODUCTION

The regulations in the world trade enhance the competitiveness of the Global Market and the national wide companies have been threatened by this wild competition whereas international companies have opportunity of accessing unexplored markets. These conditions oblige the national wide companies to develop new strategies for their sustainability in the market. However, companies must be aware of their internal and external environments to identify their pros and cons in order to develop strategies. Self assessment, which is a structured internal process to identify strengths and weakness for improvement is used by companies for years. (Higgins, J. M. and Vincze, J. W., 1991) The change is unavoidable to keep on competitiveness in today's global market. It is important to use right methods to collect data against resistance and misunderstandings. (McLean, G. N. P., 2006)

Kipaş Group founded 26 years ago when the Turkish textile and apparel sector initiated continuing progress by joint-venture of two families and now employs more than 4000 workers in different sectors. Kipaş Group, a leading institution within its sector and renown due to its professionalism, its expertise and its high quality standards, is a precious member of Turkish Textile Industry whereby it transformed a mere cotton yarn manufacturing plant over years into a fully-integrated textile manufacturing giant. The companies of the group which have benefited from incentives of Turkish Textile and apparel sector have been growing very rapidly.

Kipaş Group has been formalized by including numerous subsidiary companies through the reorganization of the group companies since 2005. Kipas Group decided to change their management structure considering the recent developments in textile sector and raising conflicts

among stakeholders due to the management system of the company. The removal of quotas and Chinese effects to world textile were the focus point of researches. The effects of removal of quotas to Turkish textile were assessed with the premature indicators of Turkey's total export and import. By taking account of enormity of the group and economical situation, the group was proposed to establish a holding. After the proposal was accepted, the project was started with a more extensive research. Their recent system and companies were initially examined by observations, surveys, and interviews.

The steps of project are shown below:

Step 1: Organization

- A team leader was appointed.
- CEOs and other organizational leaders affirmed the project team's suggestions.
- A timeline was developed for the entire project which was one year for the first part.
- Individual task force members from different companies of the Group took assignments.
- Trainings were prepared for the company about the strategic management to create a common language.

Step 2: Completing the Questionnaire

- The project team discussed what supplementary materials might support the information provided in the questionnaire and took responsibility for obtaining them.
- The Project Manager determined who was the best able to complete each section of questionnaire and took responsibility for its completion.

Step 3: Interviews

- The project team discussed findings from the questionnaire. Based on those results, the project manager determined what individual or group interviews should be conducted to explore further some issues identified in the questionnaire or to clarify areas that were ambiguous.
- The Project Manager decided who would complete each of the interviews. Interviews were mainly carried out by the whole team.

Step 4: Evaluations of Results

- The project team reviewed the data from the questionnaire, interviews and financial assessment.
- Drawing on the data and analyses, the team decided where the organization needs changes
- The strengths and weaknesses of company were found.
- Satisfaction analysis was performed to examine the results of questionnaires.

Step 5: Reports and Action

- Depending on the charge given the team in Step 1, the project team discussed findings with multiple audiences from top management of the group. These findings were often offered in a written report to the Assembly of Partners.
- In addition to a self-assessment of overall cultural competence, the report would likely include specific recommendations for actions to be taken, identifying who would be accountable for taking the actions. The results of this internal review would help the organization gain a broad perspective of its policies, programs and procedures.
- Combining the quantitative data acquired from questionnaires and financial assessment with qualitative data, results of observations and interviews to carry out the internal analysis of the firm.
- To perform an external analysis, the economical situation of Turkey and the World especially China and India was researched.

Step 6: Preparing Organization Chart and Organization Handbook

- Sectors that Kipas invested or had an intention of investment were examined by using the statistics, foresight and economic reports of textile and those sectors.
- External analysis of Kipas was completed with the results of researches.
- SWOT (Strengths, Weaknesses, Opportunities, and Threats) analysis of Kipas with most significant factors was prepared. In the light of these factors, new organization structure of Kipas was determined and presented to the owners of the company.

- Organization Handbook was prepared to determine duties and responsibilities of Top Management

STRATEGIC MANAGEMENT

Strategic Management is the process of assessing “what organization is” and deciding and implementing “what it intends to be and how it is going to get there.” It is used to determine the long-term activities of the organization. Many approaches and techniques are used for strategic management processes. It is not directed just a single functional area of group. All efforts are directed toward the mission and vision of the firm to find the best for the whole group. Multiple stakeholders are included in decision making. (Houben G., et al., 1999; Dincer O., 2004; Ketelhohn W., 2006) The Kipaş Group belongs to two families and both want to get more control over the group. The managers of firm cannot be successful if they focus on a single family. Many organizations can satisfy multiple shareholders’ needs. Strategic management requires including both short-term and long-term perspective. Both a vision for the future of the organization and a focus on its present operating needs must be taken into account. Moreover, the resources of the organization must be allocated wisely not just for a shareholder but for overall objectives of the group. (Gregory G., et al., 2005)

Deep changes occur in this era with unexpected results. (Diskien D., et al., 2008) Change management is a sub-set of ongoing strategic management. It is about modifying or transforming organizations in order to maintain or improve the effectiveness. (Higgins, J. M. et al., 1991; Hayes, J., 2007) The reorganization is driven by changes in the competitive environment on the global market. With the reorganization of the group, the group will react to the growing changes more quickly. (Albach, H., Wiedemann, H., 1986) The prerequisite condition for any effective change is that somebody in strategic position really feels the need for change. “Ready state” for needed changes means that the top management or enough people in the middle of the hierarchy think that the change is necessary. The reasons for strategic change in are mostly found in abrupt and predominantly extrinsic influences such as technological changes, economical changes. For large scale strategic change, the organization’s goals, the environment and the organization should be consistent with each other. (Sminia, H. and Van Nistelrooij A., 2006) Large and successful companies of Kipaş Group have operated very successfully for 26 years. All positions above the upper middle of the organization were restricted to some members of the families. Moreover, all policy decisions were made by a family board. Some members of the families strongly felt the need for changing from a family-owned, family-controlled organization to a family controlled, professionally-managed organization. (Beckhard R., 2007) The Dynamics of the Group must be changed due to changes in technology, the way of people living and working conditions. Moreover, national and international organizations have to reassess their position due to China and India’s effect on their strategic objectives. (Wirtenberg, J., et al., 2004) Organizational changes efforts and activities should be better understood in to avoid reactions among organization members. Changes are not able to be taken lightly. Some changes have no affect on losing the job. The content of organizational change can be expressed with impact of them on employees by explaining the purpose of change to gain acceptance from them. (Self, Dennis R. , et al., Mike, 2007) Each organization has a capability or ability initiating, managing and implementing large-scale changes in organization structure to improve organization ability for a quick adaptation, flexibility and innovation. There should be a trade-off between available assets of the firm and its continuous development requirements for firm-specific capabilities. (Yan, Y. , et al., 2009)

Management systems of the firm use internal and external information to gain a better strategically competitive position in the market by providing outstanding services and products. (Phelan, Steven E., 2005) Organizations determine their strategies based on external and internal data to penetrate the market as shown in Figure 1.

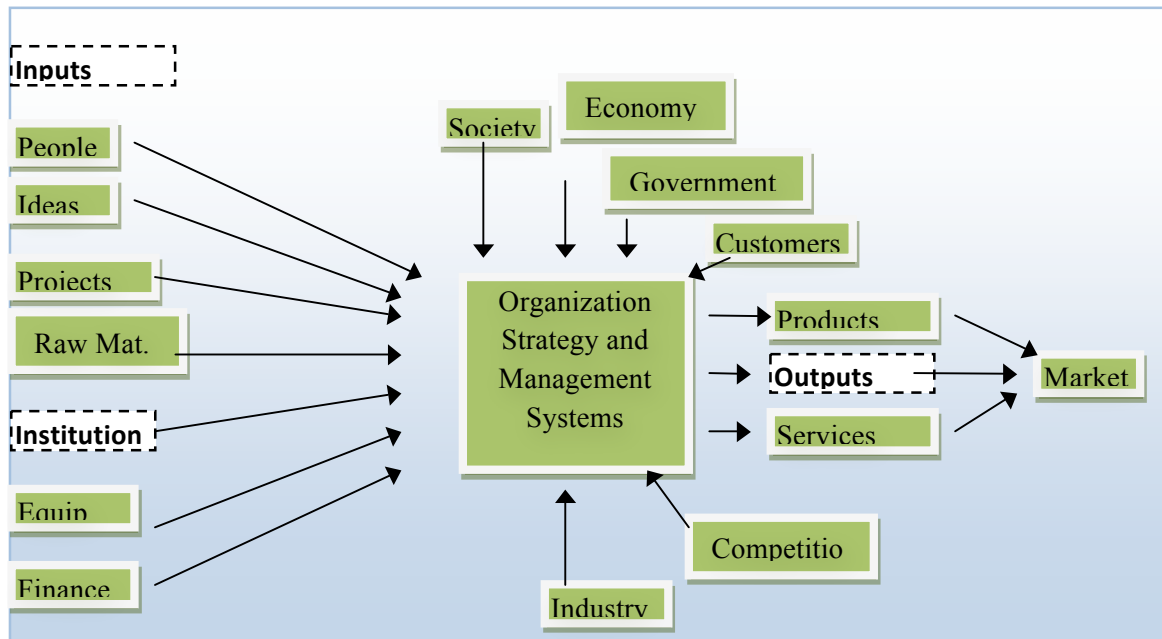

Figure 1: Strategic Management and Environment (Thomson, 2005)

Self assessment is a structured internal process of assessment against a set of standards to identify strengths and opportunities for improvement. It is simply a process of evaluating the firm and its performance against a framework, a model or a set of standards. An assessment model is established for the group. This model is shaped by considering group's specific requirements and priorities. (Ainscough M., Neailey K, 2003) Assessment tools can be used to determine the actual accomplishment of goals and objectives by leaders and managers. The enterprise can have an assessment team to manage internal assessment (Deborah L. et al., 2006)

Model of the Strategy

Strategy defines itself in terms of drafting the plan of the war, shaping individual campaigns and, within these, deciding on individual engagements (battles) with the enemy. Strategy in this military sense is the art of war. The analogy with business is that business too is on a war footing as competition becomes more and more fierce and survival more problematic strategy answers two basic questions: 'Where do you want to go?' and 'How do you want to get there?' Strategy manages the correlation between organization and changing environment. Internal and external factors effecting company are identified to form strategies. There should be a relationship between internal competences and values to firm's external environment. Four key elements of strategy formulation are shown in Figure 2. There is a strong relationship among parties which are internal and external. Each part requires reciprocal data sharing. Internal factors use resources to avoid external dangers (Viljoen, J. and Dann, S., 2003) There is a challenge for the firms to find the 'fit' what the firm does and what the environment requires. Moreover, it should be ready for the new environment that future may bring. This environment can be totally different and firm should evolve its capabilities and culture to tackle with new environment. (Porter, et al., 2001)

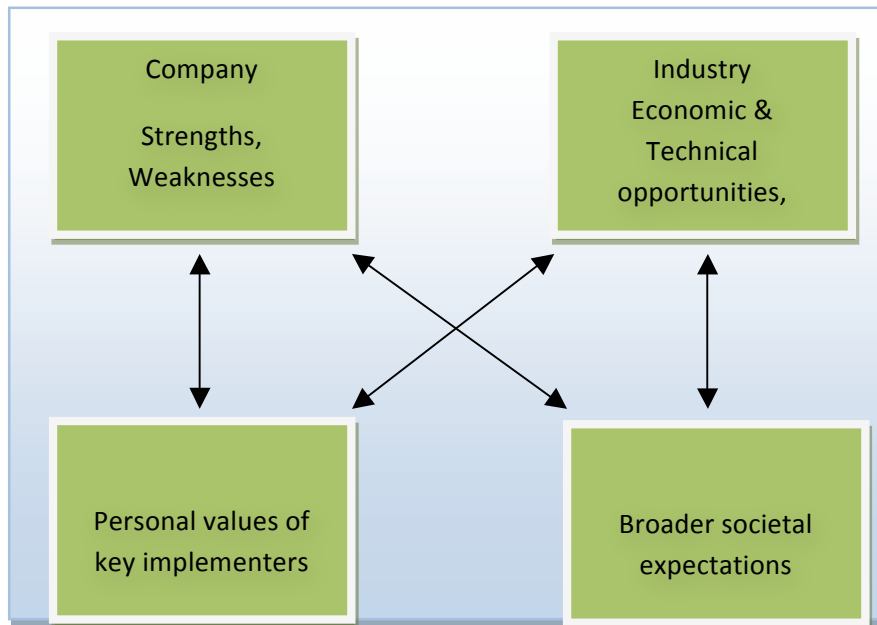

Figure 2: Four Key Elements of Effective Strategy formulation (Browne, et al., 1999)

The key strategic issue is to put in place a system of management that will facilitate the capability of the organization to respond to an environment that is essentially unpredictable, fast-changing and, therefore, not agreeable to a planning approach. There is no one best way of strategy. This approach emphasizes speed of reaction and flexibility to enable the organization to function with surrounding environment. The essence of strategy, according to this view, is adaptability and instrumentalism. (Thomson, 2005)

To understand the strategies of the group, we have to understand, unless we were in a start-up situation, what factors had made the firm what it was in 2005. The existing state, particular range of products and services, plans for future, reasons of changes, strategic decisions taken in the organization, management style, organization structure and the link between strategy and structure must be well understood. (M. Higgins, et al., 2001) Firm's business investment strategy can be built to get sustainable resource advantages through effective organizational controls. Critical organizational changes involving in implementing firm's investments are to be consistent with intended organizational development goals. (Yan, et al., 2009)

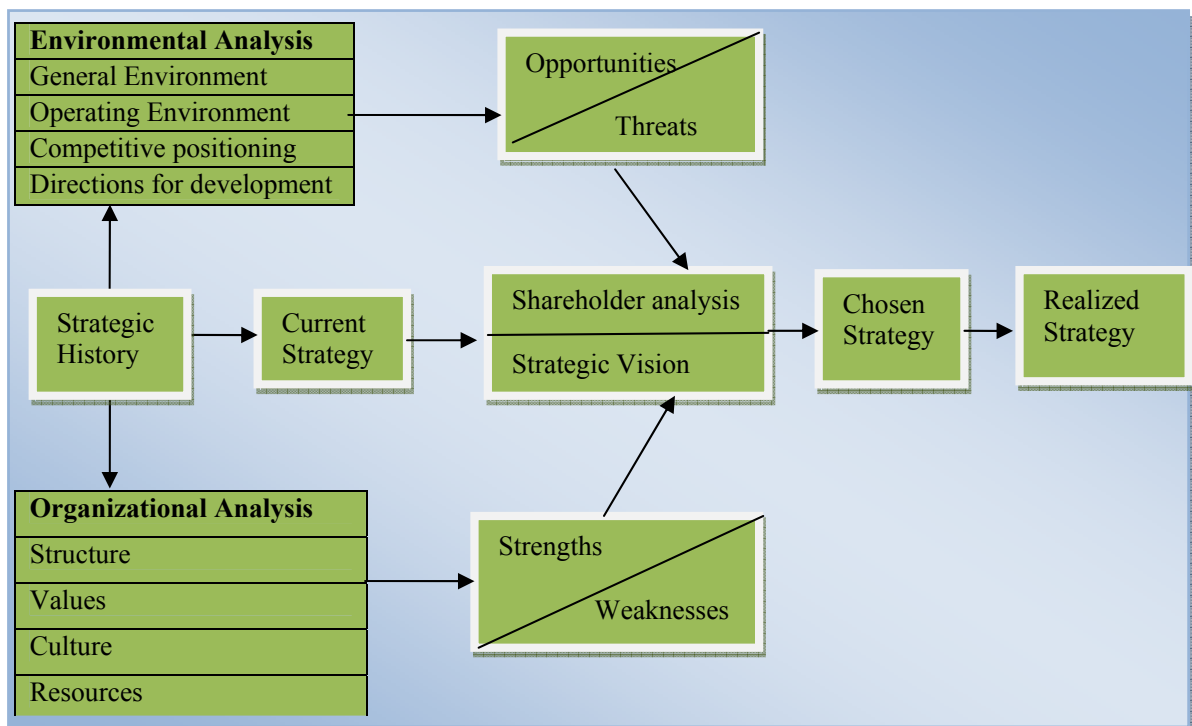

Figure 3: Strategic Model (M. Higgins, et al., 2001)

A model of the strategic management process is set out in Figure 3. This is a model that worked for us in terms of organizing our thinking about strategy and our attempts to understand the strategic issues facing firms. It is not suggested that it is the only model that is useful or that this is the best. Current strategy has its roots in the strategic history of the firm and its management. Employees' current strategy is the result of the interaction of intended strategy and emergent strategy. The organization's realized strategy can be the direct result of strategic planning and the deliberate formulation and implementation of a plan. More often, it is the outcome of environment analysis and organizational analysis. In some cases, realized strategy can be very different from the chosen strategy. In such cases, the strategy can be described as emergent in the sense that strategy emerges from an ongoing series of decisions. SWOT analysis is drawn from external and internal environments of the organization to determine the strategic vision of firm based on the analysis of shareholders. One can think of a well developed strategic vision in terms of probing opponents' weaknesses; withdrawing to consider how to act, given the knowledge of the opposition generated by such a probing; forcing opponents to stretch their resources; concentrating one's own resources to attack an opponent's exposed position; overwhelming selected markets or market segments; establishing a leadership position of dominance in certain markets; then regrouping one's resources, deciding where to make the next thrust; then expanding from the base thus created to dominate a broader area. The leading strategy is the best strategy is geared towards radical change and creating a new vision in which the firm is a leader rather than a follower of trends set by others to help managers improve organizational effectiveness and corporate profitability. (El Sawy, et al., 1988)

Managers may scan their environment and decide that there are major changes occurring in their business world to which they have to adapt. Or they might decide, through internal analysis, that they have the ability to develop a new way of doing business that will redefine the nature of the business they are in. If change is the order of the day, then two issues need to be addressed: external analysis and internal analysis. For a change of strategy to work, there must be alignment between internal capability and external opportunity. This is described as 'strategic fit'. (Tiwana, Amrit, 1999)

Organizational Design

An appropriate organizational design is generally viewed as enabling “an organization to execute better, learn faster, and change more easily.” It comprises multiple, interrelated elements, frequently categorized as structure, people, processes, rewards, and tasks or work systems that together can create unique organizational capabilities that provide a competitive advantage . For organization design, top-bottom approach with full participation and active involvement are seen as essential for getting commitment from all involved parts and ensuring that strategic reorganization actually is realized.(Beer, M., 2001) The main decision lies with top management since they decide how to allocate the resources of the firm. The resource theory of the firm is generally recognized that a good fit between strategy, organizational design, and external opportunity creates a competitive advantage for the organization. (Sminia, A., 2006)

In hypercompetitive industries, organizations increasingly compete on the basis of being “good at combining difficult-to-combine organizational capabilities” and being able to adjust its strategies to take advantage of or create new opportunities. (Thomson, 2005) Organization development improves the total system and interdependent parts of the company. Moreover, the effectiveness and performance of the organization increase closely with shareholders. (Dunn, J., 2006)

Mission and Vision

The mission defines the long-term vision of the organization in terms of what it wants to be and whom it wants to serve. The concept of mission has become increasingly fashionable in discussions of strategy. Indeed, some analysts go as far as asserting that a good ‘mission statement’ can provide an actual worthwhile alternative to the whole task of corporate planning. The definition of a firm’s strategic mission encapsulated in the mission statement can be thought of as the first stage of the strategy process. A business is defined by its mission. Only a clear definition of the mission of the organization makes possible clear and realistic business objectives, because the purpose of the firm in terms of its enduring sense of its reason for being is understood from the mission statement. (Thomson, 2005) A firm needs a well defined sense of its mission, its unique place in its environment and scope and direction of the growth. Such a sense of mission defines the firm’s strategy. A firm also needs an approach to management itself that will harness the internal energies of the organization to the realization of its mission. (El Sawyet, et al., 1988)

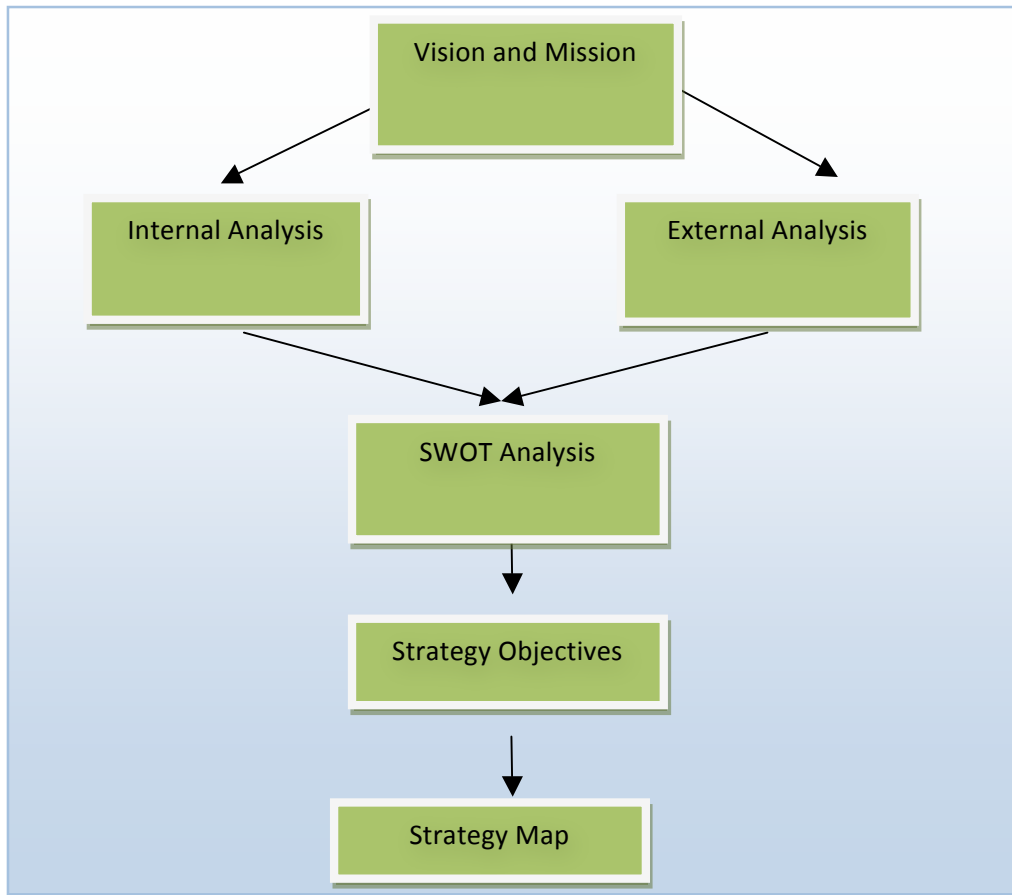

Figure 3: Identifying Strategy Map (Luis E.Q., et al., 2009)

Every organization has a ‘theory of the business. When this theory fits the external reality, is internally coherent, and known and understood by everyone in the organization, then success follows. Based on the mission and vision of the firm, external and internal analyses of the firm are carried out. After that the SWOT analysis is undertaken. As shown in Figure 3, the strategic objectives are determined from SWOT. From strategic objectives, the strategy map of the firm is established.

SWOT Analysis

SWOT analysis is a tool for auditing an organization and commonly used for analysing internal and external environments in order to attain a systematic approach and support for decision making. If it is used correctly, it can provide a good basis for successful strategy formulation (Hsu-Hsi C. and Wen-Chih H. , 2006). It involves the design of the organizational structure and control systems necessary to implement the chosen strategy. SWOT analysis can be conducted before mission and goal statement. (Hax, A.C. and Majluf, N.S., 1991) SWOT identifies Strengths and Weakness and examines the Opportunities and Threats of an organization. SWOT analysis suggests that firms that use their internal strengths in exploiting environmental opportunities and neutralizing environmental threats, while avoiding internal weakness, are more likely to gain competitive advantages than other kinds of firms (Jay B, William H., 2007).

It is essential to conduct SWOT before proceeding to the formulation of a corporate strategy. As, SWOT Analysis is an extremely useful tool for strategic analysis and understanding an

organization's current position in its business environment, the implementation of it become vital for an self assessment project. The internal assessment interrogates all aspects of the organization covering, for instance, technical knowledge, personnel, facilities, location, products and services in order to identify the organizations strengths and weaknesses. The external assessment examines the anthropological effects, political, economic, social, technological and competitive environment with a view to identifying opportunities and threats. (Karppi, I., et al., 2001) It is also used for problem defining and solving as well as for market analysis. It is known that SWOT is offered before a development of an effective budgeting. (Lee, S.F, et al., 2005) Analyzers must be realistic about the strengths and weaknesses of the organization. It is vital that not being humble and being as pragmatic as possible.(Leslie L. J. and Grossman T., 2002) The analysis should distinguish between where the organization is today, and where it could be in the future. Keeping SWOT Analysis short and simple will enable to use these information in related tools i.e. TOWS (Threats, Opportunities, Weaknesses, Strengths) matrix. So, during the analysis avoiding complexity is important. The issues must be examined from customer's perspective over the analysis. (Dyson, Robert G., 2004)

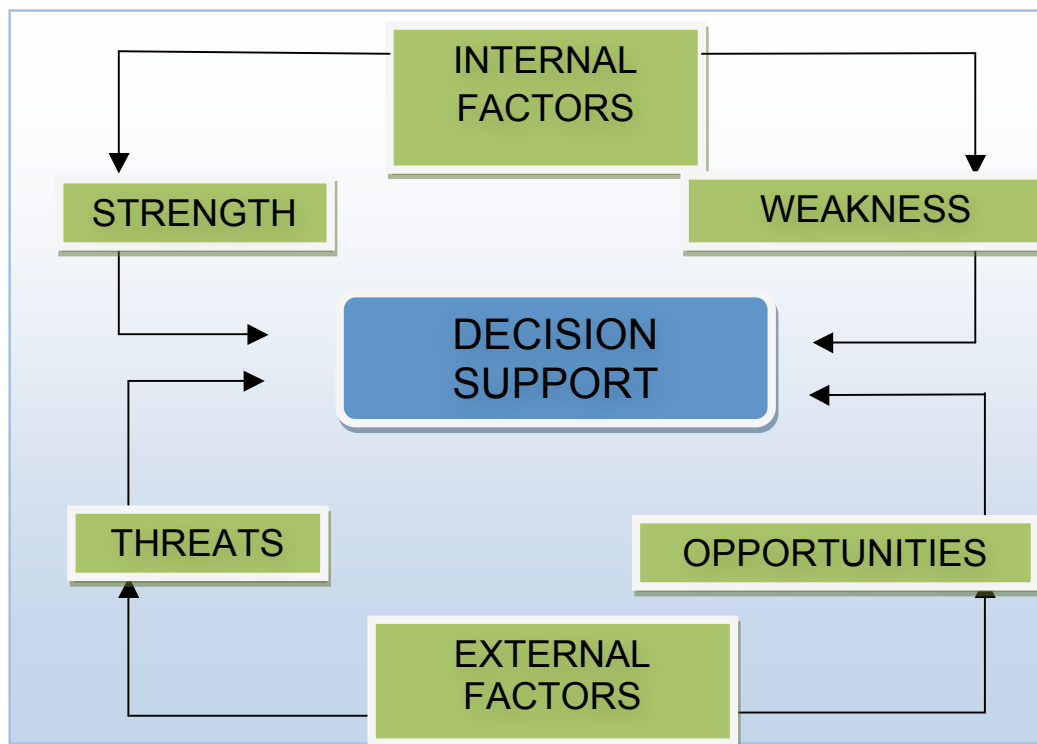

Figure 4: SWOT analysis and Decision Support (Thomson, 2005)

Strength is the affirmative internal factor. It is firms' strong points. This should be from both internal and external factors. (Dunn, J., 2006) Weakness is the unfavorable internal factors (T. Pascale, Richard, 1984) Opportunities are favorable external factors. Determining opportunities means determining how organization can continue to grow within the marketplace. Threats are unfavorable external factors that are out of our control. (Lee, S.F.et al. , 2005) How internal and external factors affect decision supporting system of the firm is shown in Figure 4.

Coverage of SWOT Analysis

The coverage of the SWOT Analysis is determined by the firm's and competitors' resources. Major types of resources are financial, organizational, intellectual, informational, relational, legal, human resources and resources related with reputation. The coverage can be extended for management information, supply of raw materials and production process. However, these are more specific titles. In this study, we had also the opportunity to assess the management information, however, couldn't examined supply of raw materials and

production process. The technicians of the organization could assess raw materials and production process in the project.

There are several tools that are used in strategic management. Some of them are used as complementary to SWOT. TOWS matrix is the essential completing tool. It enhances deploying strategies systemically considering the relations between Strengths, Weakness, Opportunities, and Threats. PEST analysis, which stands for Political-Economical-Social-Technological, is another complementary tool. Social environment is another concept that must be evaluated by PEST Analysis. The consequences of the internal and external factors can be replaced in a matrix called TOWS Matrix is shown in Figure5. TOWS matrix helps to systematically identify relationships between threats, opportunities, weaknesses and strengths, and offers a structure for generating strategies on the basis of these relationships. (Weihrich, H., 1982)

TOWS Matrix	External Opportunities (O) 1. 2. 3.	External Threats (T) 1. 2. 3.
Internal Strengths (S) 1. 2. 3.	SO Strategies that use strengths to maximize opportunities.	ST Strategies that use strengths to minimize threats.
Internal Weaknesses (W) 1. 2. 3. 4.	WO Strategies that minimize weaknesses by taking advantage of opportunities.	WT Strategies that minimize weaknesses and avoid threats

Figure 5: TOWS Matrix (Weihrich, H., 1982)

The external environment of any organization can be analyzed by conducting a PEST analysis. External factors usually are beyond the firm's control and sometimes present themselves as threats. For this reason, some say that "PEST" is an appropriate term for these factors. However, changes in the external environment also create new opportunities and the letters sometimes are rearranged to construct the more optimistic term of STEP analysis. The organization's environment is made up from three factors known:

- The internal environment: staff (or internal customers), office technology, wages, finance etc.
- The micro - environment: the external customers, agents, distributors, suppliers, competitors etc.
- The macro - environment: Social-cultural forces, Economic forces, Environmental forces, and Political (legal) forces.

Macro-environment's components are known as STEP factors. (Dyson, Robert G., 2004)

REORGANIZATION OF KIPAŞ GROUP

The reorganization of the group was done after internal and external analyses of the firms and observations from surveys and interviews. From internal and external analysis, SWOT Analysis of the group was carried out. The details of project were explained to every person from top management during interviews. Everything must be planned well otherwise desired changes may be resisted and not accepted by persons. It was expected from them that they evaluate the firm objectively for such a critical project. Moreover, their political considerations were also taken into

account. They were employed by both families. Thus, they support the family that employed them. Every family desired to get more control over the group.

Conditions were considered at outset of project:

- Organizational transformation
- Whole system analysis
- Making the organization climate more consistent with both individual needs and the changing needs of the environment and shareholders.
- Cultural norms and ethics
- The old organization structure and roles of top management
- Intergroup collaboration among companies
- Opening up the communications system to the whole group
- Better planning
- Motivation of the work force
- Adaptation to a new environment such as crisis.

SWOT Analysis of Kipaş

In this part, strengths, weaknesses, opportunities and threats of Kipaş group are presented in the light of the internal analysis and external analysis. The strengths and weaknesses stem from the interviews, observations and results of questionnaire, however, the opportunities and threats are drawn out from external analysis, especially from SWOT analysis of Turkish textile & apparel industry and removal of quotas. The summary of SWOT Analysis of group is shown in Figure 6.

<p style="text-align: center;">• STRENGTHS</p> <ul style="list-style-type: none"> • One of the powerful group in Turkish Textile Sector • 26 year experience in Textile Sector • Successful entrepreneurs • Experiences in Energy Sector • Having strong support from Governments 	<p style="text-align: center;">• WEAKNESSES</p> <ul style="list-style-type: none"> • Lack of Human Resource(HR) Management • Insufficient expert workers • Lack of performance measurements • Carrying high inventory and lack of Aggregate Planning • Distance among firms
<p style="text-align: center;">• OPPURTUNITIES</p> <ul style="list-style-type: none"> • Accessing to European Union(EU) • Removal of Quotas if used well • Having capital for investments • Regulations and improvements in Energy Sector • Turkish Governments Policies for regional developments 	<p style="text-align: center;">• THREATS</p> <ul style="list-style-type: none"> • Increasing customer expectations • Improvements in competitors • Disagreements among stakeholders • Low labor countries such as China and India • Removal of Quotas

Figure 6: SWOT Analysis of Kipaş Group

Strengths

The most significant strength of Kipaş is its influence in territory and influence of territory on it. It employs approximately 4000 worker in Kahramanmaraş which is southwest of Turkey and not well developed city when compared with other cities in Turkey, which makes Kipaş precious for the region. It is also at the top ranks in terms of employment in country wide lists. This makes it not only an economic but also a political force in the region. Besides, it is experienced in legislations during the incentive programs for the region, sector and export.

The integrated structure of its facilities and producing resources required for textile production are other advantages of it. At the head facility of it, the different factories which are located side by side, supply the subsequent beginning spinning to the fabric. The output of each factory is input for another one. Moreover, it produces its own energy and grows cotton as well. The new machinery pool of it is another important asset. As all the production facilities of it are located at Kahramanmaraş, it results in significant advantages for the company since the labor costs are lower in territory than Marmara and Aegean region. Additionally, the company is close to harbors and cotton growing centers such as Adana and South East Anatolia.

The founders of Kipaş are successful entrepreneurs and since company was established, they have made right investment decisions. The harmony between stakeholders is the main source of these correct decisions. The managers of companies, who have been working since foundation, considered the company as theirs. Consequently, the loyalty among these managers is worthy for company. The knowledge created during 26 years and experiences in all substructures of textile sector and energy sector are additional strengths. Furthermore, the financial success of company and possessing the venture capital are other advantages of company which differ it from general situation of sector.

Weaknesses

The significant drawback of the company is neglecting human factor and not considering Human Resources (HR) as an asset as realized from interviews and surveys. The main symptom of this approach is lack of HR strategies for top management. Shareholders employed high wage workers. As a result, the company hired inappropriate managers and engineers, generally relatives and incapable expert workers. Moreover, as company ignored education activities, these managers couldn't develop themselves. Moreover, many workers were unhappy about working conditions and wages. The other weakness of the company is vagueness in task, responsibilities and job descriptions. Authority problems among managers and top management are occurred as result of this ambiguity, consequently, motivation lessened.

The gap between companies of group and absence of aggregate planning activities are other problems. The logistics of company is not well managed, just carried out task in an unorganized way, which resulted in high inventory. The company doesn't have adequate marketing activities and customer relations. The lack of their own brand is another weakness of the company even though they have the potential. Disregarding manager's ideas and suggestions in tactical level decisions, lack of performance measurement and team working are other incompetence of company.

Opportunities

If company creates its own brand and invests in retailing part of textile with high value-added products that they can easily produce, removal of quotas, however, seems as a threat, can also be a significant occasion. From associate towards full membership, Turkey's European Union journey is another international positive development for Kipaş considering the share of EU in total exports of company. Additionally, this development enables the group to start their first retailing attempts in Europe, particularly in Western Europe where the profit margins are high for the textile retailers.

Recent improvements in macroeconomic level, export incentive policies and planning of recent government and some legal arrangements, made in order to improve the investment environment are other chances considering the capital that company owes. They have very good relationships with existing governments and could get funds from them for investments. The potential energy requirement of Turkey and the experiences and new investments of the company in that area can also change the focus point of Kipaş from textile to energy. Moreover, with the completion of Southeastern Anatolia Project (GAP) increasing cotton production and the improving investment environment for food and agriculture sectors lead company new ventures.

Threats

In the condition that Kipaş does not respond to change requirements such as removal of quotas, crisis etc. can cause dramatic results. It is clear that Kipaş at the segments in which it is active is

possible to be invaded by China, India and other low labor cost economies' products and domestic competitors.

The other threats for the company are improvements in competitors, increasing customer expectations, decreasing loyalty among blue collar worker as reaction to subcontracting and low salaries

Organization Structure of Kipaş

After wide analysis, it showed that there was a need for change and this change must be started from top. Thus, the old organization structure of the Group was changed by taking into consideration the current needs and future expectations. The SWOT Analysis was very helpful while designing the structure. It was used to determine strengths and weaknesses of the group to get opportunities and avoid threats. It was not only the decision of project team to change the structure but the decision of two families. Both families must agree on new structure otherwise conflicts would start again. Duties and responsibilities of each function were prepared.

The Old Organization Structure of Kipaş

The main characteristic of the old organization of Kipaş Group illustrated at Figure 7 was its dual headed structure. Every department and company was directly responsible to this structure and every decision must be made or approved by chairmen of the board. These decisions vary from very simple ones such as an official procurement to very extensive ones. Moreover, the single approve of a chairman was not enough to execute; both of the chairmen had to approve and sign any decision or document. There were many conflicts between families. There were two individuals, fiscal coordinator and an internal auditor, who was also directly related to chairmen. The major duty of fiscal coordinator was to assist in budget preparation and accounting support. The internal auditor was responsible for finding out any factors which conflict to benefits of the organization. These factors can be action, such as a theft, or worker, such as an insider. In other words, we can define internal auditor as the company police. There were 6 functional departments in Kipaş: Finance, Procurement, IT (Information Technology), Accounting, Sales and Personal Department as shown in Figure 7.

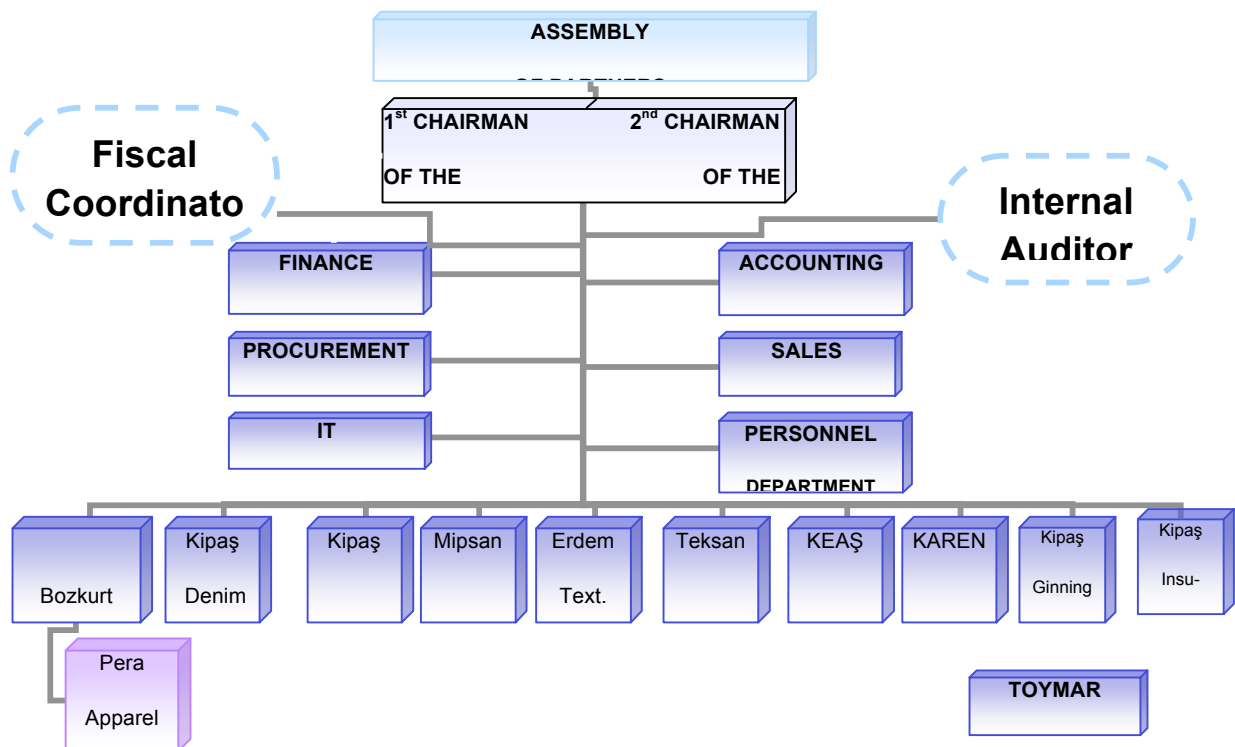

Figure 7: The old organization structure

The financial situation and credits of customer were being tracked by the Finance Department. Accounting Department was responsible for bookkeeping of all companies. Procurement was responsible for all purchasing; direct material, indirect material and overheads but cotton. Cotton was procured by the 1st chairman which is equivalent to the 70% of its total purchase of the company. However, with the procurement department, the 2nd chairman was responsible for the second important purchased item which is chemicals used in production. All of other items were being purchased by procurement department although they don't know how and where these materials are used. It was possible that some machine parts were purchased by this department. Shortly, they were also responsible for spare parts without technical knowledge on it. Sales department was responsible for the domestic sale activities. The exportation was generally performed by Bozkurt Textile's sales department in Istanbul. There were no marketing activities in sales department. Information Technologies Department was responsible for all communication infrastructure of the company and security of the system. It also managed the hardware and software assets and the web page of the group. However, this web page is just for the representation of the company and doesn't have any function for e-business or e-commerce.

The whole infrastructures of all firms had been decided to be combined in a project but IT department could not finish this project in two years. It was still a going on project. The workers of this department were not well educated in technological improvements. They did not know even the details of project. Many of them were employed long time ago. Personnel Department was dealing with the hiring of the low level workers and public transactions of social security, insurance and wages. However, middle and top level workers were employed by the chairmen of the board. They did not have any human resource politics. The chairmen of the board have mainly employed their relatives.

At the old structure, the two chairmen of the board directly controlled all companies of Kipaş Group, but Bozkurt Textile and Toyomar. As the head office of the Bozkurt Textile Co. was located in Istanbul, the two chairmen whose offices are in Kahramanmaraş were far from there. The former owners of the Bozkurt Textile, where the avant-garde modern product planning applications launched in Turkey, was Koç Holding and it has a reputation in the sector. Respectively, Bozkurt Textile is different than all other companies of Kipaş. It was managed independent from Kahramanmaraş and also has own separate functions such as sales. As Bozkurt Textile generally does international business, its sales department have experienced in world markets especially in USA and EU. Toyomar was the head agent of Toyota in the territory and it differs from other companies by sector. Its bookkeeping activities were performed by the center of Kipaş.

New Organization Structure of Kipaş Holding

In this part, the proposed organization structure shown in Figure 8 and the factors of SWOT analysis in Figure 6 how they affected new design are explained. New organization structure of new holding is designed regarding the outputs of assessment studies.

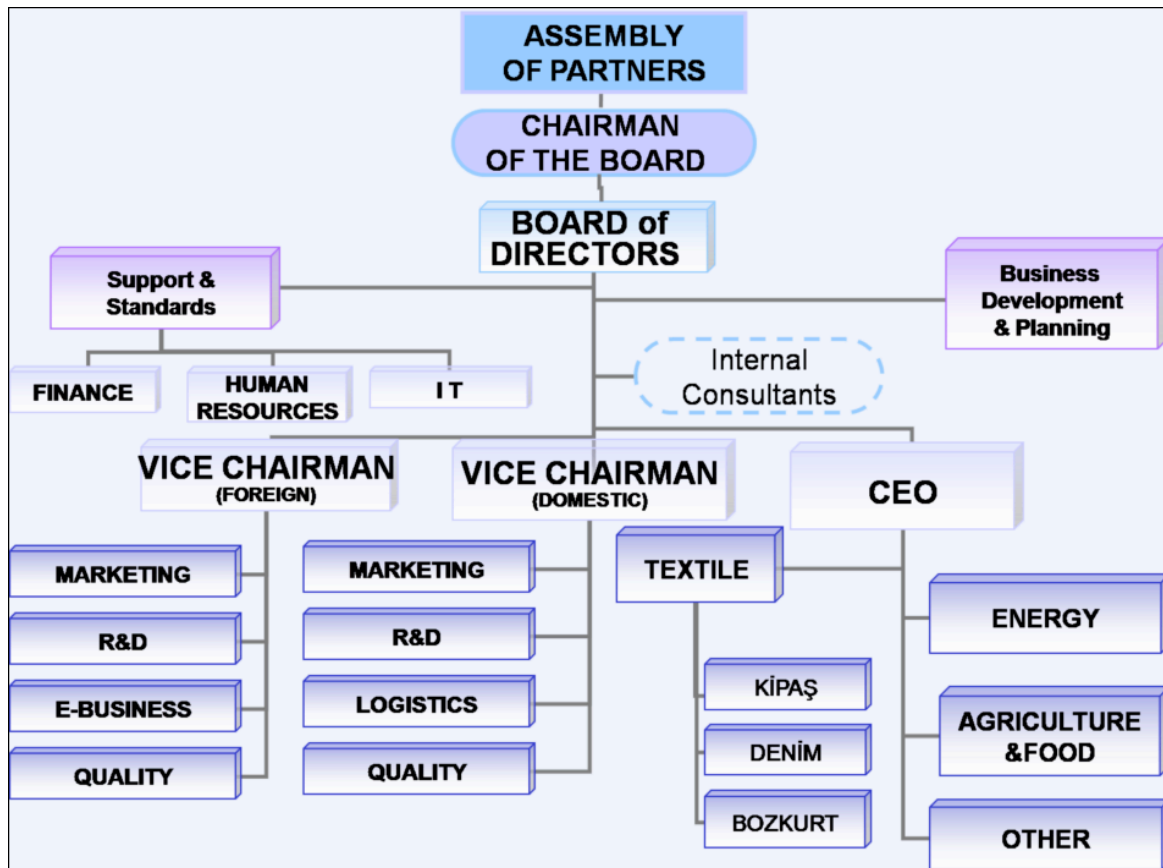

Figure 8: New Proposed Organization Structure of Holding

The separation of the basic functions, marketing, R&D, Logistics (E-Business) and Quality, in two groups, Foreign Business and Domestic Business, is the different part of this structure. Export has a great share in revenues of Kipaş and organization considers the Foreign Market as the target point. However, the way of business in textile differs incredibly in Domestic and Foreign Markets. Consequently, the approach of the functions which work with abroad (Istanbul side of the group) and the ones doesn't contact with foreigners (Kahramanmaraş side of group) differs. Taking into account of broadening gap between the departments and production functions in Kahramanmaraş and Istanbul, this separation becomes essential. To illustrate, the foreign marketing deals with abroad activities and the promotion of products that are sold in Foreign Markets. On the contrary, domestic marketing deals with activities in Turkey and the promotion of products that are sold in Turkish Market. Similarly, Foreign Quality focuses on catching the voice of foreign customers and Domestic Quality focuses on customers of domestic market. However, there are some differences between E-Business and Logistics

Domestic Logistics

Logistics activities are very critical for the Group. One of the significant weaknesses Kipaş was carrying high inventory and lack of aggregate planning. Each company of group was making their own production plan but this was not performed by looking at the big picture. This is resulted with high inventories and costs. To eliminate this logistics department is offered. When we think of the huge production of textile products of the group, the management of logistics is understood better

The tasks of domestic logistics are as following:

- Make business plans so that the customer orders are matched to production orders and accordingly scheduled material purchase orders. It manages the value chain from customer back to the supplier.
- Choose the right suppliers according to the quality-price performance and manage the suppliers so that they deliver the raw-material on the planned times. (Powerful customers make loyal suppliers keep safety stock for a month etc. so that spot requests can also be responded).

- Manage warehouses: Kipas Group has Maras and Istanbul warehouses for finished products and two warehouses in Kahramanmaraş for material stocks, Kipas and Bozkurt.
- Plan and manage the transportation.

E-Business

E-business operates and manages business relations on internet. It is not e-commerce since there were no direct sales to customers. E-business includes relations with the suppliers through Supply Chain Management (SCM) and partner relations through Partner Relations Management (PRM). For Kipas we mean:

- Communication and formal document exchange among Kipas and the resellers in United Kingdom and USA.
- Communication and document exchange with the Cotton providers for cotton importation.
- Sales operation management for the sales to the representatives and the distributors for the purpose of exportation.

These need not only a web page for the presentations but technological infrastructure to run and manage operations on the Internet. Shortly, in this side, separation of functions by domestic and foreign, departmentation by customer is used.

Grouping of Companies

To manage effectively the activities of companies, they were grouped. Their geographical positions were considered while doing grouping.

Textile Group

The companies under this group are Kipaş Denim Mills, Bozkurt and Kipaş which would be the combination of Erdem Textile, Kipaş and Mipsan. Considering the proximity of these three companies' (Erdem Textile, Kipaş and Mipsan) with respect to products, processes and input output relations, they can be considered as a value chain, they are combined to enhance the control of production. Shortly, these are the companies under textile group:

- Kipaş Denim Mills
- Bozkurt
- Kipaş
 - Old Kipaş
 - Erdem Textile
 - Mipsan

Energy Group

Under this group, there are two companies: one of them is Karen which produces the energy that factories use and Keaş that is founded for dam construction and management activities. However, this number of companies and their size seems small to create a group, this is sector will be one of the target sector of Kipaş.

Food and Agriculture Group

Recently, there is only one company in this group named Kipaş Ginning Agriculture which mainly obtains the needed raw material for textile companies, but this sector will be the other target point for new investments and with forthcoming investments that it will reach a group size.

Other Firms of Group

Under this group there was only one active organization which is Kipaş Insurance. Kipaş Education which was a private high school was just on paper and the construction launched in 2005 and finished in 2007. The schools have students now and expected that they will enlarge this group more. Teksan, paper cone producer, and Toyamar have been excluded from holding structure because of internal issues. They have their own management and give reports to the shareholders.

Factors Affects New Design

Considering the financial and consequently political power of company, it is not so tough to venture in new sectors. Business Development and Planning is a critical directory that aims to integrate the strategic planning of the current business as well as evaluating the opportunities for the whole group to assure the sustainability of the Holding Group.

We can separate the functions of this department as “Strategic Planning” and “Business Development”. Each company has his own planning unit that deals with the operational planning which feeds the Holding with information. Yet, integrating all the operational plans is a necessity not only to improve the effectiveness of the tactical plans but also to prepare the basis for long-term strategic business plans. For example, denim production plans and Kipas textile production plans are separately prepared but exportation is handled by Vice President of External Business. Integration gives the possibility for using the spot or durable opportunities in exportation besides domestic sales. To perform business development, there is one planning engineer tracing the global business opportunities in all fields concerning Kipas Holding and informing the decision makers (President and 2 Vice Presidents). He prepares the feasibility reports before presentation. Once an opportunity is found realistic in the Board, the case is taken as a particular project to be run. Then, the Project Team is established to include the experts from the field to analyze the business in detail. This department handles the project until the project is started as:

- a) a new function of one of the companies
- b) a new company

After that state, it is handled to the General Manager of the Company concerned (existing or new) to continue the operations. In fact, this function is performed by 1st Chairmen of Board. Business Development and Planning Department have significant responsibilities for enlargement in energy sector to value the new regulations and possible demand rise in this sector.

When the satisfaction analysis of the company by using surveys is examined, the lack of human resources considered the most important problem of Kipaş. Additionally, our observations resulted in a consensus on the majority of the inappropriate managers in company, especially, at the Kahramanmaraş. To compensate this drawback, a robust human resources department is proposed for company. By this department, the company can also measure the performances of the workers, this was absent at that time.

Creating a brand requires hard, intensive and lots of efforts. However, if the image of brand is set down, then the company can reach very high yield. The profit margin of the company can increase with creation of this high value added product. Firstly, the creation of brand requires a vigorous marketing department that would firstly decide the appropriate promotion process and then keep the sustainability of this brand. Moreover, to improve the attributes of product and use new technologies in an innovative way, the presence of Research and Development Department is fundamental. The quality concept of brand is developed by quality departments. Being at the right point at the right time would be run by E-business and Logistics departments.

EU is an important market for Kipaş and the foreign structure of Kipaş would enhance the activities in this market. Moreover, with dismiss of quotas, new markets are emerging and the new players would place to these virgin markets. The shares created in this process would be very easy but after a while, when the markets reach steady state, to penetrate these markets would not be easy. On the other, the low labor cost countries are threats in this foggy weather. However, this structure enables Kipaş differ from the companies of these countries by their service level and product quality. To evaluate these opportunities and eliminate this threat, the foreign part is strictly proposed

The other threats for Kipaş are increasing customer demands and improvements in competitors. The R&D (Research and Development) and Quality Departments could be effective to eliminate these threats. The R&D department focuses on not only the products but also the process and by developing processes of production the company increases its competitiveness. Quality department works with R&D concurrently for continuous improvement. This would enable to value Kipaş's experience in the sector and turn its knowledge assets to added value.

The Definition of Top Management and Organization Handbook

There was vagueness at carrying out the tasks. Every member of family tried to take part in every decision. Hence, it was not easy to make decisions. The most important steps for top management of Kipaş during establishing the holding were to balance internal and external dynamics in the global world in order to advance the holding. Duties and responsibilities are efficiently shared among stakeholders and professionals. The things that should be done for the future of Holding:

- Strategic and operational decisions should be separated.
- New departments needed for the holding should be opened.
- New standards should be prepared and implemented without any problem.
- Stakeholders should be empowered according to these standards.
- Strategic decisions should not be taken individually; they should be taken and applied by Board of Directors.

In Organization Handbook, duties and responsibilities of every function in the New Organization Structure are defined. Everyone is responsible just from his or her part. The job and main objectives of this job and responsibilities of each function or person are written on that part. Moreover, requirements for that function are determined. An example of Organization Handbook for Vice Chairman (Foreign) is shown in Figure 8.

KİPAŞ HOLDING	ORGANIZATION HANDBOOK
	Definition of the Job
DUTY	Vice Chairman (Foreign)
UNIT	Board of Directors
DEPENDING ON DUTY	Board of Directors
DUTIES DEPENDING ON VICE CHAIRMAN (FOREIGN)	Research & Development, Exportation, Quality and Marketing Directors
	The Main Objective of the Job
	Supporting Chairman of the Board and managing strategic decisions for the foreign countries in order to ensure the holding being successful.
	Responsibilities
	Defining marketing strategies for other countries Represent the Holding at abroad Establishing units at abroad under Holding Managing R&D for other countries markets according to Holding Targets Determining exportation politics for all firms and implement them Defining suppliers at abroad and coordinate them for the whole Holding Defining Quality Politics for other countries. Coordinating Design, Quality , exportation and importation activities of the firms Performing Exportation, Design , importation and Quality activities of each firm according to Holding politics and standards Coordinating directors and solve problems among them
	CRITICAL PERFECTIONS FOR THE JOB
	Assigned by the Board of Directors Shareholders or must administer at least 100 workers Having International experience Being open to the changes and having an extensive vision Being active to take Strategic Decisions and implement them Knowing very good at least one foreign language especially English
	WORKING CONDITIONS
Working Order	Attending Board of Directors once per month Meeting with directors depending on him once per week
Working Place	Istanbul

Figure 8: An example of Organization Handbook

CURRENT SITUATION OF KİPAŞ HOLDİNG

The group has finished the steps of the project and is a holding now. They have changed their structure in 4 years. These changes have helped them even in the last financial crisis started in 2008. The old structure was a big stone in front of them to see the future. After transition, they could make changes quicker. The core product of them is still textile but now they have done investment in cement industry which has not suggested in the project. They have done their other investments as suggested in the project. To compete with China and other countries, they have improved their quality as planned. The quality is not only enough to get more shares in the market and so they have improved their marketing and sales activities as well. They have been using their political power in the country for new investments and opportunities. In order to get that support, they have improved their production as sensitive to the environment. Moreover, they have opened a new hospital and done more investment in education even though they do not gain so much profit.

FIRM	ACTIVITY AREA
Kipaş Mensucat	Shirting, Velvet, Home Textiles
Bozkurt Konfeksiyon	Confection
Kipaş Denim	Denim Manufacturing
KÇS	Cement and Clinker Production
Mipsan	Open-End and Ring Spun Yarn Production
Teksan	Coil-Rolin Manufacturing
Kipaş Tarım	Greenhouse Farming, Fruit Growing and Viticulture
Kipaş Özel Eğitim	Education
Karen	Electricity Generation
Toymar	Motor-Fuel Vehicle Maintenance
Kipaş Pazarlama	Yarn, Fabric and Denim Marketing
Kipaş Sigorta	Insurance
Erdem Tekstil	Yarn and Fabric

Figure 9: Firms of the Kipaş Holding in 2010

CONCLUSION

The textile apparel sector is in a transition era and January 1, 2005 was a cornerstone for sector. The 40 years temporarily protection, began with The General Agreement on Tariffs and Trade (GATT) agreement, of developed countries' textile apparel sector has been terminated. After failing the attempts against China such as Istanbul Declaration, to extend the deadline for

implementation of the final integration stage from January 1, 2005 to December 31, 2007, significant player of the market including Turkey began to focus on non-tariff quotas or investigation of China due to unfair advantage as a result of government policies (currency manipulation, state subsidies etc.). Noticing the reactions and rapid increasing portion of China's in the market, the developed countries have been taking precautions and China respond to reactions with a little increase in tax of these sectors. Despite of these recent developments, it is impossible to turn to conditions before 2005 and the revolution in the sector initiated with new rules.

Countries and companies have developed or are still going on developing new strategies for the new game. Self assessment and SWOT analysis of Kipaş Group mainly focused on textile and apparel sector. An organization structure was prepared to respond to highly competitive markets. It is clear that, China and other low labor cost Asian Countries, such as India, have been gained advantage in the market. However, these regulations would undisputedly increase the competitiveness and in this environment companies would attempt to differentiate by design. Particularly in clothing, the importance of time to market would ascend dramatically. Consequently, the importance of proximity to markets such as EU and North America would intensify, which is an important advantage for both Turkey and Kipaş considering proximity to E.U. However, Turkish companies and Kipaş are obliged to concentrate on quality and supply chain activities and establish robust R&D structures to create innovative products and design in short periods to turn over these opportunities to yield. The yields of vertical growth are uncontroversial and Kipaş is a good instance of this. Kipaş had all steps of supply chain of textile from cotton to apparel. However, just last step of general supply chain was neglected by Kipas that was retailing. Kipaş must concentrate on last and most value added part of to chain. Creation of own brand is the most important step in this essence. In the light of the developments in EU journey of Turkey, as a strategy, Kipaş can start its retailing activities in Western Europe, more value-added markets rather than domestic market. The company has the knowledge, culture and values to implement the aforementioned strategies and proposed organizing structure.

Kipaş Group's two companies were enlisted in 2005 among the "Turkey's top 500 largest companies", according to a research conducted annually by the Istanbul Chamber of Industry. Subsidiary Companies Kipaş Mensucat A.Ş was ranked as 260th and Kipaş Denim 415th. Kipaş Group has been ranked among top 500 companies since 1991. In addition, two other subsidiaries has been enlisted among the "Turkey's second 500 largest companies" where Erdem Textile and Bozkurt Konfeksiyon has been ranked 173rd and 191st respectively. A new target of Kipaş Holding is to work harder so as to make other subsidiaries enlisted in these lists; and in return add value to Turkish Economy. Kipaş Holding, an institution that sets big goals for regional development and for our country, will continue to serve to our countries' future by leveraging the expertise gained throughout the 26 years.

FINANCE STRATEGIES

THE EFFECTS OF THE FOREIGN DIRECT INVESTMENT ON TURKISH ECONOMY BETWEEN 2000-2009 PERIOD

Furkan Diskaya, Senel Secil Olmez, Ebru Terazi
Beykent University, Turkey

ABSTRACT

Foreign Direct Investment (FDI) became an increasingly important element in global development and integration during the 2000s. In today's global marketplace, many firms find it strategically necessary to engage in foreign direct investment (FDI) in one or more countries. These firms are attracted to FDI because it may offer them competitive advantage over local firms, a lower cost for labor and/or physical resources, secure access to physical resources and proximity to major markets and increasing market share. Foreign direct investment has spread rapidly through the world economy in the past two decades. More countries and more sectors have become part of the international FDI network. Turkey, as a developing country, has been one of the most attractive destinations for FDI especially after the 1980's with the effect of neoliberal policies. The aim of this study is to examine the influence of foreign direct investment on the growth of Turkey for the period 2000-2009.

Keywords: *foreign direct investment, Turkish economy, regression analysis, Granger causality test*

INTRODUCTION

Globalization and neoliberal policies in today's world necessitate the presence of foreign capital more than ever. Today's developing economies, which take economic growth and development as the ultimate goal but do not have sufficient domestic capital and savings try to do their best to attract foreign capital. Global FDI flows have been severely affected worldwide by the economic and financial crisis.

This paper examines the influence of foreign direct investment on the growth of Turkey for the period 2000-2009. The reason why the period 2000-2009 is chosen is to investigate the presence of hypotheses that the economic recession in Turkey and the global crisis in 2008 effect foreign direct investment. Regression and Granger causality analysis will be used in order to test the hypotheses about the presence of causality between Foreign Direct Investment and economic growth.

The article proceeds in the following manner. First, we briefly review the literature regarding foreign direct investment, economic growth and global crisis. We develop hypothesis concerning the effects of foreign direct investment on economic growth. Second, we focus on foreign direct investment trends in the world and Turkey. Next, we test our hypothesis using data from World Investment Report and Turkish macroeconomic indicators. Finally, we provide the research findings and discuss their economical and social implications.

DEFINING FOREIGN DIRECT INVESTMENT (FDI)

Foreign investment involves ownership of foreign property in exchange for financial return. Foreign investment is either made as portfolio investment or foreign direct investment. Portfolio investments do not require the physical presence of a firm's personnel or products on foreign shores. These investments can be made in the form of marketable securities in foreign markets, such as notes, bonds, commercial paper, certificates of deposit, and noncontrolling shares of stock. They can also be investments in foreign bank accounts or as foreign loans. Investors make decisions to acquire securities or invest money abroad for several reasons, primarily to diversify their portfolios among markets and locations, to achieve higher rates of return, to avoid political risks by taking their investments out of the country, or to speculate in foreign exchange market (Khambata and Ajami, 1992).

A direct investment is one that gives the investor a controlling interest in a foreign company. Such a direct investment also is called a foreign direct investment (FDI) (Daniels and Radebaugh, 1998). Foreign Direct Investment is direct investment outside the boundary of the investor's home country and is often the natural extension of direct exports (Levary and Wan, 1999).

The main concept behind FDI is the control of assets in another country. That is, foreign direct investment is generally undertaken by a firm that seeks to serve a new market for its products or services or that seeks to serve a new market for its products or service or that seeks to obtain additional supplies for its existing markets (Grosse and Kujawa, 1992).

Foreign Direct Investment occurs as the transfer of investable resources to other countries by individuals and companies. Therefore unlike portfolio investment, which is the second type of investment, it includes the transfer of intangible assets such as trademark, technology and business management as well as the authorization given to the investor to control the investment (Blomstrom and Kokko, 1998). Foreign direct investments are mostly made by multinational corporations. A multinational corporation is a business with significant investments in several foreign nations, which derives a substantial part of its income from foreign operations, and which maximizes its profits on the global rather than national level (Bennett, 1996). When a company invests directly within foreign shores, it is making a very real commitment of its capital, personnel, and assets beyond domestic borders. While this commitment of resources increases the profit potential of a multinational corporation dramatically by providing greater control over costs and operations of the foreign firm, it is also accompanied by an increase in the risks involved in operating in a foreign country and environment (Khambata and Ajami, 1992).

THE STRATEGY OF FOREIGN DIRECT INVESTMENT

There are many reasons for a firm to undertake foreign direct investment. A majority of studies done during the 1960s and 1970s disclosed that the most important reason for entering a foreign market was to sell products that the firm already sold successfully in its home country. Many other reasons have been defined since then. The reasons why a firm undertakes foreign direct investment can be grouped into the supply side and the demand side. The reasons for the supply side include: To lower production costs, to lower delivery costs (costs of transportation, insurance, tariffs, etc.), to acquire necessary raw material easily, to do offshore assembly, to establish a ‘portfolio’ of production sources and to obtain technology and know-how. The reasons for the demand side include: to explore new markets and to serve a ‘portfolio’ of markets, due to closure of an export market by a prohibitive tariff and quota, to establish a local presence with service and product availability, to meet ‘buy national’ rules or preferences in the host country, to gain ‘visibility’ as a local firm by employing local people, paying taxes etc. and to respond to rivals’ threats (Grosse & Kujawa, 1992).

PATTERNS OF FOREIGN DIRECT INVESTMENT

The vast majority of foreign direct investment that has occurred historically has been made in the period since World War II. This is the result of the growth in national markets, coupled with the willingness of developed-country governments to permit foreign ownership of local companies. In addition, such investment and exports has been facilitated by the tremendous decline in international transportation costs and improvement in transportation availability that have occurred in the postwar period.

Chart 1.

Source: UNCTAD 2010

Especially after the 1980's there has been a marked liberalization of government policies and attitudes toward foreign investment in both developed and developing nations (Ball and McCulloch, 1999). Over the past decade, foreign direct investment flows have increased significantly worldwide. As seen in the graphic worldwide foreign direct investment have increased from an annual average of USD 181 billion between 1985- 1995, and an annual average of USD 310 billion between 1992-1997, made a peak in 2000 with USD 1400 billion and reached an annual figure of USD 916 billion in 2005. In 2006, worldwide foreign direct investment made was 1461 and has increased to 1979 in 2007 and has decreased 14 % to 1697 in 2008 due to the effect of the global economic crisis. (Unctad, World Investment Report 2009)

Chart 2.

Source: UNCTAD 2009

Turkey's experience with FDI flows has been slightly different from the worldwide pattern. Between 1994 and 2003 the average FDI Inflows to Turkey was USD 1.2 billion. In 2004 FDI has increased to USD 2.9 billion and USD 10 billion in 2005. The level of international direct investments made a sharp increase in 2006 to USD 20.2 billion. Among the main characteristics were the rising trend for developing countries as the source country for international direct investments and the increasing role for collective funds such as private equity funds in cross-border mergers and acquisitions. By the end of 2009, foreign direct investment (FDI) inflows to Turkey have reached to 7.6 billion US\$. In 2009, FDI inflows fell down by 58% compared to 2008. In 2008, the decrease had been limited to 17% because the effects of the crisis had only been felt towards the end of the year. As the crisis was more deeply felt, a sharper decrease followed in 2009.

Foreign Direct Investment has innumerable effects on the economy of a host country. It influences the production, employment, income, prices, exports, imports, economic growth, balance of payments and general welfare of the recipient country (Erdal and Tatoğlu, 2002).

FDI provides to the host country mainly, cheap capital, some advanced technology and entrepreneurial talent (Serin, Çalışkan and Karahmet, 2008). It is particularly critical for countries with low levels of domestic investment like Turkey. More generally, the strength of Foreign Direct Investment global flows is an indicator of the health of economic globalization.

Recently in the studies about the effects of foreign direct investment on economic growth there has not been a real consensus. The most common opinion is that there is a parallelism between these two facts. According to many researches, there should be appropriate investment conditions and a minimum economic development degree in a country for the increasing effects of foreign direct investment on economic growth (Arslan and Kökocak, 2006).

In the majority of the studies on the impact of FDI on economic growth, the production function approach and various methods in analyzing the data such as Granger causality test, panel data estimation, and error correction model is used (Jajri, 2009). Marwah and Takavoli (2004) examined the effect of FDI and imports on economic

growth in four Asian countries. The elasticity of the estimated production function of FDI was found to be significant in explaining the economic growth of all of the four countries. Estimated foreign capital elasticity was found to be 0.086, while import contributed 0.443 to growth in the case of Malaysia. Clearly, they conclude that both FDI and imports had a significant impact on growth.

Liu and Liu (2005), on the other hand, used the panel data of 84 countries to investigate the influence of FDI on growth. The study found a significant relationship between FDI and economic growth. Additionally, a stronger relationship was extracted when FDI interacted with human capital. This is because stronger human capital poses better absorptive capacities due to the complementary nature of the FDI and the human capital, most importantly for the developing countries.

In contrast, there have been several studies indicating a negative or no relationship between FDI and growth. Akinlo (2004) investigating the impact of FDI on economic growth Nigeria using the ECM, showed an insignificant negative influence of FDI on growth. FDI may influence growth negatively once there is an evidence of the foreign investors transferring profits, or other investment gains to their home country. Other noteworthy studies examining the influences of FDI employed the Granger causality test (Nair- Reichert and Weinhold, 2001 and Knoldy, 1995), but the results varied according to the country, the methodology and time frame of the study.

The 2001 economical crisis in Turkey and 2008 global recession and financial crisis have significantly affected FDI inflows. Even though FDI is more stable than portfolio investment, it is not insensitive to crises and especially to changes in the determinants of investment induced by a crisis (UNCTAD Report). On the relationship between FDI and crises, the literature on inward FDI postulates the well-known “fire-sale” phenomenon: paradoxically, FDI inflows may increase even while there has been short-term capital flight. The explanation is that the two flows are driven by different determinants—the latter is in response to a perceived increase in short-term risk profiles, while the former, which pursues a longer-term motive, is attracted by the asset-cheapening effects of a crisis (through lower prices in domestic currency terms and a depreciating Exchange rate) as well as a frequent by-product of a crisis, a more liberal FDI regime (Hill and Jongwanich, 2009).

METHODS

Data on GDP and FDI over the 2000-2009 period are obtained from UNCTAD World Investment Reports, YASED (International Investors Association) Reports.

While conducting an econometric study, the direction of the causal relationship among variables is determined according to the information obtained from the theory. Classical regression analysis is based on the assumption that the method used is correct and the direction of the causality is the determined in the model therefore; in this study Granger Causality Test will be used in order to test the hypothesis regarding the presence and the direction of causality between FDI and economic growth. In order to apply Granger Causality Test the series that belong to variables should be stationary. Therefore, it is necessary to make test for unit roots to examine whether the series for these two variables are stationary or not. Macroeconomic time series are usually not stationary. Such series are made stationary by calculating logarithm or taking first or second differences. There are many tests used to determine stationary. In this study, the stationary of the variables will be tested by using Augmented Dickey- Fuller unit root test. Here, Akaike and Schwarz criteria are used while determining the appropriate lag length for delayed variable. The models suggested for this test are as follows:

$$\Delta Y_t = \gamma Y_{t-1} + \sum_{i=2}^m \beta_i \Delta Y_{t-i+1} + \varepsilon_t \quad (1)$$

$$\Delta Y_t = \alpha_0 + \gamma Y_{t-1} + \sum_{i=2}^m \beta_i \Delta Y_{t-i+1} + \varepsilon_t \quad (2)$$

$$\Delta Y = \alpha_0 + \gamma Y_{t-1} + \beta_t + \sum_{i=2}^m \beta_i \Delta Y_{t-i+1} + \varepsilon_t \quad (3)$$

Here H0 hypothesis are tested by comparing the τ value obtained in this test with the values calculated by Dicker- Fuller (Enders, 1995). Null Hypothesis shows that series is not stationary and has a unit root

($H_0 : \gamma = 0$) and alternative hypothesis shows that series is stationary.

If the absolute value of calculated τ statics is higher than the absolute value of critical values, we cannot reject the hypothesis which shows that series is stationary. However, if this value is lower than critical value, time series is not stationary (Gujarati, 1995).

DATA ANALYSIS AND HYPOTHESES TEST RESULTS

In this study, Granger causality test was applied in order to determine the presence of the relationship between two variables and its direction in Turkish economy between 2000 and 2009 fiscal years. Accordingly the model developed for economic growth (GDP) and foreign direct investment (FDI) is as follows:

$$GDP = \beta_0 + \beta_1 FDI \quad (4)$$

When the results of the test displayed in the table below are examined, it can be seen that the series belonging to GDP is not stationary in level value and it becomes stationary only when first differences are taken. Foreign direct investment and economic growth, expanded to test the stability of a series of Dickey-Fuller (ADF) test was used and the results in Table 1 are presented.

Table 1. Augmented Dickey-Fuller Test Results

MacKinnon One-Sided P-Value Null Hypothesis: GDP has a unit root			MacKinnon One-Sided P-Value Null Hypothesis: FDI has a unit root		
Augmented Dickey-Fuller test statistic	t-Statistic	Probability	Augmented Dickey-Fuller test statistic	t-Statistic	Probability
	- 3.4567	0.0775		- 7.6798	0.0000
Test Critical Values:	1% level	- 4.3478	Test Critical Values:	1% level	- 5.5367
	5% level	- 3.7837		5% level	- 4.7489
	10% level	- 2.4531		10% level	- 3.1143

Here, by applying ADF unit root test, as Mc-Kinnon critical values are greater than of 1%, 5% and 10% significance level we can conclude that there is no unit root. After testing stationary of the variables, Granger causality test was applied in order to determine the presence of the relationship among variables and its direction. The results of Granger test done between the two variables for which unit roots test is carried out displayed in the table below.

Table 2. Granger Causality Test Results

Two Time Lags Sample: 2000 - 2009			
Null Hypothesis	Observation	F-Statistic	Probability
GDP does not Granger Cause FDI	36	0.33341	0.78323
FDI does not Granger Cause GDP	36	4.32452	0.14321

According to Granger causality test done by using quarterly data between 2000 and 2009 in Turkey, economic growth (GDP) is not the cause of FDI. (0.78323, 0.14321 > 1%, 5% and 10%)
 In other words, there is no causality relationship from economic growth to FDI.
 After the test of causality, the regression equation model was estimated. A generated model with respect to the period is as follows:

Table 3. Results of regression analysis

<i>2000 – 2009 Period</i>			
Coefficients		β_0	β_1
		2943.3	0.32
Standard Deviation		1734.2	0.091
T - Value		1.3256	2.873
$R^2 = 0.723$	$D - W = 1.4012$	$F = 7.461$	

As seen in Table 3, in the regression equation analyzed, 1 unit increase in FDI approximately causes a 0,32 unit increase in GDP. In this period the explanation rate of FDI on GDP is about 72% and the parameters in the model are meaningful. Furthermore the parameters in the model are meaningful when analyzed as a whole.

CONCLUSION

In this study the direction of the relationship between economic growth rate and FDI is examined by using Granger causality test and regression analysis. According to the results of this study, there is no reciprocal causality relationship between economic growth and FDI in Turkey. The direction of causality relationship is only from FDI to growth rate and there is no causality relationship from growth rate to FDI. Consequently FDI in Turkey is one of the factors affecting economic growth. Therefore, the highness or lowness of economic growth rate doesn't have an effect on the presence of FDI. The results definitely show that large amount of FDI inflows in Turkey play a role in high growth rate observed in Turkey currently. As a result, it is necessary to continue to encourage FDI inflows so as to ensure constant economic growth in Turkey.

SYSTEMIC RISK and HEDGE FUNDS

Nuray Terzi

Marmara University, Turkey

ABSTRACT

There is a significant rise in concerns about the financial stability in international financial systems. Systemic risk is mainly accepted as the fundamental underlying concept for the study of financial instability. There is no clear understanding of the concept of systemic risk and the linkages between systemic risk and hedge funds. This paper has attempted to define the concept of systemic risk and to analyze the relationship between systemic risk and hedge funds as the main rationale for financial system.

INTRODUCTION

Hedge funds have attracted growing attention from policy makers, financial market participants and the general public due to their rapid growth and substantial scale, their importance to banks as clients and the impact of their trading activity on global capital markets. Moreover, hedge funds improve overall liquidity and efficiency and make a wide range of risk hedges and position adjustments available to other market participants (Higashio, Terada and Shimizu; 2006;5).

However, there is a significant rise in concerns about the financial stability in international financial systems. Systemic risk is mainly accepted as the fundamental underlying concept for the study of financial instability and policymakers have raised concerns that hedge funds may contribute to systemic risk. One way this might occur is if a failing hedge fund causes the collapse of a large financial institution with direct exposure to it. Aside from causing the failure of a major counterparty, a failing hedge fund can disrupt the financial markets indirectly. As a result, there is no clear understanding of the concept of systemic risk and the linkages between systemic risk and hedge funds.

This paper has attempted to define the concept of systemic risk and to analyze the relationship between systemic risk and hedge funds as the main rationale for financial system. This article proceeds in the following manner. First, I begin with the most important characteristics of systemic risk and explain the concept of hedge fund. Second, I review the relationship between systemic risk and hedge funds. Third, I give regulatory approaches of systemic risk. Finally, I provide a conclusion.

THE CONCEPT OF SYSTEMIC RISK AND HEDGE FUND

This section focuses on the define of systemic risk and hedge funds. Systemic risk is examined in the light of the related literature. Hedge funds is also analyzed in terms of their characteristics and size in the financial system.

Systemic Risk

Systemic risk is defined in different perspectives in literature. Systemic risk can be defined in terms of integrated perspective. Integrated perspective includes both institutional systemic risk and market risk. Others define systemic risk as a systemic event. As a systemic event, systemic risk is defined as the risk of experiencing systemic events.

Schwarcz (2008;202) defines systemic risk in terms of integrated perspective. Integrated perspective includes both institutional systemic risk and market risk. Banks and other financial institutions are important sources of capital. Therefore, their failure can deprive society of capital and increase its cost. Increases in the cost of capital, or decreases in its availability, are the most serious direct consequences of a systemic failure. Systemic risk is also positively correlated with the markets. Markets can also create a systemic risk.

Bordo, Mizrahi, and Schwartz (1998;31) offer a description of a systemic event as a situation where: “*shocks to one part of the financial system lead to shocks elsewhere, in turn impinging on the stability of the real economy*” while the Counterparty Risk Management Policy Group II (2005;5) describes a financial shock with systemic consequences as one with: “*major damage to the financial system and the real economy*”. In principle, systemic

risk is defined as the risk of experiencing systemic event. The spectrum of systemic risk ranges from the second-round effect on a single institution or market to the risk of having a systemic crisis affecting most of the financial system at the upper extreme (Table 1).

Table 1. Systemic Events in Financial System

Type of initial shock	Single Systemic Events (affect only one institution or one market in the second round effect)		Wide systemic events (affect many institutions or markets in the second round effect)	
	Weak (No failure or crash)	Strong (failure of one institution or crash of one market)	Weak (No failure or crash)	Strong (failure of many institutions or crashes of many markets)
Narrow shock that propagates				
*Idiosyncratic shock	✓	✓ contagion	✓	✓ Contagion leading to a systemic crisis
*Systematic shock	✓	✓ contagion	✓	✓ Contagion leading to a systemic crisis
Wide systematic shock			✓	✓ Systemic crisis

Source : Oliver de Bandt and Philipp Hartmann, (2000).

As a systemic event, the key element in this definition of systemic risk is composed of two important elements itself, shocks and propagation mechanisms. Shocks can be idiosyncratic or systematic. In an extreme sense idiosyncratic shocks are those which affect only the health of a single financial institution or only the price of a single asset, while systematic shocks affect the whole economy, e.g. all financial institutions together at the same time. The second key element in systemic events in the narrow sense is the mechanism through which shocks propagate from one financial institution or market to the other (Bandt and Hartmann, 2000;12).

Hedge Funds

Hedge Funds have grown quickly over the past ten years, and are important part of the financial landscape. There is no legal or even generally accepted definition of a hedge fund, although the US President's Working Group on Financial Markets characterised such entities as *"any pooled investment vehicle that is privately organised, administered by professional investment managers, and not widely available to the public"* (Garbaravicius and Dierick, 2005:7).

Hedge funds have three main structural features: they are private pools of capital, they pursue multiple and complex strategies and their returns are boosted by financial leverage. They undergo few restrictions in their investment strategies. They are regulated only indirectly through their prime brokers and a loose market discipline resting on the promotion of standards of good conduct (Aglietta and Rigot, 2008:2).

Extensive use of leverage and derivatives is a common feature of hedge funds. Overall, hedge funds play a key role in providing liquidity in markets where pricing anomalies have occurred, often due to lack of breadth. In the main this is a volatility reducing activity that is an essential part of the efficient working of financial markets and financial stability (Blundell-Wignall, 2007;37).

Hedge funds are moving increasingly into less liquid markets, with structured credit and distressed debt at the top of the list (Chan et al. 2006; 240). Because of their nature, hedge funds are restricted to large-scale investors. Historically, they have attracted high-net-worth individuals and institutional investors, and the array of the latter has widened significantly in recent years to include pension funds, charities, universities, endowments, and foundations (Ubide, 2006; 1).

By the end of 2007, the global hedge fund had about \$ 2 trillion in assets under management. However, because hedge funds are not required to register with any financial regulator or supervisor, these numbers can only be estimated. According to graph 1, hedge funds had less than \$ 500 billion in 1999 in assets under management, and the \$ 1.5 trillion mark was passed in 2007.

Graph.1 The Size of Hedge Funds, 1999-2007, Billion Dollar

Source: Hedge Fund Research (HFR), 2Q 2007 Industry Report.

Hedge funds are also dominant players in several markets: in 2005, by one estimate, they accounted for 89 percent of U.S. trading volume in convertible bonds, 66 percent of volume in distressed debt, 33 percent of volume in emerging market bonds and in leveraged loans, 20 percent of speculative-grade bond volume, and 38 percent of credit derivatives volume. By early 2006, their estimated share of credit derivatives trading had increased to 58 percent (Kambhu, Schuermann and Stiroh, 2007;5) As these figures suggest, hedge funds are engaged in a broader range of activity than in the past, especially in the trading of credit instruments.

Hedge funds also move fast. Estimates of hedge fund survival rates vary between 85 percent and 95 percent per year, depending on the year and the style of fund. Chan et al. (2006, 250) report that 30 percent of funds do not make it past three years, and 40 percent of funds do not survive past the fifth year. The average one-year attrition of hedge fund is less than 4 percent (Carhart et al. 2002, 1455). Gupta and Liang (2005:230) also report that nearly 90 percent of dead funds in their study were adequately capitalized at the time of closure.

THE RELATIONSHIP BETWEEN SYSTEMIC RISK AND HEDGE FUNDS

The key question from a financial stability perspective is whether hedge funds could potentially pose a systemic risk. Policy-makers and regulators have been examining both direct and indirect channels. If systemic risk is fundamentally about financial market linkages to the real economy, then hedge funds create systemic risk to the extent that they can disrupt the ability of financial intermediaries or financial markets to efficiently provide credit. A hedge fund link to the real economy might occur through banks' direct exposures to hedge funds, disruptions to capital markets that hinder credit provision or allocation, or indirect effects as bank problems feed back into the broader financial markets (Kambhu, Schuermann and Stiroh, 2007;7).

A direct channel occurs when a collapse of a hedge fund holding large positions leads to forced liquidations of those positions at fire-sale prices. The impact on asset prices may be amplified through the use of leverage. Such a disorderly unwinding could generate heavy losses to counterparties and ultimately contribute to severe financial distress at one or more systematically important financial institutions (King and Meier, 2007;6). Commercial banks and securities firms are directly linked to hedge funds through their counterparty exposures, for example, short-run financing for leveraged positions, prime brokerage activity, and trading counterparty exposures in over-the-counter and other markets. If a bank has a large exposure to a hedge fund that defaults or operates in markets where prices are falling rapidly, the bank's greater exposure to risk may reduce its ability or willingness to extend credit to worthy borrowers (Kambhu, Schuermann and Stiroh, 2007;7).

During the collapse of Long Term Capital Management (LTCM) in the autumn of 1998, 17 counterparties, mostly large banks, would collectively have lost between USD 3 and 5 billion had LTCM not been bailed out by a group of its counterparties. Many of the counterparties had direct exposure to LTCM, mostly arising from over-the-counter derivatives (Ferguson and Laster, 2007;50).

The potential market weight of hedge funds also poses indirect risks to financial market participants' asset positions. Banks are often exposed to market risks similar to those of hedge funds, especially if, in their

proprietary trading, they pursue strategies comparable to those of hedge funds. Thus, they risk sustaining marked losses in the event of abrupt market shifts in the trading segments dominated by hedge funds. This is likely to affect market segments in which a withdrawal by a few key market makers could cause market liquidity to dry up (Weber, 2007;165).

In the indirect channel, a forced hedge fund liquidation exacerbates market volatility and reduces liquidity in key markets. Thus, systemic risk occurs when correlations in asset classes increase during times of stress, or when the potential for herding amplifies market movements (King and Meier, 2007;6) Large commercial banks and broker-dealers provide substantial liquidity to the hedge fund sector by absorbing the counterparty credit exposure of trading positions, collateralizing financing, providing contingent credit lines, and making direct equity stakes. A hedge-fund-induced shock to a commercial bank could have knock-on effects if that bank or other banks reduces the provision of liquidity to other hedge funds or to other banks, and thus further disrupts financial markets and credit provision (Kambhu, Schuermann and Stiroh, 2007;9).

On the basis of these channels, policy-makers and academics have identified the following factors that might contribute to, or mitigate, systemic risk: excessive leverage, liquidity shocks, trades and herding behaviour, counterparty risk, and the state of the economy and financial balance sheets. (King and Meier, 2007;7)

One feature of hedge funds on which particular attention has now been focussed is that of leverage. Leverage can be defined in two ways: (i) balance sheet leverage, which is the ratio of assets to net worth; and (ii) as a form of risk, in which leverage is measured as economic risk relative to capital (Becker and Minicozzi, 2000;9). Leverage relates equity capital to trading exposures. When leverage is excessive, even a moderate price swing could force hedge funds to liquidate positions to meet margin calls. As hedge funds seek to sell their most liquid assets first, shocks in one market might lead to ripple effects across markets (Garbaravicius and Dierick 2005, 32). The 1998 collapse of Long-Term Capital Management provides a striking example of the impact of excessive leverage. The report of the President's Working Group on Financial identified excessive leverage as the key factor contributing to the collapse of LTCM (King and Meier, 2007;7).

Liquidity is a key concept in the debate about systemic risk. Funding liquidity refers to the ability of an investor to raise cash to meet its financial obligations. A hedge fund may have liquidity problems even though the financial markets themselves are liquid. Financial institutions go bankrupt because of funding illiquidity. Funding illiquidity occurs when an institution runs out of cash and it cannot raise additional financing, even though it may have positive equity. LTCM and Amaranth were brought down by funding illiquidity: their positions had a positive mark-to-market value, but they were unable to meet margin calls. LTCM was the victim of a market-wide liquidity shock with systemic effects. The devaluation of the Russian rouble and Russia's default in August 1998 caused a sharp reduction in market-wide liquidity, an increase in risk aversion, and a flight to quality. Bond-trading desks and investors sold high-risk, illiquid securities and bought low-risk, liquid securities. The high degree of leverage employed by LTCM amplified its losses. Amaranth Advisors LLC was the victim of funding illiquidity that was specific to its trading strategy. An unexpected fall in the price of natural gas futures for delivery over the winter caused Amaranth to lose more than \$2 billion. When Amaranth could not meet its margin requirements, its positions were sold at fire-sale prices. While volatility in the natural gas market increased, other markets were relatively unaffected (King and Meier, 2007;8).

Reductions in market liquidity and increased volatility can transform a financial disturbance to a financial shock, if many participants hold similar or closely correlated positions (herding). (King and Meier, 2007;9) Evidence on hedge fund herding is mixed. Studies suggest that herding occurred during the 1992 exchange rate mechanism crisis, while studies of the 1997 Asian crisis indicate that hedge funds provided liquidity and took opposing positions in many markets, reducing volatility and mitigating the fall in asset prices. (Danielsson, Taylor, and Zigrand 2005;530).

One way to prevent a financial disturbance from becoming a financial shock is through adequate counterparty risk-management practices, which reduce the exposure of a financial intermediary in the event of default of its counterparties (King and Meier, 2007;9). Counterparty risk management systems are the first line of defense between unregulated hedge funds and regulated financial institutions. Counterparty risk management practices are designed to reduce counterparty credit risk in leveraged trading by providing a buffer against increased exposure to the dealer providing the financing or derivatives contract. This reduction in settlement risk in leveraged trading increases confidence and thereby promotes active financing of leveraged trading (Kambhu, Schuermann and Stiroh, 2007; 3) After the LTCM episode, risk managers at banks and securities houses formed the counterparty risk management policy group, which developed recommendations and diligently implemented them (Ferguson and Laster, 2007;52).

The ability of counterparties and other market participants to weather a financial disturbance or shock depends on the state of the economy and their balance sheets. The collapse of LTCM in 1998 followed a prolonged period of difficult economic and financial conditions, due to the Asian crisis and the Russian default. This period witnessed declining profits and a reduction of credit as lenders became more risk averse. By contrast, the collapse of Amaranth in 2006 occurred during benign economic and financial conditions. The risk of a systemic shock from the hedge fund sector is therefore greater when economic and financial conditions are worse (King and Meier, 2007;10).

REGULATORY APPROCHES

Identifying regulatory approaches is important to reduce the systemic risk. Regulatory approaches in systemic risk is classified into two groups: historical approaches and future approaches.

Historically, regulation of systemic risk has focused largely on preventing bank failure. For example, an insurance corporation is intended to prevent bank runs by alleviating fear that banks will default on deposit accounts. Also, capital adequacy requires banks to hold minimum levels of capital, a requirement intended to limit excessive risk taking and buffer against financial crisis. However, some economists argue that rules preventing bank failure can cause moral hazard. Banks may increase risk exposures and reduce their capital ratios, knowing that the safety net will protect against sudden runs. In addition, capital requirements can be imperfect. Constraining lending activities of banks can redirect funds to lenders whose constraints are not binding. Capital requirements also are said to undercut the ability of banks to build equity value (Schwartz, 2008; 211).

Future approaches is based on different concepts, such as averting panics, disclosure, financial exposure limits, reducing leverage, ensuring liquidity, ad hoc approaches, market discipline. Some of future approaches reduce the risk of systemic collapse, others mitigate the spread and consequences of systemic collapse.

Averting panics regulatory approach aims to eliminate the risk of systemic collapse. This goal could be achieved by preventing financial panics, since they are often the triggers that commence a chain of failures. Imposing regulation to help avert panics can facilitate the goal of stability. Regulation might place conditions on closing capital markets and provide liquidity to keep them open, thereby obviating the vicious cycle that would be triggered if one or more such markets stopped functioning (Schwartz, 2008;214).

Another potential approach is disclosure. Inadequate disclosure and transparency are to a very large extent rooted in the largely unregulated nature of hedge funds (Garbaravicius and Dierick, 2005:51). Disclosing risks traditionally has been viewed as the primary market-regulatory mechanism at least under U.S. securities laws. It works by reducing asymmetric information among market players, making the risks transparent to all. It therefore might seem that financial panics would be minimized in a world of perfect disclosure because investors would price-in all risks (Schwartz, 2008;218).

Another possible approach is financial exposure limits. Financial exposure limits would facilitate stability by diversifying risk, in effect by reducing the losses of any given contractual counterparty and thus the likelihood that such losses would cause the counterparty to fail. Such limits also might reduce the urgency, and hence the panic, that contractual counterparties feel about closing out their positions. This approach already applies to banks through lending limits, which restrict the amount of bank exposure to any given customer's risk (Schwartz, 2008; 222).

One problem that seems to be common among the financial risks associated with hedge funds is excess leverage. An un-leveraged hedge fund poses a risk only to investors, who can lose their invested capital. An un-leveraged hedge fund may not be practical for many funds, though, because leveraging can be an effective way to capitalize on interest-rate arbitrage. However, the more a fund is leveraged, the more volatile the risk becomes. Excessive leverage is a problem not only to hedge fund investors, but to banks as well, since the banks risk losing the credit they have extended if a hedge fund cannot pay (Brook, 2007:238). Reducing leverage is relevant to systemic risk insofar as it reduces the risk that a financial entity fails in the first place and also reduces the likelihood "that problems at one financial institution could be transmitted to other institutions. This approach is intended to reduce the risk and mitigate the spread and consequences of systemic collapse. Reducing leverage would also strongly facilitate the goal of stability (Schwartz, 2008; 223).

Liquidity is a problem for investors due in part to the investment styles of hedge funds. For instance, a spread arbitrage would fail, if investors withdrew funds prior to the contraction and during a margin call. Likewise, distressed debt investments require substantial time for returns to materialize given the slow nature of the bankruptcy process. Conversely, the same bankruptcy process also creates inefficiencies in the market and the subsequent premiums for investors. Liquidity could easily be resolved by creating a secondary over the counter market for tradable hedge fund securities (Cheng, 2002, 4). Ensuring liquidity could facilitate stability in two ways: by providing liquidity to prevent financial entities from defaulting, and by providing liquidity to capital markets as necessary to keep them functioning. There are at least two possible regulatory ways to ensure liquidity: creating a lender/market-maker of last resort, and imposing entity-level liquidity requirements (Schwartz, 2008; 225).

Ad hoc approaches can help to minimize the difficulties in measuring, and balancing, costs and benefits. The extent to which ad hoc regulatory responses to systemic risk facilitate stability. Furthermore, ad hoc approaches reduce moral-hazard cost (Schwartz, 2008; 230).

Market-imposed regulation is efficient insofar as it minimizes regulatory costs. Under a market discipline approach, the regulator's job is to ensure that market participants exercise the type of diligence that enables the market to work efficiently. This is often achieved by ensuring that market participants have access to adequate information about risks and by arranging incentives so those who influence an institution's behavior will suffer if that behavior generates losses (Schwartz, 2008; 231). In a market economy, strengthening market discipline is a natural approach to containing potential risk to financial stability resulting from the failure, or the collective behaviour, of hedge funds. Market imperfections such as incentive problems, market clout and information asymmetries may, however, weaken the market's ability to discipline the managers of hedge funds. An appropriate degree of transparency is an essential requirement for market discipline to be effective. Transparency helps the market players to make more efficient decisions because it improves the quality of information and reduces uncertainty (Weber, 2007; 166).

CONCLUSION

Systemic risk in one country inevitably will affect markets and institutions in other countries as finance and markets are globally interconnected. In addition, studies state that hedge funds can potentially pose a systemic risk in two ways; direct and indirectly. To mitigate the systemic risk, regulatory approaches can be used if they are appropriate. Regulatory solutions are universal or should be different for different countries. However, hedge funds play an important role in financial markets by providing liquidity and lowering volatility. They contribute to the elimination of market inefficiencies, and offer diversification benefits to investors. Moreover, their activities have contributed to the integration of financial markets. Therefore, the regulations about hedge funds shouldn't prevent hedge funds movements in a market place.

PRICE TRANSMISSION AND THE GLOBALIZATION OF STOCK MARKETS: EVIDENCE FROM FIVE COUNTRIES

Rui Menezes
ISCTE Business School, Portugal

ABSTRACT

This paper analyzes the stock market globalization on the basis of the price theory and the Law of One Price. This leads to the concept of market integration which, under the nonstationarity of price level variables, can be empirically tested by using cointegration techniques. An error correction model incorporating prices and returns is specified and empirically tested. The results show that the five stock markets under analysis are cointegrated and there is just one cointegrating vector that rules the long-run relationship between these markets. The Portuguese and Spanish stock markets are weakly exogenous while the remaining are endogenous in the context of our system. Market integration in the sense of the Law of One Price holds for the system as a whole but full price transmission is only accepted for the pairs Portugal-UK, UK-Japan and Japan-US, for which one can say that the Law of One Price also holds. The results, therefore, show that price movements between pairwise stock markets are highly nonlinear and complex.

INTRODUCTION

The contemporary world is dominated by the idea of globalization and there is evidence on this in many aspects of our lives. In some way, it seems clear that the world became much more interrelated and even much more uniform than it was in the past not so far. Of course, there still remain important exceptions but if we look at the western world we can see that differences between countries and markets are progressively mitigated.

Several studies conducted in the field of economics have shown that markets are nowadays much more integrated than they were in the past, both at the horizontal and vertical levels [1]. This is true, at least in Western Europe, for some commodity markets but it also seems to be applied to financial markets. How can we extend this notion to the stock markets? Many authors have studied the process of globalization of international stock markets and, invariably, they point to the conclusion that stock markets are highly “globalized” [2, 3, 4, 5, 6, 7]. This is intuitively appealing since it is well known that shocks occurred in major markets such as, for instance, the NYSE have a strong impact on the behavior of worldwide stock markets. However, it is quite surprising that many studies do not in general rely on a concrete definition of market globalization. They basically assess stock market globalization by observing the extent of correlation between markets but no theory lies behind these empirical tests [8, 9].

Bearing these caveats in mind, this paper analyses the process of stock market globalization on the basis of a theoretical framework derived from the price theory. A precise definition of market globalization based on the Law of One Price leads to a dynamic model specification where the long-run and the short-run effects can be clearly separated. This error correction mechanism uses daily prices and price changes for five stock market indexes over a period of ten years. The model specification is quite flexible and allows for different impacts of price and return movements across markets. For example, a change in the US market, the dominant market, may be transmitted in quite different manners to the remaining markets, in which case it is difficult to conclude that markets tend to uniformity. The process of market globalization is a complex one, and the nonlinear transmission of price movements may obscure the general idea of stock market globalization [10, 11].

Stock prices and returns are preferable to use in this context than just stock returns since the former retain the long-run information contained in the original data while the latter only capture the short-run information. However, some technical problems arise in this context because the nonstationary nature of price data may lead to spurious relationships. These problems are overcome if the price series are cointegrated in which case the error correction model provides an appropriate representation of the whole system [12, 13]. Additionally, formal tests both of proportionality and weak exogeneity can be performed on the basis of the error correction model. The former leads to tests of full linear price transmission. The latter allows one to test for market leadership.

GLOBALIZATION, MARKET INTEGRATION AND THE LAW OF ONE PRICE

Empirical analyses of market integration often rely on price data to inquire the extent and shape of asset price co-movements over time. The theoretical framework for many of these studies is based upon the price theory as well as precise definitions of market and market integration. A market can be defined as “the area within which the price of an asset tends to uniformity after allowing for different transportation costs” [14] or “differences in quality, marketing, etc” [15]. This definition relates the price evolution in the long-run, although deviations may occur in the short-run. It is, therefore, an equilibrium relationship or long-run trend. On the basis of this kind of relationship it is possible to test for correlation, causality or proportionality in order to verify the extent of market integration [16, 17]. Market integration, on the other hand, is one way to analyze the process of globalization, in particular economic globalization, which can be defined as the integration of national economies into the international economy through trade, foreign direct investment, capital flows, migration, the spread of technology, and so on.

If the definition of market based on the relationship between prices is straightforward to understand and model, the empirical estimation of such models can be complicated by technical problems whose resolution is far from trivial. Such difficulties arise because the vast majority of price series present a property that may result into spurious regressions if not appropriately accounted for: stochastic nonstationarity. As we shall see, this problem is overcome if the price series under analysis are cointegrated; however, if they are not, the results obtained from regressing nonstationary prices suffer from severe biases and the usual test statistics are no longer valid [18]. Of course, in the latter case and if the price variables are integrated of first order, one can always estimate a regression model based on the first price differences, that is, the price changes or returns, but then all the long-run information contained in the original price series is removed. In this case, regression tests of market integration based on the price theory (and thus economic globalization) cannot be carried out.

The market definition presented above incorporates one element that is crucial in our context, the issue of price uniformity, and it is precisely this issue that leads to the idea of market integration. Indeed, the markets for an asset or asset group are said to be integrated if the underlying prices move proportionally over time, that is, if the Law of One Price (LOP) holds. As noticed before, differences may occur due to different transportation costs, marketing costs, quality, and so on. This implies that, not only prices must be cointegrated (if nonstationary) but they must also be proportional over time. This law, described by Cassel [19] and other prominent economists such as Cournot and Marshall, can be regarded as a particular case of the following ADL(p, q) price relationship:

$$x_{1t} = \theta + \sum_{k=1}^p \rho_k x_{1,t-k} + \sum_{j=0}^q \beta_j x_{2,t-j} + v_t, \quad (1)$$

where x_{it} ($i = 1, 2$) denotes the relative prices (measured in logs) of asset i at time t , ρ_k captures the extent of autocorrelation in x_{1t} , β_j measures the relationship between prices (in levels and lags) and v_t is a white noise perturbation. A generalization of this relationship to more than two price variables is fairly trivial.

One can say that x_{2t} causes x_{1t} if the null hypothesis that all parameters β_j are simultaneously zero is rejected; notice that the relationship can be bidirectional. If there is just one unidirectional causal relationship, then one of the markets can effectively influence the other market prices, but the reverse is not true. If the null hypothesis is not rejected in both cases, then there is no causal relationship between the underlying prices and one can say that they do not belong to the same market space.

A test of the LOP based on (1) can be set up from the restriction:

$$\sum_{k=1}^p \rho_k + \sum_{j=0}^q \beta_j = 1, \quad (2)$$

where, under the null, one says that there is long-run market integration. If $\beta_0 = 1 \wedge \beta_j = \rho_k = 0, \forall k, j > 0$, there occurs instantaneous market integration and expression (1) reduces to a static or contemporaneous model with no lagged effects [20, 21].

If the null hypotheses of no causal relationship and market integration are rejected, the variables are nonlinearly related and the sum of ρ_k and β_j captures the degree of nonlinearity between them. It is important to note that (1)

comes out from a multiplicative model of the original (no logarithmic) price variables and, under the estimated solution of the model, the price function is homogeneous where $m^{\Sigma \rho + \Sigma \beta}$ is the multiplicative factor of $\exp(x_{1t})$ when $\exp(x_{2t})$ is multiplied by m .

The $\exp(\theta)$ parameter measures the intertemporal relationship between prices and is, in our case, a constant. It has a direct economic interpretation when there is market integration and the LOP holds. In the case of the estimated static model, if $\theta = 0$, prices are alike. If $\theta \neq 0$, prices move proportionally but may differ due to different transportation costs, quality, etc. The first case is known as the strong version of the LOP and the second case is the corresponding weak version [22].

Although the LOP has been mainly used in studies of market integration for food products and other commodities, it provides an adequate framework for studying financial market integration as well, in particular studies involving stock market comparisons as is our case. In finance, the LOP is frequently described in the context of the Arbitrage Pricing Theory [23] in terms of price equality independently of the means used to create the underlying asset and it can be said that the LOP and the Purchasing Power Parity (PPP) are equivalent concepts. In particular, the notion of absolute PPP is equivalent to the strong version of the LOP whereas the relative PPP is equivalent to the weak version of the LOP.

Under the PPP conditions, model (1) can be estimated using data converted to the same currency. In our case all data were converted to Euros. As noticed before, if all lagged relationships are non-significant we have the following long-run equilibrium model (attractor):

$$v_t = x_{1t} - \theta - \beta_0 x_{2t}. \quad (3)$$

A test of the LOP using (3) can be carried out under the null hypothesis that $\beta = (1, -\theta, -1)$, where β is the vector of right-hand side parameter estimates of the model, normalized to x_{1t} and β_0 is the elasticity of price transmission. Recall that if $\theta \neq 0$, the weak version of the LOP holds; otherwise one faces the strong version of the LOP.

NONSTATIONARITY AND COINTEGRATION

Estimation of (3) is straightforward if the variables in the model are stationary and there is no residual autocorrelation, since the OLS estimates converge asymptotically to the true values of the parameters. In the latter case the problem is overcome using an adequate ADL specification such as (1). However, in the case of nonstationary variables, the solution is not as simple as that. It is, therefore, important to know the stationarity properties of x_{it} before proceeding to the estimation of any regression model linking them. In general, a stochastic time series is said to be strictly stationary if its joint probability distribution is invariant over time. This means that one needs to analyze all the moments of the joint probability distribution which is impossible or, at least, cumbersome in many cases. Alternatively, the second order properties of the distribution are a sufficient characterization of the joint probability distribution in the case of the multivariate normal distribution. Stationarity of x_{it} under these conditions is known as weak (or covariance) stationarity, where:

$$\begin{aligned} E(x_{it}) &= \mu & \forall t = 1, K, T \\ Cov(x_{it}, x_{i,t-k}) &= \gamma_k & \forall t = 1, K, T \wedge k = 0, 1, 2, K \end{aligned} \quad (4)$$

There are two basic cases where one can say that a time series exhibits nonstationarity: (1) the trend stationary process (TSP) and (2) the difference stationary process (DSP). If the process is a TSP, the nonstationary component can be explicitly modeled by a deterministic term of the type $\mu_0 + \mu_1 t$ (or any other deterministic function of time), where μ_0 and μ_1 are parameters and t measures time. On the other hand, if it is a DSP, stationarity can only be induced by differencing the original time series as much as required to obtain stationarity. The random walk and the random walk with drift belong to this latter class of stochastic models. In practice, however, it is quite common to find situations where a process combines both types of nonstationarity.

Stochastic nonstationarity can be examined on the basis of unit root tests, of which the most popular is the Augmented Dickey-Fuller or ADF test [24, 25]. The ADF test, also known as τ test, is based on the following regression model:

$$\Delta x_{it} = \mu_0 + \mu_1 t + (\rho - 1)x_{i,t-1} + \sum_{k=1}^p \gamma_k \Delta x_{i,t-k} + \varepsilon_t, \quad (5)$$

where μ_0 is a constant term, $\mu_1 t$ is a linear deterministic trend in the data, $(\rho - 1)x_{i,t-1}$ denotes the corresponding stochastic trend and the residuals $\varepsilon_t \sim \text{iid}(0, \sigma_\varepsilon^2)$. The symbol Δ denotes a first difference, as usual, and the summation term captures any autocorrelation of the left-hand side variable. Taking $\mu_1 = \gamma_k = 0$, the ADF equation reduces to an AR(1) process. The null hypothesis in the ADF test is $\rho = 1$, using for the effect the MacKinnon [26, 27] critical values.

The distribution of the ADF test under the null hypothesis is given by [28]:

$$t_{\rho} \underset{(H_0)}{\sim} \frac{W^2(1) - 1}{2\sqrt{\int_0^1 W^2(s) ds}}, \quad (6)$$

where $W(s)$ represents a Brownian Motion over $[0, 1]$. Under the null hypothesis the variable is nonstationary, *i.e.*, it contains a stochastic trend. The alternative hypothesis postulates that $|\rho| < 1$ under which the variable is stationary. In fact, under the alternative hypothesis the time series is a stationary AR($p+1$) process with or without deterministic terms.

Despite their popularity, the ADF tests suffer from low power problems when the process is stationary with roots close to one [29]. Additionally, some unit root processes behave more like a white noise than like a random walk in finite samples. For this reason, it is convenient to use alternative tests in order to conclude more accurately about the stationary nature of the series under analysis. An alternative to the ADF test is the KPSS [30], which postulates as the null hypothesis that the time series is trend stationary, against the alternative that it contains a stochastic trend. Many other unit root or stationarity tests have been proposed in the literature (see, *e.g.*, Phillips-Perron - PP [31], Elliott, Rothenberg and Stock - Point Optimal [32], Elliott, Rothenberg and Stock - DFGLS [32], Ng and Perron - NP [33]). For the purposes of this paper, however, the ADF and the KPSS tests will suffice.

The data generation process of the KPSS test is given by:

$$\begin{aligned} x_{it} &= \mu t + z_t + u_t \\ z_t &= z_{t-1} + \varepsilon_t \end{aligned}, \quad (7)$$

where x_{it} is the sum of a deterministic trend (μt), a random walk (z_t) and a stationary residual variable (u_t) and where $\varepsilon_t \sim \text{iid}(0, \sigma_\varepsilon^2)$. The null hypothesis of stationarity is given by $\sigma_\varepsilon^2 = 0$, where the initial value z_0 is a constant. Given that u_t is a stationary residual variable, then x_{it} is a TSP. Indeed, given the null hypothesis $\sigma_\varepsilon^2 = 0$, the residuals ε_t must all be zero and, therefore, $z_t = z_{t-1}, \forall t$, which is a constant. Thus, under the null hypothesis, the first equation in (7) represents a trend stationary process. The test statistic of the KPSS is a Lagrange Multiplier where the numerator is the sum of squared residuals obtained from regressing x_{it} on a constant and a deterministic trend and the denominator is an estimator of the variance of the residuals u_t .

Most economic and financial time series that are stochastically nonstationary are also integrated of first order, that is, differencing once is enough to achieve stationarity. It is the case of the vast majority of stock market price series and indexes. Suppose, for instance, that one is interested in the long-run properties that rule the relationship between two or more first-order integrated price series. In this case, one needs to focus the analysis on the variables measured in levels. However, a linear combination of first-order integrated variables usually generates a residual variable that is also first-order integrated. Under these circumstances, the usual t and F tests carried out on the OLS estimates do not follow, respectively, the t and F distributions and are, thus, meaningless [34]. What the model is most possibly capturing is a common stochastic trend between the variables in levels and not a causal relationship as required. Additionally, the residuals are strongly autocorrelated and the Durbin-Watson statistic converges to zero. Thus, the time series being analyzed are not related in the long-run although they may be related in the short-run, as is the case of the relationship between two random walks.

The random walk process is deeply rooted in the financial literature, in particular in what refers to stock markets. This model is on the basis of the Efficient Market Hypothesis developed by Fama [35, 36] and Fama and French

[37, 38, 39]. The basic idea underlying this theory is that returns (or price changes) can be adequately represented by non predictable fluctuations around a certain mean return, that is, the returns distribution at time t is uncorrelated with (and possibly independent of) the returns distribution at any other moment in time. Under these circumstances, the residuals are white noise and no investor can make abnormal profits from any type of speculative activity; that is, the best prediction for the price of an asset today is the price it had yesterday.

Albeit in general a linear combination of nonstationary variables generates residuals that are also nonstationary, there is a special case where the residuals thus obtained are stationary. This is the case when the variables in the model are said to be cointegrated [12]. In this case, the OLS estimator of β_0 in (3) is super-consistent, converging to its actual value more quickly than if the variables were stationary [40]. Under these circumstances, the usual t and F statistics remain valid for testing hypothesis about the parameters. One simple way to test for cointegration is to regress x_{it} on x_{jt} ($i \neq j$) and then analyze whether the resulting residuals are stationary. Note that if the variables are cointegrated then $\beta_0 \neq 0$ and the cointegration test can be interpreted in terms of market integration. However, which variable should be considered as endogenous and which should be considered as exogenous? Isn't it possible that they are both endogenous and thus exert a mutual influence? In this case biases may occur due to endogeneity [41] and a multi-equation model would be preferable to use instead of the single equation model given in (3). Furthermore, since the dynamic terms are omitted in model (3), one would expect that the residuals v_t are autocorrelated.

An alternative to the single equation models presented in (1) and (3) is based on the specification of a Vector Autoregression (VAR) of the type:

$$\mathbf{x}_t = \sum_{k=1}^p \mathbf{A}_k \mathbf{x}_{t-k} + \boldsymbol{\mu} + \boldsymbol{\varepsilon}_t, \quad (8)$$

where \mathbf{x}_t is an i -dimension vector of nonstationary endogenous variables, given in levels, and representing, for instance, the natural logarithms of relative asset prices (*e.g.*, stock indexes). The \mathbf{A}_k denote p i -order matrices of parameters where each of them is associated with an i -dimension vector of lagged endogenous variables up to order p , $\boldsymbol{\mu}$ is an i -dimension vector of constants and $\boldsymbol{\varepsilon}_t$ denotes an i -dimension vector of residuals where $\boldsymbol{\varepsilon}_t \sim \text{iid}(\mathbf{0}, \boldsymbol{\Omega})$. The covariance matrix $\boldsymbol{\Omega}$ is definite positive and the residuals $\boldsymbol{\varepsilon}_t$ are not serially correlated since the dynamic process linking the data is explicitly specified in the model, although they may be contemporaneously correlated.

The VAR system given in (8) can be represented in the Error Correction form [42], known in the literature as the Vector Error Correction (VEC) model and given by:

$$\Delta \mathbf{x}_t = \boldsymbol{\Pi} \mathbf{x}_{t-1} + \sum_{k=1}^{p-1} \boldsymbol{\Gamma}_k \Delta \mathbf{x}_{t-k} + \boldsymbol{\mu} + \boldsymbol{\varepsilon}_t, \quad (9)$$

where $\boldsymbol{\Pi} = \sum_{k=1}^p \mathbf{A}_k - \mathbf{I}$ and $\boldsymbol{\Gamma}_k = -\sum_{j=k+1}^p \mathbf{A}_j$. The remaining symbols are as previously defined. This system specification contains information about the short-run and the long-run adjustment parameters through the estimates $\hat{\boldsymbol{\Gamma}}_k$ and $\hat{\boldsymbol{\Pi}}$, respectively.

The possibility of using the VEC model in the context of cointegration is guaranteed by what is known in the literature as the *Granger Representation Theorem*, which states that “if there exists a dynamic linear model with stationary perturbations and the data are first-order integrated, then the variables are cointegrated of order $\text{CI}(1, 1)$ ”. A generalization of this statement says that “if there exists a $\boldsymbol{\beta}$ matrix such that the residuals generated by regressing the data are $\text{I}(d-b)$, being the data $\text{I}(d)$, with $d \geq b$, then the variables are cointegrated of order $\text{CI}(d, b)$ ”.

If $\mathbf{x}_t \sim \text{I}(1)$, then $\Delta \mathbf{x}_t \sim \text{I}(0)$ and $\boldsymbol{\Gamma}_k \Delta \mathbf{x}_{t-k} \sim \text{I}(0)$. The term $\boldsymbol{\Pi} \mathbf{x}_{t-1}$ is a linear combination of $\text{I}(1)$ variables which in turn is $\text{I}(0)$ under the assumption of cointegration. Matrix $\boldsymbol{\Pi}$ can be factorized as $\boldsymbol{\Pi} = \boldsymbol{\alpha} \boldsymbol{\beta}'$, where $\boldsymbol{\alpha}$ represents the speed of adjustment to equilibrium and $\boldsymbol{\beta}$ is the matrix of long-run coefficients, that is, the cointegrating vectors. This is true when there are r cointegrating vectors (with $0 < r < i$) representing the error correction mechanism in the VEC system. Once obtained the cointegrating relationships and the matrices $\boldsymbol{\alpha}$ and $\boldsymbol{\beta}$ are estimated, the VEC can be fully estimated incorporating those vectors.

The VEC model represented in (9) can be interpreted as a relationship between prices and returns in a given market. What it says is that the current returns or price changes are a linear function of previous returns or price changes and historical prices. Such historical prices form a long-run or equilibrium relationship, where the involved variables co-move over time independently of the existence of stochastic trends in each of them, so that their difference is stable. The long-run residuals measure the distance of the system to equilibrium at each moment t , which may be due to the impossibility of the economic agents to adjust instantaneously to new information or to the short-run dynamics also present in the data. There is, therefore, a whole complex adjustment process involving short-run and long-run dynamics when the variables are cointegrated.

For a set of variables to be cointegrated is necessary that there is at least one cointegrating vector in the system. However, the matrix Π cannot be regular since in this case all vectors contained in Π are linearly independent. Thus, if $r = i$, \mathbf{x}_t is a vector of stationary variables. If $r = 0$, then $\Pi = \mathbf{0}$ and the variables in \mathbf{x}_t are not cointegrated since there is none cointegrating vector or a long-run relationship linking the variables in levels. In this case, current returns or price changes are only a function of previous returns or price changes; prices play no role in the overall system and long-run predictions cannot be made. Finally, cointegration exists when $0 < r < i$ where r is the rank of Π and indicates how many long-run relationships exist in the system.

Johansen [43, 44] proposed two tests for the null hypothesis that the cointegrating rank is, at most, r (less than i): the trace test and the maximum eigenvalue test. In the former, the alternative hypothesis postulates that the rank is i and, in the latter H_1 postulates that the rank is $r+1$. This method is adequate to resolve the above mentioned problem of endogeneity bias, since no prior assumption has to be made about the exogeneity of any variable in \mathbf{x}_t [43, 44, 45]. Additionally, Gonzalo [46] concluded that the Johansen tests are more powerful than the former single equation Engle-Granger tests.

DATA AND RESULTS

The data set used in our empirical modeling consists of five daily stock price series representing several markets in the world: Portugal, Spain, UK, Japan and US. The data are the natural logarithms of the relative indexes for these markets, where the base 100 was set at January, 4th 1999. All the series were converted to Euros using the adequate exchange rates. The series were collected in the Datastream database and cover the period from January, 4th 1999 to January, 21st 2009, with a total of 2623 daily observations (five days per week). Exhibit 1 shows a graphical representation of the five series in log levels over the period analyzed:

EXHIBIT 1. TIME SERIES OF FIVE STOCK MARKET INDEXES IN LOG-LEVELS

Source: Datastream

These five markets were chosen in order to have a representation of some worldwide leading economies (US, UK and Japan) and also some smaller and apparently more dependent economies but with moderately mature stock markets (Spain and Portugal). It is remarkable how similar the graphical behavior looks over time for these

five stock market indexes, although one should note some differences in the shape of the histograms presented on the left hand-side of the graphic. The series, roughly, exhibit two local maxima, one around 2000 and the other in 2007, and two local minima, one in 2002/03 and the other in 2008/09, the latter corresponding to the recent financial crisis. Substantial variation occurs within the period analyzed. Notice that all series are flatter than the Gaussian distribution and slightly skewed, therefore the J-B test statistic rejects the null hypothesis of normality for all of them. This is typical of stock market price series as well as leptokurtosis and fat tails is usually observed in returns data. In the next step, one should look at the stationarity nature of the series under analysis.

Unit root and stationarity tests in levels and in first differences for all the series were carried on and the results (not reported here) show that all series are $I(1)$ at the 1% level. Therefore, the analysis of stock market integration has to be conducted in the environment of cointegration and the method of Johansen will be used. Recall that the Johansen cointegration tests are more powerful than the EG tests under the assumption of endogeneity of the system variables. In this study there is no prior reason to assume exogeneity of any variable, and this property can be tested on the basis of the VEC estimates. The Johansen test statistics are presented in Table 1:

TABLE 1. JOHANSEN COINTEGRATION TESTS

Rank	Eigenvalue	Trace Statistic ^a	Max. Eigenvalue Statistic ^a
$r = 0$	0.016963	95.07805 *	44.73770 **
$r \leq 1$	0.008803	50.34035	23.12232
$r \leq 2$	0.007378	27.21803	19.36479
$r \leq 3$	0.002557	7.853236	6.695686
$r \leq 4$	0.000443	1.157550	1.157550

Notes: ^a MacKinnon-Haug-Michelis [48] p -values. Exogenous terms in CE: constant and linear deterministic trend. 7 lags in the endogenous variables. 2615 observations. ** significant at 1%. * significant at 5%.

The results indicate that there is one cointegrating vector since the null hypothesis that $r = 0$ is rejected at 1% in the maximum eigenvalue test and at 5% in the trace test but the null $r \leq 1$ is not rejected at standard levels. Autocorrelation was controlled for while computing the trace and maximum eigenvalue test statistics. To this end a dynamic VEC specification with seven lags was employed. A Portmanteau test for the null hypothesis of no residual autocorrelation up to lag p does not reject the null for $p = 8$ (the Q-Stat. is 34.153 with a p -value of 0.1047, $df = 25$).

The finding of just one cointegrating vector is consistent with the idea that there is only one single long-run mechanism that governs the relationships between stock markets around the world. This is in line with the idea of stock market globalization, although pairwise relationships may vary greatly across markets. In fact, these results show that the first condition for testing market integration on the light of the LOP is satisfied. The second condition, *i.e.*, proportionality or full price transmission will be analyzed below. For the moment, however, it is sufficient to know that the five stock markets under analysis do appear to belong to the same market space over the period analyzed. On the light of the above cointegration tests and under the Granger Representation Theorem it is possible to specify a VEC model with the guarantee that the residuals are stationary as required for inference purposes. Under these circumstances, the parameter estimates can be computed as usual and the t and F statistics can be used for testing purposes in the same way as in the case of a stationary OLS or ML model. The VEC model allows for testing parameter restrictions on the Π -matrix vectors α and β that contain the long-run system information. A test of the null of $\square_{i1} = 0$ allows for assessing whether the dependent variable in row i of the system is exogenous. If the null hypothesis is rejected one says that the underlying variable is endogenous. The results for this test, along with the α estimates and the corresponding standard errors, are displayed in Table 2. The test $H_0: \square_{i1} = 0$ follows a χ^2 distribution with one degree of freedom.

TABLE 2. WEAK EXOGENEITY TESTS FOR MULTIVARIATE SYSTEMS

Variable	$\chi^2(1)$	p -value	α	Std. error
Portugal	2.007758	0.156496	-0.004062	0.00234
Spain	0.219459	0.639453	0.001647	0.00294
UK	4.082357	0.043333	-0.007065	0.00306 *
Japan	16.28954	0.000054	-0.016888	0.00339 **
US	3.706678	0.054195	-0.009506	0.00368 *

Notes: $H_0: \square_{i1} = 0$. Exogenous terms in CE: constant and linear deterministic trend. 7 lags in the endogenous variables. 2615 observations. ** significant at 1%. * significant at 5%.

The results show that, in the five country system, the smallest economies (Portugal and Spain) are weakly exogenous while the biggest ones (UK, Japan and US) are endogenous. Endogeneity appears to be stronger in the case of Japan ($p < 0.01$) than in the case of UK ($p = 0.0433$) and US ($p = 0.0542$), (results not reported here).

The interpretation of the weak exogeneity results for Portugal and Spain should be made with some caution since it does not exactly mean that these markets are not influenced by shocks that occur in other markets. Indeed, the Granger causality tests for Portugal indicate that the null that i does not Granger cause j , where j represents Portugal, is rejected at 1% for the UK and the US and at 5% for Japan. With regard to Spain, the null hypothesis is rejected at 1% for Portugal and the US and at 5% for the UK. Thus, since the weak exogeneity tests are carried out on the α coefficients, which measure the speed of adjustment to long-run equilibrium, the results in Table 2 are only saying that Portugal and Spain do not react in the long-run to shocks occurred in the system, although substantial adjustment will occur in the short-run given major shocks that may hit the stock markets in the system.

From the above mentioned results it appears that there is a group of major countries (UK, Japan and US) whose stock markets react to shocks both in the long-run and in the short-run, thus adjusting to re-attain equilibrium, and there is another group of smaller countries (Portugal and Spain) that only react to shocks in the short-run. That is, the former react to price and returns changes while the latter only react to returns changes. Altogether, there is a significant influence of all these markets in the global system. In the case of the UK, the adjustment speed is about 0.7% per working day, thus taking about 6.4 months to re-attain long-run equilibrium. The US adjusts faster to shocks in the system: 1% per each working day or about 4.8 months to re-attain long-run equilibrium. Finally, Japan exhibits the fastest adjustment speed of all of them: 1.7% per working day or about 2.7 months to re-attain long-run equilibrium.

One may now proceed to the analysis of proportionality between market prices and returns in order to investigate whether the LOP holds for the system as a whole and/or for some of these markets bilaterally. The first step considers the VAR estimates of the five country system in order to investigate whether there is long-run market integration. This test utilizes the sum of the VAR estimates for each equation in the system as described in Section 2 (see model 2), where the null hypothesis is $H_0: \sum_{h=1}^p a_{ih} = 1$ ($a_{ih} \in \mathbf{A}_k$, $k = 1, \dots, p$). The results are presented in Table 3:

TABLE 3. LONG-RUN MARKET INTEGRATION TESTS FOR MULTIVARIATE SYSTEMS

Variable	$\sum a_{ih}$	Std. error	β	Std. error	
Portugal	0.999066	0.96230	1.00000	-	
Spain	0.995712	1.21343	-1.861809	0.18025	**
UK	0.997853	1.25962	0.689695	0.31225	*
Japan	0.999824	1.39904	0.174494	0.11568	
US	0.994839	1.51325	-0.047349	0.26401	

Notes: $H_0: \sum a_{ih} = 1$. Exogenous terms: constant. 7 lags in the endogenous variables. 2616 observations. ** significant at 1%. * significant at 5%.

The null hypothesis is not rejected in any equation of the VAR, indicating that long-run market integration occurs in this system. These results can be further confirmed using the long-run VEC estimates. The null hypothesis in this test postulates that $\alpha_{11} = 1$ and $\sum_{k=2}^5 \beta_{1k} = -1$. The test statistic is $\chi^2(1) = 0.192777$ ($p = 0.660615$) and therefore the null is not rejected. The estimated α coefficients are reported in Table 3 along with the corresponding standard errors.

While being important to determine whether market integration occurs for the system as a whole, it is also important to know if shocks to the system propagate uniformly over the five markets in analysis. To this end, bivariate market integration tests must be conducted. The results of these tests are displayed in Table 4.

TABLE 4. LONG-RUN MARKET INTEGRATION TESTS FOR BIVARIATE SYSTEMS

Variable 1 (\square_{1j})	Variable 2 (\square_{1k})	$\chi^2(1)$	p -value
Portugal	Spain	14.67241	0.000128 **
Portugal	UK	0.395354	0.529498
Portugal	Japan	5.348930	0.020735 *
Portugal	US	4.176506	0.040988 *
Spain	UK	8.056931	0.004533 **
Spain	Japan	15.94533	0.000065 **
Spain	US	14.96671	0.000109 **
UK	Japan	2.095258	0.147757
UK	US	7.320365	0.006818 **
Japan	US	0.186013	0.666256

Notes: $H_0: \square_{1j} = 1, \square_{1k} = -1 (j \neq k)$. Exogenous terms in CE: constant and linear deterministic trend. 7 lags in the endogenous variables. 2615 observations after adjustments. ** significant at 1%.

The test statistic follows a χ^2 distribution with one degree of freedom. The null hypothesis in this test indicates proportionality or full price transmission. If the null hypothesis is not rejected then market j and market k are integrated in the long-run, *i.e.*, price transmission in these markets is proportional over time. The null hypothesis is rejected in all cases except for Portugal-UK, UK-Japan and Japan-US, where the LOP holds in the relationship between these markets. For the remaining cases it was found that, in terms of pairwise relationships, although the underlying markets belong to the same market space, they are not related in a linear way. Such relationships are, therefore, much more complex and certainly some type of nonlinear relationship links the markets in the global world.

CONCLUSIONS

This paper investigates stock market integration in the context of the global economy using a theoretical framework based on price theory and the Law of One Price. The empirical modeling of market integration is complicated by the nonstationary nature of price data. A structure based on multivariate cointegration provides the right setting for such analysis, which involves the specification of a dynamic VEC model of prices and returns.

The results show that the five stock markets analyzed do belong to the same market space and long-run market integration occurs in the system but the evidence on proportionality of pairwise price transmission is limited. It seems, therefore, that pairwise market integration in this context contains several elements that point to nonlinearities or other types of complexities that drive the behavior of the markets or their agents and move them away from homogeneous linear price transmission. Thus, pairwise nonlinear movements must be examined in a different atmosphere. Future work should look into the possibility of non-exogeneity of the exchange rates used to convert stock indexes to a single currency and on the nonlinearities in the transmission process of shocks from one market to another.

CRITERIA FOR OFFSHORING DECISIONS IN EMERGING ECONOMIES

Fabienne Fel

ESDES, IAE Lyon3, France

ABSTRACT

The purpose of our study is to investigate which criteria are taken into account in offshoring decisions towards emerging countries: the review of literature shows that there are two different approaches. On one hand, the quantitative approach focuses on financial analyze, using NPV calculation. On the other hand, managerial literature underlines necessity to take into account strategic, practical and cultural features, related to identified target countries. So, we decided to adopt a global approach, linking both financial and managerial analysis. We conducted a qualitative study among five multinational firms, which invested in factories or services in emerging countries. Data were collected through in-depth face-to-face interviews with top managers involved in these offshoring decisions. Our results show that the choice between emerging countries is not based on the quantitative approach, because the choice between offshoring countries lies on strategic reasons, as market potential. However, the quantitative approach is a useful guideline to make choice between entry modes once the country's choice has been made. At last, our results show that international firms with large offshoring experience have developed a real methodology in order to analyze and to prevent risks related to offshoring towards emerging countries.

Keywords : *Strategy; emerging markets; production offshoring; valuation; risks.*

INTRODUCTION

The purpose of the present paper is to investigate which criteria are taken into account in offshoring decisions: since the 1980s, lots of western firms of all sizes are offshoring their production, particularly towards emerging countries, in order to reduce costs and, more recently, to get access to new markets in fast-growing countries. But recent papers (Kinkel and Maloca, 2009) enhance failure cases, leading to backshoring. In these cases, risks related to “long physical and mental distances” –as lack of flexibility in the supply chain, or cultural differences, for instance- were underestimated.

This research studies the criteria usually used by firms not only to choose whether they should offshore their production (or part of it), but also to choose between emerging countries. Conceptual approaches either focus on financial or managerial analyses; the originality of our study is to show not only that they cannot be separated but also they are often linked to each other.

The article proceeds in the following way: after defining the concept of “offshoring”, we review the literature dealing with both financial and non financial opportunities and risks of offshoring, in order to determine all potential criteria of an offshoring decision. In a second part, we define our research methodology. Third, we provide the main findings and conclusions of our research, and present its limits.

LITERATURE REVIEW

According with Jahns and al. (2006), the term “offshoring” is seldom explicitly defined in the literature; in some cases, it includes offshore buying. For instance, Kinkel and Maloca (2009) define “offshoring of production capacities as relocation of parts of production to own locations abroad as well as to foreign suppliers”. A bit differently, we focus in our paper on direct investments in emerging countries, and consequently “offshoring” will refer to “foreign relocation of firms’ plants”.

Our literature review proceeds in the following way: first, we analyze potential benefits of offshoring operations. In a second part, we study risks linked to offshoring. Then, we discuss the literature regarding the decision process when offshoring, and particularly the way risks are effectively taken into account by top managers.

Potential benefits of Offshoring

A large number of studies deal with the motives for offshoring production activities, particularly towards low-wages countries (Farell, 2004, 2005). Kinkel and al (Kinkel and al., 2009) underline that there were two major waves in this literature: the first one is quite old (Vernon, 1966; Dunning, 1980, 1988), and focuses on the differences between capital-intensive activities and labour-intensive activities. As differences between countries are more important for labour costs than for capital costs, these authors think that offshoring is particularly interesting for labour-intensive companies, which may be relocated in low cost countries, whereas there is no real interest in relocating capital-intensive abroad. The second wave of literature regarding offshoring is more recent (Aron and Singh, 2005; Doh, 2005, Farell, 2004, 2005), and is related with the growing interest of firms of all sizes (including SMEs) and of all sectors for offshoring: in the past, offshoring was the concern of big industrial firms for production activities only; nowadays, many SMEs are following the biggest ones, and big industrial firms relocate non-industrial activities, such as R&D; on the same way, some labour-intensive services (as call centers or software production, for instance), are also relocating some units abroad.

The first reason for offshoring is often the expectation of reduced costs (Chan & al., 1995), which has led to many studies; strong differences between wages can induce important savings, particularly for labour-intensive activities, as said before. A Deloitte study about Global Offshoring (Abramovich, 2005) shows that the return on offshoring investment is higher when the first investment is high, and that it is necessary to have a large offshoring policy to maximize savings and profits.

Furthermore, savings are not only linked to production costs, but, in some cases, to logistic costs too: as the demand in emerging countries increases, local production allows logistic savings by reducing transportation distances and consequently transportation costs.

But savings are not the only motive for offshoring: since the 1990s, because of all the new emerging markets, researches point out that offshoring leads to other important benefits (MacCarthy and al, 2003; Kinkel and Maloca, 2009): in particular, offshoring makes it easier for firms to get access to new markets, access to foreign distribution channels, and, in some cases, access to raw materials too.

In the past, offshoring was used for producing parts or goods, which were then re-imported in western countries, where they were consumed. In some cases, offshoring could be the only way to get an access to interesting markets located in “closed” countries, with which no international trade was allowed, as Argentina or Brazil (Lopez and al, 2009).

But nowadays, lots of countries have emerged, and international trade barriers have fallen (as with China or countries belonging to the soviet area before the wall’s fall, for instance). Trade is free, and emerging economies are often fast growing markets, with an increasing demand of new customers, when western markets are mature and slow growing. So far, western companies are interested in these countries, and get an easier access to these markets when they produce locally and can use local distribution channels.

Despite these evolutions, Kinkel and Maloca (2009), who analyzed motives of German firms for offshoring during the 10 last years, conclude that these motives did not change during this period: the first motive is “the reduction of personnel costs”, and only clearly behind, search for extended capacity, opening up of new markets abroad, key’s customers’ wish for production near their area, and then taxes and subsidiaries. So, according to them, we phrase our first hypothesis to analyze the actual motives for offshoring:

H1: despite demand is increasing in emerging countries, the first motive for offshoring is still production costs reduction.

Risks related to Offshoring

At the same time, studies underline risks related to offshoring. According to Farrell (2006), risks -or criteria to be examined before an offshoring decision- can be ranged into the following categories:

- Costs :
 - Labor costs: risks are these of unexpected expenses due to lower productivity abroad, or to quality failures (Berger, 2006), which increase the production price. Knudsen and Servais (Knudsen and Servais, 2007) identify reduced quality of the final product as the most important risk for offshoring.

According to them, Kinkel and Maloca (2009) underline that preventing risks of poor quality leads to “unexpected expenses for quality securing measures, quality control and coordination costs for the foreign locations in order to guarantee the necessary product and process quality”.

- Supply chain costs: considering that offshoring means a longer supply chain when re-importing, some studies point out risks related to disruption or delays in delivery of goods (Moatti, 2009): the length of transportation can induce stock outages; in order to avoid these risks, many firms increase their stock level, which induce other costs. For Jahns and al. (2009), international networking leads to “massive economic damage” for the company when supply chain is not under control.
- Availability of qualified skills, both for workers and management (Fillis, 2001)
- Quality of infrastructure, which is important for two different reasons: first, parts or goods produced abroad have to be transported on an efficient way and at a reasonable cost, which is possible only when transportation infrastructures are correct. Second, coordination needs between the holding and its foreign factories lead to numerous travels of western top managers, and localization of foreign units near international airports enables costs and time savings.
- Market potential, which has to be well-estimated when the purpose of offshoring is to sell on local market.
- Risk profile, including natural and political risks of disruptive events, as well as intellectual-property risk,
- Environment, including government support, business environment, local culture.

Criteria for the offshoring decision

Financial criteria

According to the financial approach, the profitability of future foreign investments is normally based on the NPV calculation (Net Present Value). Should cash flows generated by the future investments be higher than the initial investment, then the NPV would be positive and consequently the project regarded as profitable (Eitman, 2004). But the NPV calculation is based on two essential variables, the anticipated cash flows and the discount rate. Then the limits of this analysis – if exclusively financial - arise. How can cash flows based on market studies be relevant? How can the discount rate used be relevant? A low rate based on under estimated risks will make many projects profitable whereas a rate based on over estimated risks would condemn all of all them. Moreover, managers decide on the basis of their cost perceptions, and these perceptions are based on past experiences. So, firms’ ability to estimate these costs is linked in their international experience (Eriksson and al, 1997).

H2 : As the purpose for offshoring is to make profits (by lowering costs, or increasing margin and turnover):

** NPV calculation is the first step in the offshoring decision process, leading to the choice of the country where to invest.*

** NPV calculation is the first criteria to be taken into account when choosing between different entry modes (Greenfield, joint-venture, acquisition or buyout) only once the country has been selected.*

Non financial criteria and risks

As said before, many risks and opportunities have to be taken into account when offshoring, to limit the risks of failure (Lewin and Peeters, 2006). Lots of them are very difficult to anticipate, and many studies conclude that top management does not pay sufficient attention to them when choosing between different locations (van Eenemaam and Brouthers, 1996; Kinkel, 2004). For Ellis (2000), location decisions are influenced by existing interpersonal links rather than by systematically collected research, because of the difficulty of getting complete information about far and unknown countries. As a consequence, some companies do not earn as much money as they planned to (Song and al, 2007), because of unexpected expenses. Firms globally invest in emerging economics for strategic reasons, without measuring all risks -either financial or non financial- linked to the operation. One the first motives is the imitation of other firms in the same sector, which seems a sort of guaranty. Risks related to the supply chain’s robustness are particularly ignored or underestimated, which induces unexpected costs; in some cases, offshoring operations are given up, and capacities are transferred back to the domestic location, or to a nearer region than the first location, what Kinkel and Maloca call “backshoring” (2009). For these authors, who tried to put a figure to this phenomenon, “within 4-5 years every fourth to sixth offshoring activity is countered by a backshoring activity”, which seems quite important.

H3: Top management often does not pay attention enough to risks related to offshoring, what leads to unexpected expenses, and decreases the potential profits of the operation.

However, as companies progress by learning or imitation ((Henisz and Delios, 2001), it seems that firms with large offshoring experience are more able to appreciate risks than other firms.

H4: Firms with large offshoring experience have developed a real methodology to analyze potential risks of offshoring operations.

METHODS

This study is concerned with the need of understanding deeply a complex process, so, we chose a qualitative approach to test our hypotheses. In order to understand the respective part of financial and non financial criteria taken into account in an offshoring decision, and to analyze the way risks were estimated, we conducted a study among 5 european firms, which invested in factories or services in emerging countries; these firms are all multinational companies, from different sectors; four are industrial ones, and belong to car equipment, construction, steel and automotive sectors. The fifth one makes software products.

Data were collected through in-depth face-to-face interviews with top managers involved in these offshoring decisions. We asked them questions related to both financial and non financial approaches, and on the importance of each category of criteria when having to choose between different countries. So, we analyzed deeply with them the offshoring decision process. The data collection was completed with secondary data relative to cases published in the media.

FINDINGS AND CONCLUSIONS

Case studies

Renault: Offshoring in Slovenia

The Renault's experience in Slovenia is older than the other experiences related in this paper, since the joint venture with the Yugoslavian plant of Revoz took place in 1988. In 1990, Renault became the majority shareholder, with 51% of the capital. At this time, Yugoslavia was still a country belonging more or less to the soviet area; Slovenia, created in 1991, was at the beginning of its existence considered as an emerging country.

Greenfield was not thought of, because Renault already had a partnership with an existing company : before 1990, Revoz plant produced cars for the local market (R4 and R5), with Renault license. In 1990, Renault decided to invest in this plant, to increase its capacity, to build a new painting workshop observing European standards, and to modernize the other workshops. The project was to ramp up the production of "Clio" cars in this site.

At this period, Renault was looking for increasing its global capacity, because of the saturation of all its plants. Renault chose Slovenia for economic reasons: first of all, Slovenia was located near key markets, as Germany, Austria and Italy, which allowed important logistic savings. Then, wages in Slovenia were very low. So, the decision of offshoring was taken despite political instability in this country.

Many unexpected events happened before the end of the project: the most important was the war in 1991, which delayed the delivery of the new workshop. The factory was located near a nuclear station, which was a potential target in the case of Yugoslavian attacks. So, the project was stopped during three months, because of the risk of failure, but it went on after the initial threat. As Renault did not invest in Yugoslavia in the aim to sell cars on the local market, the project was not discussed despite the split of Yugoslavia in many little countries (the population of Slovenia was less than 2 million people, a tenth the population of Yugoslavia).

Renault faced some problems with a low quality level of cars, and invested in training for all employees. Many of them were sent to another Renault's factory in Portugal, to receive a specific training. As employees had a high education level, and were very involved in the company, one of the most important of their new country; Renault obtained spectacular results, and one year later, in 1992, the quality level of Revoz factory was one of the highest of all Renault factories in Europe.

Renault's investment in Slovenia has never been discussed after these initial difficulties; on the contrary, the strategic decision of Carlos Gohn to specialize each Renault factory in one type of car to get economies of scale enhanced the importance of this factory, which produces today Twingo cars for the whole Europe. But we did

not discuss the recent evolution of Revoz factory, because Slovenia, which joined the U.E in 2004, is not yet an emerging country.

Steel company : offshoring in Russia

The steel company makes cans, both for vegetables and dry products, as coffee or pet food. It is an European firm, with 60 plants in 14 countries all over the world. The decision of investing in Russia was taken in 2005, for two main reasons: the first one was the need for finding growing markets, because western markets grew too slowly. The second reason was the satisfaction of “key account” customers’ requests: some international firms in the food industry were already in Russia, and their local factories had problems in supplying metal cans for packing their products: because of the poor quality level of Russian cans suppliers, they were forced to supply their cans from other countries, which led to very high logistic costs.

So, the steel company did not expect reduced production costs in Russia, but higher margins: as European customers based in Russia did not have to support high logistic costs any longer, the steel company could sell its cans at a very best price than in European countries. Furthermore, steel firm’s managers did not consider Russia as a low cost country, because of the amount of taxes.

They decided to invest in two different Russian areas, because of the size of the country and the distance between their different customers: customers producing canned vegetables were based in the agricultural regions of the south of Russia, though other customers were based in the Moscow area.

Although the research of low production costs was not the motive for investing in Russia, the financial aspects of investment were naturally taken into account, using classical financial tools. All investment ways were analyzed, from Greenfield to joint-ventures and buyout of an existing plant. Managers gave up quickly the Greenfield project, because of the very high price of the building land. So, the manager in charge of the Russian project spent six months in the country, looking for joint venture or buyout opportunities. At the end, the steel company decided to buyout an existing firm near Moscow, and to realize a joint venture in the south of Russia, because of the lack of buyout opportunity.

As the steel company had some experience concerning unexpected costs in emerging countries, the expected profitability of these investments was calculated on the basis of the past “performances” of these two plants, with targets of improvement. The initial plants efficiency (about 30%) was expected to reach the European average level (70%) within 3 years. All financial classical methods were used to evaluate the potential benefits of these investments.

The steel company did not face any problem with industrial property, because the technology used to make steel cans is quite old, and well known around the world. Major risks were very well estimated: for instance, 3 French managers (for production, logistics and quality) were sent for one year to Russia for working with local managers in order to prevent risks in these areas.

Some unexpected problems arose: thefts of containers and tools, and problems with the owner of Moscow’s plant walls, who sent an armed militia to require more money. These problems were quite anecdotic, and the steel company considers these Russian investments as real successes.

Car equipments firm

This French industrial firm makes high technological car equipment. The firm is a large corporation investing as much as 400 million Euros in the emerging countries per year. It’s a world leader regarding the product. The brand is famous for the quality of its products.

Asian countries are key markets for the firm. According to the investment director, average growth should be as high as 17 % over the next few years as compared to 2 or 3 % for the industrialized countries. The firm’s goal is to build one plant per year in the emerging countries. The main motive for the foreign direct investment is the market potential. Emerging markets are growing extremely fast, meaning new consumers, new opportunities and sometime new profits.

“Twenty or thirty years ago western firms invested in emerging countries mainly to lower their production costs” the investment director explained. What previously was the main motive for foreign direct investments now comes second and sometime is no even mentioned. Making high technological products requires reliable and skilled teams able to work together. What initially meant low costs often later leads to high production costs. Furthermore reducing costs as an ultimate goal for western firm can turn into a disaster.

Any greenfield investment or any off-shoring strategies decided by the firm always refers to a quantitative approach. A rigorous firm-made model based on carefully anticipated cash flows over the next 10 coming years is carried out. Calculating the present value of the future investment requires adequate discount rates. To the usual firm's domestic weighted average capital cost (WACC) is a specific percentage added so as to take into account the level of risks of the considered emerging market. A table set up by the financial department gives relevant discount rates for each emerging countries.

This approach is regarded as efficient; the usual critics regarded anticipated cash flows and the choice for the discount are not regarded as inconsistent by the firm.

Investing in emerging countries also means expected and unexpected risks and problems. It's clear that firm's patents will be stolen; what matters is to keep them as long as possible. It's also crucial to always be more technologically advanced. Research in France is crucial.

When the firm enters a market through an acquisition it takes no less than ten years to adjust the production and the management to the firm's criteria. It's usually easy to recruit local workers but much more difficult to find skilled workers and even more to find skilled engineers in China. Building reliable teams is also a real challenge; French managers and engineers have to be sent to China for long periods of time; that means high transportation costs as well as high living costs and wages for expatriates.

Construction company

This group produces aggregate materials all over the world used in construction. It employs 16 000 people. The process used by the firm to turn raw materials into finished product is not so sophisticated. Therefore many firms can access the market. The competitive advantage is here based on the marketing strategy.

Production is usually made no further than 200 km away from the markets. The only exception concerns markets located near the sea; production can then be shipped from emerging countries to the markets so as to take advantage of low production costs. Other than that, the main motive for off-shoring is here mainly the potential of the emerging markets given the firm's production technical constraints.

When entering a new market, considering the specificity of this unsophisticated product, the firm considers as a necessity to be the first foreign investor to ensure a successful strategy. The choice of entry mode mainly focuses on acquisitions; Greenfield investments requiring too much cash. Emerging markets are regarded as important; from one hundred to five hundred million Euros are invested each year. Emerging markets are split into three zones: Asia, Central Europe–Middle East–Africa, Latin America. Asia looks very promising.

The decision to invest is carefully assessed and based on the usual quantitative approach. Cash flows are anticipated over a twenty-year period but only a single discount rate is used for all the emerging countries. It's the same as the domestic WACC normally used by the firm in France amounting to 15% as imposed by shareholders. The decision process is normally based on three steps. First Managers for the different zones make investment proposals. Second the present value of the future investment is calculated. Third marketing studies are carried out in the considered emerging market so as to ensure relevant figures for anticipated sales and cash flows.

At last what was probably unexpected concerns the Chinese market. The firm considers China as a difficult market. "We have no margin, we make no money", the investment manager said.

Software industry

The software company core activity mainly concerns middleware, linking software to various applications or components. Other activities also include data operating systems, counseling and information technology. 16 000 employees work today for the group including 600 people in India, 500 in Romania and 100 hundred in Morocco. There are no operations in China. India attracts service off shoring; English is widely spoken in India. Very few Chinese speak English, consequently the country doesn't attract much service off shoring.

Two main motives account here for the off shoring strategy: the potential of the new emerging countries as well as the requirements of the firm's clients. Clients consider it makes it easy for them to increase their market shares in emerging countries if their own suppliers have off shored part of their activities. Seeking for low costs is not a motive for the firm. Obviously hiring an engineer costs 330 Euros in France versus 40 Euros in India but when operations take place in India reliable teams have to set up. It requires expatriates to make them work imposing at last very high extra costs.

Quantitative valuation of the foreign investments is not a mandatory step for the firm in the decision process. The firm's chairman insists on the cultural gap between the two worlds. It seems to him that constantly and globally seeking for lower costs creates risks and tensions. He is also worried about growing antagonism between cultures. It seems it is time to stop offshoring and may be to focus on the collective know-how in France.

Discussion

Motives for offshoring

We wrote as Hypothesis 1 that *“despite demand is increasing in emerging countries, the first motive for offshoring is still production costs reduction”*. Our results don't support this hypothesis, which is clearly infirmed. The only company in our sample, whose motive was the expectation of reduced production costs, is Renault, which took this decision 20 years ago. In more recent offshoring operations, the first motive of our respondents is the need to get an access to fast growing markets to enhance company's growth, and the second motive is the satisfaction of key customers' requests for producing near their own factories abroad.

We assume that the differences between Kinkel and Maloca's conclusions and ours are linked to the composition of the sample. These authors realized a quantitative survey, including more than 1660 German companies, with 90% SMEs of medium-sized firms (less than 250 employees). As SMEs have followed the wave of offshoring later than big companies by an imitation effect, their motives seem close to the past motives of multinational firms, which were production costs reduction.

On the contrary, we studied 5 multinational firms, whose past motives for offshoring were expectations for costs reduction, but which are now looking for fast-growing markets, sometimes under the pressure of key customers. So, we assume that motives for offshoring depend both on the size of the firm and of its maturity about offshoring concerns, which is a way for future researches.

Financial criteria

Regarding the financial criteria we considered a double hypothesis:

*H2a * NPV calculation is the first step in the offshoring decision process, leading to the choice of the country where to invest.*

*H2b * NPV calculation is the first criteria to be taken into account when choosing between different entry modes (Greenfield, joint-venture, acquisition or buyout) only once the country has been selected.*

Considering our sample, hypothesis 2a is clearly infirmed. None of the firms use NPV calculation to choose between emerging countries when considering offshoring operations. Countries are chosen because of their characteristics; the firm in our sample selling middleware chose India or Romania versus China because of the skills of the local engineers and the absence of language barrier. Very few people speak English in China.

On the opposite hypothesis 2b seems to hold particularly for the industrial firms of the sample (the only exception concerns the firm selling middleware). Managers often made it clear that no offshoring could be made without the quantitative approach based on the project present value calculation. To the usual criticisms put forward during the interviews underlying the difficulty to properly assess the future cash flows over ten or twenty years or to choose a relevant discount rate or Wacc, managers expressed very confident on their firm's specific methodologies.

Obviously the quantitative approach does help firms to choose between different entry modes -*Greenfield, joint-venture, acquisition or buyout*- but only once the country choice has been made. So, firms' ability to estimate these costs depend on their international experience (Eriksson and al, 1997).

Non financial criteria and risks

H3: Top management often does not pay attention enough to risks related to offshoring, what leads to unexpected expenses, and decreases the potential profits of the operation.

H4: Firms with large offshoring experience have developed a real methodology to analyze potential risks of offshoring operations.

Experiences studied in this paper are considered as successes by our five respondents. Although they all faced some problems, as low productivity (Steel company), poor quality level (Renault, Steel company), most of these problems were anticipated during the offshoring decision process, and integrated in the NVP calculation, what clearly infirms hypothesis 3. For instance, Steel company budgeted subsidiary managers wages for production, logistics and quality, in order to work with local managers for one year. Car equipment company takes into

account risks about intellectual or technological property, and does not transfer recent technologies, in order to limit theft risks. As our five respondents did not decide to invest abroad in order to get reduced production costs, but to get access to fast growing markets, extra costs linked to poor quality or poor productivity level were not considered as major problems.

Our five cases are companies with large offshoring experience, and they have developed a real methodology to analyze potential risks in emerging countries, which confirm our hypothesis 4; they invest in the preparation phase, sending managers on the field during long periods, in order to identify local opportunities and risks. They invest in coaching and training to smooth transition phase, and to minimize identified risks. If some trouble occurs, they set action plans up, in order to correct the problems. So, it seems that firms progress with offshoring experience, and that our respondents, who have a large experience in this area, are now aware of potential problems in emerging countries.

CONCLUSION

The target of our study was to analyze criteria taken into account when offshoring. Our results show that multinational firms choose nowadays offshoring countries for strategic reasons, related to market potential, rather than for cost minimization aims. So, the choice between emerging countries is not based on the quantitative approach. However, NPV calculation is a useful guideline to make choice between entry modes (Greenfield, buyout or joint-venture) once the country's choice has been made. At last, although literature underlines a lack of real methodology concerning the analysis of all sorts of risks when offshoring, our results show that international firms with large offshoring experience have developed a real methodology in order to analyze and to prevent risks related to emerging countries.

The limits of our study are linked to our methodology research: by choosing a qualitative approach, we are not able to generalize our findings. Future research will have to follow to confirm these conclusions with a larger sample. Moreover, we have assumed that motives for offshoring depend both on the size of the firm and of its maturity about offshoring concerns, which is a way for future researches.

MARKET ASYMMETRIES, ARBITRAGE AND TRANSITION: THE CASE OF RUSSIA

Mikhail Glazunov

University of Hertfordshire, UK

ABSTRACT

This paper develops the concept of corporate strategy as a process of arbitrage between markets where different nature asymmetries are exploited by corporate managers. From a development position, this research tries to find answers for questions: How could strategy as arbitrage be employed in transitive economies? What creates asymmetries and opportunity for arbitrage in transitive economies? In this paper we show that arbitrage is possible when encountering price asymmetries and a technical opportunity of realisation arbitrage. Examples from the Russian forestry, construction, mining and car industries reveal how executives can create and employ price asymmetries. Also the paper shows opportunity for labour safety, labour law and environmental pollution arbitrage. Also this paper reveals additional type of strategy - anti-arbitrage strategy.

Keywords: strategy, arbitrage, price asymmetries, Russia.

INTRODUCTION

This paper develops the concept of corporate strategy as a process of arbitrage between markets where different nature asymmetries are exploited by corporate managers to improve cash ROCE. According to the traditional definition, strategy is the course of a company over the long term, seeking an advantage through its configuration of resources and competences with the aim of fulfilling stakeholder and shareholder expectations.

Anderson et al (2008) offer a new look on corporate strategy as a ‘process of arbitrage between markets where physical, financial and temporal asymmetries are exploited by corporate managers to boost earnings-capacity’. Also, Ghemawat (2003) notes that the scope for arbitrage is the differences that continue among countries and distances between them could be measured by a four-dimensional framework which includes differences in culture, in the administrative and institutional context, geography and differences in economic attributes.

This paper increases the scope of arbitrage and proposes that arbitrage also is the differences that persist between regions of a country. From a development position, this research sets additional questions: Is there another type of strategy as arbitrage? How could strategy as arbitrage be employed in transitive economies? What creates asymmetries and opportunity for arbitrage in transitive economies? This research tries to find answers for these questions through the experiences of the transitive economy of Russia.

In this paper we show that arbitrage is possible when two conditions are met: the same asset does not trade at the same price on all markets and there is a technical opportunity of realisation arbitrage. Examples from the Russian forestry, construction and car industries reveal how executives can create price asymmetries and opportunity for arbitrage and use strategy as arbitrage getting a competitive advantage. Also the paper shows the opportunity for exploiting asymmetries between high and low level of labour safety cost, labour law cost and environmental pollution cost to boost earning capacity. In addition, by disclosing the car maker Avtovaz competition strategy we reveal an additional type of strategy - anti-arbitrage strategy.

This article is divided into three sections: the first of which offers a new look on corporate strategy as a process of arbitrage between markets where different types of asymmetries are used by corporate managers to increase earnings-capacity. The second section represents different examples from various Russian industries which reveal strategy as arbitrage. In the final section, we use the Avtovaz case to consider, in more detail, arbitrage practice in the large companies that disclose a new phenomenon of arbitrage.

STRATEGY AS ARBITRAGE

According to the traditional definition, strategy is the direction and scope of an organisation over the long term, which achieves an advantage in a changing environment through its configuration of resources and competences with the aim of fulfilling stakeholder expectations (Jonson et al 2006). Also strategy should help to the company find the following questions: Where should the company compete? How could the company achieve and maintain advantage? What capabilities, assets, structures and culture do companies need to bring the strategy? How can the company change?

There are different types of strategy typology and these strategic alternatives are labelled generic because theoretically any type of business can implement them, whether it is a mining company, a high-technology firm or a public organisation.

Ghemawat (2003) suggests a new look on arbitrage as element of corporate strategy. He writes that arbitrage is not cheap capital or labour; the scope for arbitrage is the differences that continue among countries. He offers a four-dimensional framework for measuring distance between countries which includes differences in culture, in the administrative and institutional context, geography and differences in economic attributes. These differences from country to country launch a mass of strategic arbitrage opportunities. Ghemawat emphasizes differences that continue between countries on the contrary one can propose that arbitrage also is the differences that keep on between regions of the one country.

Anderson et al (2008) reveal corporate strategy as a 'process of arbitrage between markets where physical, financial and temporal asymmetries are exploited by corporate managers to boost earnings-capacity'. They employ a wide definition of arbitrage and propose that arbitrage is a process consisting of buying and selling on different markets with the intention of taking advantage of the differentiation in the price quoted. In addition, Anderson et al reveal a few types of arbitrage: 'off-shoring, out-sourcing and transfer pricing arbitrages: off-shoring arbitrages high labour costs against low labour costs, out-sourcing arbitrages internal settlements against an external supplier where a gradient of difference can be identified and captured, transfer pricing, between geographic subsidiaries, can be employed to arbitrage fiscal variations between one region and another reducing the firm's effective tax rate and lowering the cost of capital'.

One can propose that stable economy and political system has less opportunity for arbitrage. In developed countries, market forces relatively quickly maintain equilibrium of price differentiation. In countries with strong state regulation or with authoritarian regime price being regulated by the state and opportunity for arbitrage is minimal. For example in the USSR arbitrage as a legal business operation was forbidden and as a result was being illegally. Whereas, in transitive countries, generally with weak economic and political institutions, there are enormous opportunities for arbitrage which involve using knowledge or confident information of future economical and political decision. In addition, there is a large zone when political decision makers create opportunities for arbitrage and they are in positions to profit from their private investments. In the following sections, strategy as 'arbitrage' will be revealed through the experiences of the transitive economy of Russia.

STRATEGY AS ARBITRAGE IN RUSSIA

Arbitrage is the practice of getting benefit of a price differential between two or more markets and it is possible when two conditions are met: the same asset does not trade at the same price on all markets and there is a technical opportunity of realisation arbitrage. So two parameters determine arbitrage: a price differential and a technical opportunity. In the traditional understanding, arbitrage is the act of buying a product in one market and selling it in another for a higher price and it has to take place concurrently to avoid exposure to market risk and therefore arbitrage as financial practice has dramatically grown together with the progress of telecommunication which gives the technical opportunity for realisation arbitrage.

To analyse arbitrage, it is possible to build the matrix with two parameters: opportunity and price differentiation, and selects four possible options: absent price asymmetries and strong potential for arbitrage (option 1), absent price asymmetries and weak opportunity for arbitrage (option 3), strong price asymmetries and robust opportunity for arbitrage (option 2) and strong price asymmetries and weak opportunity for arbitrage (option 4). Fig1 shows matrix price asymmetries – opportunity with the four outcomes.

Fig1 Matrix price asymmetries – opportunity.

Absent price asymmetries and strong potential for arbitrage Option 1	Strong price asymmetries and robust opportunity for arbitrage Option 2
Absent price asymmetries and weak opportunity for arbitrage Option 3	Strong price asymmetries and weak opportunity for arbitrage Option 4

Source: author

Option 2 is the standard case of arbitrage and it was analysed above, option 3 could not give arbitrage therefore only two options are interesting for analysis business strategy. Option 4 is the typical case which determines state and regional regulation, bureaucratic barriers and limitation of infrastructure of the country and region. Often these determinants are positive because they protect ecological and economic interests of the country but often they have strong negative intensions.

An example could be the Russian forestry industry. China is the biggest market for wood products, which has fueled import growth, including a considerable quantity from Russia. Not surprisingly there is forest cutting carried out with abuse of the existing legislation however the major part of the cutting in the east part of Russia was made with official permits for cutting operations. Russian wood log imports in China are very attractive arbitrage but are limited by a weak opportunity for the increase of supply due to Russian state legislation.

That is why many forestry companies created many opportunities for cutting. This was done by obtaining permits for felling in specially protected natural areas where cutting is forbidden or without a genuine assessment of the volume of wood available for cutting, obtaining a permit to cut and transport the wood using relatively non-invasive technology but then using cheaper, more primitive methods; by exploiting cutting permits established on dubious interpretations of forest management laws and regulations and by exaggeration of the degree to which a forest is afflicted with pests or diseases, so that immediate selective or clear felling is necessary, as a result, about 40% of Russian softwood log imports were of dubious origin. (Morozov 2000). This example shows how a weak opportunity for arbitrage was strengthened and combined with strong price differentiation, strategy as arbitrage was created.

The Option 1 (strong price asymmetries and robust opportunity for arbitrage) gives the opportunity to create arbitrage by the way of organisation special conditions. An example of this option is the employment of migrant workers in Moscow and other Russian cites when the construction industry, having had potential for labour arbitrage, lobbied for special state resolutions to allow the employment of migrants. According to the report Human Rights Watch (2008) there were 9 million migrant workers in Russia, 80 percent of whom come from nine countries of the CIS with which Russia maintained a visa-free regime. Approximately 40 percent of migrant workers have been employed in the highly unregulated construction industry and two million of them work in the Moscow region.

Generally, migrant construction workers are young men, who leave their family in their home countries and enter Russia for six to nine months of seasonal employment, often for many years in a row. These workers enjoy higher wages in Russia and often send money to their families. Building workers usually live in deprived conditions and often employers commit violations of Russian law such as: confiscating passports, withholding wages and forcing employees to work long hours. The absence of a written employment contract also leaves migrant workers vulnerable in cases of workplace accidents because workers cannot access state-sponsored accident insurance that depends on employer contributions for all legal employees and in many cases employers do not provide any assistance to injured workers (Ibid).

This example shows the well-known type of economic arbitrage which exploits low-cost labour as a reaction to growing competition in markets and huge demand. However, the Russian model of off-shoring arbitrage is dissimilar to that observed elsewhere. Russian business transfers labour from developing countries to the relatively more developed Russia. More generally, off-shoring transfers capital and technology from advanced economies to developing economies with lower labour costs.

In addition, this case reveals two complementary advantages for companies moving to emerging markets: undeveloped health and safety regulations and labour law. Health and safety compliance is very expensive in

manufacturing but often ignored in developing countries. As a result, relocation into countries with more lenient health and safety regulation can create reduced operational expenditure.

Labour law in developing and transitive countries in comparison with developed countries does not provide adequate terms of employment, anti-discrimination, unfair dismissal and child labour protection. Also, trade unions are usually not independent of executives of companies, reducing union effectiveness. Consequently, companies conducting business in developing countries can often reduce effective labour costs.

In the global market generally, environmental expenditure has been increasing and there are significant differences in environmental standards and control systems between transitive and advanced economies. Multinational companies are arbitraging environment costs, relocating domestic operations into countries with low environmental standards and/or countries with undeveloped monitoring systems in order to take advantage of international differences in pay for pollution. Finland, for example, with a strong paper industry having had huge forest reserves, encountered logging limitations from the state due to environmental standards. As a result of Finnish policy since the 1990s, round wood exports from the North-West of Russia to Finland had doubled from 4-6 million cubic meters per annum in 1982-1993 to 10-11 million cubic meters per annum and this export generated a considerable deficit of raw materials for Russian paper companies (FAO 2002). In the same period, Finland increased its production of pulp and paper two-fold whereas the Russian share in the world market reduced more than two thirds. Logging dominated the structure of Russian forest exports because the industry had inadequate wood processing in an immediate vicinity of wood growth. Finland used the Russian forestry industry solely as a raw material supplier (European forest sector outlook study 2005).

In the next section, we consider case of Avtovaz. This case demonstrates strategy as arbitrage in action and questions the extent to which earnings capacity is transformed.

CASE ON STRATEGY AS ARBITRAGE

Methods

To explore the strategy as arbitrage of firms in Russia we take a case study approach looking at the post privatisation performance of Avtovaz. Yin (2003) defines case study research method as ‘an empirical investigation that examines an existing phenomenon within its real-life context when the boundaries between phenomenon and context are not clearly evident’ and in which numerous sources of evidence are used. To construct the case study we combine a narrative and numbers account whereby narratives are collected from semi-structured interviews with executives of the companies, corporate publications and direct and participant observation have been employed to establish factors which impacted on post-privatisation corporate performance. In addition, to the collection and interpretation of narratives, we have collected financial information for Avtovaz covering the period 1994 to 2007. This financial information has been structured into key performance ratios employing a nature of expenses approach (Andersson *et al* 2007) with a view to also triangulating the interview material.

Case of Avtovaz

Avtovaz was the largest Russian firm that built and assembled cars from parts sourced within Russia and its satellite countries. Significantly, the company built approximately 750,000 cars each year before its privatisation and was a major supplier of cars to Russian consumers. It employed roughly 125,000 employees and was generating a 20% return on capital employed (Avtovaz 2000). In 1990s, Russia had a comparatively underdeveloped car market and according to official statistics market penetration was at 83 cars per 1,000 people, considerably lower than that in other European markets (ASM 1995). This factor created a huge demand for cars and price asymmetries between domestic and external markets because national manufactories did not have adequate capacity and the quality of cars could not satisfy consumers. Consequently, numerous small companies and entrepreneurs employed opportunities for arbitrage and in 1996 there was colossal growth in foreign second hand motor vehicles which rose to 457,000 (about 50% of the market) which was a serious threat to the domestic automotive industry and for Avtovaz in particular (ASM 1997). In order to stop the significant growth of used-car imports Avtovaz lobbied the government to create a programme to encourage domestic production of cars and increase tariff on used cars by 35% to protect the domestic producers from inexpensive used-car imports.

This case reveals two outcomes: on the one hand it demonstrates again strong price asymmetries and robust opportunity for arbitrage (Option 2) in an undeveloped market and on the other hand it shows a strategy of defense against arbitrage which is employed by opponent(s). This example clearly discloses the Avtovaz competition strategy – increasing the trade barrier for foreign producers.

Employing matrix ‘price asymmetries – opportunity’ gives a new opportunity for strategic analysis. In the context of arbitrage, the strategy of Avtovaz was the transference of the company’s opponents position from

option 2 to option 4 and as result of this movement it had been decreasing opportunities for arbitrage. Also as the second company sub-strategy could be the movement itself from option 2 to option 1 (the absence of price asymmetries and strong potential for arbitrage): by increasing capacity, improving quality and optimising car price; consequently decreasing price asymmetries and eliminating arbitrage. The history of Avtovaz shows that the company maintained competitive advantages for 10 years by using anti-arbitrage strategy.

In that time, however, the competition in the Russian car market had been getting stronger. Despite high duties, which were reducing demand for second-hand foreign-made cars, Avtovaz could not save its position because growth of the national economy shifted consumer preferences toward new foreign-made cars of the low and average cost segments. Since 2000 all major world car manufacturers paid increased attention to the Russian market and by the end of 2002 there were already six foreign car assembly operations in Russia such as Ford, General Motors, Kia, BMW and Renault. (ASM 2003).

The Russian new cars market steadily posted solid rates of growth throughout the 2003-2007 period. Additionally, after years of protecting the domestic car industry through prohibitive tariffs, the government reduced the duty on imported auto components to virtually zero. This motivated the world's car producers to significantly increase production facilities in Russia. In the struggle for Russian customers, foreign companies used all possible trade methods: building car assembly plants in Russia, offering consumer credit on a wider scale, improving and developing dealer networks, selling new models in the Russia market simultaneously with sales in markets of Western countries and using wide, aggressive marketing. In 2007, the total sales of new passenger cars constituted 2,000,000 units and the domestic cars made up only 30% of them (ASM 2007). Generally, in that time Avtovaz maintained its volume of production, which fluctuated between 600,000 and 700,000, although the company dramatically decreased its market share from 50% to 24%. The financial capacity of the Russian market was growing faster than the volume indexes of sales. The Russian new cars market generated total revenues of \$24.6 billion in 2007, representing a compound annual growth rate (CAGR) of 31.3% for the period spanning 2003-2007 and market consumption volumes increased with a CAGR of 19.7%. The company increased sales from \$3.3Bn to \$5.1Bn but the share of LADA by financial volume had been decreased from 32% to 20% because it could not make up the expensive models and maintained position only in the cheapest market niche (Avtovaz 2004).

Analysis of return on capital employed (ROCE) Fig 1 shows that in the period 1995-1999 the average ROCE for Avtovaz placed at about 10%. In that time, ROCE was on a failing trajectory from a high of 20% in 1995 towards -25% in the crises of 1998 because the corporate sales did not generate healthy gross profit margins and the company had serious problems with liquidity, marketing and operation management. However, in 2000 the ratio quickly recovered to 19% due to considerable growth of company earning and relatively slow growth of capital employed. In the years 2000-2005 Avtovaz could not improve its ROCE and it fluctuated between 3 and 8 %.

Figure1 Avtovaz ROCE

Note: ROCE is defined as operating result before depreciation and amortization in relation to the sum of equity and long-term debt. Source: Author calculation.

The problem facing Avtovaz during the 1990s was its increasingly weak finances driven by wealth extraction, poor operating finances and weak strategy where the anti-arbitrage struggle against foreign producers of new and used cars was the major element of corporate strategy. This story reveals a limitation of employing strategy as arbitrage and/or anti-arbitrage if these strategy employed are independently of alternative strategies and do not support other elements of corporate management.

DISCUSSION AND CONCLUSION

This paper has studied the concept of corporate strategy as a process of arbitrage between markets where different nature asymmetries are exploited by corporate managers. Also, the scope for arbitrage traditionally includes the differences that continue among countries but we have shown that opportunity for arbitrage could comprise the differences that exist between regions of one country and the level of the differences depends on size of the country, political system and institutional variation in the culture as well as geography of the country. Conditions within the country, deficit of modern economic and political institutions, regulatory policy framework and non-transparency were paramount factors in determining the strategy and influencing outcomes from privatisation in relation to economic productivity and welfare in Russia. Also all these factors formed and maintained price asymmetries and opportunity for arbitrage in different segments of national economy. Additionally, the period reforms was characterised by an enormous level of inflation, a huge migration from eleven members of the Commonwealth of Independent States, a large differentiation in living standards and wages between Russia and CIS countries as well as between Russian regions and increasing of the share of tax in GDP. These factors formed and maintained price asymmetries and opportunity for different types of arbitrage in the Russian economy.

In this paper, it has been shown that arbitrage is possible when there are two conditions: the same asset does not trade at the same price on all markets and there is a technical opportunity of realisation of arbitrage. Consequently to analyse arbitrage, a matrix with two parameters is built: those of opportunity and price differentiation, selecting four possible options for arbitrage. Examples from the Russian forestry, construction and car industries have revealed how executives can create price asymmetries and opportunity for arbitrage and use strategy as arbitrage getting a competitive advantage.

Also the paper has revealed some complementary advantages for companies moving to emerging markets and exploiting asymmetries between high and low level of labour safety cost, labour law cost and environmental pollution cost to boost earning capacity. In addition, by disclosing the car maker Avtovaz competition strategy we reveal an additional type of strategy - anti-arbitrage strategy. Generally, this type of arbitrage is more possible in countries with weak institutional and regulatory bodies such as Russia and other countries with transitive and developing economies.

SMEs STRATEGIES

INTERNATIONALIZATION OF SMALL AND MEDIUM SIZED ENTERPRISES (SME) IN GERMANY

Christopher Stehr
Karlshochschule International University, Germany

ACADEMIC ABSTRACT

In 2008, Germany was still the biggest single exporting nation in the world. But entrepreneurial internationalization and an internationalization strategy of a Small and Medium Sized Enterprise (SME) is more than just export. Some SMEs reach their limits in the process of an entrepreneurial globalization which needs activities steps beyond the previous internationalization of businesses. The main aspect of the paper is - on the basis of a theoretical approach adapted from practical examples - how SMEs can tap their full entrepreneurial globalization potential.

Keywords: *internationalization, globalization, strategy, factors of success, small and medium-sized enterprises*

EXECUTIVE SUMMARY

The aim of the paper is to show on different examples how it is possible to develop from a former regional market leader to an actual world market leader. 30 world market leaders from different branches of the southern part of Germany have been chosen for this best practice oriented survey. The paper shows which possible globalization strategies can be used by SME and how to find out which strategy would fit best for a company.

The methodology and scientific content evolved are based on structured interviews as well as on the descriptive method. Other findings are from a questionnaire. The results of the questionnaire represent the first findings from a bigger research among more than 10 000 SME. For this paper only the 27 questionnaires are used because the research just started in August 2009. Final results of this research will be available in the middle of 2010.

INTRODUCTION

Globalization as scientific term is undifferentiated used and in the same time a context-linked catchword (Löffler, 2000). Because of a continuous liberalization of worldwide trade - even within the slow down of the negotiations of the Doha Development Round and the actual global financial crises - the global competition will increase. That means that also SMEs with regional or national orientation have to face an increasing number of potential foreign competitors in their home markets.

The continuous processes of economical globalization comprise several chances for small and medium sized enterprises (SME) but also some risks. Chances exist in the abilities to export and the continuous market entries in to new markets and the final globalization of business. The economic ability of taking strategic or operational advantage for a company out of the arising chances offered by globalization becomes more important for the present and future success. Especially the entrepreneurial globalization strategy that is developed, adopted and adjusted specifically for the companies' needs is essential.

The paper shows how companies can develop and implement a globalization strategy for their entrepreneurial globalization. Following this, the current globalization strategies of enterprises will be introduced and pointed out by examples of successful globalized SMEs and some big German companies. For this purpose structured interviews with 30 SMEs of the southern part of Germany, which are already market or world market leaders, were done. The empirical findings of the survey are used to develop the theoretical background.

ENTREPRENEURIAL GLOBALIZATION STRATEGY

The globalization of business activities is not a new development in the framework of economic acting. Therefore entrepreneurial globalization found its reference in the economic literature (Kumar & Haussmann,

1992). There are differences between the definition and the dimensions mentioned beneath globalization and globalization strategy (Welge & Holtbrügge, 2001).

First of all, it is necessary to differentiate between entrepreneurial internationalization and entrepreneurial globalization. Entrepreneurial internationalization or the internationalization of businesses is already reached if the enterprise supplies markets in two or more countries. So it is possible to speak of internationalization when a company becomes active on a foreign market for the first time (Peng, 2009). With that, even for example exports to Austria and to Switzerland by German firms or exports to Mexico and to Canada by US-American are included in this definition of internationalization.

Even more, the entrepreneurial globalization is the economical process of enlargement the existing international activities to a global extend (Bamberger & Wrona, 2002). Thus, globalization is the “generic term for all forms of international economical activities” (Krystek & Zur, 2002, p. 6).

Concerning the term globalization strategy – similar to the term globalization - there is no general definition and a wide range of dimensions. Out of management perspective globalization strategy is to understand as the strategic development and the following operational planning and the successful implementation of the global entrepreneurial economical activities (Becker, 2001).

ANALYSIS OF THE ENTREPRENEURIAL GLOBALIZATION POTENTIAL

German SMEs – for example - are facing more and more global competition in their international captured markets and in their national or regional markets. SMEs have to face new competitors and at the same time they have to develop strategies for abroad respectively to focus on the enlargement of their foreign activities going further than the classical export activities. In the research we found out that most of the SME get internationalized because of the exploitation of new markets for distribution and purchasing.

For SMEs and its processes of entrepreneurial globalization it seems necessary to check as well the classical (procurement, production and sales) as the enlarged economical areas (human resources, finance and so on) for non-utilised globalization potential. With a positive benchmark of their potential SMEs develop and implement comprehensive globalization strategies to accomplish these challenges. For being successful in globalization a strategy is needed which is adjusted on the current company (adaptation). Based on this and according to the framework of an operationalized globalization strategy there should be a continuous inspection with latent top-down/bottom-up planning process taking place.

Thus, for SMEs having only very limited international activities so far the basic analysis of their own globalization potential is the first and at the same time one of the most important steps for entrepreneurial globalization. Not only for global non-active SMEs is the development and implementation of a globalization strategy of importance (Ghemawat, 2007). A refreshing analysis of the own actual or passed strategy is also helpful for internationalized SMEs, as a basis for further activities in the process of entrepreneurial globalization.

Of particular importance are already executed international economic activities and the experiences the SME can derive from these. If the SME has already problems with its current degree of internationalization, the possibility of failure of the adjustment or enlargement to the point of global activities increases as a result of non-solved problems.

It is useful for an entrepreneur to check critically the companies’ international activities before the “going global” in order to analyse the possible strengths and to eliminate the weaknesses. Besides the structural analysis that follows the five-forces model also the SWOT-analysis as a strategic instrument to check the globalization potential can be used. Thereby, in the framework of the internal inspection the strengths and weaknesses - and in the external view - the opportunities and threats get analysed and valued (Porter, 1989).

A wrong decision respectively the overestimation of the company’s internal resources and qualifications in the course of globalization can lead to a misinvestment (Tilly & Welfens, 2000). The company will be financially burdened in this case. This can lead to - for example with the decision in the framework of the so-called “off-shoring” - back sourcing of the added value process into the particular descending country with loss of the investment. In the worst case the global competitor will also be strengthened by a withdrawal from the foreign market. Continuously, current examples are found in the economical press (for example the withdrawal of a

German do-it-yourself store from China and the sale to the market leader). The analysis of the globalization potential of the particular SME results from the inspection of the following central analysis:

- The globalization potential develops generally out of the SMEs willingness to adjust and to adapt to the global conditions (law, culture, administration) and worldwide (political/economical) situations. The central challenge thereby is the motivation and support of the associates and employees for the “going global”. The willingness to adjust needs a gradual development and has to be worked out systematically within the SME especially at the beginning of the process of entrepreneurial globalization (for example, the transparent internal communication concerning the planned foreign and the new global activities in the framework of an associate gathering).
- There is a direct relation between the possibility of entrepreneurial globalization and the organizational structure and the human resources of the SME. To that belong as well the general organizational and structural capacities of the SME as the necessary increased qualification of the employees (for example: administrators for export/import, language courses, intercultural training, global mindset and globalization competencies etc.) and especially the willingness of the management to take additional costs for further internal and external investments (for additional foreign subsidiaries: shortage of the resource “time” as a result of, for example, the executive’s absence for several weeks).
- The question of financing the planned foreign and global investments is also a central criterion for the decision whether there is a positive or negative potential of globalization of a SME. An increased leverage in the framework of a changed quantitative and qualitative orientated credit rating for the SME (Basel II) complicates the financing of globalization activities even more. In general, several federal states and state-owned banks offer loans for external financing of the globalization efforts. Depending of the form of the company, in the framework of self financing the stock of the company can be increased by a new distribution of shares or by deposits of the partners.
- So, the competence and ability for entrepreneurial globalization refers to the particular resources, the aims of the company, the business segment and the position of the SME in the competition (using for example the five-forces model, SWOT analysis and the portfolio analysis).

FIGURE 1: Relevant sections for entrepreneurial globalization (Own figure)

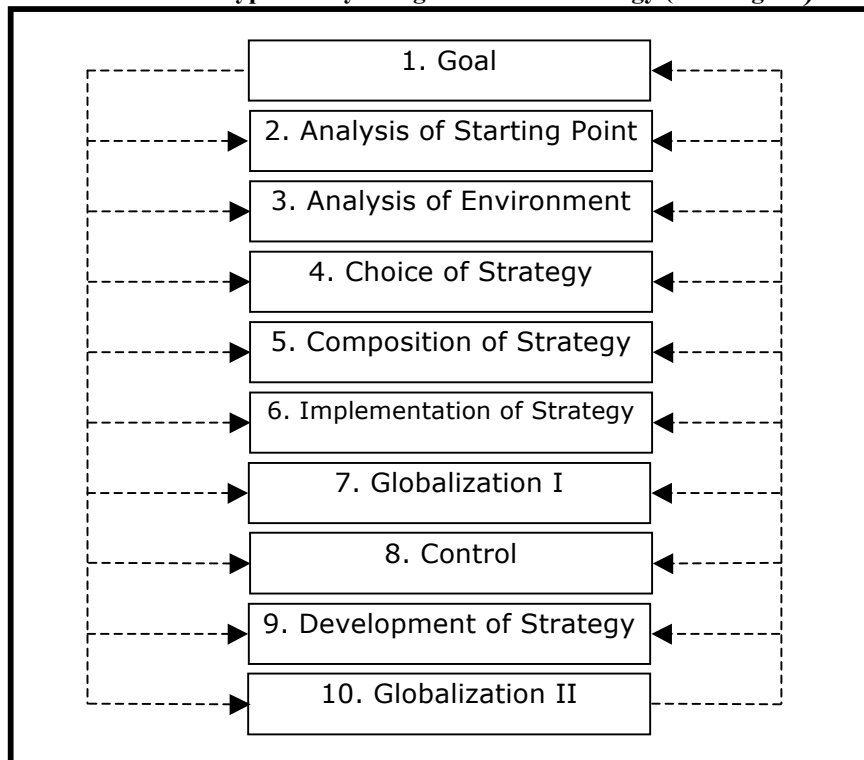

To summarize it, within the survey four central internal sections were discovered in which the entrepreneur has to develop detailed clearness about: 1) general management capacities 2) number and qualification of the employees 3) organizational structure and 4) finance (see fig. 1). This theoretical analysis fits with the results of the empirical survey. Four fields were mentioned by most of the interview partners as important for the development of a globalization strategy as basis for their successful entrepreneurial globalization. In all of the four sections the central question of preparation of the development of a globalization strategy of the SME has to be answered: “Are we as a company really ready for a “going global”?”

DEVELOPMENT OF GLOBALIZATION STRATEGIES

Enterprise specific life circle

The next step after a positive decision for a “going global” is the strategic development and the operational implementation. While big enterprises for example from the German automotive industry already dispose of a tradition of globalization and with that of adequate resources for the corporate global evolution (Grube, 2003) to reach a global level SMEs are missing consistent globalization strategies. Already at the beginning of global activities and in particular during the development of an explicit globalization strategy there are deficits in SMEs (EU, 2004). This keeps independent from the level of strategy, may it be the corporate strategy or the following strategies for business areas and functional areas. Apart from the difficulties like for example the correct estimation of the market volume and the market potential the choice of partners abroad or the lack of globalization know-how (knowledge about the country, laws, language, culture, etc.) are special management challenges which can cause difficulties for SMEs in the process of entrepreneurial globalization (Göker, 2000). Thus, the focus of the management is more on marketing activities respectively questions of technology (quality, technological transfers) than on strategic adjustment. The entrepreneur’s personality plays an important role during the globalization of the enterprise (Nahrendorf, 2008).

FIGURE 2: Ideal type of way of a globalization strategy (Own figure)

The research shows that 27 of the 30 interviewed companies would not exist anymore if they wouldn’t have had an explicit or implicit strategy for their entrepreneurial globalization. The vision of the founders was therefore an important issue. The vision includes in the main cases a global view which reduces the notional entry-barriers.

For the analysis of the above mentioned deficit of strategic adjustment for example an ideal type of action-phase model with counter current processes can be used, which has to be adapted to the specific SME and the company specific situation of the founders and managers (see fig. 2).

In the beginning of each and every corporate activity (1) stands the vision of the founder(s) and the current manager. An analysis (2) of the corporate starting point and the resulting aspects is accompanied by an environmental analysis (3), leading with the next steps to the strategy and the choice of strategy (4). The following process of working out a globalization strategy has to be integrated into the already existing corporate strategy.

After that, related to the expansion of the business a general strategy (5) (for example timing strategy) gets verbalized and worked out in detail (for example strategy for market cultivation respectively market entry). The next step is the implementation of the strategy (6), which is reflected in the embodiment of internal organization (e.g. the designation of a responsible for the globalization), implementation of the strategies and the action programs. This leads finally to the desired entrepreneurial globalization according to the developed definition (7).

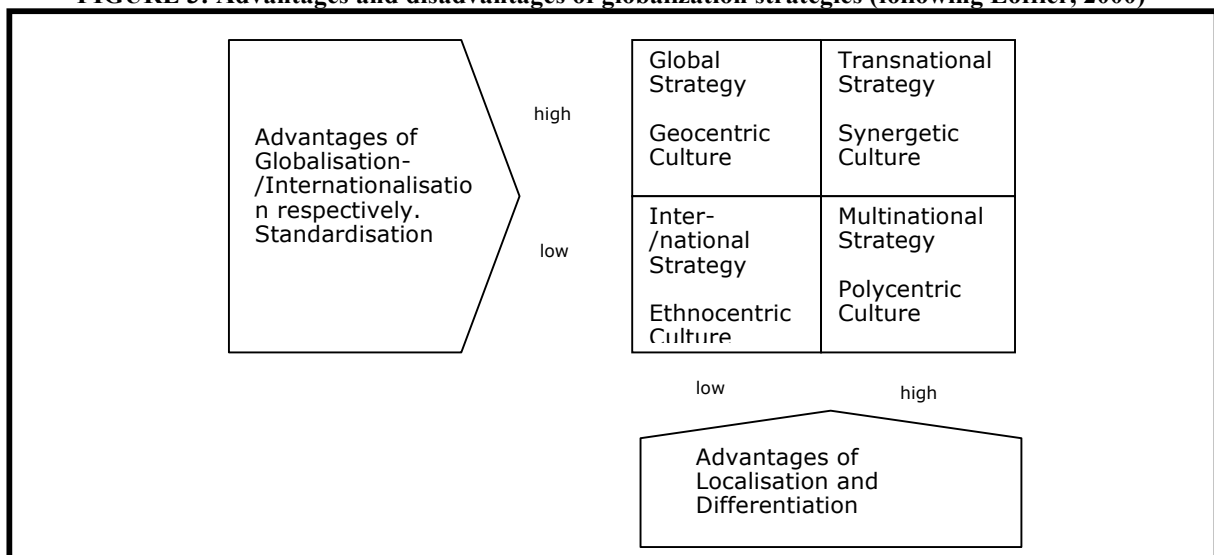

The next step is the permanent control (8) (variance analysis) of the executed global activities. By means of that, frictional losses can be discovered and optimization potentials of and so called synergy potentials can be made available. The new insights lead to a handling (9) of the given and with that to a revised and enlarged globalization strategy. This strategy can lead, under certain circumstances, to a withdrawal from already edited markets or to a completely new adjustment. Finally, however SMEs can reach the entrepreneurial globalization (10).

An entrepreneurial globalization of a SME is obligatory. Not taking part would mean stagnation respectively a step back for the enterprise especially with respect to the increasing foreign competition on the traditional company specific market. In this context we can speak of the so called push- and pull-factors. While push-factors focus on the limits of the home market, the pull-factors focus on the customer who for example demands from the SME to follow him to different foreign markets (Bell, 2008). The SME has in this regard almost no other choice than to follow its main customer into the “new world” (that happened to several German SMEs especially in the automotive branch respectively the automotive supplying industry). The interviews show that in most cases the companies are going global, because of the requirements of their costumers. The pull-factor of an international or global demand seemed to be one of the most important factors for an entrepreneurial globalization (Yeung, 2005).

Business sections in the framework of a globalization strategy

For the adaptation and specific deepening in the framework of globalization of enterprises and the enterprise specific products there are yet even more strategic instruments (Porter, 1989) depending on the size of advantages of the globalization and on how far local adjustments are necessary. Four ideal types of globalization strategies can be specified (fig. 3). With the help of portfolios the adjustment of a globalization strategy can be summarized. This includes advantages or a global product strategy starting from a global (a) over a trans- (b) and an international (c) to a multinational (d) strategy. At the same time the portfolio provides an overview of standardization respectively differentiation advantages in the framework of the chosen globalization strategy.

FIGURE 3: Advantages and disadvantages of globalization strategies (following Löffler, 2000)

In the framework of the **global strategy** several small and country specific adjustments have to be taken (Ghemawat, 2007). The market is considered to be standardised and mostly homogeneous. With - in this case - products that are standardised worldwide (global brand) advantages of costs and prices for big sales volumes can be achieved (Backhaus & Büschken & Voeth, 2003). In connection with the global strategy entrepreneurial

decisions become centralised (Schneider, 2004). The management has to establish in this respect an integrating overview and to observe the sum of the success in all the countries/markets as one (geocentric culture). The result is, that the single maximization of the success of each and every country/market has to be achieved (acceptance of sub optimization for certain parts in favour of the common optimum).

Within the **transnational strategy** standardization advantages (economies of scale/economies of scope) are used as well as national differences. In this way, advantages of economies of scale through standardization of processes and advantages of networks for example with the simultaneous usage of brand names can be generated. Regional centres of added value have to be linked in the framework of this transnational strategy and have to be adjusted in a way that denotes a synergetic culture. With the realization of arbitrage effects (different costs for factors or productivity in the different countries) this strategy can be used as well for national differences (Ghemawat, 2007).

Concerning the **international strategy** little advantages are gained by global standardization and local differentiation. The advantages could be acquired deeply and used by revising of the strategy. The binding to the home market is still very distinct. A few countries are handled via export. Chances on foreign markets get used partially with the appearance of occasional opportunities (for example the order of a client from abroad). Preferred are countries which have similarities to the home market. The international strategy is linked in literature with the ethnocentric culture. The potentially existing foreign plants are marked by the visions and decisions of the holding company.

In the framework of the **multinational strategy** the enterprise adapts itself to the specialities of the current foreign market. The products are aligned specifically to the countries as well. The organizational structures are strongly adjusted to the specific countries and every strategy is being specified and adapted to each country. Cultural differences within single subsidiaries are accepted and as a result of that decisions are made decentred (polycentric culture). That means for the executive that a build-up of a complete organization for a country is linked to a relatively high autonomy of the subsidiaries and, coming with this, only little meaning of the headquarters in comparison to a global strategy. That tends to result as higher entry barriers for other following suppliers (Welge & Holtbrügge, 2001).

For the management, not only in the headquarters but on site as well, this results in an amount of sensitivity and flexibility regarding market developments by using slots for local suppliers. Especially the deliberate usage of limited action enables SMEs to develop lucrative slots. It is an ideal starting point for SMEs on the way into globalization and leads normally from a local to a multinational and even to global business. The starting point is a definition of a market strategy in the framework of enlarged internationalization strategy. A next step can be the development of regional concepts (transnational strategy) to a possible global strategy, finally (Kutschker & Schmid, 2005).

The here mentioned globalization strategies point out how single SMEs could act ideal typically in the environment of the already global competition. In practice mixed strategies are used primarily. Non of the four mentioned ideal typical strategies is followed exclusively. Intersections result from an adaptation to the particular reality of the company.

Ability of globalization of a product

A further central step on the way into globalization is the examination of the product with respect to its ability of worldwide distribution or sale. For the examination of the ability of globalization an appropriate classification of the markets in which the product should be launched are useful. The more precise the classification is the more precise the factors of influence will be visible - like for example governmental regulation, sociocultural and local peculiarities such as taboos. An alignment onto the target group brings competitive advantages during the upcoming globalization. As a conceptual method one of the three-dimensional approaches is suitable to classify the business areas and for the successful globalization of products:

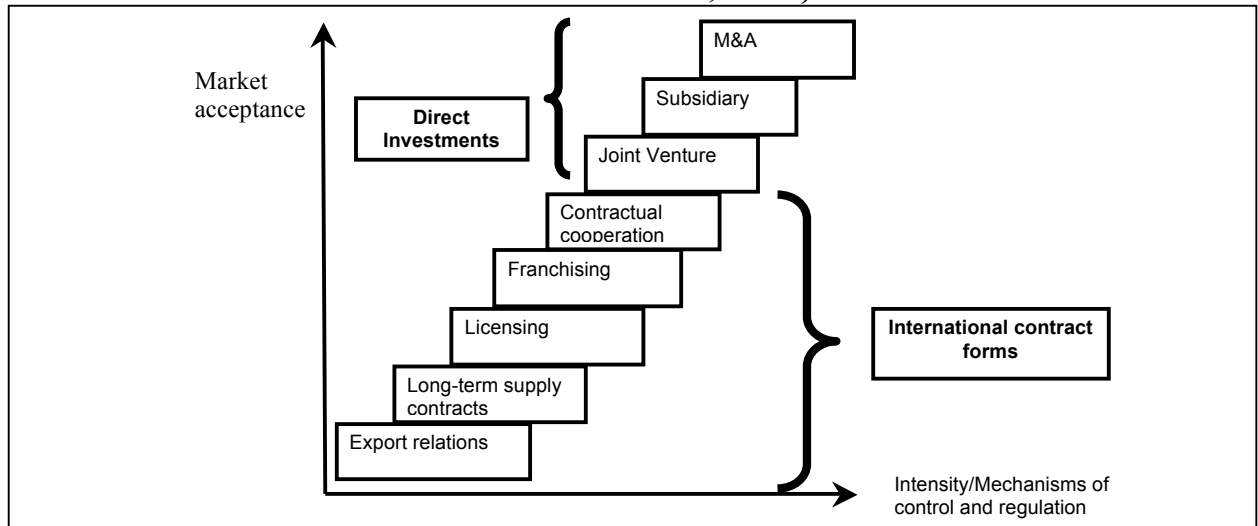

- A first dimension for the classification of business areas are the challenges which are to be fulfilled in the different client sections (consumer functions).
- A further approach is formed by the client sections which map the heterogeneity of the demand. The criteria for that have to be chosen in such a way that the conclusions regarding to buying behaviour, buying criteria, marketing and sales efforts, own strengths and weaknesses can be drawn.

- As a third dimension for the classification of single deals, the method respectively technology of the underlying duty is suitable.

EXAMPLES OF GLOBALIZATION STRATEGIES

Naturally, a general answer on the question of the “right” globalization strategy can not be given (Schmidt, 2004) but the following examples of different companies show successful ways and instruments (see fig. 4).

FIGURE 4: Procedures and instruments of globalization (following Gutmann & Kabst, 2000)

Globalization of export: a trading firm as a partner

A possibility for a faster globalization of SMEs in the framework of increasing export consists in the cooperation with a trading firm. Normally, the core competence of a trading firm is to notice chances for business independently of the industrial branch to find suitable technologies, products or partners and to build up new business models (Kutschker & Schmidt, 2005). Especially for the market entry in Japan or Asia the partnership with a trading firm is a very effective option. SMEs without extensive contacts and measures benefit from the existing networks and strategies.

The research shows, that export is the most common strategy for SMEs internationalization. 83% of the asked SME say that export is of importance for their internationalization. But also the export with a trading firm as partner is of importance for the asked companies. In this research 61% mentioned that this is of importance for their internationalization.

Global chain of economic value added through licensing

Another component is pointed out by the following example of one of the world’s biggest producers of footballs. This enterprise doesn’t only produce footballs in the Pakistani city of Sialkot the so called “world’s capital of football” but also in the Thai industrial area of Sarirasha. There the Japanese license-taker of the German enterprise produced the footballs which were used for the World Cup 2006 in a global chain of economic value added. Even though only ten percent of the production capacity of the factory is used by this order the German standards concerning lean-management or even social and environmental standards could be implemented successfully and the high product quality standards could be fulfilled.

This example shows not only a way into the globalization on the basis of the licences strategy but underlines also the possibility of a connection of worldwide desirable standards.

For SME licensing seems not just an important strategy. Just 25% of the asked SME say that this is of importance for the companies' internationalization.

Global forms of partnership: franchise/joint venture

Out of the different forms of partnerships the most relevant and interesting ones in the framework of a globalization of SMEs are besides the already mentioned trading firm especially franchise and joint venture (Peng, 2009). In this context, of many factors which are important for a successful partnership the following ones are seen as causal for the success respectively failure:

- The ability of the partners to agree to common aims
- The philosophy of the partners and the partnership (common values)
- The coordination between the partners in the partnership
- Performance and potential of the partnership
- Franchise-/partnership contracts
- Mutual trust and mutual commitments
- Style of leadership/management in the partnership
- Meaning of the planning
- Handling of special necessities/problems
- Coordination of business processes

To build up a successful global partnership the following steps have to be kept in mind and be defined in the framework of the partnership:

- Expected economic value added in the foreign market
- Wanted amendments/mutual amplification of interests
- Organizational and financial resources of the partner
- Degree of the wanted control concerning own strategic resources
- Limits of tolerance for accepted risks with respect to time aspects
- Strategic meaning of the market at the partner's location

Only when for all these points a clear answer can be given a partnership respectively in the case of franchise partnerships is on the way into global presence reasonable and has good perspectives to be economically successful.

How difficult but nevertheless successful such a globalization strategy can be is shown by an example on the market of luxury goods and in particular the jewellery branch. A SME from southern Germany made it with the above mentioned criteria in the framework of a franchise-based concept within ten years to become a "hidden champion" (Simon, 1996) and with that to the world market leader. The current expansion rates are lying in the high double digit section. The basis for this enormous success is the (inevitable) diligence selecting their franchise-partners. The management of the SME sees "common ideals" as the crucial criterion for a well-working franchise-partnership. Besides, the global chain of economic value added - the so called glocalised sales strategy - the "individualised mass production" and the high world wide product acceptance are playing an important role.

The first results of the research show that franchising is not of importance for German SME in this sample. By contrast, Joint venture is an important strategy for 36% of the asked SME.

Globalization of brands

Another promising approach to take the leading position in global markets is a sophisticated market and product policy (Subhash, 2003). The so-called global-branding-approach contains a product development on the level between local differentiation and global standardization.

Again, an example can be given by a world market leader from southern Germany: The SME became the undisputed market leader for systems technology (electricity supply) within the last ten years. Product and brand are not seen as one but conceptually as parts consisting of a functional product part and a market part. The followed strategy focuses on the grown brand which is being held "à jour" by continuous innovation, new

production techniques and newly developed products. Local needs are not overlaid by the global brand of the SME but acquired and satisfied locally.

In the meantime, additional non-calculable synergy effects have evolved regarding this globalization strategy. Newly developed products having arisen from regional client needs have been adjusted to other markets and have become bestsellers on these regional markets improving at the same time the position of the enterprise on the world market. In this case, the current growth rates are in the high double-digit almost triple-digit area as well. The ten offices in the world are spread strategically over the continents in such a way that one can speak of global market penetration. As an “add-on”, and for a continuous usage of these effects regular company meetings are usually taking place on the particular sites spread all over the world. Apart from the “global-branding” the enterprise is also an exemplar for the “glocalization of factors of success” (Perlitz, 2004).

Globalization of factors of success

A further strategy as the result of a combination of theoretical thoughts and a successful application in praxis is the alignment to the three following factors of success:

- Regular collaboration with the clients to evolve the own products
- Coevally world wide and locally organized customer service with clear concept standard for the respective regional companies (so-called glocalization)
- Build-up of the own enterprise by organized growth and reorientation of the enterprise with every new key innovation

In practice, a German software house has accomplished these factors successfully and labels them as 1. trusted innovator, 2. globalization and 3. Best-run-organization.

More than half of the interviewed firms were able to assign their national factors of success on the international and global level. These factors were in most cases the ability for innovation, a focus on the customers needs coupled with market-monitoring, a flexible reaction on new external developments and the usage of the local innovation for their globalization and vice versa.

Global customer oriented product solution

The especially given flexibility for SMEs to react rapidly and goal-oriented to demands of the customers respectively to problems, can be defined as a strategy for customer oriented solutions (Silvius, 2004). Like this for example, a German middle-sized company that produces machines as well as system solutions for production and testing steps for the manufacturing of micro-electric components recognized that the actual market in principle is partially divided world wide. According to the belief of the management a bigger share of the market can only be reached by a better product solution in comparison to their competitors. This aim should be reached by quality, innovation and productivity.

The management formulates constructive to these vision five global goals for the company (mission, compare to fig. 6):

- World wide satisfaction of the clients
- Enlargement of the world wide market presence
- Continuous product improvement
- Constant improvement of the system
- Optimal cost/performance ratio

The alignment to these world wide goals led to an annual increase in turnover in the dimension of 15% to 30%. This outstanding growth was realized in particular with deeper and constant worldwide customer proximity.

Global values of enterprises

Another globalization strategy is based on theoretical approaches to innovation and continuity. A successful German engineering company, which was interviewed for this research, defines innovation as salable idea which can be implemented very fast. Referring to globalization, the proximity to customers is a necessary condition for the trust into the own brand and to signalize continuance to the customer. Continuance as a willingness for

continuous change contains in this enterprise also to be always the ideal and to convey values. For this company that has developed out of a big middle-sized company the existence of these three factors (trust into the brand, signaling continuance to the customer and the willingness to continuous change) lead to world wide success (Leibinger, 2005).

ENTERPRISE SPECIFIC IMPLEMENTATION

The market entry and the following continuous globalization can be systematized with an increasing degree of foreign business, for example into different levels like export, franchising, licensing, direct investments (see fig. 4). For the company's further and deeper entrepreneurial globalization additional aspects have to be recognized (Hentze & Kammel, 2000):

- Acquisition-oriented reasons: Development and preservation of resources
- Product-oriented reasons: Basically advantages of rationalization and costs
- Sales-oriented reasons: Development and preservation of foreign markets including situation specific competition strategies
- Environmentally oriented reasons: Usage of country specific frameworks in a cultural, technological, legal or economical way
- Factor specific reasons: Development of new resources in the sections of research, development and staff

Generally, it should be stated that the examples and instruments mentioned here as a basis for globalization of SME have to be adjusted carefully with respect to the company's specific situation. As decision guideline table in the sense of benefit analysis (see fig. 5) can be helpful. Depending on the SME, company specific descriptions and attributes of quality with already done globalization-analysis' (see figs. 1 to 4) can be set into relation with the SMEs specific areas of function. The relevance for the globalization reflects thereby the subjective rating of the particular management. The entrepreneur decides by himself via weighting (all functional areas = 100%) about the meaning and expected effort (for example: high=6, middle=3, low=1) of the particular central factors in the framework of its globalization (management, organization, costs). In the end from the multiplication of the weighting and estimation of the effort it becomes the numerical sum of the values. Derived from that an executed descriptive company specific self-estimation and ensuring the steps to operationalized in the framework of further globalization of the particular SME (see fig. 5).

FIGURE 5: Table of examples- decision guidance for activities of globalization

Relevance/Effort for the Globalization Functional areas	Weighting	Management	Organization	Associates	Costs	Company specific Estimation
Research & Development						
Human Ressources						
Acquisition						
Production						
Sales						
Logistic						

CONCLUSION

The process of economic globalization has to be seen as a fact. In the beginning of this article the thesis of the necessary optimization of global entrepreneurial activities of SME was postulated. For SMEs it is necessary to work out an adequate globalization strategy. Also if in the beginning the SME doesn't seem to be affected by the

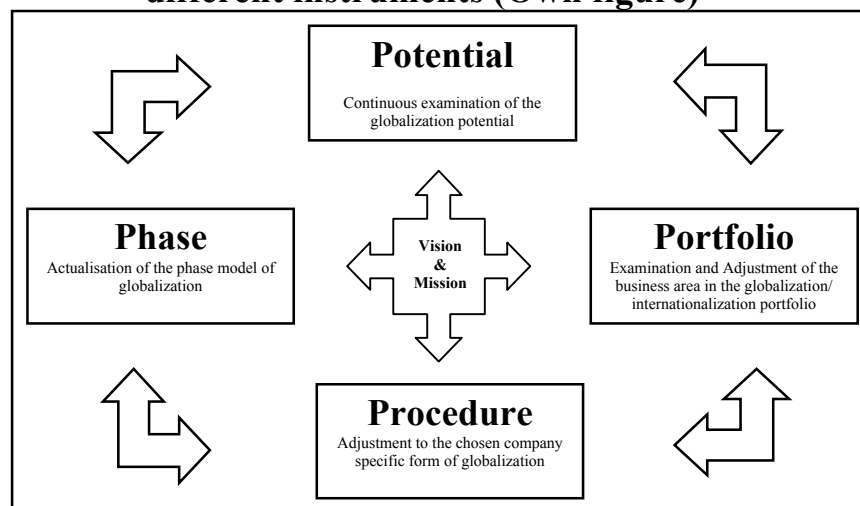

process of globalization. In the framework of globalization strategies, different variations and instruments which are already implemented successfully by different companies have been shown in this article.

According to already existing experiences, the adoption of these strategies for SME with particular company specific adjustments is a passable way. Yet if these adjustments are not implemented especially in the areas of employees, organizational structure, finance, management, product quality, innovation and demands of the market the entrepreneurial globalization of the SME will fail.

It should be the goal to see entrepreneurial globalization as a chance to find the right position on the world market - even for SMEs. The shown strategies and instruments can give a first overview. A combination of these shown strategies increase the possibilities of success during the “going global”, while the beginning, respectively the choice of the starting point of the own globalization (see fig. 6) and the latent dynamical interdependent process have to be defined for each and every SME.

The analysis instruments described in this article have been integrated in the following figure. The different areas of entrepreneurial globalization Potential (see fig. 1), Phase (fig. 2), Portfolio (fig. 3) and Procedure (fig. 4). They should have been worked out before the combination and necessary conditions for the shown processes of progress in the framework of entrepreneurial globalization. For all four areas, the essential questions regarding to a future globalization strategy and the following globalization of the enterprise should be clarified:

FIGURE 6: The 4-P-modell: Process of combination and adjustment via different instruments (Own figure)

- Which globalization potential do we really have regarding to financing, management, organization and associates?
- In which phase of globalization are we now?
- Using which business segment strategy in the framework of globalization portfolio do we want to become active?
- By means of which operational convertible and for us most suitable procedure (form/instrument) of globalization (licensing, franchising, joint venture, M&A, etc.) do we want to implement our globalization strategy?

For a constructive first estimation of efforts for the globalization of the SME in the particular areas as above mentioned decision guidance (table 1) can be accomplished. For a successful entrepreneurial globalization these four functional or factor oriented areas have to be seriously proved. If the gap between the expectation/visions and the entrepreneurial reality is too big, the process of entrepreneurial globalization might fail.

Further success indicators beyond the described ones to be figured out in the areas quality, production, staff and environment. The standards in these areas achieved in the home country are already an advantage on the way to a globally successful SME. They serve a regulated competition as well as the protection of consumers and producers (Beschorner, 2002). These aspects can be standardized world wide. Additional advantages of time,

technique and product quality in combination with ecology and fair working conditions increase the sales and at the same time increase the reputation of the then globalized SME.

HOW TO IMPROVE INNOVATIVENESS OF SMALL AND MEDIUM ENTERPRISES

Zlatko Nedelko and Vojko Potocan
University of Maribor, Slovenia

ABSTRACT

In current economic conditions, one of the primary aims of strategic management in organizations is to improve their performance. This is especially applicable for Small and medium sized enterprises (SMEs) which need continuous innovation in order to survive and further develop. In that frame is of crucial importance innovativeness of SMEs. Innovativeness of SMEs and their members is dependent upon synergic set of factors, whereas most fundamental and/or underlying are personal values of SMEs members. First step in the process of improving innovativeness of SMEs is therefore holistical understanding of innovativeness and/or preferences of SMEs members towards innovativeness. In that frame this contribution discusses two theses: 1) Personal values of SMEs members are fundamental in/for understanding innovative thinking, and 2) SMEs members' must innovate their values in order to retain/improve SMEs innovativeness. The paper presents a possible framework for innovating personal values of SMEs members in order to improve innovativeness of SMEs. Paper also lays and important ground work for further research of impact of personal values on SMEs members' innovativeness.

Keywords: *entrepreneurship, globalization, innovation, innovativeness, small and medium-sized enterprises, members values*

INTRODUCTION

Strategic management is the process of ensuring that an organization possesses and benefits from the use of an appropriate organizational strategy (Collins, 2001; Chesbrough et al., 2006; Chesbrough, 2009). Therefore an appropriate strategy is one best suited to the needs of an organization at a particular time. In the current economic conditions (i.e. global economic crisis) the primary aim of strategic management in organizations is therefore to cope with changed economics conditions. Changed conditions require quick and appropriate actions, in order to achieve superior fit between the organization and its environment so as to achieve organizational goals. In the frame of strategic management in organization, one among most important and crucial area of management working in the current economic conditions is also designing of appropriate behavior of SME's members. Currently, frequently emphasized dilemma of researching SME's member behavior is question of their innovativeness. In selected context we are focusing our attention on examination of the innovativeness problematic in the framework of SMEs members' personal values, since SME's members personal values are one among most important drivers of their working and behavior in organization.

An organization is not only a business system (BS), which it is when the selected viewpoint of dealing with it exposes its business attributes. Called with different names (such as firm, enterprise, company) business systems (BSs) became very influential institutions of the modern age (Schumpeter, 1934; Kuratko, 2008). Since the great majority of BSs are small and medium enterprises, it is almost impossible to reach any goal in the society without engaging also SMEs (Hebert & Link, 1989; Fink & Kraus, 2009). Currently, in Europe about 99 % of all enterprises are SMEs, employing beyond 50 % employees (Potocan, 2005; Potocan & Mulej, 2007; Potocan, 2008). Demands over SMEs, too, have developed from efficiency by synergetically adding quality, range, uniqueness, and sustainability, in recent decades (Collins, 2001; Potocan & Mulej, 2007). This requires innovations all the time.

Innovation is defined as every novelty found beneficial in the experience of its users (Afuah, 1998; Rogers, 2003; EU, 2006). Or, in other words: Innovation = invention + commercialization (Afuah, 1998). Business practice proves that innovative business (= business style based on innovation rather than routine) tends to yield much more value added than a routine-based one. It is especially crucial as a way out of the current economic crisis. Therefore, the modern BSs face two important challenges, at least: how to satisfy demanding customer's requirements, and how to make their own business requisitely innovative to make customers happier with it than with competitor's supplies.

Synergy of findings from research of both challenges says that one-sided professionals/humans fail to perceive that success depend on systemic thinking based on interdisciplinary creative cooperation. It is helpful to develop and maintain innovativeness and creative cooperation of all organizational members.

Therefore, SMEs must create and implement holistic working and behavior like or even more than the bigger enterprises. Meeting these requirements depends on influential humans, not only on the institutional order alone. Thus, most SMEs must create innovative behavior and working if they wish to survive in the modern environment.

We discuss here the issue of improving the level of innovativeness on the basis of knowing: situation in literature about innovation, diffusion of attributes of innovative enterprises among SMEs, and innovativeness of organizations' members in Slovenian organizations, especially in SMEs.

LITERATURE REVIEW

Literature on innovation abounds. There are many more authors and contributions about different aspects of the innovativeness of SMEs today than ever before (e.g. see Lester & Piore, 2004; Leydesdorff, 2006; Sheshimski et al., 2007; Fink & Kraus, 2009; etc.). Pyka & Scharnhorst (2009) offer an interesting new approach to change and learning. Leydesdorff (2006) offers an interesting new concept of modeling, measuring and simulating the knowledge-based economy. Schwartz (2006) is trying to help people be more entrepreneurial (and has already sold over four million copies of his book, which is a sign of its own how far many people are from the capacity to master their destiny in the innovative society). Lester & Piore (2004) are warning – under the label of the need for capacity of interpretation – that the contemporary American education lacks schooling that fosters the capacity of creative interdisciplinary co-operation, which is a precondition for success in the innovative efforts. Nussbaum (et al.) (2005) raises awareness that ‘despite spending huge sums on R&D, most corporations have dismally low levels of innovation productivity – up to 96 percent of all new projects fail – and offers suggestion how to get better at this. McGregor (2006) points to attributes of the most innovative companies of today. Huston & Sakkab (2006) are given room in Harvard Business Review to inform about their new model for innovation. Business Week decided to focus on innovation for its 75th anniversary issue under the label “The Innovation Economy” in its special report. In June 2006 Business Week published its inaugural issue of IN: Inside Innovation with these words from its editor: “We dedicate ourselves to the proposition that making innovation work is the single most important business challenge of our era. Our goal is to make a meaningful difference in the difficult journey toward building innovative business cultures.” (also see Nussbaum et al., 2005; Potocan & Mulej, 2007; Kelley, 2009). The International Society for Knowledge and Systems Science links knowledge with holistic thinking (e.g. see Potocan, 2005; Gu et al., 2006; Potocan & Mulej, 2007). Conferences STIQE, which have taken place nine times so far on a biannual basis link systems thinking, innovation, quality, entrepreneurship, and environment (Rebernik et al., 1992-2008; Potocan & Mulej, 2007; etc.).

We could no way include all references on innovation in economic, sociological, psychological and similar literature; it is no longer a technological topic only. IBM (2006) reports on a world-wide survey finding that innovation of business is even more crucial than the technological innovation (see also Potocan, 2008; Shane, 2008; Conway & Steward, 2009; etc.). Here, we are going to put another question: is it enough to deal with the innovation process, innovative business, and innovative society, once we want to attain the holism in consideration of the contemporary life and trends; our response is clear: no, it is not.

In other words: SMEs becoming more innovative mainly on the base of innovative working and behavior of their members. The important part of improving the level of innovativeness of SME's members also presents importance of innovativeness for all SME's members, and state (i.e. level of current) of their values connected with innovativeness.

DIFFUSION OF ATTRIBUTES OF INNOVATIVE ENTERPRISES AMONG SMEs

Entrepreneurship can be considered:

- A legal feature, i.e. ownership of enterprises, such as family ones (e.g. see Kuratko, 2008),
- An economic feature, i.e. searching for, creating, and using new business opportunities to make innovations (e.g. see Sheshimski et al., 2007), or
- A psychological and sociological attribute of the entrepreneur as a person (e.g. see Collins, 2001).

One-sided attempts of behavior (i.e. perception, thinking, decision making, communication, emotional and spiritual life, and action) are normal with the normal specialists, if they do not want and/or know how to cooperate with other specialists who are different from them, and make therefore oversights and finish in fictitious holism causing mistakes (from e.g. bad cooking all way to world wars). Owners, entrepreneurs and managers of SMEs are often quite close to this danger: they do not have many co-workers, they have often established their own SMEs because they had no other chance to survive after losing their jobs as employees (Rebernik et al, 1992-2008; Rebernik et al., 2000-2009). Often, this means that they are very good in a technical profession, on which they intend to live, with full right, but less good or even completely uneducated in running a SME (Nussbaum et al., 2005; Basadur & Gelade, 2006; Kelley, 2009). An entrepreneur produces an enterprise rather than a product; his professionals produce the product as a part of his/her basis to produce a SME, in the first phase (Chesbrough et al., 2006; Gloor, 2006; Chesbrough, 2009).

Entrepreneurial SME's must in the new economic conditions radical redefine their goals and tasks, rethink areas of their own work, and innovate the characteristics of their own operation, like as synergetic entity of:

- Understanding of SME itself - SMEs must be obviously viewed as inventions that are supposed to become innovations, not only their products.
- All influential stakeholders of SMEs must be persuaded in a (innovative) process for the transition from invention to innovation to happen.

The modern circumstances no longer allows for routine-loving owners, entrepreneurs and managers, like a long-term stability used to for millennia (Fagerberg et al., 2006; Meyer, 2008; Conway & Steward, 2009; Potocan & Mulej, 2009). Therefore, the new bases of a modern ownership, entrepreneurship and management may include serious novelties aimed at becoming management innovations such as (Basadur & Gelade, 2006; Potocan & Mulej, 2007; Potocan & Mulej, 2009):

- Owners, entrepreneurs and SME's members must thoroughly rethink and innovate their operation to improve their SMEs competitiveness, permanently create and sell new products and services, which must become innovations;
- Owners, entrepreneurs and SME's members must create operation globally, and act locally; they need direct links with their end users, to know both their market and the broader consequences of their action in time;
- Owners, entrepreneurs and SME's members transition from the commanding hierarchy to the 'process-based' specialization and interdisciplinary creative cooperation is of special importance, in order for a SME to activate capacities of every member and partner in the value-chain;
- Owners, entrepreneurs and SME's members must reconsider their absorption capacity for inventions and other knowledge from research organization, which are their potential and/or real partner in research and development (R&D), because most SMEs cannot afford R&D departments of their own, but need fresh knowledge and information on technology, marketing, accountancy, law, etc.;
- There is a growing need for the interdisciplinary capacity of owners, entrepreneurs and SME's members (in SMEs) (e.g. systems thinking, inter-cultural capabilities and knowledge, permanent education and training, formation of personal standards of ethics of interdependence and the standards of entrepreneurship behavior, capacity of anticipation based on a broad interdisciplinary cooperation, cooperative and team work capacity).

For above mentioned reasons, owners, entrepreneurs and SME's members must changed their values, culture, ethics and norm of their work and behavior (and perception of its role, importance and characteristics) to meet the newly emerging conditions of business operation.

But, where we are with changing of basic values (for innovativeness and innovative working and behavior of) SMEs' members in Slovenia?

INNOVATIONS AND INNOVATIVE BEHAVIOR IN SLOVENIAN ORGANIZATIONS

SMEs cannot avoid the modern global economy and its demand for innovative business as a precondition for competitiveness. Given their small size and related pool of professionals, SMEs need to work very hard on members' innovativeness and related personal traits. Making a SME successful must be considered as an invention-innovation-diffusion process that tackles: the businesses mix of the given size, the SME as an entrepreneurial achievement, and entity of values/culture/ethics/norms.

Thus all preconditions concerning both the content and the process of innovation must be considered, which requires the holism and therefore systemic rather than one-sided thinking/behavior of the usual specialists. Hence, values/culture/ethics/norms of owners, entrepreneurs, SME's members must also be innovated along with their knowledge.

Therefore the following hypotheses are postulated:

H1: Members of Slovenian SME's consider innovation as an important characteristic of their working.

Figures from research on diffusion of novelties aimed at becoming innovations (Afuah, 1998; Lester & Piore, 2004; McGregor, 2006) include into rather innovative recipients of novelties only about 18 % - 30 % of all adults. This means that new concepts such as economic entrepreneurship replacing routine-loving behavior (including employment without a lot of own responsibility) are difficult to implement.

From the viewpoint of current situation in Slovenia, the level of understanding and acceptance of innovations among SME's members is relatively favorable. About details of general framework, institutional conditions for innovativeness and state of innovativeness in Slovenian organizations see Rebernik, et al. (2000-2009) and Potocan & Mulej (2007). The results of survey of personal values of members in Slovenian organizations in 2010 indicate that members of organizations consider innovations (and innovative conditions) as important characteristics of their working.

Innovative thinking of SME's members is importantly dependent upon synergetic whole objective factors (e.g. organization goals, requirements of owners, shareholders) and especially subjective starting points of management (see Mulej, 2000). In that frame we can emphasize values of SME's members, as one among crucial factors, which influence innovative thinking of SME's members.

This lead to the conclusion that SME's members, based on their personal values, recognize and/or be aware of need for innovative thinking, which is executed though their working and behavior in organizations. Key factor in that frame are personal values of SME's members, which are either favorable either unfavorable to innovative thinking of SME's members.

Based on our previous researching and cognitions of others (see: O'Reilly et al., 1991; Lester & Piore, 2004; etc.), we identified following set of criterions for examination of innovative thinking:

- SME's members stimulation for creativity;
- Openness of SME's members for new ideas and other's knowledge;
- Benevolence to changes;
- Perception of risk;
- Innovativeness as a value.

H2: The personal values of SME's members support innovative thinking of SME's members in Slovenian organizations.

Figures from research of entrepreneurship and innovativeness include finding that about 40 % of the adults in a society must be entrepreneurial persons to make enterprises economic rather than only legal entities, called enterprises (Rogers, 2003; Rebernik et al., 2004; Chesbrough et al., 2006; Chesbrough, 2009). This percentage must be achieved by innovation (as a process) of human values, which will not be a novelty yielding no benefit to its users, but an innovation (as outcome). The results of survey of members of Slovenian organizations in 2010 indicate that personal value of organizations' members influence (and/or support) innovative thinking of members in Slovenian organizations.

Based on management literature, and above mentioned conclusion, we can conclude that there is (indirect) link (and/or relationship) between values of SME's members and innovative thinking of SME's members (see: Mulej, 2000; Mulej, 2007; Potocan & Mulej, 2007). We can assume for our research that is possible to assign (more or less) significant personal value for support of innovative thinking.

Based on presented cognitions and our experiences, we identified several (most probably) relationships between items (which constitute construct innovative thinking) and selected personal values of management) (see for example Katz, 2003; Gloor, 2006). Cognitions are summarized in Table 1.

Table 1: Significant values for innovative thinking

Innovative thinking	Significant personal value
SME's members stimulation for creativity	Creativity
Openness of SME's for new ideas and other's knowledge	Broad-minded
Benevolence to changes	Dynamic life
Perception of risk	Daring
Innovativeness as a value	Innovativeness

METHODS

Based on our cognitions presented above, we include in our sample SME's members. Our sample consists of 260 members of SME's in Slovenia. Data were obtained through a field survey of personal values of SME's members in Slovenian SMEs in 2010. Sample included SME's from all Slovenia (i.e. a relatively representative regional coverage; sample met the basic-activity structure of Slovenian SME's, with a good fit to the industry-based structure of the Slovenian economy). According to proposed hypotheses we measured personal values of SME's members and innovative thinking. More facts about survey are available by the authors of this contribution.

For measuring personal values "The Schwartz Value Survey (SVS)" was used (Schwartz, 1994). To the original SVS, which consists of 56 items, we add "innovativeness" as a value. Respondents rate each personal value, using a 9-point Likert-type scale, ranging from "opposed to my values" (-1) to "of supreme importance" (7) (see: Ralston et al., 1997; Yammarino et al., 2005).

For measuring "innovative thinking" we identify construct "Innovative thinking", based on different prior studies of innovativeness (see: O'Reilly et al., 1991; Potocan & Mulej, 2007). 5 items in construct are measured using 7-point Likert-type scale, with anchors refereeing to low innovative thinking (1) and high innovative thinking (7). Items in construct assess SME's members stimulation for creativity (1 – not supporting; 7 – supporting); openness of SME's members for new ideas and other's knowledge (1 – refusing; 7 – accepting); benevolence to changes (1 – don't support; 7 - support); perception of risk (1 – aversive; 7 – preferable); and innovativeness as a value (1 – low; 7 – high).

For examination of the impact of personal values at innovative thinking, we identify relationships between selected personal values (i.e. creativity, broad-minded, dynamic life, daring, innovativeness) and items in construct "innovative thinking".

For analyzing date several methods were used. Based on tests of normality (we used Kolmogorov Smirnov test), we can conclude that all items (i.e. items included for testing both hypotheses) are not congruent with normal distribution (see for example Argyrous, 2006). Since assumptions about normality are markedly violated, we used adequate non-parametric statistics tests (when applicable). In that frame Spearman's correlation coefficient (rho) was used for measuring association between selected item about innovative thinking and assigned personal value of SMEs members. We used Cronbach's alpha for measuring reliability of construct in Hypothesis 1 (i.e. innovative thinking). More about utilized methods for data analysis see in Argyrous (2006).

RESULTS OF SURVEY

Results for Hypothesis 1

H1: Members of Slovenian SME's consider innovation as an important characteristic of their working.

For measuring "innovative thinking" we identify construct "Innovative thinking", which consists of five items (see above). Of the total 260 cases all were processed in analysis. Cronbach's alpha is 0.806, which indicates high overall internal consistency among the five items representing the Innovative thinking construct.

Table 2: Mean values for “Innovative thinking” items

	N	Minimum	Maximum	Mean	Std. Deviation
Management stimulation for creativity	260	1	8	6,50	1,511
Openness of management for ideas and knowledge of employees	260	1	8	6,83	1,369
Benevolence to changes	260	1	8	6,53	1,482
Perception of risk	260	1	8	5,63	1,623
Innovativeness as a value	260	1	8	6,63	1,611
Valid N (listwise)	260				

Based on obtained results we can draw several tentative conclusions about Innovative thinking of Slovenian SME’s members:

- Among several items is most important openness of SME’s members for new ideas and other’s knowledge, while perception of risk is the lowest;
- SME’s members are willing to accept new ideas and other’s knowledge (i.e. from environment of organization, from other members of organizations), since current situation (e.g. coping with crisis; post-transition period of organization transformation) require mobilization of all available ideas and knowledge in organizations in order to survive in fierce (e.g. emerging, global) competition. On the other hand, accepting (also) ideas of other members is important prerequisite for innovations in organizations and especially SME’s;
- SME’s members stimulate creativity of other member of SME, since creativity is central to innovativeness. On the other hand SME’s members must be benevolent to changes, since innovativeness is based on (continuous) changes;
- On the other hand SME’s members are not so interested to accept (too high) risk. This could have deeper roots, e.g. in traditional aversive perception to risk among Slovenians.

We support Hypothesis 1.

Results for Hypothesis 2

H2: The personal values of SME’s members support innovative thinking of SME’s members in Slovenian organizations.

In our conclusions regarding Hypothesis 1, we point out several possible relations between personal values of SME’s members and items referring to innovative thinking. That will be outlined in frame of testing Hypothesis 2. For the purpose of researching the impact of personal values on innovative thinking we assign (more or less) significant personal value to each item in construct (see above).

Table 3: Correlation between innovative thinking and personal values

Innovative thinking	Significant personal value	Correlation
1. SME’s members stimulation for creativity	Creativity	r=0.172 (p=0.005)
2. Openness of SME’s members for new ideas and other’s	Broad-minded	r=0.343 (p=0.000)
3. Benevolence to changes	Dynamic life	r=0.106 (p=0.087)
4. Perception of risk	Daring	r=0.124 (p=0.046)
5. Innovativeness as a value	Innovativeness	r=0.293 (p=0.000)

Results in Table 3 indicate that there are significant relationship between assigned personal value and selected item innovative thinking ($p < 0.05$). In one instance (i.e. benevolence to change and dynamic life) a correlation of 0.076 ($p = 0.223$) indicate no relationship. Regarding strength of relationship we can conclude that for relationships 2 and 5 (see Table above) is relationship is quite strong for (used) explorative approach and from our selected view point. Other two relationships, 1 and 4 indicate weaker relationship.

Some tentative conclusions about relationship between innovative thinking and SME's members personal values are:

- SME's members who value creativity (as a personal value) high, put a lot of effort to stimulate creativity of other members of organization;
- SME's members who are broad-minded, are open for new ideas and knowledge of other employees;
- SME's members who give more priority to daring, are therefore more benevolent to changes in organization;
- SME's members, who value innovativeness, are very much concerned with innovativeness and consequently innovative thinking, which they spread among other members of organization.

On the base of our research we can therefore support 4 of 5 identified relationships in Table 3 ($p < 0.005$).

PRACTICAL IMPLICATIONS: SOME SUGGESTIONS FOR IMPROVEMENT OF INNOVATIVENESS

Based on above presented cognitions we can conclude that for improvement of innovativeness of SMEs innovation of personal values of SMEs members is needed. The cognitions about personal values of SMEs members present base for implementation of invention-innovation-diffusion processes (IIDP) in SMEs (Mulej, 2000; Rogers, 2003; Potocan & Mulej, 2009). IIDP presents entity of three phases: (1) discovering ideas and turning ideas into inventions, suggestions, and potential innovations, which is more or less an internal process in organizations, (2) finding the first happy customers ideas to become innovations, and (3) finding many happy customers by diffusion. Successful implementation of IIDP is not possible without innovation of VCEN of (all) members SMEs.

From the whole problematic of improving innovativeness in SMEs we will outline some possible and also most probable dilemmas for innovation of VCEN in SMEs.

But innovation of VCEN is connected with different questions and doubts. The first question includes: "Will the economic system and business politics practitioners accept inventions, if they do not bring solutions, which offer more benefit than used to be the habit so far?"

Many Western researchers of these problems presuppose that the market pressure alone makes businesses, including the economic system and business politics institutions willing and able to absorb whatever new knowledge shows up if they feel that their application of this knowledge will increase their competitiveness due to better efficiency and effectiveness (Rogers, 1995; Mulej, 2000, Katz, 2003; Potocan & Mulej, 2007; Conway & Steward, 2009). Therefore, they claim, it is the role of the government to remove obstacles for competition and to invest in education and training in capabilities, which are needed for people to cope with more demanding markets of products and services. This may be true, if business persons are entrepreneurial rather than routine lovers. The conclusion: modern values, knowledge, including know-how, make a system of preconditions for the institutions (i.e. SMEs) to work properly.

The second question is: In which level we must innovate VCEN, if we wish to improve the innovativeness of SMEs? The individual, organizational, and national VCEN need to be innovated, but not technology only (Mulej, 2000; Potocan & Mulej, 2007; Potocan, 2008). This helps interdependence of mutually different and hence complementary specialists to become visible. A lot of help can come from transforming the marketing-like offices of the economic system and business politics institutions from a service of selling/promoting to a service of providing information, including the one about the research organizations, and thus serving as the bridge between businesses and research organizations.

We do not see the problem in transfer of the narrow professional related knowledge, but in the managerial and organizational questions of SMEs. But the most crucial of all novelties is the following:

- According to its role as the general coordinator and manager of the most general issues of a society, the government defines the framework conditions, including the ones related to the transfer and absorption capacity concerning novelties supposed to become innovations;
- Government can act in this role by commanding, subsidizing, enabling, allowing, but also as a rather big buyer in a buyers' market; the latter role may be the best choice in this case;

- Therefore, government can and should define in its procurement rules concerning supply to all government offices, medical, educational and other public organizations, that only the most innovative organizations may be suppliers.

To be able to succeed, government must also be a role model of innovation. Innovations related to the management style and organizational process and methods can take place in its offices, too, like everywhere else.

The next question is: How to transform invention to innovation, from the view point SMEs? From empirical discussions about any product or service for market, including the new management and organization of services/offices in the economic system and business politics, we briefly conclude (Mulej, 2000; Potocan & Mulej, 2007; Potocan & Mulej, 2009):

- There are many products or services that offer the same functionality, but there are other criteria for a customer to choose one of them. This applies to the economic system and business politics institutions, too. They are no longer free of competition: the entire European Union is on its way to become one single 'market' for the economic systems and business politics regulation as well;
- Product or service developers may be concerned about the technological attributes only of their product/s, or conceive it/them more holistically, which is what the new our concept of the economic system and business politics organization suggests;
- To meet customer criteria of good enough quality, products must be good on a holistic basis. Thinking about holism must include technology, production, business planning and doing, marketing, human resources, and several more aspects, as a system. This applies to the economic system and business politics institutions, too;
- Any product or service management, developing, producing, and selling should hence better be a very interdisciplinary endeavor, which links at least business, technology, human resources, organization, management, into one whole. This applies to the economic system and business politics institutions, too.

This means that creativity and holism in the phase of a product (= the economic system and business politics services and organization and management under discussion, in this case) development (without later phases of the process) are not enough, although essential (Mulej, 2000; Potocan & Mulej, 2007).

The concept is important because today, worldwide, there is a lack of education in systems thinking / systems theory; there are many unavoidable narrow specializations; and hence there is a lack of consideration of holism (Mulej, 2000; Rogers, 2003; Shane, 2008, Kelley, 2009). Even more: holism is frequently considered fictitiously, limits of consideration being reduced inside narrow specializations with their interdisciplinary co-operation, and reviving the out-of-date reductionism under the name of systems thinking (Mulej, 2000; Potocan & Mulej, 2007; Potocan & Mulej, 2009).

We also must mention questions of systemic quality (as seen by customers / users). Another aspect of making an invention, such as the new economic system and business politics organization and management, an innovation and really useful, tackles its application by many. Research on diffusion of novelties (Afuah, 2002; Lester & Piore, 2004; Gloor, 2006; Kuratko, 2008; etc.) demonstrates on the basis of several thousand cases that it is very difficult for an author and his or her change agent to make an invention - suggestion accepted by the potential customers. What they find good enough, is called excellent / perfect; it depends on five pillars of total quality, which are interdependent and each of them must be excellent (Hebert & Link, 1989; Afuah, 2002; Lester & Piore, 2004; Chesbrough, 2009). They are: Products, Processes, Leadership, i.e. Cooperative management, and Commitment, linked in a synergy by Organization.

A product is perfect if meeting criteria of "systemic quality in frame of SMEs working" made of the system of interdependent and interactive price, (technical and commercial) quality, range, uniqueness and sustainability as they are both defined and accepted by customers and important environment/s. This is where new management model must fit in.

A detailed discussion of single starting points exceeds the chosen frame of our discussion. This is a topic for another occasion.

CONCLUSIONS

The primary aim of our paper was to present possible ways for improvement of SMEs. In that framework and based on presented theoretical cognitions, we introduce and test items for measuring innovative thinking and

their linkage to personal values of SME's members. Regarding to relative importance of other measured characteristics of organization (which are not presented here) we can conclude that innovativeness is considered as an important characteristic of SME's members. We therefore support Hypothesis 1.

Based on examination of relationship between selected personal values and innovative thinking, we can conclude that SME's members' personal values play an important role in innovativeness of SME members, since the strength of relationship is significant, and from selected view point relatively good. We therefore could confirm Hypothesis 2, in four of five identified relationships.

Results from the survey reveal that SMEs members (in Slovenian SMEs) estimate innovativeness as an important value of their work and/or work of organization.

But cognitions about importance of innovativeness (as personal or as organizational value) are not enough for holistics improvement of level of SMEs innovativeness. We must add also other important solutions, like: (1) Will the economic system and business politics practitioners accept inventions, if they do not bring solutions, which offer more benefit than used to be the habit so far?; (2) In which level we must innovate VCEN, if we wish to improve the innovativeness of SMEs?; How to transform invention to innovation, from the view point SMEs?.

This paper lays possible ground work for future examination of relationship between SMEs members' personal values and innovativeness of SME's members.

ABSTRACT

The purpose of this study is to analyze and discuss the entrepreneurial culture conceptually, which can have a positive effect on the success of the Small and Medium Scale Enterprises (SMEs). In general, SMEs are economic enterprises that use less capital, work as labor-intensive business, have quick decision-making ability and low management costs, and perform cheap production (Uludağ ve Serin, 1991:14). SMEs are also considered as dynamic and innovative enterprises that take advantage of any opportunity (Dinçer, 1994:314). Entrepreneur culture of these SMEs has a key role in their successes. The study starts with a literature review about entrepreneurship, culture and organizational culture, and in the results and discussion part the importance of these concepts on the success of SMEs are evaluated.

INTRODUCTION

Entrepreneurship is an important factor for the economy of a country. Entrepreneurs are regarded as the engine of business (Tekin, 2004). The importance of entrepreneurship in modern society is emerged as making innovations. Modern entrepreneurs have power thanks to innovations and the capacity of converting innovations to concrete products in business. Hence, entrepreneurs should be in pursuit of innovations (Tutar ve Küçük, 2003). Entrepreneurs, in general, perform entrepreneurial activities by establishing SMEs. Thus, SMEs help the development of entrepreneurship and make it prevalent (Tekin, 2004). In general, SMEs are economic and labor-intensive enterprises using less capital, having quick decision-making ability and low management costs, and performing cheap production. SMEs are not regarded literally as tiny and small scale enterprises, but they are considered as dynamic, innovative enterprises that take advantage of opportunities (Çelik ve Akgemci, 1998).

Due to rapid change in business world, SME managers have to make business in an unstable and unsteady atmosphere. Thus, owners, partners or managers of SMEs should make decisions in more risky and ambiguous environment (Çelik ve Akgemci, 1998). The success of SMEs, thereby, depends on entrepreneurial culture formed by SME's organizational culture. Following sections contain detailed literature review about entrepreneurship, culture and organizational culture.

SMALL AND MEDIUM SCALE ENTERPRISES

Employment creation and added value effects of SMEs are very important for all countries in the world. Alongside economical effects of SMEs in countries, they also have very important roles in terms of social and political view. The definitions of SMEs made by countries, institutions, organizations and experts vary depending on the economical situation of the country and sectoral capacity. Thus, a standard definition accepted by every one does not exist. However, SMEs can be described as local enterprises financed only by owner's equity and run by the owner (Tutar ve Küçük, 2003).

One of the fundamental characteristics of SMEs is that they are run by an entrepreneur. Entrepreneur, in broader sense, is the one who takes risk and brings together the factors of production to produce goods and services.

There is an entrepreneurial spirit behind each SME. The major reason of establishing an enterprise is entrepreneurial motivation. Entrepreneurship is a valuable skill which contains qualifications such as taking risk and predicting the future (Tutar ve Küçük, 2003). For this reason, the success of SMEs that established thanks to entrepreneurial spirit will depend on entrepreneurial culture. Following sections contain detailed literature review about entrepreneurship, culture and organizational culture, which are crucial for the success of a SME.

LITERATURE REVIEW ABOUT ENTREPRENEURSHIP, CULTURE AND ORGANIZATIONAL CULTURE

Entrepreneurship

There are various definitions of entrepreneurship in the literature. According to Schumpeter (1947: 132), entrepreneurship can be defined as making revolution in production models using technological opportunities or innovations to develop a new method or to produce a new product. He also extends his definition such that entrepreneurship is to find new markets for the products or new supplies for the materials by reorganizing their industry.

For most of enterprises organizational innovation and creation of market opportunities are vital. However, entrepreneurial characteristics such as risk-taking should not be ignored. Some researchers perceive entrepreneurship as taking responsibility, while others get it as a complex tradition in economic theory (Outcalt, 2000). Thompson (2004) made the definition of entrepreneurship based on six personality traits i.e., creativity, ego, ability to team work, being social, ability to focus on and advantage. Entrepreneurs having aforementioned traits have leadership characteristics and ability to adapt and change roles. These traits complement entrepreneurial skills (Thompson, 2004).

Drucker (1985) considers enterprising individuals to be innovative. According to Drucker (1985) innovation is peculiar to entrepreneurs. Bernbaum(2007), define entrepreneurship as a dynamic process regarding vision, change and creativity. Entrepreneurship requires energy and ambition in development and implementation of new ideas and creative solutions. To be enthusiastic in calculation of risk, to create effective, risk-taking teams, to have creative talent to deploy the needed resources to the right places, to have basic talents to create business plans and to have necessary vision to see opportunities in chaos and disorder are basic elements required for entrepreneurship (Bernbaum, 2007).

According to Thompson (2004), an entrepreneur perceives opportunities and creates value and innovation from the opportunities. Harrison (2006) states that entrepreneurship is consist of elements such as faith, loyalty, ability to develop strategy, and management skills. According to Entrepreneurship Centre at Miami University of Ohio (2006) entrepreneurship is a process of defining, developing and implementing a vision of life. Vision is the better way of implementing an innovative idea, making use of an opportunity or more generally doing something. At the end of this process, new risks, risky conditions and uncertainty can emerge Entrepreneurship Centre at Miami University of Ohio, 2006: 10).

Definitions of entrepreneurship can be grouped as structural, process related and activity related definitions. According to Guth and Ginsburg (1990), one of the structural definitions, entrepreneurship is renewing the business or taking risks for the enterprise. Stopford and Baden-Fuller (1994) expands this definition by adding a third variable, which is creation of a better change in the structure of enterprise. Schumpeter (1934) describes entrepreneurship as redefining the industry. These three different definitions consist of risk-taking in enterprise at individual, small team and top management levels, and industrial definition refers to the enterprise as entrepreneur. Sharma(1999) explain the difference between traditional entrepreneurship which contains actors outside enterprise and business entrepreneurship which contains actors within or at the border of enterprise. Sharma(1999) distinguish the concepts of strategic renewal and risk-taking in the enterprise. Sharma(1999) also differentiate the concepts of risk-taking within or outside the enterprise. Structural definitions focus on particularly entrepreneurs associated with human actors who take risks and carry out strategic renewal, especially within the borders of the organization (Sharma, 1999).

According to process related definitions an entrepreneur firm is described as innovative, productive and risk-taking organizations (Covin and Slevin, 1989; Kets de Vries, 1977; Miller and Friesen, 1978). Lumpkin and Dess (1996) add competitive-aggressiveness and autonomy concepts to this definition. Stopford and Baden-Fuller (1994) specifies five characteristics of business entrepreneurship. These are productivity, expectations

beyond the current capabilities, team cohesion, ability to find solutions to the problems and learning ability. Monsen (2005) also states that high performance entrepreneur organizations include five cultural dimensions: risk-taking, modernism, productivity, self-administration and team work.

According to the activity related definitions, entrepreneurship is making descriptions of individual, team and organizational levels to better understand the human dynamics of the entrepreneurship. Entrepreneurship activities in different levels of organization should be explained and status and roles of each individual and team should be dealt with in detail (Monsen, 2005). Corporate entrepreneurship as an entrepreneurship action includes not only the activities of individuals and teams in an organization, but also activities of the organization in the market or industry. These entrepreneurship activities can be classified in three categories. These are internal corporate venturing, strategic renewal and redefinition of industry (Stopford and Baden-Fuller, 1994).

When definitions of entrepreneurship is inspected, it can be figured out that some fundamental concepts such as risk-taking, vision, team work, creativity, being socialized, innovation and productivity come into prominence. Entrepreneurial organizations could see the future and take risks to get opportunities in the future. Entrepreneurship is a part of entrepreneurial culture that the enterprise has. Along with the entrepreneurs of enterprises, which are social systems, the employees are also members of this system. If the qualifications of the employees coincide with the goals and ambition of the entrepreneurs, then the success of entrepreneur enterprise will be constant. Personal traits of entrepreneur and the other employees reflect the culture of the enterprise (Çelik ve Akgemci, 1998). Therefore, culture and organizational culture concepts are very important in the success of entrepreneurial SMEs.

Culture

Examining the researches about culture, one can see that there are several main perspectives. These are psychological culture, critical/postmodern culture and sociological culture (Martin, 2002). Within psychological culture literature, culture is a model that deals with training the new members of the organization about the sharing of intro-institutional and inter-institutional adaptation problems between groups, identification and perception of the problems. In this manner, the main elements of culture are observed behavioral regularities when people interact, group norms, espoused values, formal philosophy, rules of the game, climate, embedded skills, habits of thinking, mental models, linguistic paradigms, root metaphors or integrated symbols. These can be expressed as visible organizational structures, strategies, goals and philosophies, and unconscious, taken-for-granted beliefs perceptions and feelings which are the best sources for values and actions (Schein, 1992).

Within critical/postmodern culture literature, culture can be defined in five different ways depending on the organizational research and interest areas. In regards to cross culture and competitive organizations, culture is a tool serving the biological and psychological needs of individuals. According to researchers working on organizational culture, culture is a tool with adaptive and regulating functions that connects individuals within social units; culture is a system of shared cognitions (Smircich, 1983). According to organizational symbolism, culture is system of shared symbols and values. Symbolical actions require grasping, interpreting and clarifying the meanings. Lastly, in regards to organizations and subconscious process, culture is a general reflection of mental infrastructure of subconscious. Monsen and Boss(2004) have seen culture as an intra-organizational variable, and they have approached it from the point of view of one that wants to grasp the organizational theory. One can design cognitive maps to classify organizational units, level and works. This approach makes the management examine the acquired assumptions, the increasing problems regarding the goals and conditions, and uncover the main principles (Smircich, 1983).

Martin (1992;2002) defines three perspectives for culture theories. These are integration, differentiation and fragmentation. Generally, any of these three conflicts with another (Martin and Frost, 1996). With a postmodern approach, culture can be analyzed with all these perspectives at the same time. All there are equi-valid, and they help each other. Cultural analyses between and withing groups in an organization are helpful(Monsen, 2005).

Within sociological culture literature, we can find DiMaggio who emphasized the increasing convergence of sociology and psychology. According to DiMaggio(1997), especially cognitive works can be used for cultural analyses. Culture is often seen as a dependent variable resulting from broken and inconsistent situations. First thing to accept is that if humans manage to use culture strategically, culture will present a lot of opportunities and choices for socialization (DiMaggio, 1997).

Culture is not what an organization has, but what it does (Swidler, 2001). Culture provides ingredients for action strategies of groups and individuals (Swidler, 1986). Individuals and groups can use resources selectively. This

way, individuals can establish new cultural models to help them create new strategies using time, ideology, symbols and rituals, when they encounter indeterminate situations (Swidler, 1986). Culture makes both small and large entrepreneurial firms change internally and externally (Swidler, 1986, 2001).

Organizational Culture

Organizational will exist as long as organizations will do. The notion of organizational culture started to become popular in 1980s, but its roots go as back as 1940s (Geertz, 1973). Schein (1990) introduced several definitions regarding organizational culture. These definitions for organizational culture include;

- Evaluation norms for work groups
- Organization's point of view and climate
- Product quality, price leadership and other major factors
- Organizations philosophy towards workers and clients
- Rules of game that are the backbone of the organization

Schein made a more formal definition in 1992: “ A pattern of shared basic assumptions that the group learned as it solved its problems of external adaptation and internal integration, that has worked well enough to be considered valid and therefore, to be taught to new members as the correct way to perceive, think, and feel in relation to those problems” (Schein 1992). So, organizational culture is a common background and language invented for successful external adaptation and internal integration, helping the organization achieve success. Furthermore, culture is established mostly unconsciously, as the groups within the organization gain experience. According to Schein, organizational culture has three levels. First level are aspects that can be easily discerned, but are hard to understand. These include quality systems, databases to observe and control actions.

Second level is espoused values which are conscious strategies, goals and philosophies. The third and deepest level is basic assumptions and values of the organization. The organizational culture can be defined as the basic the basic values underlying the management system, guiding the management applications, changing along with the workers' experiences, affecting customer experiences, shareholder relations and share values (Schein, 1992).

At the organization level, culture is formed parallel to the national cultural traits and desires of leaders of the organization. At the individual level, organizational culture is affected by organizational actions and perceptions of workers. To predict the potential for success of an organization, one needs to check the organization's culture. Organizational culture has a lot of complex and abstract definitions, and many researchers worked on the observable and non-observable elements of it (Hatch, 1997). The observable elements of organizational culture are behaviors, rules, rituals and ceremonies, legends, stories, dress, language, general outlook, and other similar physical characteristics of the organization. The non-observable elements are the values, perceptions, norms, assumptions, beliefs and ideology. It is hard to agree on one definition of organizational culture, but many definitions include several of the aforementioned elements. Generally, culture is seen as a shared social concept resulting from assumptions and worldview of members of the organization. Culture in an organization is often established over a long period with common experiences (Wilkins and Ouchi, 1983).

According to Denison(1990), organizational culture is the main beliefs, values and assumptions of organization members. These beliefs, values and assumptions take part in applications and behaviors and empower them (Denison, 1990). Four elements are especially important in the success of the organization. These are involvement, consistency, adaptation and mission. These affect greatly the quality, profitability, innovation, market share, sales level and workers' satisfaction in an organization (Denison, 1990).

According to Galpin (1996), organizational culture has 10 major components. These are rules and policies, goals and measurements, customs and norms, training, ceremonies and events, management behaviors, rewards and recognition, communications, physical environment, and organizational structure.

Hellriegel, Slocum and Woodman (1986) define organizational culture as beliefs and expectations of organization members. Additionally, organizational culture has the following dimensions:

- Observed behavioral regularities when people interact
- Norms shared by working groups throughout the organization
- Dominant values held by the organization
- Philosophy that guides the organization's policy
- Rules of the game for getting along in the organization
- Feelings and climate conveyed in the organization (Hellriegel, Slocum ve Woodman, 1986).

DIMENSIONS of ENTREPRENEURIAL CULTURE

Corporate entrepreneurship, which emerges in competitive environment of globalization, is considered as an essential factor for the success of the business. Many business executives and managers, especially SME managers, are regarded as an important part of the entrepreneurship process. Although corporate managers are considered as homogeneous groups in the literature of corporate entrepreneurship, in research on organizational strategy state that managers at different levels have different organizational roles. Different administrative levels that provide different structural skills offer opportunities to support entrepreneurial skills of the organization (Hornsby et. al, 2009). In this manner, managers of the SMEs, who are the top managers of the business, have an important role in the development and adoption of institutional entrepreneurial culture. Creative, social, innovative, risk taker, pro-autonomy and team worker SME managers will be able to ensure the organizational level entrepreneurial culture by supporting institutional entrepreneurial process. Entrepreneurial culture enables development of entrepreneurial strategies, which will allow to innovative, creative and responsible individuals with in organization (Ireland et. al, 2009).

“Autonomy” is an other important tool to generate the entrepreneurial culture in a corporate dimension wich SMS’s managers would use. Independent behaviour style wich is necessary for undertaken new risks, is a way of creating entrepreneurial values. For encouraging the entrepreneurship in organization level, a self governing leadership should be procured by strong leadership. Disposal of organizational pressures will conceive unrestricted teams and creative individuals. The efficient use of outonomy in organizational level will provide successful entrepreneurial applications. According to Lumpkin and Dess (1996); outonomy or in an other saying self governing is the most important dimension of entrepreneurship. Also, most of the studies on the subject of outonomy, points outs outonomy as a key factor wich contributes the “entrepreneurial value creating processes”(Lumpkin et.al, 2009).

Entrepreneurial culture emerges, depends on the entrepreneurial features of enterprise managers, organizational culture and entrepreneurial strategies of the enterprise. Especially outonomy would help individulas to encourage them to produce entrepreneurial strategies through producing creative ideas and implement them as innovative, flexible, free individuals in a borderless organizational structures. Therefore entrepreneurial culture should be improved as a basic key of success in global environment especially by SMS’s.

CONCLUSION

Entrepreneurial culture can affect the success of organizations greatly due to its openness to taking risks and bravery. Entrepreneurs often take such risks of usefulness, efficiency, saleability. Taking risks is a necessary component of entrepreneurial culture (Boss, 1989).

Entrepreneurial culture of SMEs' depends on their assumptions and perceptions about culture and organizational culture. The organization and the employees are the most important elements that help visionary and capable entrepreneurs do what they cannot do alone. The entrepreneur can succeed if he manages to establish an organization culture together with the employees. Organizational culture is a common language and a common background that develops from successful attempts by employees to external adaptation and internal integration, and it helps the organization in the path to success (Schein, 1992).

The entrepreneurial traits and talents of the leadership, the cultural situation of both the employers and employees, and the basic assumptions of the organizational culture they together built, are the main elements during the development stage of entrepreneurial culture. Entrepreneurial individual are responsible, not afraid to take the necessary risks, innovative, creative and visionary (Bernbaum, 2007). If need arises, these individuals undertake new risks, reorganize the organization, organize the actions of individuals and groups within the organization, do strategical renewals, redefine the industry (Guth ve Ginsburg, 1990; Stopford and Baden-Fuller, 1994). The organization should be capable of handling any internal integration and external adaptation problems. New members should be trained to be able to identify, solve and share these problems (Schein, 1992). Culture helps organize individual and group action strategies (Swidler, 1986). When problems arise, using ideology, symbols and rituals, new cultural models can be devised to overcome these problems (Swidler, 1986). At the organization level, culture depends on the perceptions of employees about group actions and problems (Hatch, 1997). The organizational culture can be defined as the basic the basic values underlying the management system, guiding the management applications, changing along with the workers' experiences, affecting customer experiences, shareholder relations and share values (Schein, 1992). In this aspect; the success rate of an enterprise actualize according to enterprise mergers, enterprise change overs, adaptation process to the environment, the development of new creative ideas, group work, the training level of employees, vision

development process and the cultural ingredients of enterprise (Hatch, 1997). Therefore; the continuity of success of SME's, the factors such as entrepreneurship or entrepreneurial organizational culture would be used as a tool.
